COSTLY FUEL.—Very few people, says an Eastern exchange, have ever estimated the value of the fuel which feeds the sawmill furnaces in the form of sawdust, which moves directly from the saw to the fiery gulf into which it is dropped by the automatic sawdust feeders in the mills. Rating it at the price it would bring provided it could be saved in the form of inch lumber, one would stand appalled at the figures. For every million feet of lumber piled on the docks coming from the circular saw, about 200,000 feet of the best portion of the timber passes into the "fiery furnace" as fuel in the form of sawdust. Or, to make it more comprehensible, in the year 1882, the mills on the Saginaw river cut over 1,000,000,000 feet of white pine lumber, which was the turning point in the output. During that year 200,000,000 feet of pine timber passed into the seething receptacles which produced steam, and was consumed for fuel. Suppose we estimate the cost—200,000,000 feet at $14 per thousand "straight measure," and we have the enormous sum of $2,800,000! This looks like a pretty expensive fuel account for the mills on the Saginaw river; but that is what it would amount to in the form of lumber instead of sawdust. As before stated, it is no great wonder that the lumber manufacturers of the country are looking anxiously for relief, at least partly in the direction alluded to. Even if 20 per cent of this could be saved, it would amount to over half a million dollars, and this would be the actual saving between one billion feet of lumber cut by an ordinary kerf circular saw and a thin band saw, and it looks as though it would be worth saving when pine stumpage is as high even as $10 per thousand in some instances

WORN-OUT SAWS PUT TO GOOD USE.—Says a New York journal of recent date: A wagon heavily laden with a nondescript assortment of old saws in every stage of decrepitude was slowly wending its way along Greenwich avenue the other day. The curious collection caught the eye of a reporter, who, hailing the driver, inquired whither he was bound with his unique load. "Jump aboard and I will show you." The reporter clambered to the lofty seat and there obtained a closer view of what appeared to be the most valueless rubbish imaginable. There were hundreds of saws in the load of every kind, from the long and broad two-handled instrument of the lumber camp to he delicate scroll saw of the cabinet-maker, and there was not a whole one in the wagon. Proceeding slowly to a neighboring street, the driver turned in the yard of a large factory, where the broken and rusty relics were dumped upon the ground to be sorted into separate piles according to their worth. "You will be surprised," said one of the proprietors of the establishment, "when you learn the use to which these old saws are put after they leave our hands." Then, leading the way into the exhibition-room of the place, the reporter's attention was called to a show-case containing a collection of engineering tools of delicate make and exquisite finish, including rules, sextants, quadrants, compasses, lancets and knives of the finest manufacture and all highly polished. "Every one of these scientific instruments," said the proprietor, "is made from the same stock which you saw dumped upon the ground a few minutes ago. We make a regular business of buying used-up saws from carpenters, cabinet-makers and others all over the city, which we transform into these delicate tools, and they are the best materials for our purpose We get them for prices usually paid for junk."

CHOOSING HAND SAWS. — Stiff blades are made of better material than thick ones, and are less liable to "buckle" or "twist," and are not so apt to break. They require less set, will stand an edge longer, and are not so tiresome to work. They should be hung in plain beech handles with rivets flush or countersunk. The blade should be of a dark color and have a clear bell-like ring when struck with the ball of the finger. Blades of a light iron-gray color are not so good. Never take a saw that jars or trembles in the handle. The first point is to grasp it by the handle and see that it *hangs* right, and that the handle fits the hand properly. Then try the blade by springing it and see that it bends regular and even from point to butt. See that it has a good crowning breast. Hold it at a distance and get a proper light to strike on the blade and you will see if there is any imperfection in grinding or hammering.

INVENTION OF THE CIRCULAR SAW.—Mr. J. E. Emerson, the Beaver Falls (Pa.) saw manufacturer, writes the *Bulletin* of the American Iron and Steel Association: In reply to your recent inquiry concerning the invention of circular saws, I will say that Jack Coop was probably the inventor of the circular saw. I will give you briefly his history, which I think you will find to be very interesting. In 1870, while I was making my patent inverted toothed saws in Pittsburg, Pa., a very sprightly, intelligent and well-educated old man, who said he was then 92 years of age, came in with an old rusty circular saw, about 18 inches in diameter, to get it polished up. I at once became interested in it. The old man told me that in 1799 he made that saw while in the British navy, by filing the teeth into it, and then got a hand-saw maker to straighten and polish it for him, and had a mandrel made and used the saw in the navy. At that time I gave an account of the incident to the *Scientific American*, and it was published in that journal, the editors then claiming that in all probability this was the first circular saw ever made. Mr. Coop was then living in Pittsburg, Pa. He was a very curious old man and much of a crank in many ways. Knight in his Mechanical Dictionary says the circular saw was described in an English patent in 1777—22 years prior to the claim made by Coop.

THE WOOD WORKER.

Aboriginal Wood-Workers.

At the Smithsonian Institution in Washington are collected as many of the aboriginal tools of America as the officers have been able to gather. The Indian and the mound-builders had a very good idea of wood-working. The best, of course, were Aztecs, who had arrived at quite a high stage of the art, and whose tools, although they knew nothing of steel, are really excellent. We have a few of their tools at the Smithsonian, but the best collection is of course in the City of Mexico. The material used was almost wholly glass, especially for the finer parts of their wood-cutting. To chop trees they used flint axes, and for the rough hewing out of logs the same, but when it came to the accurate fitting in of the hewn timber, they handled glass knives, chisels and saws very deftly and with beautiful results. There is a ceaba-wood post in Washington with hieroglyphics and faces cut upon it, all with glass. There are bits of the aboriginal chisel still sticking in a corner of the wood, where it broke off three centuries ago under the hand of the workman. The Aztecs knew how to make a very good and manageable glass, and their best cutting blades, swords, daggers and spears, saws, chisels and axes were made of it. When the edge dulled, they broke it from the end instead of sharpening it, and got a new cutting-line.

A great deal of aboriginal carpentry is still in use among the Moqui Indians of the United States. Of course they use our tools now, but they follow their old patterns. They know how to make ladders, and they swing their doors on hinges from the top, and they know how to mortise timbers—knew how long before Columbus landed in America. Of course they use our tools differently from our way. The chisel they push rather than hammer, and they work the board up and down on a fixed saw rather than the saw on the board, but withal they get very creditable results. The framework in the Pueblos is quite as honest as anything in Chicago.—*Chicago News.*

WOOD FOR DECORATIVE PURPOSES.—It is evident that much as we know about woods, there yet remains much to learn that may be of value in the arts, says an exchange. The secret of making good veneers which will not warp is only now becoming known, and until lately it was considered impossible to emboss wood; but now beautiful embossed panels, whose work resembles carving and whose richness compares favorably with the most costly art, are found in many places. In these the original patterns are carved by hand, and from these molds are made on which the wood is placed after being properly softened. The wood in these molds is then submitted to 250 degrees of heat and subjected to great pressure. Such a pressure effectually prevents all shrinkage. Wood may be cut as thin as the 300th part of an inch, but in this state is not useful. That which is cut to the thickness of the 100th or the 150th part of an inch, and lined with paper, is used for the decoration of walls and ceilings. This neither shrinks nor swells, there not being enough of it for the atmosphere to lay hold of. If it is desired to place such a veneer upon a wall, all holes and cracks must be filled with plaster of Paris, and being glue sized, the wall is ready for the wood in panels. The veneers are made damp with a preparation of glycerine and water, which softens them and, when dried, leaves them pliable. A checkerboard pattern of curled maple is about as thick as a piece of cardboard. To produce this, strips of wood are first woven in and out and then subjected to heat and pressure, which makes a smooth body, varied in hue as if it were made of two kinds of wood.

AN IMMENSE MACHINE for working of waste wood into the material known as "excelsior" has recently been put up at Gardiner, Maine, and is described as follows: W. H. Moore has now put in operation a machine which will work up any kind of wood, and particularly the waste edgings which have accumulated about the lumber-mills. It is a stationary upright frame 50 feet long, 6 feet high and about 2 feet wide. About on a level with a carpenter's bench is a table upon which rest 95 individual knives or planes, each of which is set in a block or frame of iron. Any one of them may be removed while the machine is in operation and replaced by another, should a dull knife require to be replaced or should an accident occur. When in operation the spruce edgings are inserted at one end of the machine, and are constantly fed by the operator. They pass the whole length of the machine, the slitting rule of each one of the knives or planes taking out a slit of thin, narrow, fine fiber, curling it more than the other machine, and delivering it all along the table of the machine in a perfect mass or bunch of curls. It has a fineness, softness and elasticity not possessed by soft fibered excelsior. The capacity of the machine is about five tons per day. The product is packed for transportation in bales two by three feet.

HOW TO STAIN FLOORS.—Have the floor well scrubbed, and let it dry. Then apply one or two coatings of size; this must be done thoroughly, for on the sizing will depend the success of the staining and varnishing. An oak stain can be obtained at any good oil and color shop, in tins, at low prices, varying according to size. If the darkest shade is used, one coating may suffice, but that depends on personal taste. When the oak stain is quite dry, apply the varnish with a thick, clean brush kept for the purpose. The broad brushes are better than the round ones; but that again depends on the worker. Apply the varnish carefully and smoothly, and buy a preparation that has been well mixed with quick dryers. Any painter or decorator will prepare the varnish. Let this dry very thoroughly before using the room; if not, all the trouble taken will be absolutely in vain. When the process is complete the floor can be kept smooth and polished with very little trouble; a soft cloth or broom will remove all dust, and a few drops of oil or beeswax and turpentine rubbed on occasionally will maintain the shiny appearance of the boards.—*Ladies' Home Visitor.*

BLACK WALNUT.—This very superior wood has nearly disappeared from the Western forests; but so earnest is the inquiry for it that its cultivation is becoming a matter of great desirability. To that end Daniel B. Emerson of Beloit, Wis., has given his experience in its culture as follows: He prefers shallow planting, seven feet apart each way, if planted in a field, or sixteen feet apart if planted around fences, as wire fences can be attached to the trunks without injury. Under favorable circumstances, the trees begin to bear in about seven years. One bushel contains from 400 to 600 nuts, or fifteen pounds of kernels, which will yield seven and one-half pounds of oil. He has trees fifteen years old which are 30 feet high and a foot through at the base. They yield ten bushels of nuts each annually, worth $4. The leaves and the husks, when boiled, furnish a liquid which will kill worms and insects on lawns, without injuring the grass.

WELL SEASONED WOOD.—If you cut down a tree in the month of its growth, and cut it right off at the butt and not trim it out any, in a few days that tree will be seasoned. "I do that," says an expert, "when we cut oak timber and leave the limbs on. When it is cut in June we find it seasoned in December when we go to take up the winter's firewood. We find if it is cut when the sap is out of the wood that it soon becomes sap-rotten. If you cut beech, poplar or birch for rails or posts, cut them in June or July and let them lie with their limbs on. You will have wood then that is not rotten. You will have fine poles of the birches or poplars, for they will be seasoned."

ROSEWOOD.—It has been a great mystery to many young persons why the dark, rich-colored wood so much used for furniture should be called "rosewood." Its deep-tinted, ruddy-streaked surface certainly does not resemble the rose, so we must seek some other reason for the name. Here it is: When the tree is first cut, the fresh wood exhales a very strong, rose-like fragrance, which soon passes away, leaving no trace of the peculiar odor. There are several varieties of rosewood trees; the best, however, are those found in South America and the East Indies and neighboring islands.

AN IMMENSE BURL.—One Chicago veneer firm, according to the *Lumber Trade Journal*, has in its possession a single burl of French walnut, weighing less than 400 pounds, out into veneers measuring 8500 feet and valued at $1400, or nearly $4 per pound, being more than four times as valuable as amaranth or ebony; and its high price does not prevent it being used quite extensively in Chicago by wood-working manufacturers of fine goods.

VERMILION WOOD has recently been used to some extent in decorative-art work. This wood, which is a product of Sumatra, is of a finer grain and darker color than mahogany and takes a finish equally beautiful. It does not grow to a very large size, and only a limited supply can be obtained. This latter fact, although it does not render it any more desirable as a decorative material, is likely to enhance its value commercially.

WOOD-POLISHING MACHINERY in these times of labor-saving is receiving much attention. No well-equipped factory is now considered complete without a sand-papering machine, and the various machines for this purpose are, some of them, marvels of ingenuity and simplicity.

EASTERN WOOD-WORKERS are using naphthaline as a wood preservative. It is said to be very effective, leaving the wood dry and with only a faint aromatic smell.

54-INCH BY 16 FEET STEEL BOILERS IN 2 SHEETS.

STEAM USERS, ATTENTION!

The engraving represents our standard 54 in. x 16 ft. Boiler. These boilers are made of homogeneous STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users. There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are supplied with a small hand hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 54 inches diameter by 16 feet, with 46 3½ inch tubes; Shell, 5 16; Heads, 7-16.
1 Steam Drum, 36 inches diameter by 72 inches long.
1 Breeching.
1 Smokestack, 30 inches by 60 feet, Nos. 12 and 14 Iron.
300 feet galvanized strand for Guys.
1 C. I. Front, complete.
1 Foundation Plate for front.
1 Set Grate Bars for coal or wood.
1 Back Bar Bearer.
1 Ash Cleaning Door and Frame.
1 Back Arch Plate.
1 Set Binder Braces and Bolts for Brickwork.
1 Stand for back end of Boiler.
1 Steam Gauge and Syphon.
1 Glass Water Gauge, complete, with column and 3 Gauge Cocks.
1 Safety Valve.
1 Stop Valve.
1 Feed Valve.
1 Blow-off Valve.
1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds. Total weight of Boiler and fixtures, 17,000 pounds.

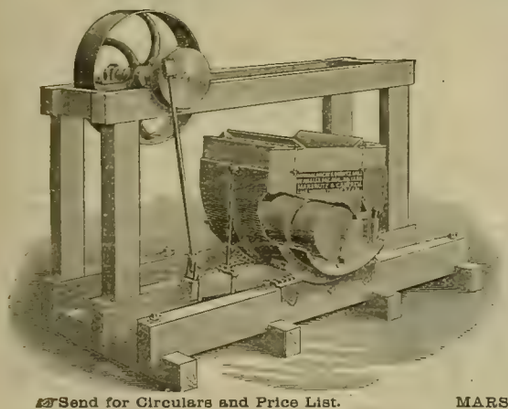
NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Timber and Tools.

It is a fact well known to millmen that it is not always the harder woods, in the ordinary acceptation of the term, that are most wearing to the saws. Many practical persons marvel at this and wonder to themselves why a piece of timber showing small crushing tension and other strengths, requires more power to work into lumber, and at the same time wears out the saws and cutting tools faster, than other varieties of timber, the strength of which, in most respects, is greater.

A log of black walnut and one of burr oak of the same size worked into the same sized stuff will show widely different results on both saws and machinery. If we attempt to rive or split these logs the walnut will work much easier than the oak, and so far as the various strengths are concerned the oak is superior by far; but when cut into by tools of any description the walnut will present much greater resistance than the oak, and the same is true as regards many other varieties of hard and soft timber.

If we take a longitudinal section of these comparatively soft timbers which are so hard on the cutting edges, we will find the minute pores or interstices filled with minute glistening particles or crystals, and subjected to chemical analysis we will find them composed of silica, one of the very hardest minerals known, while with the hard easy working woods they will be found nearly or quite absent by both the microscope and analysis. These little particles, so finely divided as to be insusceptible of ordinary touch, are really a better grit than ordinary sand, and are the means of cutting off the fine edge of cutting tools, as saw teeth, plane irons, and the like.

Two plane irons, made of a fine quality of steel, as near alike as it was possible for a skilled mechanic to make them, were each hardened in our laboratory by means of mercury, then finely sharpened, so that the edges of each presented precisely the same appearance beneath the magnifier. These were each inserted in an ordinary plane and one placed on the oak, the other on a piece of walnut, both pieces of wood having been previously dressed. At the rate of 100 pounds pressure, each iron was crowded forward four inches. On the oak stick, the pressure from the rear indicated 809.5 pounds, while with the walnut the indicator showed a pressure of over 1000 pounds. The irons were both now withdrawn, and first placed beneath the microscope; the one used on the oak presented a general upset appearance, the edge of the iron showing a slight tendency to turn downward, there being sufficient heat generated by the friction to partially draw the temper along the minute edge, which, however, would not extend back sufficient to materially affect the wearing and cutting properties of the iron if in constant use.

The iron used on the piece of walnut showed a scratched, notched appearance all along the minute edge, and by the aid of the most accurate means of measurement at hand, these notches were all of the same depth, but different distances apart, proving conclusively that the particles of grit or crystals which caused them, by being harder than the best mercury-hardened steel, were all of the same size, and evenly distributed, as far as regards depth of deposit in the grain of the wood. The small spaces of the iron edge between these notches or scratches were found nearly as the entire edge appeared originally, showing again that the cellular tissue of walnut outside its mineral deposits was really softer than that of oak; hence, were it not for these deposits the timber would cut much easier. Of course, if the iron had been drawn back, and again shoved through, the notches would have been more apparent and general, increasing each time, and distance showed until the entire cutting edge had been of itself cut off.

Consulting the law governing plant or vegetable growth, we are told that all food before becoming fit for assimilation must be reduced to its gaseous state. If this be so, the question arises, how, or by what methods of plant-growth and assimilation, is it possible for silica to appear in its original crystalline state among the tissues of the growing or matured tree? while it is universally known that this variety of wood grows only where this mineral is abundant in some of its modified forms. This, however, is not of great interest to manufacturers just how it gets there, but that it is present is shown conclusively. To get rid of it, even were it possible, would destroy the beauty and general characteristics of walnut, and to overcome its action on tools, rapid motion and softer iron is the best, safest and most efficacious method.—*Lumber Trade Journal.*

400,981.—DRIVING GEARING—J. C. Whitford, Stockton, Cal.

401,095.—LIGHTNING CONDUCTOR FOR WIRE FENCES—F. E. Wood, Yucca, A. T.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAR COUPLING.—Chas. A. McDougall, Alameda. No. 401,046. Dated April 9, 1889. This automatic coupling and uncoupling device for railway cars consists of a bumper and drawhead, having leaves or gates within the cavity or opening of the drawhead, these leaves opening automatically to receive the head of the link and being opened by suitable mechanism to release the same when desired.

ELECTRO-MEDICAL APPARATUS.—John J. Lewin, S. F. No. 401,041. Dated April 9, 1889. The invention relates to certain improvements in electro-medical apparatus, and consists especially in a novel construction of a primary coil, a contact-breaker with its adjustment, and the regulator, together with one or more electrodes which may be applied in various ways.

MACHINE FOR LABELING CANS.—Willard Lee, Los Gatos, Santa Clara Co. No. 401,039. Dated April 9, 1889. This machine for applying labels to cans consists in a cylinder having chambers around its periphery into which the cans are received from the feed-chute, a means for applying paste to the labels in a continuous sheet and leading said sheet to a point where it is applied to the cans, a means for severing the labels from the sheet at the proper point and pressing the ends around the can, together with certain details of construction.

ELECTRIC SELF-WINDING TIMEPIECE.—Manuel Carranza of Guatemala, Guatemala, and Jose M. Tinoco, S. F. No. 401,006. Dated April 9, 1889. The invention relates to the class of timepieces including clocks; and it consists in an electric motor connected with and adapted to drive the winding arbor of the timepiece to wind up its spring, an electric circuit including the motor, and a novel mechanism actuated by the timepiece for closing and opening the electrical circuit whereby the motor is thrown into and out of action. The object is to provide a timepiece so constructed that when it is nearly run down it shall be rewound by the automatic throwing into action of the electric motor.

NUT-LOCK.—Benjamin Marshall, S. F. No. 401,044. Dated April 9, 1889. This invention relates to that class of nut-locks in which the bolt is so constructed as to serve to hold the nut upon it without the assistance of washers or other independent devices. The invention consists in a bolt having a spring or resilient tongue, its junction with the bolt being toward the end or point of said bolt, while its free end is toward the head of the bolt. The invention further consists, in combination with a bolt of this character, of a nut having an interior diameter slightly less than the diameter of the bolt. This device is applicable to locking the nuts of any machinery or mechanism, but is specially adapted to railway rails and fish-plates.

THE L. A. & HUENEME R. R. Co. proposes to build a railroad from a point in or near Los Angeles, through the San Fernando valley, the Santa Susanna Pass, the Simi and Las Posas ranches and the Santa Clara valley to a point on the ocean near Hueneme. The entire length of the road and branches is put at 70 miles. The capital stock is to be $2,000,000, of which $70,000 has been subscribed. The directors are: D. McFarland, J. M. C. Marble and W. G. Hughes of Los Angeles; T. R. Bard and A. J. Salisbury of Hueneme.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes wherever he can from personal practice, and in every line and compartment we detect the hand of one of the practical miners and not a closet theorist.

The works, like Mr. Aaron's former publications "Testing and Working Silver Ores," "Leaching Gold and Silver Ores" that have been "successfully popular is written in a condensed form, which renders the information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents.

Preface; Introduction; Implements; Assay Balance; Materials. The Assay Office. Preparation of the Ore; Weighing the Charge; Mixing and Charging Assay Litharge. Systems of the Crucible Assays. Preliminary Assay. Dressing the Crucible Assays. Examples of Dressing. The Melting in Crucibles, Scorification, Cupellation, Weighing the Beads, Parting, Calculating the Assay. Assay of Ore Containing Coarse Metal. Assay of Roasted Ore for Solubility. To Assay a Cupel. Assay by Amalgamation. To Find the Value of a Specimen. Tests for Ores. A Few Special Minerals. Solubility of Metals, Substitutes and Expedients. Assay Tables.

The volume embraces 130 12mo pages, with illustrations, well bound in cloth. 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying. Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion. Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Xanthat.; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method. New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75. Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & Co., S. F.

Every Miner His Own Assayer.

A chemical for testing and ascertaining the value of all kinds of ore, by which every miner and prospector can make his own assays, anywhere in the mountains, at a cost of a little over 5 cents and in a few minutes' time. No apparatus or dangerous acid needed; a dry powder, which may be carried in the pocket. This, mixed with the ore and a little water in a teacup, produces an electric current, which separates the silver from the ore instantly, no matter how refractory. Try it; you will be delighted. Will save you many dollars for assaying. Package sufficient for 30 tests, with full directions, by mail to any address on receipt of $2; 6 packages for $10. Address, Prof. J. Herman, P. O. Box 1845, San Francisco, Cal.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leller, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 94 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Supt., or Hugh Murray, Secy.

Educational.

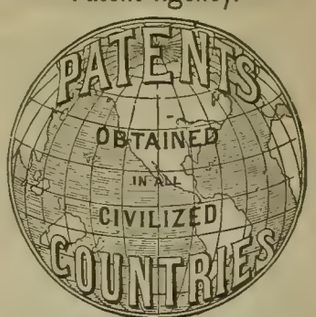
Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

"RED FLAX" TRADE MARK RED CORD CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

—BUILDERS OF—

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, April 18, 1889.

General trade is reported to be fairly active, yet the feeling is still of a conservative character. Among iron-workers there is very little doing, causing a disgusted feeling among foundrymen. So far as we can learn, there is no speculative movement in anything, and until there is, all lines of business will be more or less inactive. The banks report money generally easy, with liberal outside offerings of funds. Merchants report collections good for the season. The following receipts of treasure by sea are reported to have come to hand the past week: Coin, $5160.

The City of Sydney, hence April 15th for China, took out for Hong Kong: Mexican dollars, 237,631; silver bullion, $165,000; gold dust, $60; and gold coin, $4367. For Yokohama the same vessel took out in silver bullion, $46,000; and for Calcutta, $46,000. Total, $499 058.

SILVER—The market ruled weak up to Tuesday, at from 92 to 92½c, when it advanced to 92¾c under firm bidding. The output of the mines on this coast is barely sustained, although present indications point to a slight but steady increase for the next 60 or 90 days.

MEXICAN DOLLARS—The market continues to maintain its strength at 72¾@73¾c reported last week. At the close there appears to be a disposition on the part of one or two large receivers to ask more money.

QUICKSILVER—The market is steady at last week's quotations. Receipts the past week were as follows: Forty-five flasks, Parrott & Co.; 45, Haas Bros.; 47, A. Abbey. There was exported to Mexico, 90 flasks.

PIG IRON—Market lifeless, with holders firm, owing to the advancing tendency of the markets at the East and also abroad. The imports the past week aggregated 300 tons of foreign.

TIN—Imports the past week were 2178 ingots by sea, and 460 boxes overland. The market, owing to reported scarcity or a corner, is higher for pig. Coke is easy at another reduction, owing to liberal supplies on spot and near by. For prompt shipment, $4 75 is bid for coke tinplate, and $4.85 asked, with some business reported at $4.80. There was shipped the past week 24,300 lbs. tinplate to Victoria, B. C.

COPPER—It is very difficult to obtain any correct information regarding the outlook. At present, all buying is confined to actual requirements.

BORAX—Receipts the past week aggregated 1157 ctls., and exports by sea, 42,176 lbs. to New York. There was sent overland to New York in last month, 272,080 pounds.

ANTIMONY—The market is firm at the outside quotations.

COKE—Imports the past week by sea were 560 tons. The market is very strong for both spot and to arrive.

COAL—Imports the past week were as follows: From Tacoma, 6300 tons; Nanaimo, 3152; Seattle, 3316; and overland, 21. Total, 12,789. Coos bay coal is quoted at a decline of $1 a ton, and Cumberland in bulk at an advance of 50c a ton. The consumptive demand for house is slow, and for steam is fair. Consumers are not disposed to stock up beyond immediate wants, unless offered inducements. Australian advices under date of March 1st, say: Speculators in coal have freely chartered during the past few days, owing to low charters and collieries cutting in prices.

Eastern Metal Markets.

By Telegraph.

NEW YORK, April 18, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	92¾	$14 50	$3 65	$20 75
Friday	42½	92¾	14 50	3 67½	20 75
Saturday	42½	92½	14 50	3 70	20 75
Monday	42½	92½	14 00	3 67½	20 70
Tuesday	42 3-16	92½	13 75	3 65	20 60
Wednesday	42 3-16	92½	13 75	3 65	20 75

NEW YORK, April 17.—There are no useful reportable features to note in copper. Neither bids nor offers can be comprehensively made until the existing complications become disentangled. The output of 11 mines for March was 4842 tons. Refined petroleum—Barrels, 7c; plain cases, 9c. Pig lead is steady at $3.67½@3.70 for spot and early future delivery. Pig iron is firmer, as is pig tin.

San Francisco Metal Market.

Mining Share Market.

The market, the past week, was fairly active, with Mexican and Union still the favorites. The fluctuations in these two stocks were of a lively, attractive character, under active manipulation. With a few exceptions, the outside dealers look on the movements with suspicion, seeing at every favorable opportunity. The bearish feeling is intensified by the conflicting reports of value of the work now going on in Mexican. Union's chief attraction lies in the fact that a crosscut has been started with a view of cutting the ore body found in Mexican. There can be no doubt but the work in the two mines is of a very important character. In Sierra Nevada and Ophir, active prospecting work is reported under way. The same advices come to hand from Scorpion, Hale and Norcross, Best and Belcher, Gould and Curry, Savage, Chollar, Potosi, Crown Point, Belcher and Seg. Belcher. It is difficult to obtain reliable information of the work going on in Yellow Jacket and Challenge; probably this is due to the desire of the "Pool" to keep back everything until the assessment on the former is collected. An assessment is said to be pending on Challenge, as the mine was largely in debt on April 1st. Important crosscuts have been commenced on the upper levels in Alpha and Con. Imperial, with two others to be started within a short time in the latter. It is said that arrangements are perfected to explore the levels reaching from the 900-foot down to the 1650-foot in the following mines: Potosi, Bullion, Exchequer and Alpha. Work will be done through the Ward shaft. The explorations, it is reported, will be toward the east. Our private advices from the Comstock report the Crown Point mine looking exceedingly well on all the levels, and that in the Hale and Norcross crosscut, on the 750-foot level running west, they have run into very rich ore. This find is farther west than before found, which goes far in proving the richness of the unprospected area lying to the west. The Quijotoa stocks have been lifeless, as have the Bodies and Tuscaroras. Experienced operators are timid about dealing in the latter, fearing the public are large holders. The 50 cents assessment on Bodie, while money is reported in the treasury, destroys confidence in the stocks of the mines in that district.

It is claimed that the Sierra Nevada and Scorpion Mining Co.'s have arranged for the better development of their mines by jointly running a drift eastward from the 520 level of the former to the line of the Scorpion, where the drift will be taken up by the latter and extended well into its grounds. Mining men are very hopeful of favorable results following the contemplated work.

The assay value of ore mined the past week by Crown Point shows increased value, while Hale and Norcross and Confidence is less.

The St. Louis Mining Co., Virginia City, is to be listed on the two exchanges in this city.

The Nevada mill's 60 stamps will soon be dropping. The 40 now dropping on Hale and Norcross ore, crushes 1000 tons a week; with 60 dropping there will be 1400 tons crushed a week.

It is claimed that the new mill for the Occidental Mining Co. will be ready for service by July 1st of this year.

If there is anything calculated to prove the absurdity of the statement that the public wants dividends, it is the fact that Con. Virginia with regular 50-cent monthly dividends assured, and Confidence with monthly-dollar dividends assured, the stock of the two mines does not move up while the stock of Mexican, with a find of only two-foot rich ore, and the stock of Union with the ore yet to be found, have been steadily advancing with good fluctuations. It is an active gambling proposition that is wanted.

The bullion output of the Comstock mines is steadily increasing. For the week ending April 13th, it was $10,300 more than for the preceding week. The aggregate ore yield of the mines for the week ending April 13th, was 7403 tons, divided as follows: Con. California and Virginia, 3012 tons; assay value, $29 95; Best and Belcher, 115 tons; assay value, $22.50; Savage, 508; assay value, $19; Hale and Norcross, 930 tons, $30; Chollar and Potosi, 500 tons; Challenge and Confidence, 426 tons; assay value, $25.40; Crown Point, 763 tons; assay value, $19.31; Overman, 249 tons; Alta and Justice, 500 tons. The total bullion yield of the above was $165,000.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

CALIFORNIA FRUIT-PITTING CO., April 5. Object, to manufacture fruit-cutting machines. Capital stock, $50,000. Directors—W. F. Mau, Morris Newton, J. A. Ledden, Frank McCann and Frank H. Ames.

OREGON & CALIFORNIA LUMBER CO., April 9. Capital stock, $200,000. Directors—C. A. Hooper, Geo. W. Hooper, W. H. Talbot, A. W. Jackson and E. F. Burrell.

LA FAVORITA RAISIN VINEYARD CO., April 9. Object, to carry on fruit and raisin-growing. Capital stock, $64,000. Directors—W. W. Broughton, N. J. Bird, Robert Husband, S. W. Fergusson and T. K. Stateler.

HARQUA HALA M. CO., April 7. Location, Arizona. Capital stock, $100,000. Directors—J. S. White, W. G. Wharf, John McArthur, R. D. Hunter, A. Wilson, A. M. Benham and W. R. Thomas, all of Oakland.

MEXICAN COLORADO RIVER LAND CO., April 9. Object, to do a general land, mining, transportation, agricultural and building business in the Territory of Lower California and State of Sonora, Mexico. Directors—Wm. Hill and John Merritt of Petaluma, Guillermo Andrade, Calixte Denervand and Wenceslao Loaiza of San Francisco, Wm. Bihler of Sonoma and J. P. Thomas of Alameda. Capital stock, $20,000.

WESTERN CABLE CO., April 10. Capital stock, $1,000,000. Directors—Joseph Nash, Howard C. Holmes, Alfred S. Moore, Josiah O. Low and G. B. Willcut.

PORT CAROLINA, PALOS VERDES, MINERAL LAND & HARBOR DEVELOPMENT CO., April 16. Object, to improve the harbor of Port Carolina, northwest of San Pedro, connecting it with Los Angeles and San Bernardino and the East direct by a railroad already contracted for. The Palos Verdes ranch, where the harbor is located, contains 17 000 acres of land, on which is a lake, from whose waters the company intend to supply San Pedro and Wilmington. It is also the intention of the company to develop the coal, gold, silver and asphalt mines on the property, as well as the petroleum-wells now yielding abundant oil. Capital stock, $2 000,000. Directors—Joseph D. Redding, H. G. Wilshire, Lyman I. Mowry, J. K. Tuffrie and Lewellyn Bixby.

OCCIDENTAL BEET-SUGAR CO., April 16. Object, to conduct the Watsonville beet-sugar refinery and to erect a large number of factories throughout the Pacific Slope for the manufacture of beet sugar. Capital stock, $5,000,000. Directors—Louis Sloss, M. Ehrmann, Claus Spreckels and John D. Spreckels.

CENTRAL MILL & LUMBER CO., April 17. Capital stock, $80,000. Directors—Edwin Lord, Andrew Christenson, C. C. Dow, Leon A. Larcel and James P. Christieson.

C. E. SLADE LUMBER CO., April 17. Capital stock, $200,000. Directors—C. E. Slade, C. A. Thayer, C. N. Elliott, E. K. Wood and O. M. Kellogg.

KEITH ELECTRICAL CO., April 17. Object, to manufacture dynamos and motors and establish electric-power systems. Capital stock, $100,000. Directors — Montgomery Nicholas, T. Romaine, George W. Osborn, James R. Pickens and Sidney M. Smith.

ALASKA GOLD-EXPLORING CO., April 16. Capital stock, $2,000,000. Directors—William Johnstone, H. D. Page, William J. Gurnett, Jr., John Durant and A. Phelps.

KENAI COAL CO., April 16. Location, Alaska. Capital stock, $1,000,000. Directors—Charles F. Leege, Francis W. van Reynegom, H. M. A. Miller, Joseph Hutchinson and F. H. Eichbaum.

PACIFIC CONTRACTING CO., April 16. Object, to deal in patent rights relating to paving, roofing, building, etc. Directors—Clarence D. Vincent, Charles G. James, Wallace T. James, Sylvester Trull, J. S. Severence and E. J. Martin. Capital stock, $100,000.

TUBBS CORDAGE CO., April 16. Object, to acquire the entire plant and business of the San Francisco Cordage Company. Directors—A. L. Tubbs, Hiram Tubbs, Alfred S. Tubbs, Austin C. Tubbs and H. A. Tubbs. Capital stock, $1,000,000.

ABNER DOBLE CO., April 16. Object, transacting a general commission and mercantile business and to deal in machinery. Capital stock, $500,000. Directors—Abner, Robert F. and William A. Doble, F. L. Alderson and Francis Ferrier.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Overman, April 16, $7658; Mt. Diablo, 16, $12,780; Nevada Queen, 16, $11,000; Savage (for March), $28,271; Hale and Norcross, 16, $21,271; Cons. California and Virginia, 16, $76,404; Bluebird, 9, $17,472. Ontario (ore sales for past three weeks), $191,184; ounces fine bullion same time, $255,879; Hanauer, 9, $1600; 11, $1575; Queen of the Hills, 12, $2200.

HOW IT WORKS —If we were to put a two-line local in the most obscure corner of the paper, which stated that a certain business man charged more for his goods or kept an inferior quality than his competitors, that man would employ a bull-headed slugger to come around and kill us the next morning. But if we were to ask that same man for an advertisement of his wares, he would say: "No; I don't believe in advertising; no one reads the papers."—*Exchange.*

A LARGE SAWMILL ENTERPRISE.—Work has been commenced on a dam 48 feet high across the Klamath river, which is to afford water-power for a number of new sawmills not far from the California & Oregon line, in Shasta county. An Eastern syndicate, in which Gen. Alger of Michigan is interested, is behind the scheme, and the capital is said to be $10,000,000.

"De man wot knows it all is alluz a-makin change, a-buyin' ob experience." The man who does *not* think that he "knows it all" about Pumps can find out a great deal about them in *Grimshaw's* PUMP CATECHISM. By mail, postpaid, $1. Dewey & Co., 220 Market St., S. F., Cal.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of principal place of business San Francisco, California. Location of works, Placer County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 19th day of March, 1889, an assessment, No. 12, of Five Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 9, No 327 Pine Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of April, 1889, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 14th day of May, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOCART, Secretary.

OFFICE—No. 327 Pine Street, Room 9 S. F. Stock Exchange Building, San Francisco, Cal.

HORACE D. RANLETT,

Ores, Mining, and Commission,

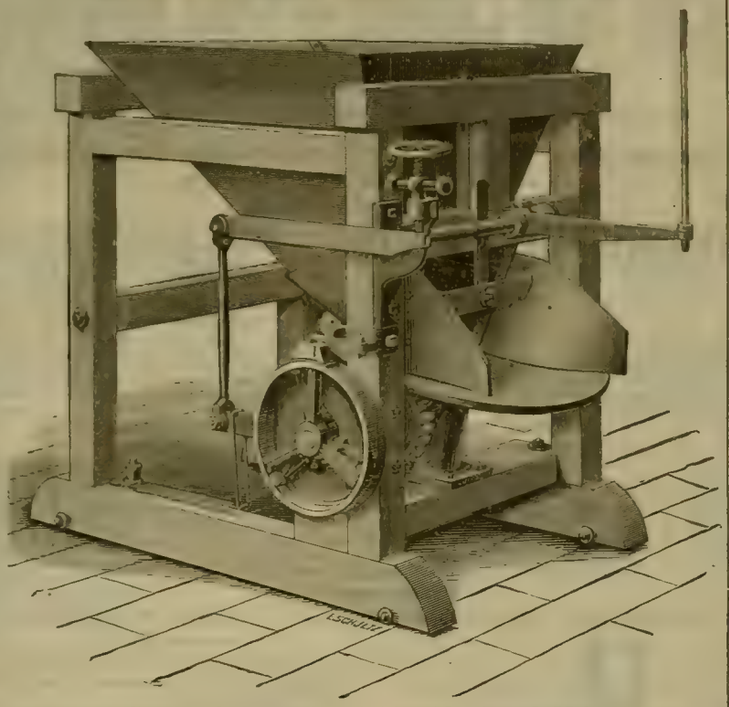
JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

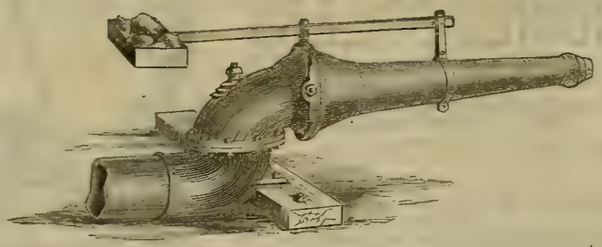
N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish **Single-Jointed Giants** when required. Prices, discounts and Catalogues of our specialties of **Hydraulic Mining Machinery** sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

CITY HOTEL.

Sonora, - - - - - - Tuolumne Co., Cal.

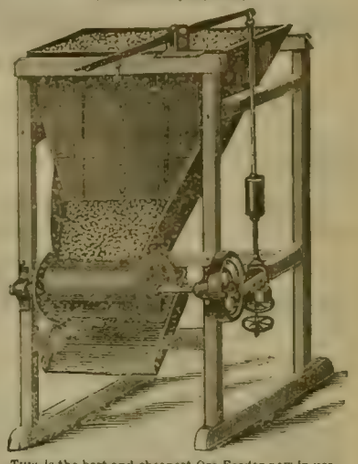
Office of all Stage Lines leading out of Sonora. Fine Bar, Billiard, Reading and Sample Rooms. Everything first-class. Terms reasonable. C. S. FITCH, Proprietor.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

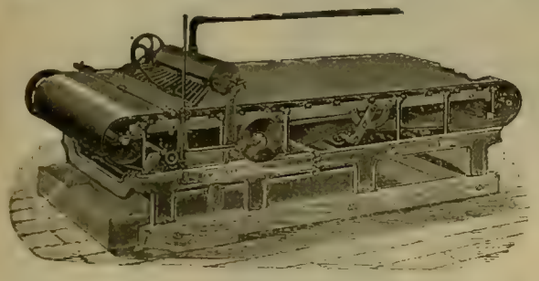
ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 15, No. 132 Market Street, - - - - - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00).



THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

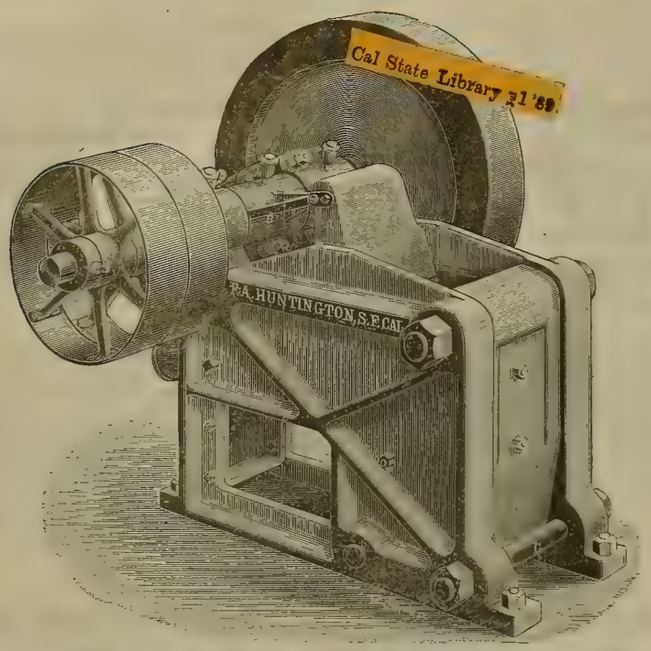
F. A. HUNTINGTON,

MANUFACTURER AND DEAL R IN

MINING MACHINERY.

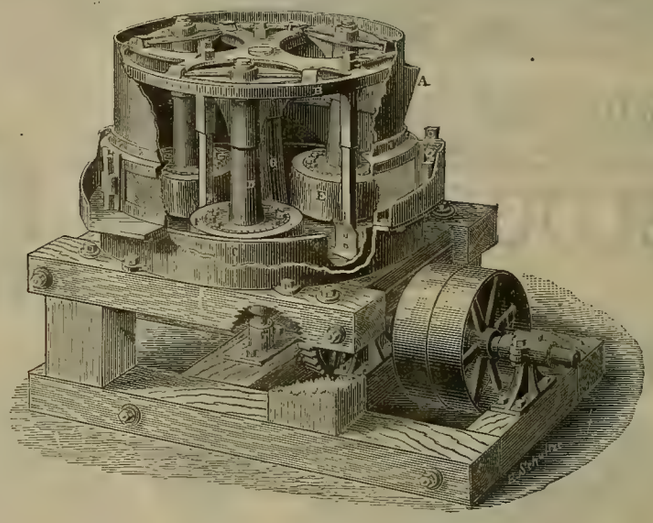


Cal State Library 21 '89

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

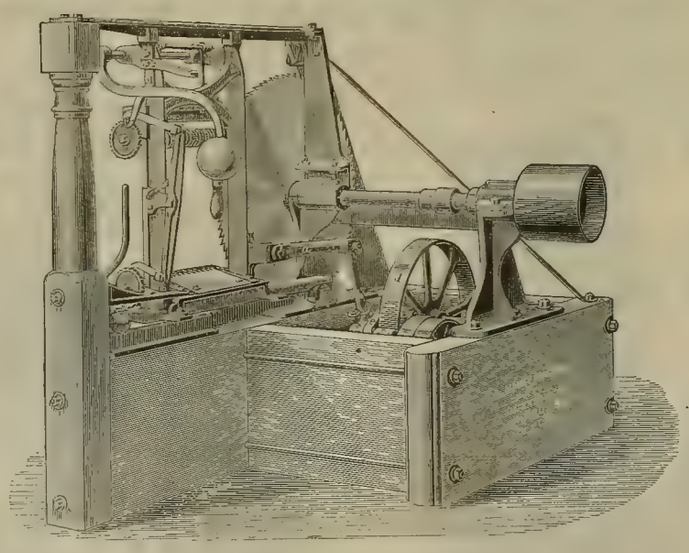
The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S
PATENT SHINGLE MACHINE.

This Machine is so well and favorably known by all the principal Lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. This feed-works is positive and uniform in its action and obviates all the jar or tremor formerly given to the machine by the weight used in the old style feed.



For simplicity, durability and rapidity of action, these machines have no equal, cutting from 50,000 to 75,500 shingles per day.

Price, complete with Jointer and one 38-inch Saw, $475.00.

The new feed-works can be applied to any of the old machines.

Price $100.

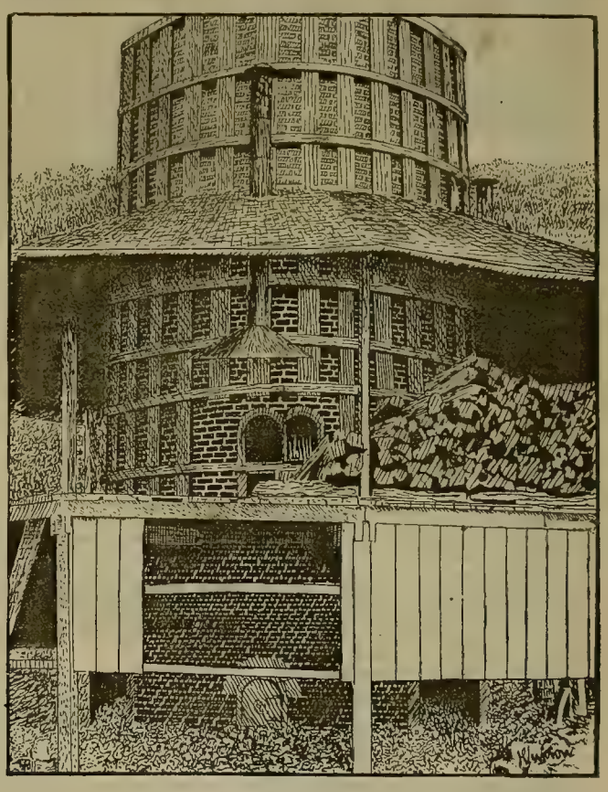
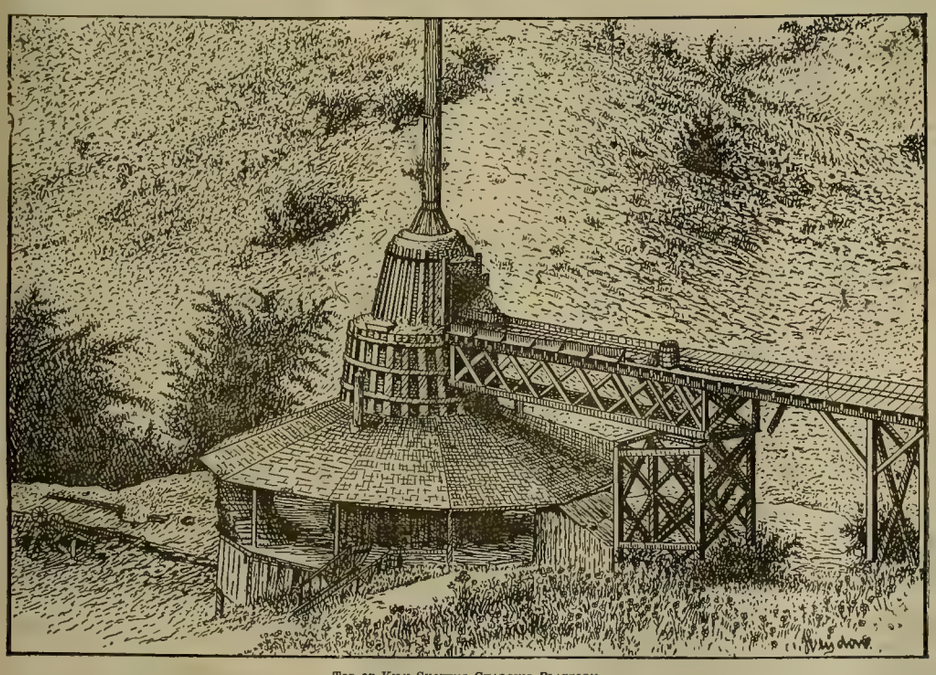
PERPETUAL LIME KILN AT GUADALUPE.



VIEW SHOWING FIRING DOOR AND DISCHARGE DOOR.



TOP OF KILN SHOWING CHARGING PLATFORM.

PERPETUAL KILNS USED IN THE MANUFACTURE OF LIME.

Lime-Burning.

At the works of the Guadalupe Lime Company an extensive business is carried on, the kiln being a perpetual one, and a decided improvement on the old-fashioned pot kiln. The works of this company are situated upon the eastern slope of the Almaden section of the Santa Cruz mountains, about ten miles southwest of San Jose and 2½ miles from Guadalupe Station, Santa Clara county, on the New Almaden branch of the Narrow Gauge Railroad. This property was first developed about the year 1864, and the lime burned in kilns on the banks of the Guadalupe creek.

The principal quarry of this company is situated at the hight of about 900 feet above sea level. It is a circular opening, and was connected by a tunnel with other workings about 150 feet below, but the tunnel has now caved in. The limestone in this quarry is about 45 feet thick, and dips to the southwest at an angle of over 30 degrees. It is a dark-colored bituminous limestone, many samples of which smell strongly of petroleum when freshly broken. Both above and below the limestone are strata of shale.

The present workings appear to be confined to smaller openings, most of which are at a lower elevation. In some of these the limestone is of a light color, but the formation presents the same general characteristics as the former. The accompanying engravings and the description, we take from the report of the State Mineralogist. Inquiry has been made by those using the old-fashioned kilns concerning the improved ones. The cuts will give those interested a good idea of the "perpetual kilns."

The limekiln, which is situated about 400 feet below the upper quarry, is supplied with limestone by trucks worked by a gravity pulley from the quarries above. The kiln is an upright circular furnace about 60 feet high, tapering from a circumference of about 100 feet at the base to about 40 at the top. It is surmounted by a smokestack 60 feet in hight. This kiln is con-

nected with an outer wall of ordinary brick and an inner one of firebrick, the space intervening being filled with concrete, altogether forming a wall of about six feet thick.

The trucks from the quarry are lowered to the charging platform, which leads to the door of the furnace. About 20 feet beneath the charging platform, the kiln is surrounded by a firing floor. On a level with this floor are three fireplaces, placed at equal distances in the main body of the kiln. The ash pits beneath the grates of the fireplaces extend directly down through the wall of the kiln, leading separately and directly to the ground or drawing floor, about 20 feet below. The space in the kiln between the level of the fireplaces and the ground floor constitutes a cooling chamber, the line being drawn from three openings at the bottom of the kiln. This kiln is charged by filling the cooling chamber with waste rock up to the level of the fireplaces, above which 18 truckloads, equal to about 30 tons, of limestone are dumped. The fires are then lighted, being fed with four-foot sticks of redwood.

After burning three days, a charge equal to 24 barrels of waste rock is drawn from the draw-holes at the bottom of the kiln, just as though it were burnt lime, and fresh limestone added at the charging door to keep the charge at the proper hight in the kiln. After six drawings, which now take place in 24½ hours, the waste rock is all drawn out, and the lime begins to make its appearance. The lime is sorted and shoveled into rawhide baskets, and hauled to the depot, where it is shipped in bulk. This kiln consumes from 4½ to 5 cords of wood in 24 hours, producing 160 barrels of lime in that time.

Production of Lead.

C. Kirchhoff, Jr., agent of the U. S. Geological Survey, makes the following preliminary estimate of the production of lead in the U. S. for 1888:

As compared with a series of years, the production of lead in 1888 was as follows, in short tons of 2000 pounds:

	1885.	1886.	1887.	1888.
Desilvered lead	107 437	114,329	135,552	151,465
Non-argentiferous lead	21,975	20,800	25,148	29,090
Totals	129,412	135,629	160,700	180,555

The total given under "Desilverized Lead" is the aggregate of the returns of every desilverizing works in the country. The quantity of "Non-Argentiferous Lead" for 1888 is the estimate made by Messrs. John Wahl & Co. of St. Louis, of which they state 13,800 tons is the output of Southeast Missouri and 7000 tons is the product of Southwest Missouri and Kansas district. A considerable increase in the make is expected during the current year from the former section.

This office is indebted to the Bureau of Statistics for the following figures relating to the amounts of lead returned by Collectors of Customs as contained in silver-lead ore imported from Mexico during the calendar year 1888:

	Pounds lead.	Value.
Corpus Christi, Texas	5,629,780	$ 49,170 10
Paso del Norte, Texas and New Mexico	41,647,291	832,944 00
Saluria, Texas	9,995,300	84,438 00
Totals	57,272,371	$966,552 10

In the calendar year 1887 the Mexican imports were estimated at 15,000 tons, so that the greater part of the enormous increase in 1888 is due to the receipts of lead in Mexican silver-lead ores imported duty free.

EUREKA DISTRICT.—The *Sentinel* says: A considerable amount of ore is again accumulating in this district, the shipment of which to the furnaces is hindered and delayed by the Government timber suits; yet there is not as much as there would be if these suits had not been commenced. The Jackson of Ruby Hill is said to be the best producing mine hereabouts at the present time; there are 32 tributers at work in it and getting lots of ore. The tributers in the Hamburg and Dunderberg mines are also doing well. There are about 25 men tributing in the Silver Lick mine, which is again looking well. These are now the principal producing mines, but there are a number of others yielding ore in paying quantities all awaiting the end of the Government suits for the furnaces to start up. If these suits are quashed this spring, the summer will bring us the best times we have had in Eureka for years past. In the meantime the Richmond and Eureka Con. mines remain closed down, except that in the former some men are at work on day's pay, timbering some yielding ground on the 100-foot level that is used by the miners as a main passageway through the mine. The Diamond tunnel is progressing, and the fact of that mine going into the hands of Salt Lake people stirs fresh hopes in those whose faith in the future of the camp was waning. There is a good prospect for a new company to operate near the Dunderberg mine, and much else in the district that bears encouragement for the future.

SMELTING COPPER.—The Adelaide Copper Company's furnace started up last week and has been running steadily since. The furnace is doing first-class work and copper ingots are being turned out by the ton. The mine is contiguous to the railroad at Golconda, and as the ore carries a high percentage of copper and assays well in silver, it will pay handsomely, notwithstanding the failure of the syndicate.—*Silver State.*

Notes on Leaching Silver Ores.

NUMBER 4.

Written for the MINING AND SCIENTIFIC PRESS by C. H AARON.]

The deterioration of the hypo in Hofmann's process never had any practical importance, whether it was calcium hypo or not, because those who use calcium sulphide seldom or never have to reinforce their leaching solution unless through mismanagement or accident. As to the bad effect of sodium sulphate, I do not attach much weight to it, because the Russell process has done and is doing excellent work, although the hypo must be charged with sodium sulphate, not only from the ore, but also from the effect of oxidation, the decomposition of lead sulphate, the use of sulphuric acid for neutralizing and the addition of bluestone for making extra solution.

Mr. Hofmann seems to attribute to the presence of sodium sulphate the constant necessity for reinforcement of the hypo in the Russell process, but this can hardly be so, because the need of reinforcement ought then to cease as soon as the hypo has accumulated the maximum proportion of sodium sulphate; but it does not appear to cease, hence we must look for some other reason why the Russell process consumes from one to seven pounds of sodium thiosulphate for each ton of ore leached.

Mr. Hofmann has cleverly turned the enemies' flank, and no doubt he is, to a great extent, right in his argument, while we others have erred in neglecting the effect of the sodium sulphate in the ore and that resulting from oxidation of the hypo, or perhaps we did not altogether neglect it, but failed of giving it due consideration. But the distinction he seeks to establish between his process and that of Kiss seems to be a distinction without a substantial difference. I think it simply comes to this—commencing work with sodium hypo, if the sodium sulphate from all sources is constantly, or on the average, equal to or greater than the equivalent of the calcium salts of the precipitant, our solution will remain sodium hypo; if the sodium sulphate is less than the equivalent of the calcium compounds introduced, calcium hypo will accumulate in the solution until it reaches such a proportion that the mechanical waste will balance the daily or periodic addition. On the other hand, if we begin with calcium hypo, in the first case we shall soon have, practically, sodium hypo to leach with, and in the second case, sodium hypo will accumulate until it reaches a proportion corresponding to its production.

In either way, so long as we use calcium sulphide and sodium sulphate is present, we are practically adding so much sodium hypo, and either some or not any calcium hypo to our stock in each operation, and withdrawing by mechanical loss about an equivalent. The result is a mere question of mathematics according to the proportions of the two added substances.

The analysis of Mr. Hofmann's solution after about three months' use indicates a very remarkable equivalence of the sodium sulphate and the calcium hypo, neither preponderating. It is hardly necessary to point out that this will not always happen.

Another singular thing in the analysis is the very small percentage of sodium chloride, which is 0.16. If the ore worked contained an average of 1.5 pounds of silver in the form of chloride, there would result about 0.8 pounds of salt for each ton of ore. However, as we neither know how many tons of ore were leached nor what quantity of solution was kept in stock, we cannot make any calculation as to the percentage of salt which might be looked for, and my only object in speaking of this is to suggest that a large part of the soluble silver may have been in the form of a double sulphate with lead, as I have found to be the case sometimes, and this would assist in accounting for the absence of calcium hypo as well as for the slow extraction of the silver in vat leaching.

The following statement from Mr. Hofmann's article is interesting:

	In tanks.	In troughs.
Quantity of water required for base-metal leaching, including sluicing per ton	943 gals.	1,129 gals.
Quantity of hypo required per ton	4 935 "	816 "
Total water required for 100 tons per day	94,300 "	112,000 "
Total hypo required for 100 tons per day	493,500 "	81,600 "
Time required to treat a tank of ore	109 hrs.	30 m. 15 h. 5 m.
Loss of silver in base leach per ton	0.25 oz.	Trace.
Extraction of silver		Equal.

In regard to the loss of silver in base-metal leaching, it must be observed that Mr. Hofmann introduces the water below the filter at first, when working the tank process, and does not recover the small quantity of silver which passes out with the base-metal solution.

As to the quantity of hypo required, it must be understood that the figures represent the number of gallons which must pass through the ore and must be pumped, etc., not the volume of the stock which depends greatly on the time required for leaching and the consequent number of tons leaching at once for a given number to be finished daily.

Mr. Hofmann has tried, and highly recommends, Mr. Stetefeldt's amendment of my method of recovering the waste sulphur from the precipitate. I did this by boiling the precipitate with slaked lime, which answered very well with the good lime at my command. Mr. Stetefeldt recommended caustic soda in place of lime. Now, Mr. Hofmann proposes to make lye from the wood ashes produced in the furnaces, convert it to caustic lye by boiling with lime, and use that to dissolve the free sulphur, producing potassium sulphide for use as a precipitant. There is one possible objection to either of these processes, which is, that gold may be dissolved from the precipitate; another objection to the latter two is that the resulting sulphide will probably contain caustic alkali; but this consideration need not trouble Mr. Hofmann if he will mix the liquid with his calcium sulphide, for I have proved that the caustic alkali is thus neutralized, calcium hydroxide being thrown down. (See article on "Lixiviation of Silver Ores," in MINING AND SCIENTIFIC PRESS, Dec. 22, 1888, in which other methods are also given for the neutralization.)

In working the Russell process, causing a regular consumption of hypo, a better way of recovering the excess of sulphur is by heating with aqueous sodium sulphite, producing sodium hypo, with no danger of dissolving gold. This additional hypo would be superfluous in Hofmann's mode of working, in which it is well known that a reinforcement of the hypo beyond that derived from the precipitant is seldom required.

In some cases the sodium sulphite may be added to the hypo, any excess simply going over to the next precipitation, but if the ore contains lead sulphate, any sulphite which may be present during the leaching will form insoluble lead sulphite, which will remain in the ore and the sodium salt will be lost. The ore of the San Francisco Del Oro mine contains some cadmium, and Mr. Hofmann proposes to recover that as cadmium sulphide, which is a valuable pigment commanding ready sale in London. He might also make lead chromate, if it would pay, by precipitating the lead from his solutions with potassium (neutral) chromate, which throws the lead down free from lime in presence of salts of calcium.

We are indebted to Mr. Hofmann for a method of ascertaining the change of weight and the loss of precious metal by volatilization during the roasting, which is as follows:

Take a sample of the already salted ore before it enters the furnace, and another of the same ore after the roasting. Weigh out a suitable quantity of each and roast in the muffle in half-hour periods until the weights remain practically constant. The percentage of weight lost by the previously roasted sample deducted from that lost by the other shows the loss of weight in the furnace, and the assay value of the raw ore being known, as well as that of the roasted ore from the furnace, the loss of silver by volatilization is easily calculated. In case an addition of salt is made during the roasting in the furnace, a similar addition must be made, at the same stage of the muffle roasting, to the sample which is roasted entirely in the muffle.

The process is open to objections: The roasting in the muffle takes place under different conditions from that in the furnace; the ore which has been roasted in the furnace will not have the same composition as the other at the same stage, because it will have lost an unknown proportion of its constituents by dusting; again, the ore from the furnace having already sustained a certain charge of weight, it is not possible to know how much ought to be taken to correspond with the taken weight of the raw ore. The error arising from the latter cause can be corrected to any required approximation by the loss of weight in the furnace indicated by the experiment. On the whole, this seems to be the best method we have, and it will doubtless prove useful, especially where reverberatory furnaces are used, as they cause less dusting than the cylinder or shaft furnaces.

NOTE.—In the *Engineering and Mining Journal* of April 6th is a letter from Mr. Ellsworth Daggett in which that gentleman replies to some of Mr. Hofmann's remarks on the Russell process at the Cusi mill, etc. Mr. Daggett also says that a week is not a sufficient length of time in which to determine the applicability of the Stetefeldt furnace to a refractory ore, which he says cannot be done in less than a month. Considering that the particular ore in question is completely ruined in the trials, it may well be that neither Mr. Hofmann nor his employers would care to risk the loss of 1000 tons or more, in addition to the expense, for the sake of a problematical success which can be readily attained by other means.

JUMBO DISTRICT.—The Blizzard and North Star mining locations in Jumbo district have been leased, and ore from them is being shipped to Fisher's mill in Six-mile canyon. The project of building a mill in the district is being discussed, as there is a large area of ore exposed in locations there that assays from $15 to $20 per ton, which is of too low grade to leave a margin after paying shipping and milling expenses. Prof. Willis has resigned the ferule and is now a knight of the pick and drill, and will soon begin developing his locations in the district. Several cabins have recently been erected in Jumbo, and the district resembles a California mining camp in the days of '49.—*Virginia Chronicle.*

OF INTEREST TO MINERS.—The Supreme Court, in the case of White vs. Lee, has decided that the location of a mining claim is incompetent and void if the location is not distinctly marked on the ground, notwithstanding the posting and recording of notice of location.

Mines and the Paris Exposition.

EDITORS PRESS:—I have just received from the Minister of Commerce and Industry in France the following information, which will probably be of interest to most of your readers:

The French Government has appointed an International Congress on the subject of mines and metallurgy, to be held in Paris on the 21 of September in this year, in connection with the exposition which is to take place there during the next summer. The Congress has for its object to make known and discuss the most recent inventions and improvements in mining and metallurgy, and will have brought before it a considerable number of memoirs which have been prepared by engineers specially detailed for the purpose. These reports will be printed and distributed in advance to persons who wish to become members of the Congress and will form the basis of the discussion, but other subjects may be introduced or other questions presented by the members, with the approbation of the officers in charge.

The Congress will consist of members and honorary members, the latter being appointed by the French Government and the former becoming so upon the payment of 20 francs.

Letters and communications from this country relating to the subject of mines and metallurgy may be addressed to Mr. Castel, Inspector-General of Mines and President of the Organizing Commission, 144 Boulevard Raspail, Paris.

The committee appointed by the French Government consists of: President, Mr. Castel, Inspector-General of Mines, President of the Society of Mineral Industry.

Vice-Presidents—Mr. Brull, Past-President of the Society of Civil Engineers in Paris; Mr. Haton de la Coupilliere, member of the institute, Inspector-General of Mines, Director of the School of Mines of Paris; Mr. Jordan, professor of metallurgy at the Central School, Past-President of the Society of Civil Engineers of Paris; Mr. Remaury, civil engineer of mines.

Secretaries—Mr. Dujardin Beaumetz, secretary of the Central Committee of Coal Mines; Mr. Gautier, civil engineer of mines; Mr. E. Gruner, civil engineer of mines; Mr. Lodin, engineer of mines, professor of metallurgy at the School of Mines of Paris. THOS EGLESTON

35 West Washington Square, N. Y. City, March 30, 1889.

An Alaskan Coal Mine.

The schooner Active, Captain William Murphy, which left Sitka on September 22d, last year, on a prospecting trip to the Yakutat Coal Co.'s coal mine, returned on Tuesday last, after an absence of over five months. The party, consisting of Peter Callsen, Harry Lyons and Jack Dalton, arrived at Yakutat on October 3d, and a few days subsequently started for the scene of the discovery, which was reached on the 8th of the month. The coal deposit lies two miles from the beach, some 30 miles north and a little to the west of Yakutat, on the Point Manby side of Yakutat bay. The beach is flat and level, being very favorable for hauling, and the whole of the adjacent country heavily timbered, with so little underbrush that a team can be driven through the woods at any point. The first thing which the prospectors commenced on was the building of a house for winter quarters, and when that was completed the work of opening up the deposit began in earnest. Forty sacks of coal were taken out of a five-foot vein, which widened as the work proceeded. The vein was found to dip due north at an angle of 45 degrees, but rose gradually as a greater depth was attained. A shaft 45 feet deep and 4x6 wide was sunk, and in the sinking three different seams were struck, each about one foot in thickness and some ten feet apart. These seams were made up of partly decomposed coal.

At the bottom of the shaft a drift was run in for 40 feet in a southerly direction, toward the point where the main body of coal lies. On reaching the outer wall of this main body, coal partly decomposed was struck and surface water was found in such a volume that further operations were suspended, the party having no suitable apparatus with which to pump out the water and ascertain the complete extent of the deposit. There are ample reasons, however, for believing that there is abundance of coal, as at a point 900 feet south of the discovery shaft the surface of the ground is covered with outcroppings for a distance of 20 feet; and 1½ miles west of the shaft, outcroppings are seen for a distance of 24 feet; these two places and the scene of the discovery being the only points where the mineral is exposed, all the remaining surface being covered with glacial deposits, underneath which there is supposed to be one vast bed of the mineral. The formation is that known as micaceous sandstone and fire-clay. The work of sinking and drifting was accomplished by means of the pick, no blasting being necessary. It may be asked why no more than 250 pounds of coal were brought down on the Active when the mineral was found to be so plentiful. This is very easily explained. There was no means of transporting the coal from the shaft to the beach, the snow being so soft, in consequence of the mild, open weather, that carrying the coal on a sleigh, as was intended originally, was found to be impracticable.—*Alaskan.*

THE Telephone Exchange of Stockholm, Sweden, is equipped with an American apparatus.

Intellect and Emotion.

Man is a very peculiar being and stands alone in the great creation of God. There is a gulf between him and the rest of animated nature—a gulf without a link, a chasm that only God could stride.

Below man we find all the rudiments of his nature except the cap sheaf, the intellect. The same flesh, bone, senses, instincts and wants are all there. Man is based upon nature, allied to it, subject to all its laws, and has nothing above it till we come to the mind. There he steps out; he is alone. There is not even a rudiment of his great mind and its appurtenances in all that stands below him.

He thinks, speaks, imagines, speculates on the past, the future, on causes and consequences. If God or angels wanted to select a being on earth to be an agent of heaven, all the conditions would point to man as that agent. No other could be thought of for a moment.

Even the passions of man are modified by this mind to make them fit company as it were. He cooks his food. He forms a family compact for life. He loves his wife and children till death. He builds a home. He uses weapons and tools. He works to-day for to-morrow. He becomes a philosopher, a judge, orator, artist, law-maker, a king.

He may be said to have two lives, one emotional and the other intellectual, and he plays between the one and the other continually. The emotional is the basis of his nature, the bedrock of his happiness or misery; and with a thousand the sum of their happiness, while only the one will abandon them for the pleasures of the mind.

Occasionally we find a rapt genius who soars upward, and regardless of parents, wife or child, will revel only in art or science, deeming life well spent, a grand success, if he have carried fame or fortune in his favorite pursuit. But for the most part these things are pursued only as a means to an end; the end, the home where wife and children bring him all his reward when the toil is done.

To have become Pope, to have reached the pinnacle of fame, or wealth, or any other eminence, cannot be deemed or accepted as a happy and successful life, if it imply a single state.

On the contrary, the poorest and least cultured of all, have lived well, who were born of a loving mother, with loving brothers and sisters, left them only for a loving wife, raised a good family of affectionate children and died in their arms. This is emotional life. It may be humble or great, but when complete it is the crowning joy of this world. Is is the perfection of human life when attended by modest fortune and the charm of cultivation. Domestic felicity is the only picture that can begin to realize the kingdom of heaven.

John Knox of Scotland, somewhat of an ascetic, in conversation with one of the "Old Kirk," who was thus happily situated, said to him:

"You and your whole family lack the grace that saves, and unless you change your hearts, St. Peter will shut the door in your faces."

"Well, well," said the old man, "we will camp outside and have heaven there. Wherever we are we make heaven for ourselves."

When we count up all the items of our happiness, we shall find the emotions are concerned in at least nine-tenths of the whole sum. If this is true as to man, it is doubly true for woman. She is essentially emotional. Her life is made up of her loves; indifference is a distress. For her, love must be active, demonstrative, and ever present. It begins with the cradle, and it should follow her to the grave. A loved child, sister, wife, mother, is the perfection of woman's life. To have been that is success; and not that, a dreary failure.

Accomplishments, high culture, ambition, fortune, fame, are well, but for the few only, and in their utmost perfection cannot compensate for the other. What a blank, when they attain nothing, and yet lose the pearl of great price.

This emotional nature needs practice, training and modulation. It should be the mother's care to see that it has all these from the earliest infancy. Cultivate the emotions in their proper channels. Teach your children to love one another. Impress upon them that they are near relatives, your children, brothers and sisters, allies and friends for life, and must on no account be hasty, or unreasonable, or unduly angry with each other. Train them to demonstrate their love for each other. Refer them to the fact that you love them all, and as they love you they must love each other. The kiss of peace and good-night, and the salute at morn will help them. Make the home a nest of love and helpfulness. Then in after-life all these things will be remembered to the end. They are not truly brothers and sisters who are not trained thus; and when we look around on society we fear that many have not been warmed in that nest.

We have a doubt if any education away from home can compensate for the loss of these advantages. We are not certain that even our boys do not lose more in mother's love and father's kind, homely instruction than they gain from the most erudite profession. Could not the college be near home so as to have both? Look at the world, and you will find more truly great men whose hearts were kept by their mothers than from the college or university. And for girls we deem the mother and the family indispensable.

We would not deprive our young women of all the knowledge and finish their natures admit of; but we insist that nature shall not be suppressed by art. You may refine and elevate, but you must leave the germ, you must cultivate the domestic affections, habits, and instincts, and the mother and the family is the only school where they can be nurtured and trained to a useful end. The mother's love is the great educator of the affections.

Mining for "Flour Gold"

From Mr. J. S. Hunt of Bliss, Idaho, who is engaged in mining in the "flour gold" placers at Salmon Falls, on the Snake river, a reporter derived some interesting information in regard to those mines, which are certainly among the most curious deposits of the precious metal.

The gold, of which Mr. Hunt has a sample in a vial, is literally as fine as flour, it taking, as he says, 100 colors to make a cent. Placers of this kind are found along the Snake river from Blackfoot to near Huntington, and in the locality where his mine is situated there has never been found a "nugget" as big as a pin's point. Notwithstanding the dust like nature of the gold, his mine yields about $1000 per month.

The gravel in which it is found is from 12 to 30 feet in depth. It is worked by ground-sluicing, the coarse gravel being separated and the fine allowed to run over burlap cloths. The fine sand and gold which collects on these cloths is then passed over plates coated with quicksilver, which takes up the fine gold. There should be no trouble about saving the gold in the black sand found on beaches by this system, as it cannot be any finer than the gold Mr. Hunt has. The difficulty probably would be to get plenty of water and to find sand with plenty of gold in it. The placers along the Snake river can only be worked in a few places on account of the impossibility of getting water on them.

When asked how he supposed this gold came to be so fine, Mr. Hunt, who is an intelligent gentleman, said he had three theories, but he did not know which was the right one, if either was. It was possible that at some time the country where this flour gold is found was the beach of a sea, and the gold came there as it did on any of the beaches of this coast. Another theory was that glaciers coming down from the north, grinding and powdering everything before them, might have ground up this gold on their way and deposited it in this place. The third theory is that the gold was thrown out by volcanoes in a vaporized form and settled in some lake in the form of gold "dust."—*Portland Oregonian.*

A Metallic Railroad Tie.

George W. Thompson, who is an old Californian, but now a resident of Sag Harbor, N. Y., has invented and patented a metallic railroad tie which is illustrated on this page. The invention is an improvement in the class of metallic tubular ties having bearing blocks arranged within them for supporting their top portions when a train is passing over the rails laid thereon. Heretofore such bearing-blocks have been made longer than the distance between the heads of the bolts that secure the rails to the tie, and have also been provided with openings to receive the heads of such bolts. The ties to which such blocks were applied were necessarily made open on the under side to enable the rail-bolts to be inserted through the openings in the blocks.

Fig. 1.

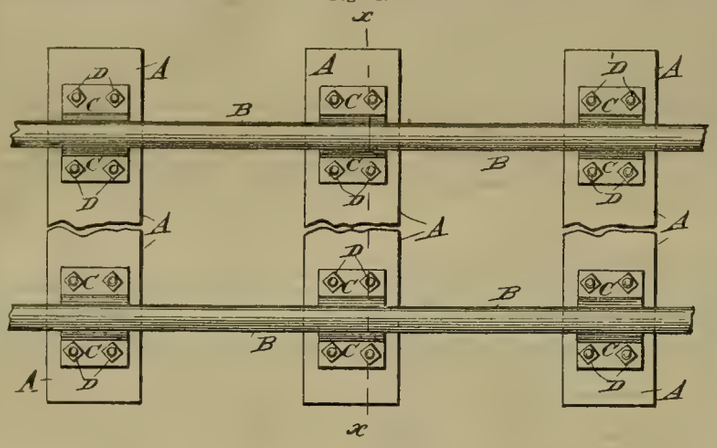


Fig. 2.

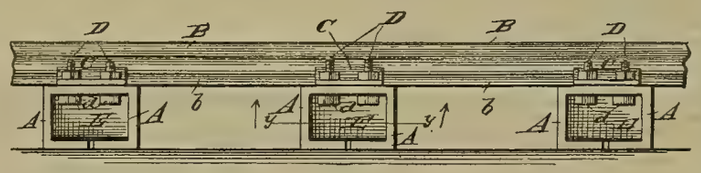

Fig. 3.

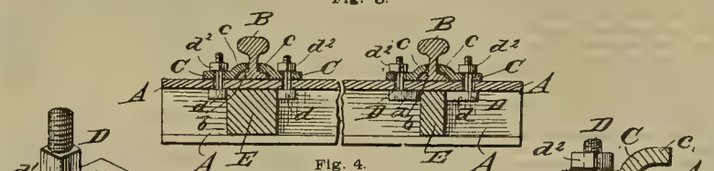

Fig. 4.

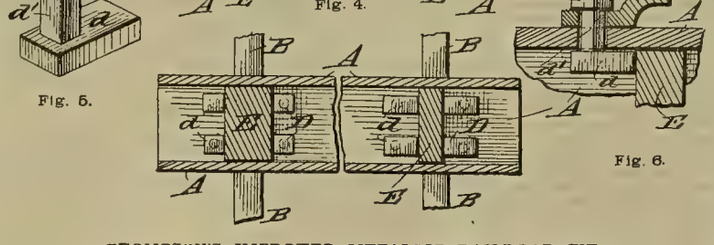

Fig. 5.

Fig. 6.

THOMPSON'S IMPROVED METALLIC RAILROAD TIE.

In Mr. Thompson's invention the bottom of the tie is closed, or nearly so, and the bearing-blocks are put in place by inserting them in the ends of the ties after the inner bolts have been applied. The heads of both the inner and outer bolts abut the sides of said blocks, and thus hold them in position.

The invention consists in certain novel features of construction of the railway tie and rail connections and supports.

In the engravings, Fig. 1 is a plan view of a section of a railway track laid upon the improved ties, which are broken away at their central parts. Fig. 2 is a side view thereof. Fig. 3 is a transverse section taken on the line *x x*, Fig. 1. Fig. 4 is a horizontal section taken on the line *y y*, Fig. 2, and shows the parts as they would be seen in the direction of the arrows; and Figs. 5 and 6 are detail views.

The main body of the improved railroad tie consists of a tube *A* which is preferably of rectangular cross-sectional form, produced by bending four times at right angles a rolled metal plate about two feet wide, seven feet long, or longer, and about three-eighths of an inch thick, more or less, the opposite edges of said plate meeting or nearly meeting at the lower side and longitudinal center of the tube, which is about seven inches wide, five inches high, and seven feet long.

The railway rails *B B* of a track are held to the solid or unbroken tops of the ties by rolled or wrought metal chair plates *C*, which are placed in pairs opposite each other on each tie and at the opposite sides of the rails, and are fixed by bolts *D* to the ties, and so that horizontal or nearly horizontal flanges or lips *c c*, formed at the inner edges of each pair of chair plates *C C*, overlap the opposite base flanges *b b* of the rails and securely bind them to each tie, as clearly shown in the drawings.

The bolts *D* are passed upward through the top of the tie and the chair plates thereon, and the heads *d* of the bolts rest against the under side of the tie top plate. Those portions of the bolts which pass through the tie and chair plates are made square or flat-sided to prevent turning of them, and the upper parts of the bolts which project above the chair plates are made round and are threaded to receive nuts d^2, which are tightened upon the chair plates to bind the ties, the rails, and the chair plates together in one substantial structure along the roadbed, which may be of earth, sand, gravel, or coal-dust, or may be a bridge, trestle, or other support, and the ties may be ballasted or not, as may be desirable or necessary.

The inventor utilizes the heads *d* of the bolts *D* of each pair of chair plates *C C* on every tie as lateral supports or braces to hold bearers *E* within the tubular ties and directly below the railway rails. These bearers are applied as follows: After the inner chair plate *C* of each pair of plates is fastened to the tie by its pair of bolts *D*, the bearer *E* will be slipped into the end of the tie and up snugly to the heads of this pair of bolts, and when the rail *B* and outer chair plate *C* are put in place the pair of bolts *D* to hold this outer plate will be applied, and so that their heads fit snugly against the outer face of the bearer, which will thus be held secure against displacement to give effective support to the tubular tie where the rail crosses it, and thus largely increase the durability of the ties and rails and the entire roadbed.

These bearers *E*, which are preferably made of cast metal, are fitted fairly at the edges to the inner faces or walls of the tubular tie, and may be of any desired width and yet be held by the heads of the chair-plate bolts, which will be made to fit the bearers. For instance, should rather broad bearers be used, the bolts *D* will be of ordinary form with bodies or stems concentric with their heads, as shown at the left-hand side of Figs. 3 and 4 of the drawings; and should the bearers be made narrower, the bolt-heads *d* will be elongated at the inside so as to bear fairly, as shown at the right-hand side of Figs. 3 and 4 and from the detail views Figs. 5 and 6. The bolt *D* having an elongated head *d* is shown in Fig. 5, while Fig. 6 shows in larger scale than the other views, such a bolt as applied to the tie, chair-plate and bearer. These elongated bolt-heads *d*, forming lateral supports to the bearer blocks, may either be made in one piece with the bodies or stems of the bolts or they may be made separate and as nut plates to screw into the lower ends of the bolts, as will be readily understood.

Railroad ties made and supporting the rails as described may be set about three feet apart from center to center or much farther apart than ordinary wood ties, and will be far more durable even when not coated with coal tar or other rust-preventing compound, which may be done to increase the durability of the ties and roadbed. The patent rights of this invention are for sale.

Those desiring further information may address the inventor as above, or "H. F. D.," Box 2361, San Francisco.

Visiting the Lick Observatory.

Prof. E. S. Holden, Director of the Lick Observatory, has issued the following circular:

The observatory building will be open to visitors, during office hours, every day in the year. Upon their arrival visitors will please go at once to the visitors' room and register their names.

An hour or so can be profitably occupied in viewing the various instruments, and the rest of the stay can be well spent in walks to the various reservoirs, from which magnificent views of the surrounding country can be had. At least an hour and a half of daylight should be allowed for the drive from the Summit to Smith Creek. There are no hotel accommodations at the Summit.

For the present, visitors will be received at the observatory to look through the great telescope every Saturday night, between the hours of 7 and 10, and at these times only.

Whenever the work of the observatory will allow, other telescopes will also be put at the disposition of visitors on Saturdays between the same hours (only).

At 10 P. M. the observatory will be closed to visitors, who should provide their own conveyance to Smith Creek, as there is no way of lodging them on the mountain.

It is expected by setting apart these times for visitors (which allow freer access to the Lick observatory than is allowed to any other observatory in the world) that all interested may be able to arrange their visits in conformity to them, and that the remaining hours of the week will be kept entirely uninterrupted, in order that the astronomers may do the work upon which the reputation and the good name of the observatory entirely depends.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW LONDON.—Amador *Ledger*, April 20: Steps have been taken toward the erection of a mill on the New London mine near Plymouth. The contractors were on the ground last week, and the erection of the work will be proceeded with at once. At the Morley or Wetzlar mine, the company have decided to open up the property further, before proceeding with the building of the mill. They are busy putting up the Rudd pulverizer for the reduction of cement gravel at the French claim at Volcano. The company, we are informed, have secured an extension of the bond, and the general impression now is that a sale will be effected. Some of the gold-bearing cement was sent to the city for reduction, and the yield was deemed satisfactory.

MORLEY.—Amador *Dispatch*, April 20: Mr. Parker, a brother to Chas. Parker, manager of the Morley property, is here looking after the interest of the company. Work has been suspended on the mill, and we understand a few men have been put to work in the tunnel.

NORTH STAR.—The negotiations for extension of the bond on this property, which will expire in June, have been satisfactorily completed. All of the owners except Daniel Boon, who is in Arizona, have signed the extension bond, and Mr. Boon has signified his intention to sign as soon as he receives the papers. The new arrangements provide for the payment, by the company to the owners, of $4500 at the end of each and every year the mine is worked, for six years, and the gross proceeds until the total amount paid aggregates $27,000. This new agreement has put renewed life into the North Star. The shaft will be at once driven down a couple of hundred feet.

COSMOPOLITAN.—The north drift on the 300 is out 200 feet, the ore body is 15 feet wide where cut; will crosscut soon again. The north and south drifts on the 500 still look well; they are now cutting a station at the 400 level; the new boiler and donkey engine were started the first of this week; a contract has been let to Knight & Co. for a 30-stamp mill, with all the improvements, to be ready by August 1.

SALE.—Mr. C. T. Crocker of Fitchburg, Mass., has purchased the Henry Clay and Providence mines near Drytown. They will soon start a crosscut tunnel from the west side of the hill and will run to the hanging-wall of the ledge, then raise to the surface for a shaft, then machinery will be put on and a shaft put down 300 or 600 feet.

MILL.—Frank Guerra and G. Bonnefoy had 40 tons of ore crushed at the Moore mill last week, from their prospect on Schober's hill. The result was so favorable that they now contemplate the erection of a small mill near the property. They have considerable rock in sight, which is exceedingly rich.

GINOCCHIO MINE.—There is a party of four men who have leased this mine after an idleness of a number of years and have put in a tunnel and have struck some very good ore; they will soon put up a Huntington mill and crush the ore that they have on hand.

OVERPLUS.—The Huntington mill at this mine is kept busy grinding ore; mine is looking better at present than ever before. The Overplus, together with the Original Quartz Mountain, has been bonded by an English company for $100,000.

GOVER.—This mine still goes on in the same old groove. The hoisting works has been made a success, but the mill and the hoist cannot be run from the same pipe.

DRYTOWN CON.—The hoisting works are up and the work of hoisting water will begin the first of the week. The company expect to start sinking the first of May.

NORTH CAROLINA.—They are still running their mill; they cleaned up last week; their ore paid a fair margin.

Calaveras.

UNO.—Angels *Record*, April 16: Rumor says that the Uno mine, located in the Nassau valley, and owned by Sylvester & Co., has been bonded to an English Co. for $6000, also the Golden Eagle mine at Albany Flat has been sold to the same company for $10,000. Last Wednesday, just as the miners were changing shifts at the Whittle mine, the final blast unearthed and disclosed an immense pocket, the extent of which has not yet been ascertained. The mine is owned by Mrs. Whittle and L. Graham, and is bonded to a San Francisco Co.

TULLOCH & LANE MINE.—*Mountain Echo*, April 17: The Tulloch & Lane mine, situated in the southern part of this town, is making an excellent showing, and we are informed that as the tunnel is pushed ahead the ore increases in richness. A new chute of ore has been struck and it is said the ore is better than any yet taken out of the mine. The owners are highly elated over the fine appearance of the mine and their continued success.

RICH ROCK.—We were shown some immensely rich specimens of quartz the other day which were taken from the Feet mine at a depth of 150 feet. This mine is situated near Albany flat and owned in part by Louis Graham. The fissure from which the rock was taken is about a foot in width and near the center of the shaft. Some of the rock was crushed in a mortar and yielded a fraction over $7 a pound.

El Dorado.

MINING OUTLOOK.—Placerville *Observer*, April 23: The outlook for mining in this vicinity is certainly promising. The water is out of the Pacific shaft and retimbering about completed, and ore will be coming to the surface during the present week. The 20-stamp mill is now about ready to commence crushing. The fine tramway from the mine to the mill is about completed. The Rose, on a parallel vein, is under the same management, and will also be ready for operation in a short time. The Epley mine is also under the same management, and development work is being prosecuted with vigor. This mine was worked in early times. This company is also developing other mines on the mother lode. The Big Sandy mine, in Kelsey district, has erected a new 20-stamp mill with all necessary gold-saving apparatus, and are about ready to start up under favorable auspices. The Taylor is now in running order. The Superior M. Co. are now doing development work, and have a vein of good milling ore ranging from two to ten feet in width. The True M. Co. have their tunnel in about 1600 feet. The Church M. Co. are erecting large hoisting works which will be completed by the 15th of May. The Equator M. Co., in their west tunnel, are finding promising ore. At the Bassett gravel mine, on Weaver Hill, a Rudd pulverizer has been erected and will be in operation the present week. These two gravel mines are being thoroughly opened up and put in complete working order, so that gravel may be rapidly and cheaply obtained. These mines are being fitted up with machinery different from anything yet tried on gravel in this county, and if they should prove successful a revolution will be created in this kind of mining, as we have miles of these gravel-beds running through the county.

THE GIGNAC MINE.—At this mine everything is in active operation. A new Bryan roller-mill has just been completed, which is one of the most complete establishments for the reduction of ores, perhaps, in the county. The cement is dumped into a large ore-bin, from which it passes into a heavy Dodge rock-breaker, with capacity of 100 tons per day. From the rock-breaker the ore passes into a Challenge ore-feeder, from which it is fed into the mill, being regulated so as to feed with perfect regularity, and as fast as may be required for proper reduction, the whole process being automatic. The screens used for this cement gravel are 16 meshes to the inch. Coarser screens are sometimes used in stamp-mills, but the screen-room in the Bryan mill is so far superior to the stamp-mill that the finer screen may be used, thereby saving a greater percentage of the metal contained in the cement, and work as much or more of it. The whole work is driven by a two-foot Pelton water-wheel, with 200 feet pressure. Work in the mine, under the supervision of Supt. A. A. Gignac, is being prosecuted with vigor. A large tunnel has been run and is now in solid ground over 150 feet.

Inyo.

SUCCESSFUL PROSPECTORS.—*Independent*, April 20: A few weeks ago a party of mining prospectors came from Pasadena to Owens valley. The party consists of Fred Burnham, Howard Burnham and Jack Gesford. They crossed over the Inyo mountains into Saline valley and went to prospecting. Last Thursday Howard Burnham came to Independence for supplies. He says that up Marble canyon, about three miles from the Waucoba road, they have struck what appears to be a big mine. The ledge is at least 20 feet wide, carrying galena ore. The ore is rich in silver and lead. The mine is easy of access and the ore can be got to the railroad at moderate expense. There are not wanting other indications that we are on the eve of a big revival of mining interests in Inyo county. No other part of the State offers such promising fields for prospecting as does Inyo county. These prospectors are a good deal elated over their success so far. Several specimens of the ore brought to Independence look very well indeed.

A WELCOME CHANGE.—The lessee of the Maxim property is making a very important move. One great drawback to gold mining in this locality has been caused by want of any means for extracting gold from sulphurets, and as the ore carries a good deal of this, the loss in working has been very heavy. Now this trouble will be remedied. A dry-kiln is being built at the Maxim mill to dry the tailings, and concentrators are being put in. The machine chosen is a late invention claimed to be much superior to anything yet in use. It is called the Victor, and the inventor, Mr. S. W. Shaw, will be here in a few days to put the machinery in operation. The lessee expects to have the machinery running by the 1st of May. All along the Inyo and Sierra mountains in Owens valley, miners are working small claims that are rich in gold; but in all of these the loss by sulphurets is heavy. The lessee will work all such ores at the lowest possible cost to the miners, and his enterprise will therefore prove a benefit to all, and will lead to the working of many more claims. In the past, every enterprise started in the valley that promised to be of public benefit has had the life crushed out of it by grasping greed and extortion. The lessee is free to do as he pleases and will pursue a more intelligent and liberal policy, doing good to his neighbors as well as himself.

A VALUABLE MINE.—The mill at Beveridge has been started up on a run of ore from the Keynot mine. The old Keynot never fails to respond with a lot of good ore when touched with the pick of the miner. There is a great deal of virgin ground in the mine that could be reached by a moderate outlay of money. Near the mouth of the tunnel is an almost sheer precipice of about 400 feet. A tunnel run from this would tap the ledge and beyond doubt would open up a large body of ore. If opened up properly the mine would develop into valuable property.

Los Angeles.

MONROVIA.—*Messenger*, April 16: No hurrah is being made, but a number of practical miners are on the ground. Every one who has done any intelligent prospecting has been rewarded with precious metal from a few cents to a few dollars' worth. The company has commenced to sink a shaft on the Bliss place. There were between 50 and 100 men at work on the hills yesterday, and the work of sinking a shaft is progressing finely. In addition to this number several old-time miners were abroad on the hills hunting quartz ledges. It should be borne in mind that the placers are not confined to the Bliss place, but extend from Diamond flats eastward for more than a mile. Colors have been taken from all the gulches nearly for that distance. Other ledges have been found, both east and west of the city, on the first range of hills, which promise a rich enough yield to cause quite a flutter among the miners.

TIN.—Monrovia *Messenger*, April 20: Mr. Van Tassel considers the mine as good as sold. Mr. Van Tassel also claims that a recent assay returned 20 per cent tin. Tin is worth about 20 cents a pound. A ton of rock carrying 20 per cent tin stone will reduce to 320 pounds metallic tin, which would make a ton of ore worth $64. The cost of concentrating and reduction is about $12, which leaves a handsome profit. It is hoped these gentlemen have as great a bonanza as they think they have. Monrovia is now wallowing in wealth. A vein of rich silver ore is the latest strike in the vicinity of that ambitious city. The new find is but three miles from town.

Monterey.

LOS BURROS.—Cambria *Critic*, April 16: A correspondent writing from Los Burros district says: "From all indications this district will before long be one of the most important in the State, the gold-mining belt extending from the ocean to the Lion's Den country, a distance of about 15 miles. Gold has been found the entire length, from fine colors to a nugget weighing $41, and the main and most important mines and prospects of the camp—Sure Pop, Melville, Last Chance, King, Ajax, Wild Bill, and many others—lie almost in a direct line, showing that it must be one continuous fissure vein or mother lode, having its many spurs and feeders. That the gold-bearing ledges are permanent below the surface is proved by the Cruikshank lead, which is the only mine that has been prospected any depth. This mine at the depth of 150 feet shows the ledges three times the size they are at the surface, and as rich in proportion."

Nevada.

SAN FRANCISCO MINE.—Nevada *Herald*, April 16: Eureka district is going to be lively this season. There will be a large amount of prospecting done there. One important enterprise will be started in the course of a few weeks which promises well. There is a ledge located south of the California about 300 yards, and running parallel with it, known as the San Francisco. It was located in January by James Grimes. He now has as partners Pat Foley, R. B. Brenham and Landers of San Francisco. The ledge is over 14 feet in width, and all the rock prospects favorably. The claim is situated about five miles south of Graniteville. A tunnel of between 200 and 300 feet only will have to be run to tap the ledge at a depth of 200 feet. The North Bloomfield ditch runs above the claim, near by, and will afford a fall of water of over 300 feet, which will give a splendid power. The company has two locations of 1500 feet each. The ledge is a contact vein, having a granite hanging and a slate foot-wall. The location is convenient of access and there are the best indications of a paying mine being developed. Jas. Grimes will superintend the work of development soon to be commenced.

AROUND SPENCEVILLE.—Cor. Wheatland *Four Corners*, April 16: We are informed that the owners of the Good Hope Quartz Claim, situated two miles from here, have started to work their shaft and are making several improvements. The owners are awaiting the pleasure of a company with whom they have been communicating for some time in regard to this mine. A representative of some capitalist from Nevada City has been around here for a few days, looking up and trying to bond some mining claims owned by different parties here, and we hear has been successful in getting the promise of some claims. Ed Redenger and John Sweet, who own a quartz mine near the Lime Kiln, Nevada county, are shipping ten tons of ore to Benicia to have it smelted. The ore contains a large percentage of silver as well as gold.

Placer.

OPHIR.—Cor. Placer *Herald*, April 20: Jameson's arastra has temporarily suspended. The steady roar of the stamps at the Hathaway mine, however, reminds us that despite the apathetic arastra aforesaid, the mining interests hereabout are alive and prosperous. Shurtleff reports excellent prospects in the Patrick. The Bell-Hamlin mine, under the supervision of Mr. Hartley, is employing quite a force of men, and its successful permanency is fully assured. There are many minor claims in this vicinity which are paying well, and with all due deference to the various other mining localities of the county, we are constrained to believe that Ophir and vicinity represent some of the most solid, paying mining claims in the county.

Plumas.

THE REWARD MINE.—Greenville *Bulletin*, April 20: Mr. Swearingen, who was in Greenville Saturday, informs us that good progress is being made in the Reward mine. The lower tunnel taps the ledge 350 feet from the top. The vein is the full width of the tunnel, which will be run 80 feet further. Then a crosscut will be made. The ore contains gold, silver and copper, and it is claimed that it is of very good quality.

Sierra.

WIDE AWAKE.—*Mountain Messenger*, April 17: Oscar Jones, who superintends the Wide Awake drift mine on Alabama Hill, was down the first of the week. He reports the mine a good one, but laboring under the disadvantage of the tunnel being too high, compelling them to work through an incline.

AT SIERRA CITY.—John Penaluna & Co. have leased the Colombo mine. Rumor has it that the Phœnix mine will soon be started. Mr. Morris, supt. of the Marguerite mine, returned on Wednesday. The mine will start up again in a few days. The San Luis Co. have let another contract. This company is composed of our own town's people, who have spent a good deal of money on their claim.

FOREST CITY.—Mr. Colman, of the Ruby, is now working a force of over 40 men. A very fine specimen of quartz from the crevice lately found in the mine has been on exhibition here during the past week.

Siskiyou.

QUARTZ AND PLACER.—Yreka *Journal*, April 17: Mr. W. B. Hull, who has secured the Johnson mine at Mugginsville in Scott valley, is now taking out some very fine quartz, having made a rich strike last week. Some of the river miners feel a little alarmed in reference to the building of a dam at Klamath city, thinking the flow may be irregular, to interfere with the running of the wheels or flood their wing-dams. From what we can learn, however, the dam will cause no difference, as the object is merely to secure a pond for retaining logs sent down from above, from which they can be taken into the mill run by steam-power. Lawson & Co. have struck an extensive body of rich decomposed quartz in their ledge on the south fork of Humbug creek, and expect to take out considerable gold during the coming summer. The Hamilton Brothers are also doing well in their quartz ledge on the Humbug, and Simmons & Co. and other companies in same section are finding excellent prospects. A pack train of 20 mules are kept busy hauling quartz to mill at Forks of Humbug, and John Burgess has also been hauling with team, making the Forks quite a lively mining camp. McCook & Co. are running their quartz mill day and night at Humbug city on the Forks, to keep up with the rush of quartz from various mines. The Hegler Bros. and Bruce Aldrich on the North Fork of Humbug, are also doing well in taking out rich quartz, are running their mill day and night. Kincaid & Co. have struck very rich pay in their placer claim at Humbug gulch, a short distance west of Yreka, the old Joe Lang claim. They took out a nugget of gold and quartz last week, which being pounded out in town, realized $52, and taking home the sand left, washed out $8 more. From the gravel drifted a couple of days at same time, they secured $12, wheeling it 200 yards and washing in a rocker. Heckathorn & Co., of Greenhorn, have also been finding rich prospects in their mine, and Charley Abbott has a large lot of rich quartz on the dump, ready to haul to mill. Herman Green intends starting up the Warren mill again, on Yreka Flats, near town, next week, to crush a large amount of quartz for several miners anxious to haul to mill.

San Bernardino.

GOLDEN BAR.—*Times-Index*, April 20: The Golden Bar M. Co., whose property is situated in the Yucaipa mining district, about six miles east of Redlands, have their arrangements all completed to put quite a force of men to work upon their properties next week, and as the assays and mill tests from their ore have proved so satisfactory, it is probable that in a very short time the company will begin receiving some handsome returns from their investment. News from the Bagdad mines continues to be good. A shaft is being sunk on the Silver Cornucopia mine, and the ledge gets better and larger as the shaft goes down. About a mile distant is another claim, the Mirage, upon which a tunnel is being run, and from the ledge in this tunnel ore has been taken which is very rich in horn silver, yielding 4000 ounces to the ton. The ledge is continuous from one claim to the other and claims have been located all along the ledge. E. P. Clyde, who recently located a mine in the Yucaipa district, yesterday received a return of $19 from 100 pounds of rock sent to the Colton Sampling Works. Reports from the Mt. Baldy M. Co. who have a force of men now at work on their property situated near the summit of Baldy mountain, are very flattering, and it is expected when the cleanup is made on the first of next month, that quite an amount of gold will be realized. A large number of men are at work on the upper portion of Lytle creek, placering, and good wages are being made. The *Times-Index* reporter was this morning shown some very handsome specimens of gold ore taken from the Coyote mine, located at Cottonwood springs, 30 miles northeast of Walters station on the Southern Pacific railroad. Mr. A. J. Downer, who had the ore in question, informed us that the ledge is about three feet wide and is getting richer as depth is attained. They have an arastra at the mine and are working the ore as fast as they take it out.

AT CALICO.—Pasadena *Union*, April 18: A few days ago a miner passing along the only street in Calico picked up a piece of rock, more from curiosity than from any value attached to the stone. He took it to his cabin and applied the "hypo" test to it, and to his unutterable surprise it showed a large quantity of silver. He returned to the place with a pick and commenced digging a hole. The details are unnecessary. Where was once the street is now a big hole in the ground, and several hundred tons of rock have been sent to the mill which returned from 70 to over 100 ounces silver to the ton. This place had been walked over, driven over and even prospected for the past five or six years, and yet it remained for the lucky miner to make the strike. This instance was almost equaled a few months ago by a rich strike not over a hundred yards from the same place. A miner commenced to dig a grade in a soft rock on the hillside, intending to place a cabin there. The rock was of light, ashy gray color, slightly tinged with green. Here and there was a red spot, and fine veins of iron oxide ran in irregular streaks through it. He tried the "hypo" on it. The miners at Calico "hypo" everything, from rich chloride ore to bricks and bed-posts. Silver in considerable quantities was revealed by the test, and taking a lease on the ground, the poor but lucky "drill polisher" went to work. To-day his cabin-site is a hole in the ground and a deep shaft has been sunken down into the rocks, and thousands of dollars in silver have been taken from the find. This place is also right on the main street, in the heart of the town of Calico.

NEVADA.

Washoe District.

HALE & NORCROSS.—*Enterprise*, April 20: On the 400 level the north drift from No. 1 west crosscut continues in excellent ore. Have started sill for sets and commenced stoping this ore. In the south drift from joint west crosscut have started a winze in the ore body; the winze is down six feet and continues in ore of good quality. On the 500 level have resumed work in the face of north drift and advanced the same 18 feet; about half of this drift is fair-grade ore. The northwest crosscut was extended 45 feet. North and south upraises continue in good ore. During the week have hoisted 1206 tons of ore; have shipped to the Nevada mill 1042½ tons, and have milled 1048 tons; average battery assay, $28.40; have shipped $27,150 in bullion since last report.

CONFIDENCE.—The joint Challenge-Confidence north drift on the 300 level advanced during the week 23 feet; total length, 73 feet. The face shows a mixture of quartz and porphyry. The joint Challenge-Confidence raise from the 300 level is up 28 feet, 14 feet having been added during the week. The top of the raise still shows ore of fair quality. Have shipped during the week to the Brunswick mill 328 tons of ore, the average battery sample showing a value of $26.31 per ton.

CHALLENGE CON.—The same as for several weeks previous, the work in this mine is jointly with the Confidence. During the week the Challenge shipped to the Brunswick mill 49 tons of ore, the average battery samples showing a value of $26.31 per ton.

SAVAGE.—On the 400 level have resumed work in the joint west crosscut on south boundary, and have advanced the same 24 feet from No. 1 and No. 2 west crosscuts. Are stoping ore of fair quality from main north drift. Are extracting ore from the old stopes. During the week have hoisted 491 tons of

ore. Have shipped to the Rock Point mill 480¾ tons, and have melted 505 tons; average battery assays, $19 32.

CROWN POINT.—Are now up five floors in the stopes above the 400 level. The top is badly mixed with porphyry and clay and does not look well. Are extracting some good ore from No. 1 crosscut, but it appears to cut out in going north. The 450 and 350 stopes look about the same as usual. Shipped to the mill during the week 907 tons of ore, the average battery sample of which was $21.10 per ton.

CHOLLAR — North lateral drift, 538 level, has reached the Hale and Norcross south line. The only work done this week on the 700 level has been confined to retimbering north lateral drift. The north lateral drift, 850 level, is out 121 feet. The face is in hard porphyry.

POTOSI.—South drift, 750 level, has not been advanced during the week on account of needed repairs to the drift. The south drift, 850 level, is out 183 feet. The face is in hard porphyry. The south drift, 930 level, has been repaired a distance of 475 feet south of the shaft.

BELCHER.—The 200 east crosscut is out 200 feet, having advanced 25 feet during the week. The face shows streaks of quartz giving low assays. The 200 west crosscut is out 143 feet, having advanced 28 feet since last report. The face continues still in soft porphyry.

ALTA.—Are still raising toward the 100 level, preparatory to crosscutting toward the Keystone vein and prospecting it. The usual quantity of ore is being extracted and milled from the 800, 825 and 925 levels.

EXCHEQUER.—The west crosscut on the north line is out 85 feet; face in clay and porphyry. The north lateral drift, 500 level, is out north of shaft 435 feet; face in clay and porphyry.

SILVER HILL.—On the 200 level southeast drift is in from the shaft 100 feet, having run 10 feet during the week; face in porphyry and quartz, and the ground getting harder.

CON. IMPERIAL.—No work is being done in the mine, but the Alpha Con. Co. has started an east crosscut on the 500 level on the Imperial line.

ALPHA.—Started east crosscut on south line jointly with Imperial, which is now in four feet in quartz giving assays of from $6 to $10 a ton.

SEC. BELCHER.—The 1100 west crosscut advanced 49 feet during the week; a total distance of 238 feet. The face continues in soft porphyry.

SCORPION.—During the week the west crosscut on the 300 level was advanced 17 feet; total, 457; face, vein porphyry and clay.

BALTIMORE.—Work of exploration is progressing favorably on the 225 and 338 levels in drifts westward.

OVERMAN.—Extracted 229 tons of ore and shipped to the Vivian mill 240 tons. Nothing new to report.

BULLION.—Are cutting out a station on the 760 level, preparatory to drifting north on the ledge.

JUSTICE.—The mill is running steadily and the mine is producing the usual quantity of ore.

NEW YORK.—West crosscut driven 18 feet; total, 115, on the 800 level.

Jackrabbit District.

ONONDAGA. — Pioche *Record*, April 16: The Onondaga mine is shipping ore again. About 14 tons of good ore was shipped to Salt Lake last month. The new hoisting plant has been in operation long enough to clear the shaft and drifts of waste, and regular development work is again going ahead. The owners have confidence in the future of the mine and should soon know now what they have there. Only the better grades of ore are shipped. Ore carrying 60 ounces silver is piled on the dump to await the advent of a railroad or the starting up of some furnace in the vicinity. Present freight rates make it undesirable to ship it to the Salt Lake smelters. Over 500 tons of this second-grade stuff are piled on the dump now. It can be held as a sort of reserve fund on which to draw in future if necessary, though no need of doing so is now apparent.

Morey District.

MILL.—Belmont *Courier*, April 20: Superintendent Cohen, of the Morey Mining Co., will arrive at Morey, Nye county, to-day. County Assessor Charles McGregor informs us that Mr. Cohen will soon start up the mill at that place on ores from the mines of that district. The mines are looking well, and there is plenty of rich ore in sight, some of it assaying as high as 1000 ounces to the ton. Morey promises to be a lively camp the coming summer.

ARIZONA.

CHLORIDE.—Mohave *Miner*, April 20: John Barry has a force of men at work prospecting the Minnesota mine. James Cadden, at work on the St. Petersburg, is taking out some fine ore. Cross & Co. are still taking lead ore from the Elkhart, the ore being shipped to Denver. M. P. Delhanty is making a shipment of about 20 tons of ore from the Schuylkill mine. Kelly & McKinnon have purchased the Alatta mine, formerly owned by J. J. Goshorn, and from which considerable good ore has been taken. Kelly & McKinnon, whose lease on the Connor mine expires next month, are busy sorting and sacking a lot of high-grade ore for shipment. There are a good many mines in this district which produce ore which works from $20 to $50, but are too low grade for profitable working, and the time is anxiously awaited by the miners when reduction works will be built in this camp, and the mining interest will then take a boom. H. P. Ewing and Joseph Prisk are taking out some good ore from the Tuckaho. The ore is being leached by Mr. Ewing, who seems to have good success in this direction.

CERBAT.—Tom Mulligan has charge of the Flores mill, and everything about the place is in good working order. The Cerbat mill is nearly in shape, and it is expected that everything will be in readiness next week. Tortelotte & Wilkins are having about 160 tons of ore run through the Flores mill. The ore is being packed down from the mine above the mill by the Conard Bros. burro train. Chas. E. Sherman has struck two feet of high-grade ore in the Queen Bee. The Keystone mine is now being worked with about a dozen miners under the foremanship of Steve Smith. The report of a wonderful rich discovery of a gold-bearing ledge, near Ehrenberg, is brought to this place. It is said that it excels in richness the Harqua Halas. A Mexican, from near Sigoal, stumbled on the ledge and brought the specimens to that place. Considerable excitement exists there over the discovery.

DRILLING.—Tombstone *Epitaph*, April 21: From R. S. Fisher of the Sterling Silver Company we learn that the mill will drop stamps as soon as the contractor has finished his work, which will be the first part of next month. The diamond drill will be put in the well in a few days to prospect for an additional supply of water, although the well is now producing about 3000 gallons of water every 24 hours. After prospecting for water is finished the drill will be placed in the Vizina mine and will be used to thoroughly prospect the mine. If this method proves a success other mining companies will undoubtedly pursue the same course, as it will save the expense of deadwork. The company will accept custom ores in 10-ton lots and over, in addition to working the ore from their own mines. They can work $15 ore at a profit and have now about 6500 tons of ore on hand that will be graded up to $17 per ton. The mill has a capacity of 30 tons per 24 hours.

BLUE DICK.—Prescott *Courier*, April 17: McDonald of the Blue Dick had another carload of ore worked at the sampling works, the net proceeds of which was $2000, making in all about four carloads in the last month, which netted over $10,000.

BRITISH COLUMBIA.

WORK TO BE RESUMED AT FIELD.—Donald *Truth*, April 16: The latest news in regard to the affairs of the company who built the smelter at Vancouver and opened the Monarch mine at Field is more encouraging. The management has placed L. D. Davis practically in charge of both smelter and mine. If this is true there is a show for the company to run their business successfully. It is claimed that he will have the smelter blown in within three weeks, and that when it is blown in it will not freeze up before a trial run is made. Operations are to recommence at the mine at once.

PORCUPINE CREEK.—The Donald G. M. Co., with a capital of $10,000 in stock, has applied for registration under the provincial law. They will probably commence to do business within ten days. The Elsie Co. have secured the services of an old-time Cariboo man for foreman, and will put on a force of eight men as soon as practicable. The Discovery company intend to put in a bedrock flume. Porcupine will boom, simply because it has something to boom on.

PRETTY GOOD ROCK.—Dave Woolsey believes that he has struck a mine on Cariboo creek, 45 miles west of Donald. It is close to the C. P. R. track. The vein is 11 feet wide, carrying silver-lead ore. Assays give returns of $40 and $90 to the ton of silver.

COLORADO.

COKE OVENS.—Elk Mountain *Pilot*, April 20: The Rio Grande Western is building 30 coke ovens at Castle Gate. It is said that they will make coke equal to that made at Crested Butte. We stated last week that the Augusta Mining Co. would erect a concentrator at Pittsburg. We now learn from Erbine Groesbeck that the machinery is purchased and will be on the ground soon. S. C. Robinson is waiting for the water to run sufficient to start his concentrator. He has been delayed somewhat on that account, but expects to run by next Monday. Pittsburg will be the scene of great activity this summer.

DAKOTA.

REPORT ON THE GOLDEN REWARD.—Deadwood *Pioneer*, April 20: The directors of the old reduction works and the officers of the Golden Reward have expressed an intention of engaging a thoroughly competent person to visit the Golden Reward property and make a comprehensive and faithful report of the condition and workings of the property, and the same will be published in the *Pioneer*, after which it will be issued in neat pamphlet form, together with a clear statement of facts and plans connected with the formation of the Deadwood Consolidated M. and M. Co. The gentlemen have not designated as yet who they will engage for the labor spoken of, but at all events he will be some person wholly competent for the work.

TIN.—There has been going on for some time quite an extensive correspondence between many of our citizens and Eastern capitalists regarding the tin mines of Nigger Hill and elsewhere in the Black Hills, from which it is to be inferred that considerable interest is being manifested in Eastern quarters. That there are tin mines in the Hills is so well an established fact that anything said concerning their existence seems a waste of words. What is wanted in the Hills is capital to develop and mills to reduce the ores, and the supply of tin for which millions of dollars are paid annually to foreign markets can be produced within a few miles of Deadwood.

IDAHO.

WATER SCARCE.—Cœur d'Alene *Record*, April 14: The owners of the Arizona old wash claim are making the most of the very limited supply of water for hydraulic work. What little they get they have to reservoir, and the supply at present is but very little greater than it generally is when they shut down for the season. Mining under such unfavorable circumstances is very discouraging. The Arizona claim is well opened, and there is every reason to believe that with an abundant water supply it would be one of the best paying claims on the old wash channel.

ADVANCE. — Wardner *News*, April 16: Cœur d'Alene is experiencing a continual advance in its mining interests and general prosperity. It is not a boom of short duration, such as too often occurs in mining regions, but it is a steady and onward move that increases every year, augmenting our business activity, not alone in mining matters, but in every branch of trade and industry. When a claim or location gives fair promise of containing mineral, the owners pursue their work of development with good heart, feeling confident before the season ends they will be enrolled on the list of mine-owners. The natural advantages and unequaled resources of Cœur d'Alene form the broad basis on which we build our hopes of future prosperity. The prosperous period has been reached and an era of activity is inaugurated that will stand unparalleled in the annals of mining in the Northwest. Our miners are using greater caution than was the habit in former years, and while they have every right to expect large returns from their labor, still, they do not "want the earth" but are content with fair and liberal profits. Our mineral belts and veins speak for themselves; there is nothing to conceal, but on the contrary everything that their owners are proud to exhibit.

STRIPPING GROUND.—Idaho *World*, April 16: B. F. Hayden is to make a new departure in placer mining where ground has to be stripped—that is, the method of mining that is employed where hydraulic-power cannot be had, and the surface is stripped off and removed down to the pay, and the gravel shoveled into boxes. Mr. Hayden last Friday received two railroad-wheel scrapers, which, being pulled by horses, scoops up the surface until a sort of a shovel, provided with sides, is filled, when it is hauled off and dumped. The rig is a two-wheeled vehicle, with the attachment mentioned, the wheels being the same distance apart as those of a wagon or buggy.

THE TUNNEL at the Buckeye mine is in over 300 feet, and is underneath the old shaft. This tunnel cut the top of a pay chute, but no pay ore outside of this chute has been struck, but may be any day. The tunnel was run south to the ledge, and is now being driven east.

CŒUR D'ALENE. — *Montana Mining Review*, April 20: The mines in the Cœur d'Alene country are reported to have never presented so good an appearance as at present. The output of the mines is steadily increasing, and likewise the prosperity of the country in which they are located. The large quantity of ores constantly arriving at the Helena smelter for treatment furnish ample testimony as to the value of Cœur d'Alene mines.

LOWER CALIFORNIA.

SANTA CLARA AND ALAMO.—*Lower Californian*, April 16: Notwithstanding the bitter and unwarranted attacks made upon the new gold mines at Santa Clara and Alamo by many newspapers, the camp is growing and the mines are a wonder to all who have carefully examined them. Present indications in 10 or more mines upon which work has been done, go to show that the ore is as rich and veins as wide as the most sanguine expected. In most cases where shafts have been sunk the ore is better and shows more free gold than on the surface. In some instances the surface rock showed no gold, but at 20 to 30 feet deep great richness was developed. Two thousand men are at work in the placer mines. The veteran prospector Peck is in town from the Santa Clara and Alamo mines, and states that he believes the camp will be permanent and prosperous. He said: "I purpose to follow that mineral belt on toward San Fernando. Lower California will show them what a genuine gold mining camp is." Eighty-eight quartz mines have been located in the new mining camp—18 at Santa Clara and 70 at Alamo. Some good discoveries have been made on the same belt beyond Alamo. All of the 250 placer claims are being worked. The old Tunnel mill at the Real del Castillo is hard at work on ore from the Occidental mine, which is one of the old Tunnel group. The ore is said to pay $30 to the ton, and the vein is four feet wide.

MONTANA.

RICH DISCOVERY.—Butte *Miner*, April 17: It is not a month since Michael Gilmore and his partner, James Keeton, left Butte on a prospecting tour, taking a northeasterly direction. They made for a section of Jefferson county which has hitherto escaped the attention of the prospector. The place selected by Mr. Gilmore and his partner for prospecting is about 38 miles southeast of Boulder, three miles from the mouth of Boulder river and about 12 miles from Pony. Here they discovered a ledge from a foot to four feet wide where it crops out of the surface. Eight inches from the grass roots the vein showed up handsomely in both copper and silver. Going down four feet they got into a gold quartz, and assays from samples sent by them to Messrs. Carney & Hand of this city showed 192 ounces gold and 7 ounces in silver to the ton. He and his partner have located seven claims which they have named the Julia, Mary Ann, Jefferson Chief, Pony, Posey, Parnell and Gilmore. All have equally fair prospects, the surface indications being exactly similar. Mr. Gilmore says the district has only been scratched over. One of the ledges that bears evidently a high percentage of copper and silver had been opened before, but the former locator had abandoned it, no work having been done for a long time. The news of this discovery has already been discounted in town. A number of men hearing of it but ignorant of the whereabouts, are out now hunting for the district. He reports the district as having the prettiest location for a townsite in the Territory. Three miles away is Caldwell's ranch, one of the richest in the Boulder valley, and within a short distance is the proposed Butte and Gallatin branch of the Northern Pacific. He reports game abundant there, and the surroundings attractive enough to make an ideal spot to live in.

CABLE AND GEORGETOWN.—Anaconda *Review*, April 18: In looking around Cable and Georgetown last week the *Review* finds that there is unusual activity in mining circles there. The camp is fully one month ahead with its work this season, owing to the early spring.

THE BLUE-EYED NELLIE.—Work on this well-known mine is going on as usual. They have a force of 28 men taking out and sacking ore, a good part of which is being stored in the mine. They are hauling about 8 tons per day to Anaconda for shipment. We learn from outside sources that it is the intention of the management to erect at once a blast furnace, of a capacity of 40 tons per day, to work the ores from this mine, and save the expense of shipping to Denver and Omaha.

RED LION.—The new mill on this valuable property is just completed, and the owners expect to start it running about the 1st of May. The body of the ore has improved and the company beyond all doubt have a very handsome property, which will pay dividends from the start. Salton Cameron is grading for a 10-stamp mill of his own. He intends to work in this mill the ores from his Luxemberg mine and also what custom ores he can handle.

THE SOUTHERN CROSS.—The Southern Cross gives promise of being the best property on the west side of the range. They have an incline shaft, 4x7, down 250 feet, which is all in ore. They have not crosscut the vein and do not know what is the exact width. The company intend to immediately erect a 10-stamp mill to handle the ore.

THE PYRENEES.—Last Tuesday it was three years since the stamps were dropped at their mill, and during that period they have been hung up only 40 days. The property, though small, is a good paying one. They have a good body of ore, and the dividends to the stockholders are regular.

CABLE.—*Montana Mining Record*, April 20: The Cable company recently struck a good body of $1000 ore in their mine near Phillipsburg, and there is said to be every indication of its holding out. The output of the Granite Mountain for the week ending April 11th was 38 bars of bullion containing 61,686.06 ounces silver and 51.60 ounces gold.

NEW MEXICO.

LAKE VALLEY.—Silver City *Enterprise*, April 20: The Lake Valley mill will start up Monday next. The rolls have been replaced by 20 stamps, with a capacity of about 60 tons daily. This week the Mountain Key shipped $2650 in gold; the Aztec, $1200; the First National Bank, $174 in gold and $600 in silver; the Silver City National Bank, $375. The excavation work will be completed this week for both the Pacific and Aztec mills. A large per cent of the ore shipped from Sierra county is sampled at the Lake Valley Works before being loaded on the cars. During the last 15 months the Comstock mine at Kingston has paid over $100,000 under the efficient management of Messrs. Barton & White, with a working force of from 10 to 12 men, and during the past couple of months it has been doing better than at any time within the last half year. While opening up a new piece of ground on one of the Bremen group this week, a 3½-foot ledge of talc was encountered between the lime and porphyry contact, which is literally full of silver glance. The Minnie Grande, the Mogul and the Bullion were last week transferred by Bell & Stephens of Pinos Altos to W. H. Newcomb of this city for $25,000, the larger portion of which was paid in cash. G. Wormser of Deming reports that 14 men are now regularly employed upon the Flower Queen at Cook's Peak. Two shifts of two men to a shift are kept constantly stoping, and average two tons per day to the shift. The ore is all good and of the grade heretofore shipped with satisfactory returns. On Saturday last 18,000 ounces of bullion was shipped by the Mimbres Co. of Georgetown, making a total shipment of 34,200 ounces in 28 days. The concentrates on hand and the amalgam in the pans on the close of the 28th day from the starting of the mill was sufficient to have swelled the output to about $45,000—not a bad showing. The mill is in splendid shape, and will continue to output at about its present ratio for some time to come, as no more stops will be necessary. Since the discovery of the Georgetown mines, the output of the camp has been over $7,000,000, and the mines will probably do better this year than ever before.

OREGON.

CORNUCOPIA.—Bedrock *Democrat*, April 16: Mr. Fred Dill says the Oregon Gold Mining Co., Major Smith, superintendent, started up their 20-stamp mill last Friday, and are pounding away on ore from the Red Jacket, and it is expected the mill will be kept running for many months to come, as there is an abundance of ore awaiting reduction. The ore is exceedingly rich. A new mill has been contracted for by Dr. Howard, owner of the Last Chance mine, and it is to be ready by the first day of July. It is to be a Huntington, with all the latest improvements. The Last Chance is one of the leading mines of the camp, and is developing into a wonderfully rich property. The general outlook of the camp is of a most encouraging nature, and Mr. Dill says the grand future of Cornucopia is assured. Business of all kinds is prosperous, and the residents of the camp cheerful and content with the bright prospects ahead.

CRACKER CREEK ITEMS.—Much is being said for and against this camp, but only those who live here can give a correct account, and they not wholly so, as mining operators do not always herald their business to the public; but I will say that all of the mines that ever were worked here are being worked now, except a few that are not accessible on account of the snow. The mines that are now running are full-handed and have plenty of men, hence I would advise men seeking work to apply elsewhere until the machinery for the plant arrives. The mines here are rich and extensive, but time will be required to fully develop them.

UTAH.

ORE RATES.—Salt Lake *Tribune*, April 21: Local smeltermen think the reduction on bullion and ores by the Union Pacific will tend to keep them going, but one interested party said the railroads could afford to lower the rate to $10 and $11 and yet make money.

PARK CITY.—Bullion shipments: April 16th, 18 bars Ontario, 9454 ounces; April 17th, 17 bars Ontario, 8883 ounces. Received at Park City sampler for the week ending April 19th, 565,870 pounds Woodside ore; 306,520 pounds Ontario ore; 301,560 pounds Daly ore. The Crescent Co. made the first shipment this year amounting to 224,000 pounds of concentrates. The tramway has been cleared and put in good repair, and during the coming week the hauling of ore will be resumed. The Woodside stands at the head of the list this week in ore shipments. It is confidently expected that during the coming week the Mayflower will be added to the list. The Ontario drain tunnel is in over 1000 feet. Owing to the soft ground the progress has been rather slow during the past few weeks. The bids for running the Alliance tunnel will be opened on the 27th inst. In the meantime the buildings are being put up, and a small force of men has been put on at the mine under the charge of Geo. B. Norman. A force of carpenters are now at work on the new concentrator in Empire canyon, and the work will be pushed along as rapidly as possible.

SCIENTIFIC PROGRESS.

Self-Mending Insects and Snakes.

Much has been said and written in regard to what are sometimes called "self-mending insects and snakes." The *Scientific American* of Sept. 24, 1887, contains a communication from Oliver White, secretary of the Peoria, Ill., Scientific Association, in which he relates of breaking one of these reptiles into pieces from one to two inches long, from the vent to the tip of his tail—two-thirds of the whole length of the way—then placing a cage over him. On returning to the place 24 hours after, the snake was there, sound and whole, in full length.

Another and later correspondent of the same paper, referring to the above, says: "A similar operation is performed by the insect known as the earwig. One resting on a board was cut in two with a knife, when the head half crawled away about a foot, and, after making a circuit, came back to the tail half, butted against it, and was again united with it, when the severed insect became whole—a perfect, living, moving object. Can you or any of your readers, Mr. Editor, give me a scientific reason for, or an exp anation of, this most marvelous operation of the self-mending snake and the earwig? Are there any other insects, reptiles or living objects that do the same?"

To the above still a third correspondent of the *Scientific American*, G. A. Stockwell, M. D., F. L. S., of Port Huron, Mich., in the issue of Oct. 29, 1887, says: "In the 'glass snake' and other low orders of life repair is usually by primary adhesion, by scabbing, or more rarely immediate union; or it may, in a sense, be a medium between the two former. Creatures with three-chambered hearts and sluggish (cold) circulation retain vitality in severed tissue much longer than those possessed of a four-chambered heart and quick, warm circulation; and to even greater extent is this true of white-blooded insects, without complete circulatory apparatus. Here reparative material is poured out, undergoing changes similar to those in primary adhesion; and the wound cicatrizes rapidly beneath the scab formed by the highly plastic serum of the blood effused on the surface, and which coagulates with extreme rapidity and firmness in the lower orders of creatures. The scab affords support, the embryo cells with the plastic lymph being the medium of repair. The process is identical in all grades of life, and in all tissues, whether bone, muscle, integument, tendon, capillaries or nerves, and depends solely upon the blood supply and the capability of the nervous system to provide this nourishment. Severed fingers have successfully been reunited to the hand in the human subject; bits of muscle, integument, or scalp grafted; teeth transplanted; and even the spurs made to grow in the comb of the same barnyard cock. The processes are precisely the same as in the reunion of a severed portion in reptiles or insects when the latter are led by instinct to approximate the separated portions of their economies, and to await the exudation and 'sealing' that will insure permanent union. The exudation about the wound gives support, exactly as the 'provisional callous' forms a false splint holding the bone in place until reparative processes shall reunite the fractured surfaces. Had the *opheosaurus* of Mr. White been reunited *without* exhibiting traces of the injury, we might be justified in deeming it phenomenal, or in believing the gentleman had been unconsciously deceived; but under the circumstance, he narrates nothing but what is an every-day physiological occurrence, curious only as the severed digit, when replaced and healed, is curious! But withal his observation is valuable, since it adds one more link to the chain that must eventually strangle superstition and silence 'doubting Thomases' possessed of narrow minds, and race egoism, that can conceive of nothing less than man as an object of Nature's fostering care."

One of these curious reptiles—the glass snake—is said to have been seen, a few years since, by a party of ladies near Pescadero beach, in this State. As the party passed the reptile, one of the ladies—Mrs. Swanton, who resides at Pescadero—struck it lightly with a stick, when it immediately separated into several pieces. Soon afterward, in returning by the same path, what they supposed to be the same snake, appeared united and in quite a lively condition. At least, a snake similar to the first seen, was observed lying in identically the same place and no portions of the reptile which had been separated before their eyes were anywhere to be seen.

WONDERS OF BOTANY.—The finest botanical gardens in the world are said to be those of Peredinja, near Kandy, in Ceylon. They comprise 150 acres. Among the curiosities are bamboos 100 feet high and nine inches in diameter, which in the month of July grow between one and two feet a day. India-rubber trees with immense roots three and four feet above the ground, when cut with a knife give forth a milky substance. Ginger, cloves and jack fruit are passed in succession; most beautiful orchids, such as would command fabulous prices in Europe, are seen in profusion with flowers of every shade and color.

THE MAGNETIC PROPERTIES OF IRON.—A series of experiments, with a view to determine the temperature at which soft iron becomes non-magnetic, have recently been carried out in the laboratory of the Sorbonne, by M. Ledeboer. The bar of iron experimented on was first insulated by being completely covered with mica, over which was wrapped a helix of platinum wire, and the whole was then placed inside one of two exactly similar induction coils, which were connected with a Wheatstone bridge, so that their relative self-inductions could be compared, and would, of course, be equal when the iron lost its magnetic properties. The bar was heated by passing a current through the platinum helix mentioned above, and the raise of temperature was measured by means of a thermopile. The results obtained were that up to a temperature of 680° C. the iron preserved sensibly the same magnetic properties as when cold, but beyond this temperature the decrease of permeability was very rapid, and the bar became completely non-magnetic at 770° C.

The Microbe of the Magnet.

With all the paraphernalia of the modern physical and electrical laboratory, the instruments of precision that will handle a millionth of an inch as readily as a laborer his pick and shovel; with all the evolution going on through generations of scientists, and the almost incessant wresting of secrets from the bosom of nature, we doubt if science is any closer to the isolation or attenuation of the microbe of the magnet.

It is absurd to suppose that a primary energy is impressed upon a piece of hardened steel once for all. The transfer of that energy into actual work would quickly destroy the magnetic power, yet such a destruction not only does not take place, but the very exercise of the power strengthens the magnet. A horseshoe of steel may be magnetized in ten seconds by the current of a few amperes from a battery, a ridiculously small amount of energy all told, and such magnet can lift many pounds of iron in contact. But without contact it may lift and hold a pound of iron easily. It will hold that pound for an eternity, and every second of that time without end the magnet is expending energy until it foots up an almost inconceivable total of actual power. Not alone that, but the magnet of one pound lifting-power to-day may and will be stronger to-morrow. Where does all this really tremendous amount of energy come from? By what inscrutable process does the mere magnetization of a bar of steel make of it a machine for the transformation of energy? Not a reactionary or storage device which, like a steel spring, honestly gives back approximately all it has received, but a perpetual transforming or converting machine. There is a hidden process going on of some kind; energy is going into the magnet all the time it is doing work—energy in some form. Where does it come from—gravity? atmosphere? solar rays? earth currents? Who can say? It is a great problem, worthy of a lifetime of indefatigable research. It is a microbe and it will be discovered, and the discovery will make electricity the queen of nature's forces and steam will become a dim vision of the dark ages of the past.—*Electrical Review.*

Light Without Heat

A great many experimenters are now trying to find out some way of producing light without producing heat at the same time. If this can be done at all it will probably lessen the cost of lighting our streets and buildings very considerably. Some years ago James Clerk Maxwell advanced the theory that light is a sort of electrical disturbance of the ether that is supposed to fill space. This theory, though not yet rigorously proven, is supported by a great deal of evidence—in fact, by all the evidence we have. We know, for instance, that light and electric induction are propagated by the same medium, and with the same velocity. We know, further, that each consists of wave-like motions, or strains, in that medium; and that the waves of both are transverse and unlike those of sound. There are other reasons, too, for believing that Maxwell's theory is correct, and that the difference between light and electric induction is the period of their respective waves. If this is a fact, it is evident that if we could charge and discharge a Leyden jar rapidly enough it would break out and shine with a brilliancy that would depend only on the intensity of the electricity supplied to it. Now it is believed to be possible to charge and discharge such a jar a thousand million times a second, which would be the same as sending a thousand million waves a second out into space; yet this rapidity, though it is utterly inconceivable to the human mind, is stillness itself compared with what is required to produce light, and it must be increased at least 400,000 fold before it can produce the faintest glimmer.

Grim as the outlook is, we can take courage from the fire-flies, for they seem to have overcome the difficulties somehow. Maxwell's theory, if correct, is a stupendous generalization; and though it has been of no use to us yet, some way of applying it in the arts must soon be discovered. The possibility that it suggests, of transmitting light by electricity as we now transmit sound, is curious and interesting; and it would be a novel experience to stroll the streets of Hartford on a summer evening, bathed in light shining somewhere in China.—*Locomotion.*

THE NATIONAL ACADEMY OF SCIENCE met at Washington on the 6th inst. The attendance was full, and an interesting session is was held.

MECHANICAL PROGRESS.

Progress in the Iron Foundry.

It is admitted that foundry practice has made but little important advance in the past generation. Beyond some improvements in molding, a little better knowledge of mixtures of iron, and some recent study of the use of ferro-aluminum, ferro-silicon, etc., this whole great industry is practically where it was 25 years ago. There are exceptions to this rule. A few wide-awake, energetic foundrymen, under the stress of keen competition for important work, have experimented successfully with lower grades and reached results both as to economy and quality hitherto deemed impossible. In nine-tenths of all foundries, however, one or other of the two conditions prevails: Either the shop is so full of work and crowded to get out castings on time and in good order that the responsible head cannot find time and thought for careful experiments, or else a state of ancient and rock-rooted prejudice exists that forbids any departure from the good old ways of the fathers. Under either of these conditions the chance for progress is small. It is an unfortunate circumstance, also, that intelligent, well-equipped foundrymen, with some little acquaintance with books and theory and good practical experience, are scarce, and when found are expensive men.

Our attention has been called of late to an extended series of experiments in this line made by Rogers, Brown & Co., Cincinnati and Chicago; 119 distinct foundry mixtures are covered by these tests; in all, about 300 bars were broken. The standard adopted is an inch-square bar, 24 inches between supports, and broken by transverse pressure applied in the center. It was noted that nearly all bars overran in size from one-thirty-second to one-eighth inch, making the actual breaking strength from 50 to 300 pounds greater than the correct result after being reduced by mathematical formula to inch square. This scarcely noticeable difference in the size of bars makes a far greater disparity in breaking strength than is usually supposed, and accounts for cases of unusual strength reported in foundries where only average results are realized. The bars for these tests were furnished by leading foundries in the West, particularly Ohio, Indiana, Missouri and the Northwest. They represent all classes of work—agricultural machinery, general machinery, architectural work, jobbing, stove plate, hardware, etc. The mixtures used are from coke and charcoal irons, mainly the former. The proportion of foundries using charcoal iron at all is less than 20 per cent. Those using it in any considerable proportion scarcely amount to eight per cent. These are mainly in the Northwest, where Lake Superior charcoal iron has been a recognized standard for years and is slow to give place to newer mixtures.

One of the most interesting facts brought out is the average strength of about 300 test bars broken. This is 1120 pounds, and it may fairly be assumed that this is the average strength of all foundry mixtures west of the Alleghenies. Exclusive of bars containing flaws, and of which no account was made in the inquiry, 37 broke below 1000 pounds, only 12 broke above 1400 pounds and 3 above 1500 pounds. One bar in which wrought-iron scrap and ferro-aluminium were mixed with pig iron broke at 1958 pounds, the strongest of the series, but it was hard to drill or work. The two weakest bars were made from a mixture of half each Lake Superior charcoal No. 1 (a favorite brand) and old car-wheels. The strongest bar, other than the one above named, was from an all-coke iron mixture, in which Lake Superior, Southern and Hanging Rock ores were about equally blended. It is clearly proved by the experiments that it is rather by the intelligent mixing of medium-grade irons than by the use of the strongest and highest-priced brands that best results are achieved. In several conspicuous cases, where the highest-priced Lake Superior charcoal irons were mixed with best known Northern Ohio soft or "Scotch" brands, the object being to "get the best," without reference to price, the results were below the general average, while of the very strongest mixtures a majority were from the cheaper brands. In scarcely a single instance where Hanging Rock, Lake Superior and Alabama or Tennessee coke irons, of proper grades, were mixed in judicious proportions was a weak, hard or defective casting obtained. Some low-grade and low-cost mixtures, thus judiciously made up, yielded strength and general working qualities that were quite surprising. In such adaptations Nos. 2 and 3 grades were freely used without rendering work too hard for machine-shop. Wrongly adapted, the same grades would doubtless yield hard and brittle castings.

The bending capacity or deflection of bars was in each case noted. The maximum test was .53 inch, the breaking strength 1435 pounds. The minimum test was one-fourth inch, the breaking strength being 845 pounds. In color and grain, results were conflicting. The darkest fractures and those of the cleanest, sharpest grain were sometimes among the weakest, but as a rule were of good strength and soft. A mixture with too much silicon invariably proved weak and brittle, while too little silicon produced physical results very similar. An interchange of views and information was had among the foundrymen taking part in these tests as to facts of foundry practice, methods of charging cupolas, pressure of blast at tuyeres, kind and proportions of fuel used, etc., and it is promised that a summary of the results of these will be given at a later time.—*The Iron Age.*

MELTING ZINC.—Zinc is troublesome to cast, and more troublesome when small thin molds are to be cast. Lining the mold with whiting and water which must be allowed to thoroughly dry, will often cause the metal to fill the mold well. Burning of the zinc (oxidizing) may be prevented by covering the metal while in crucible or ladle with a layer of common salt, a little muriatic acid, which amounts to the same, as a coat of zinc oxide is immediately formed on the surface of the melted metal, which effectually prevents further oxidation from action of oxygen in the atmosphere. It is an improvement to keep a layer of charcoal on top of the zinc, or any other soft metal which can be melted in a ladle; the coating of oxide forms a protection against oxidization to only a certain degree, while the layer of charcoal tends to reduce the oxide again to its metallic form. Indeed, it is possible to recover lead, tin, zinc and antimony from the "dross" or oxide which gathers in the ladle. It is only necessary to melt the oxide with charcoal, salt, and soda to get it again into useful shape. The dross should be powdered, likewise the salt, charcoal and soda. Mix them together and melt. The soda and salt melt into a pasty mass and the carbon unites with the oxygen of the dross, leaving the metal free, but burning off the charcoal. The salt and soda act simply as flux in reducing the oxides.

CAR CABLES.—The strain put upon a cable in operating a cable road is very heavy, while the power required to move one is enormous. On most lines a cable 1¼ inches in thickness is used, which consists of a hemp or jute heart wrapped with 6 strands composed of 19 wires of crucible steel. The weight of the cable is 3½ pounds to the foot, so that a mile of cable figures up a dead weight of 10 tons. The force necessary to draw this weight extended over the entire line is very much greater than would be required to move the same weight in a compact body. The breaking strain guaranteed by cable manufacturers is 45 tons, but the maximum strain used is only 10 tons. An average of 75 per cent of power is spent in pulling the empty cable, and the balance is all that is used for profit. A cable can be used only about 7 months, when it becomes so worn as to be of no further use.

CENTRAL WORKSHOPS FOR SMALL MANUFACTURERS.—The scheme for assisting small manufacturers in a practical manner by establishing in the large towns a central workshop, where the manufacturer may at the same time use steam-power, has so far been highly successful. These central workshops have for some time existed in some of the large towns of France and Italy. The experiment is now to be tried in Hamburg, where a central workshop of a similar character is to be erected. The result of this new departure will be awaited with great interest.—*Kuhlow's.*

THE BEST AMERICAN TOOL STEEL is made of iron which comes from Sweden, and, so far as known, there is no iron produced elsewhere from which steel of equal quality can be made. Our American steel-makers pay a heavy import duty upon this iron, while the English steel-makers import it free. But while this undoubtedly affects the cost of the steel, no one will assert that it affects its quality, so long as the iron is imported and used.

ANOTHER USE FOR STEEL.—The high price of brass has led the clock manufacturers of Ansonia, Walesburg, and Thomaston, Conn., and other places to experiment with steel for certain parts of the cheaper grades of clocks, and the result has been gratifying. Soft steel has been put under the dies, and many working parts are now made entirely of steel which were formerly composed of brass.

HARDENED STEEL TOOLS.—The *Scientific American* says that hardness on steel tools, almost equal to that of the diamond, is obtained by plunging them when white-hot into sealing-wax, repeating the operation until the steel is too cold to enter the wax. The tool is then just touched with oil of turpentine.

AN IMPROVED BARREL HOOP.—A corrugated steel barrel hoop has been invented, which is said to be elastic and firm, hugging a package tightly. Four steel hoops will take the place of ten wooden hoops on a flour barrel. They are made at Worcester, Mass.

PETROLEUM FUEL.—An English firm has been using petroleum for fuel in a torpedo boat, and getting a speed of 21 knots. The oil is carried in the vessel's double bottom. The boilers, it is said, steamed excellently.

COPPER MAY BE HARDENED by melting with it and thoroughly stirring into it from one to six per cent of manganese oxide. The other ingredients for bronze may then be added.

CAST IRON COLUMNS with flat ends uniformly bear about three times as much as those of the same dimensions with rounded ends.

THERE should be less pride felt in peculiarity of employment and more in excellence of achievement.

GOOD HEALTH.

Health of the State.

The monthly report of the State Board of Health has been received. The introductory remarks are as follows:

Reports of mortality received from 74 localities, with an estimated population of 741,500, give, in the aggregate, 907 deaths, which is an annual death rate of 14 88 per annum. If we compare this percentage with that of any other State within the Union, we will at once begin to realize the salubrity of our climate and the lessened tendency to death that exists within its borders. There is hardly a State that can be named whose death rate for the month of March comes within one per cent of our average, and when we reflect that one per cent means 10,000 lives spared in each million persons per annum, we no longer wonder at the large number of emigrants that seek our shores.

Reports of sickness from 79 localities show a remarkable absence of any epidemic, or indeed of any very prevalent disease, if we may except pneumonia, bronchitis and influenza, which were very general in their diffusion, but of a mild type and sporadic character. The temperature of the month being much warmer than what we usually experience in March, and the rainfall being somewhat in excess, may have had a modifying influence upon the character of these diseases, as it has been conclusively shown that the prevalence of coughs, colds, bronchial and rheumatic affections depends very much upon temperature, a very moist atmosphere accompanied by a low temperature being conducive to their frequency, an increase of temperature lessening their fatality. It was noticed during the month that when the atmosphere was dry, and the temperature low, an increase of acute pneumonia was developed, and in the higher altitudes it seemed to determine its fatality. The connection between meteorological conditions and disease is still a problem to be solved, and appears to be worthy the attention of every votary of science whose mission is to consider all the influences affecting the public health.

We would call especial attention to the following remarks in the report in regard to the care which should be taken to avoid that greatly dreaded disease—scarlet fever: As the tendency to infection from this disease lessens with advancing years, the longer a child can be protected from it, the greater the likelihood that it will escape it entirely. To attain this desirable end, it is absolutely necessary to isolate patients as soon as the disease is discovered; and this isolation must be maintained until the shedding of the epithelium or outer skin is completed. It is a well-known fact that scarlet fever patients are most dangerous to others when the skin is beginning to desquamate or peel off. During this time they should be frequently bathed, and their skin afterward anointed with fresh lard or other animal oil which will hinder the dissemination of the branny scales. Children exposed to scarlet fever should remain under observation 10 or 12 days before being allowed to mingle with other children, and all attendants on the sick should change their garments, and disinfect their hands, face and hair by washing in a disinfectant solution before mixing with the public. It must not be forgotten that the type of the disease in one person is not certain to reproduce the same in another, as what is so mild as scarcely to confine to bed in one person, may communicate a poison to another that will be so very malignant as to cause death in a few hours. It is therefore the part of prudence to confine the spread of the disease to within as small a radius as may be possible. To determine the most infective period of the disease, Dr. Whitlegge of London analyzed 1700 cases, of which he had exact particulars, and found the infectiveness suddenly decreased at about the sixth day, increased again about the twelfth day, and reached its maximum on the sixteenth day.

TYPHOID FEVER TREATMENT IN GERMANY.—The Philadelphia *Record* speaks as follows in regard to the efficacy of cold baths as used in German hospitals as a typhoid fever remedy: Dr. Simon Branch, attending physician to the Manhattan General Hospital, published a paper in the *Medical Record* on the treatment of typhoid fever which advocates the abandonment of the present method of treatment, and the substitution of the cold-bath treatment as successfully practiced in the German military hospitals. Without burdening the reader with the methods of the cold-water system, which are the province of the physician, it is worth while to note the valuable results attained. Out of 19,017 cases treated with "all kinds of cold baths," there was a mortality of 7.9 per cent. Out of 2841 cases in which the treatment was "intermediate, with water," the mortality was 12.2 per cent. Out of 2198 cases treated with "strict cold baths," the mortality was 1.7 per cent, and in the same cases 2150 patients who were treated before the disease had progressed five days, all recovered.

VACCINATION FOR DIPHTHERIA.—It is claimed that two professors connected with the Pasteur Institute have discovered the generative microbe of diphtheria, and that a preventive of this disease by means of vaccine virus is expected to follow. Should this expectation be realized, the discovery and its successful application will certainly take rank among the most important triumphs in the realm of medical science. The prevalence of diphtheria, especially in the principal cities, and the very large proportion of fatal cases, is little dreamed of excepting by those who are giving special attention to the subject. In Brooklyn, N. Y., for instance, there were, in 1888, 984 deaths from diphtheria, which probably represented 3000 cases.—*Scientific American.*

DANGER IN NEWLY BUILT HOUSES.—There is too great haste in occupying a house after its completion. In many places there is such a demand for dwellings, and often business apartments, that, so soon as finished, they are occupied. This is especially true of small dwellings. There is more danger in this than is supposed. There is no health in dampness and mold under any circumstances, and in living apartments, where the tendency is toward poor ventilation, the dampness of newly finished houses contributes largely to ill health. In the town of Basle, Switzerland, a regulation has been adopted which prevents newly built houses from being occupied until four months after completion. Under many circumstances, so long a time as above specified is not necessary, but it is often well to err on the side of safety. The size of the house, its location, surroundings, the material used, and the state of the weather enter into the consideration of the time necessary in which a building should become sufficiently dry for occupancy.

THE LATEST SMOKING CRAZE.—The latest dissipation invented by the women of Paris and London is the smoking of tea cigarettes. Special grades of the finest tea are used, and the effect of the cigarette is said to be delightful for fully an hour after one has ceased to smoke. After that comes a reaction in the form of a nervous trembling and excitability, which is best endured, according to a woman of title who goes in for all these things, by drinking a thimbleful of frozen absinthe.

DANGEROUS DRUGS.—The Grand Jury of this city have asked the Board of Supervisors to pass an ordinance making it unlawful to sell or give away any opium, morphine or cocaine, except upon the written prescription of a practicing physician, and then only upon the day of the date of said prescription. The ordinance is also to make it unlawful for a prescription to be given, except for special medical purposes. Penalty, $500. Such an ordinance, rigidly enforced, has become a necessity.

USEFUL INFORMATION.

A Curious Character.

Some years ago a curious character, known as Jack Coop, lived in Pittsburg, Pa. He claimed to have been the inventor of the circular saw. His story in that regard is told in another column of our present issue, under the head of "Sawmill Notes." He occupied three rooms filled with an inconceivable amount of old relics, including a large library of old books, many of them from Russia and England.

He claimed that he was born in 1778, on a British man-of-war, during an engagement with a French man-of-war, the British ship being commanded by the afterward famous Lord Nelson; that his father and mother were both killed in the naval battle before he was two days old; that he was put into a hen-coop and cared for by the sailors; that he was educated by the British Government as a sapper and miner, and was sent with a corps of sappers and miners to Russia, and was in Moscow when it was invaded by Napoleon Bonaparte, and that he became a Russian citizen, and afterward traveled with the Emperor over England in disguise.

In the fall of 1870 the old man packed all his traps in boxes, put them on a flatboat, and left for the South, saying that he was going to spend the remainder of his life where the winters were warmer. He had not tasted meat, fish, or flesh of any kind for 30 years, his principal food being bread (which he made himself, cleaning and grinding the wheat in a handmill) and apples.

He is said to have had more than a peck of old gold watches of all kinds in his room, and over $10,000 in ready money, and he refused an offer of $25 for his old saw. He would never allow any one to call him by any other name than "Old Jack" or "Old Coop."

HISTORY OF SOAP.—The accurate history of the manufacture of soap stretches back to the factories built at Marseilles, where there was an apparent recognition of the principles of saponification. Neither then nor until centuries later, however, was there any desire to understand what the principle was, and for many years every effort to wrest the secret from chemistry and make soap-boiling an art was fought by the manufacturer and workman. "The factories at Marseilles had around them all the materials necessary for soap-making," says a recent English work upon the art. "The olive tree, the fruit of which yields a fixed oil in great abundance, flourished in the south of France, while the shores of the Mediterranean yielded an ample supply of maritime plants from which crude soda was obtained by calcination. As time progressed Italy furnished olive oil, while Spain contributed crude soda, or barilla. The gradual development of the art, while extremely interesting to the chemist, is of no special interest to the general reader. Leblanc's discovery of a process for the manufacture of soda from common salt, and Chevreul's explanation of the nature of the reaction which takes place when fatty substances are treated with boiling solutions of caustic alkali, give an exactness to the manufacture of soap such as it never before had, but it was a long time before the boilers would avail themselves of the aid of these men of science. Steam succeeded the ordinary fire, and the list of fatty substances used in soap-making grew and grew, until there are now a dozen of them forming the base of soap, with over 100 entering into the composition of different kinds of soap to greater or less degree."

The Use of Ropes.

The *American Architect* translates from the *Bautechnische Zeitung* the following practical suggestions in regard to the use of ropes, which may be worth remembering. With hemp ropes the character and probable strength may be judged in some degree from the appearance. A good hemp rope is hard, but pliant, yellowish or greenish-gray in color, with a certain silvery or pearly luster. A dark or blackish color indicates that the hemp has suffered from fermentation in the process of curing, and brown spots show that the rope was spun while fibers were damp, and is consequently weak and soft in those places.

Sometimes a rope is made with inferior hemp on the inside, covered with yarns of good material, but this fraud can be detected by dissecting a portion of the rope, or, in practiced hands, by its behavior in use. Other inferior ropes are made with short fibers, or with strands of unequal strength, or unevenly spun. In the first case the rope appears woolly, from the number of ends of fibers projecting, and in the latter the irregularity of manufacture can be seen by inspection. Occasionally a hemp rope is spun with a core or central strand, such as is used in the interior of many wire ropes. This somewhat increases the strength, but the core, shut in by the outside strands, is liable to rot and infect the rest, and any rope with a musty, moldy smell should be rejected.

The best hemp comes from Russia, Switzerland, Alsace and Northern Italy, and it is said that the strongest fibers are obtained from plants grown at the foot of high mountains. Ropes to be used on board ship, or where they are liable to be often wet, are usually soaked in tar to preserve them, but the tarring diminishes the strength by about one-third, and increases the friction of the rope.

The injurious action of tar upon the hemp fibers seems not to be clearly explained, but it is said to be lessened by subjecting the tar, before applying it to the rope, to repeated melting and washing with water. The effect on a rope of soaking with water is, however, worse than that of saturating with tar.

According to accurate experiments, the tensile strength of a wet rope is only about one-third that of the same rope in a dry condition, and a rope treated with grease or soap is weaker still, apparently through the influence of the lubricant in facilitating the slipping of the fibers. It should never be forgotten that hemp cords contract strongly on being wet, a dry rope 25 feet long shortening to 24 feet or less when dipped in water or exposed to heavy rain.

ELEVATORS FOR DWELLING HOUSES.—The ingenious plan proposed by a Berlin inventor of a simple and inexpensive elevator for private dwellings, in place of the ordinary staircase, has attracted some attention. It is on the principle of the inclined railway, and the motive-power is furnished by the city water, which is applied in the cellar. Each flight has its separate chair, so that, for example, one person can ascend from the first to the second story while another is on his way from the second to the third, or still another is descending from the fifth to the fourth. The chair, being only of the width of the human body, requires but little space, and still leaves a free passage for any who wish to walk up or down, instead of riding. It is set in motion by a simple pressure of one of its arms, while after it has been used it slides back to the bottom step, its descent being regulated in such a manner that the carrying of passengers is a matter of entire safety. The motive-power is, of course, more or less expensive, according to the cost of water, this being, it is stated, at Berlin at the rate of a little more than one-tenth of a cent only for each trip.

TRANSPORTING GAS BY RAIL.—It is said that a party of Denver men are engaged in a project that contemplates the transportation of natural gas from the wells in Pennsylvania to Denver by rail. The cars are made of steel boiler plate, and much in the form of oil-tank cars, and are expected to contain from 10,000 to 15,000 feet of gas when compressed. It is to be used as fuel to operate the engines of a cable line of street cars.

THE CENTENNIAL ANNIVERSARY of the inauguration of President Washington will occur on Tuesday, April 30th. General Washington was inaugurated on April 30, 1789, because the bad weather had prevented Congress from assembling and organizing. James Monroe and Zachary Taylor were inaugurated on March 5, 1821, and 1849, respectively, because March 4th in those years fell on Sunday.

ENGINEERING NOTES.

Direct Production of Hot Air From Cold.

A discovery having an important bearing in the present upon the arts and manufactures has recently been made by Mr. Wm. Gibbs of Essex, says the London *Times*. The discovery is to the effect that perfectly pure air can be produced from the combustion of coal. The arrangement for effecting this result is extremely simple. It consists of a brick chamber, about five feet long by two feet wide and two feet high, built upon the ground. At one end is a lead chamber and a fuel chamber, and at the other a powerful exhaust and blast fan. Placed immediately between the chamber and the fan are baffle plates, a standing ridge with perforations at the back and a hanging ridge with perforations at the front. There are also several carefully proportioned inlets to supply the exact quantity of air requisite for perfect combustion. The exact apportionment of the air constitutes one of the main points of success, and it is the one which Mr. Gibbs found the most difficult to determine. Once known, however, this law of proportion between air and fire is, of course, easily maintained.

Another point having a very important bearing on the result is the exact relative proportion of the fuel chamber to the feed chamber, and both to the volume of air drawn per minute by the fan. This also being ascertained, after many failures, is now a fixed instead of a doubtful quantity. Given these proportions and some other of minor importance, the result is distinctly curious.

Issuing from a fan-mouth 12 inches in diameter comes rushing a column of hot air, marking on the pyrometer at its exit a steady, uniform temperature of about 500° Fahr. Not a trace of smoke or fume is visible to the naked eye; not a taint of any kind is perceptible to the taste or smell. Standing as we did on the range of this simoon, with the hot blast full in the face, the heat is, of course, excessive, but the air is perfectly pure. Save in the matter of temperature, it affects neither the eyes, the throat, nor the nostrils. As a proof of this purity, some choice tea which had been saturated with hot water was placed in the hot-air current, and when redried was pronounced by an expert to be wholly free from any imparted taint or taste.

In order to show the character of the products of combustion before being submitted to the fiery ordeal, the fan was stopped, and a dense cloud of thick smoke rose up from the coal in the feed chamber, charged with suffocating fumes. On restarting the fan it was quickly drawn in again, and not a sign of it appeared at the exit from the fan, and the air when inhaled was as pure as ever. It would be interesting to know the rationale of the process by means of which all the varied products from coal combustion are thus so completely destroyed. Mr. Gibbs suggests that the water contained in the coal is decomposed into oxygen and hydrogen, and that the hydrogen in burning adds to the heat of the resultant air, while the oxygen, reinforced as it is by that obtained from the large volume of fresh air admitted at the various inlets, decomposes and purifies all these products. But whatever the theory may be, the fact remains that it is not only possible but easy and economical to obtain the utmost amount of heat from coal without deterioration of the atmosphere.

The success attained by Dr. Gibbs naturally suggests the application of the principle in many other very important directions in connection with the industrial and mechanical arts as well as for steam-raising purposes and for domestic use by the suppression of open fires in stoves.

A PROBLEM IN COAL HAULAGE.—The Lens Colliery Company has satisfactorily solved an interesting problem. The development—thanks largely to the use of compressed air—of one of their deep seams, 1100 feet from surface, rendered necessary the addition of a third deck to the cage. But with this additional weight the engine was found unequal to the task of drawing the load. The difficulty had, however, been foreseen, and in part provided for. A special engine has been erected to condense the steam in the air-compressing, pumping and ventilating engines. A few hours' work was sufficient to connect this with the winding-engine. The success was complete. By means of this condensation the engine has been rendered capable of drawing 1000 tons a day from the depth mentioned. The stroke is 1.60 meters, and the diameter 0.70 meter. The principle of condensation is likely in future to be generally applied to winding-engines. All examples hitherto, so far as can be learned, have given satisfactory results.—*Colliery Guardian.*

OUR PRESENT POPULATION.—It is estimated that the present population of the United States is 64,000,000. The total increase is said to be 100,000 a month, exclusive of immigration, and last year the increase by immigration was 518,000. At this rate the next census, which will be taken in July, 1890, will show about 67,000,000.

AN excellent polishing powder for gold and silver consists of burnt and finely pulverized rock alum, five parts, and levigated chalk, one part. Mix and apply with a dry brush.

Passing Events.

The miners on the Comstock lode, Nevada, are much interested in the question now being discussed as to suspending underground work in the mines on Sunday. Such work has been kept right on 365 days in the year, the custom having prevailed since they commenced mining there. It is now proposed to stop the Sunday work. In California it has never been the custom to carry on underground work on Sundays. The Comstock mine managers are willing to leave the question to the miners themselves.

Public attention is turned at present toward Oklahoma, where vast tracts of land were thrown open to settlement this week. Thousands of people were prepared to enter the region, and a town of 15,000 inhabitants sprung up in a day. Many are disappointed, however, water being scanty and poor.

There is just now some little excitement at Monrovia, Los Angeles county, over gold discoveries. Nothing very big has been found, but enough to encourage a lot of people to continue prospecting.

The Santa Clara gold excitement in Lower California has about died out. It appears, however, that some of the ledges found are pretty good and will be developed to prove their extent and value.

JOSEPH POWNING, for 20 years the controlling spirit of the California Powder Works, has resigned his position in the Board of Directors.

Mexican Mines and Miners.

The Conditions in Various Districts.

We had a conversation this week with Alexander H. Dubois, who has been for many years a resident of Mexico, where he has been identified with the mining industry. From him we learned many interesting facts concerning mining sections of which we hear but little. Mr. Dubois agrees with others familiar with the country in saying that the Mexicans are good miners and can mine and beneficiate their ores cheaply and well. They have been working their mines for 300 years or more, treating mainly the free-milling ores. In many places they have worked the claims by open cuts as far down as free-milling ores existed, and then left them. About 25 miles from Sombrerete is one of these open cuts, which is from 15 to 20 miles in length. There Mr. Dubois saw blast holes the size of a man's arm and in one of these he found lime, showing they had used this to rend the rocks.

As far as raising ores are concerned they can do it as cheaply by hand as we do by steam in many cases. Not long since he saw an instance of this. The peons were making 40 trips a day each from a depth of 400 feet, and a lateral drift of 1000 feet, carrying loads of 200 pounds, for 75 cents a day. These men were paid mainly in produce.

The cause of failure of so many foreign mining companies in Mexico Mr. Dubois attributes to their sending out men who were not miners. They get the most expensive labor and do not properly handle it. A few years ago Mr. Dubois met a California prospector who was an exceptionally intelligent man, and who was about to return to this State, saying the Mexicans knew too much about mining and that there were better old dumps and abandoned mines left in California than in Mexico. The ore has to be very rebellious for the native not to attempt to work it. At Topia, where there is a mining camp of about 5000 people, the ore is base, but they work the zinc blende by roasting and patio up to 80 per cent of the assay value. The lead ores are smelted imperfectly, but are made to pay.

These Mexicans get hold of foreign "tenderfeet" and sell them the shells of their old mines for good prices. Practical mining men would not give ten per cent of the price asked, but lots of people get fooled on the past records of abandoned mines.

From the seaport of Altats, with fortnightly steamer communication from Mazatlan, and say 150 miles north of same near the mouth of Humaya river, is Culiacan, a town with 10,000 inhabitants, the capital of the State of Sinaloa, on the confluence of Humaya and Canelas rivers. This is the ancient Colhuacan, one of the stopping places of the Aztec tribe on their peregrination from unknown northern regions, according to the old Aztec traditions and hieroglyphic manuscripts. There are here cotton-mills, extensive sugar-cane plantations and a sugar factory.

Following up the Canelas river, we find Tamazula, in the State of Durango, now almost in ruins. It is on the confluent of Canelas and Sianori rivers, 80 miles from Culiacan.

La Bajada.

About 30 to 35 miles farther up the Canelas river, at La Bajada, are the ruins of a 30-stamp mill driven by three overshot-wheels, and a White & Howell's roasting furnace, abandoned because of failure in working the ores from La Prieta y Los Hollines mine. This was due to the grossest mismanagement. The ores run 60 to 90 ounces troy in silver per ton, and had given fair results by leaching process and roasting in brick furnaces, but the managers erected a White & Howell furnace and pans to work the roasted ores and no settlers, but discharged the pulp directly from the pans into a sluice or flume, resulting in scandalous losses of quicksilver and amalgam; in fact, ores which, according to the establishment's assay record, showed a battery assay of 60 to 90 ounces troy silver only produced some 30 ounces silver.

The mine is worked on two parallel veins respectively named La Prieta and Los Hollines, distant say 40 feet from one another. Each of these veins is two to four feet in thickness and have a dip of about 45° out of the mountain. They are almost completely gutted above the mouth of the tunnel (named La Sierpe); below said tunnel the deposit is almost intact. The hillside slopes pretty much parallel to the dip of said veins and a lower tunnel located probably 500 or more feet below the La Sierpe tunnel would crosscut these two deposits, besides cutting several other virgin mineral veins. These deposits consist mainly of blende, pyrite, mispickel, besides some other arsenical and antimonial ores in quartz and other ore chimneys in calcspar carrying ruby silver between the cleavages of the calcspar. These last ores have mostly been overlooked, and I found considerable quantities of them on the dumps. The mine is located about two miles from the mill, and the mouth of La Sierpe tunnel is say 600 feet above the river-bed and mill.

The most remarkable feature about this mine is the extent of ore-bearing ground; if I recollect rightly, 1500 to 2000 feet in the horizontal, and would probably reach further were it not faulted and displaced.

Near the intersection of La Sierpe tunnel and the Prieta and Hollines veins we find a cross vein. This is the San Carlos, some four feet in breadth with ruby silver as mineral constituent in a quartz gangue. It is but little developed.

The mine is at present only nominally worked, in fact not sufficient to hold it under Mexican mining law, which requires that every year 26 weeks' work at least be performed inside of the property to hold it.

The walls are as firm as a bell, so that although the upper levels are almost completely gutted, the mine is not in a ruinous condition.

The Sierpe tunnel and workings are furnished with a tramway extending the whole length of the worked deposit.

Some ten miles above La Bajada is Las Juntas, the confluent of Canelas river, with the creek that comes down from Pilones and Birimoa, of which more further on. Some 30 miles further up the Canelas river on a creek near the headwaters of Canelas river we reach

Topia,

A mining town with 5000 inhabitants. It is reached from Culiacan by following up the Canelas river, mostly up a narrow valley following the bed of the river and crossing the same river 365 times. It is only accessible from the Pacific Coast in the dry season, except by mountain paths.

Topia is the capital of the Tamazula county of Durango State. It is a flourishing camp, producing about $1,000,000 yearly product of silver bullion and considerable quantities of exporting ores. The ores of the district are rich fahlerz mostly exported and galena worked there in *galene* furnaces; zinc blende and some pyrite worked either by leaching process or by patio after roasting with salt in brick reverberatories and yielding by same 80 per cent and even more of the assay value! It must be conceded that the Mexican azogueras do not work so badly!

The chief mines are Cantaranas with three steam engines, Cornish pumps, compressors and machine drills, hoisting works, a small crusher, a pair of rollers, jiggers, a dry stamp battery, brick-roasting furnace and patio, all located at the mouth of the shafts. The mine, about 400 feet deep, is remarkably well timbered, but is now nearly worked out. It was developed by mining engineer Ei Wertheman, who in some 10 or 12 years made a snug little fortune out of it.

La Madrugada is a relatively recent mine with rich galena and fahlerz ores.

La Oliva has rich fahlerz ores and zinc blende.

La Leona, which furnished a very large bunch of $100 per ton galena ores, lay abandoned for several years, but a Mexican company has lately resumed developing by means of a tunnel on the extension. La Juliana, with its extensions, among the first mines developed in Topia, has a large vein some 8 or 10 feet in breadth, with ores of copper, silver glance, fahlerz, galenas, zinc blende and pyrites. The vein has a clay gouge and is exposed to extensive cavings. It has to be very heavily timbered and has given rise to large loss of life. It is worked by deep levels and tunnel. The mines have produced very largely, and even now are valuable properties, belonging to M. M. Lopez.

The ores from these mines are worked in an establishment Molinos in a gulch below Topia moved by water-power. There are two brick furnaces 10 or 12 feet high, with a water blast, as in the old Catalan forges in Spain. They smelt daily some four tons each. The slags are rather rich and ores rebellious.

A stamp-mill with square stamps is moved by an overshot wheel. There are brick reverberatories, and leaching and patio processes are both successfully and economically worked.

These two last mines were among the first opened out in Topia. They were developed (1825 or 1830) by D. Zeferino de Anitua, the administrator of the Vetanegra mine and other properties belonging to M. M. Fagoaga in Sombrerete, who in 1812 or 1815, when the Spaniards were expelled from Mexico, remained in possession of the Sombrerete mines and worked until it was entirely worked out. The Vetanegra mine was abandoned only after considerable search for new ore bodies. Subsequently the working by barrel process of the dump of Vetanegra (and Pabellon?) produced very considerable quantities of bullion.

Work has been resumed in late years by an American capitalist (Haggin) on the Sombrerete mines.

Half-way between Topia and Canelas, in a deep gulch or canyon, is the old mine La Prieta, latterly reopened by Mr. Rivera. It yields considerable quantities of exporting ores and good roasting and patio ores, mainly fahlerz.

Canelas,

A small town of 1000 to 2000 inhabitants, is in a pretty valley well watered by numerous mountain creeks, with many gardens and orchards. Under Spanish dominion it was the seat of local government and center of mining enterprise in the district. Now Topia has taken the lead, and is the seat of the Prefecture. Canelas is surrounded by old mining camps, now mostly abandoned, viz.: Ceballetas, Los Tajos, La Perenya, San Ramon, Mesas de Culiacan and others too numerous to enumerate.

The Mining Bureau Museum.

The museum of the State Mining Bureau in the Pioneer building, Fourth street, near Market, is well worth a visit, both from strangers and tourists, and also from residents of the city, many of whom are quite unaware of the extent of the collection which has grown up there.

During the last few months a gallery has been added to the museum, which has been filled with showcases, most of which are full of various objects of interest, such as fossils, corals, shells, Indian stone implements, etc.

The division devoted to the gold quartz mines of California has been increased by more than 50 per cent, and the representation of the silver ores of the State has also been largely extended. The "mineral collection" (as distinguished from the ores) has also been largely increased, and, together with the ores, entirely rearranged. The useful minerals and building stones of the State have had special attention paid them and are pretty well represented. Altogether about 1000 new specimens of ores and minerals have been added to the collection during this period, besides many sundries not yet catalogued.

Tin.

Although the first tin mine in the United States was found in San Bernardino county, California, yet the mine is still unworked, though it is about to be. Another deposit is reported lately in the same county. The tin deposits of Dakota, which have been known for some years, have been, for some strange reason, neglected, though within the past year the attention of English capitalists has been drawn to them. Doubtless before long we will have some practical results. There are many lodes, some of them carrying a high percentage of tin ore, and the whole tin region of Dakota ought to become prosperous as soon as capital assists the miners. A few weeks since the discovery of tin was announced in Nevada, but thus far little is known of the value or extent of the deposit, but it is not believed to amount to much.

It would seem, in view of these facts, that before very long tin will be one of the products of the United States to a practical extent. The Dakota deposits are the most advanced toward a producing point. A great deal of interest is manifested there, and very many claims have been located. It is to be hoped that the California deposits will be properly explored before long.

The Washington Centenary.

New York advices are heavily laden with the details of the celebration planned for April 30th in that city as the last of the series of centennial events, the formal seating of Washington in the Presidential chair. The event is one of crowning significance, and we trust Nature may smile upon the great occasion for thanksgiving and rejoicing.

The celebration of the event in California will be general. The day, April 30th, is a public holiday by proclamation of President and Governor. In San Francisco there will be a formal celebration, and other towns will no doubt commemorate the day appropriately. As the churches in New York in 1789 held fitting services, so the churches in 1889 will open their doors for prayer and praise. The occasion is one fit to arouse praise and patriotism in every loyal heart.

A. F. MCGREW, electrician of the San Francisco Underground Conduit and Electric Light Telegraph and Telephone Co., sent a communication to the Board of Supervisors submitting an ordinance granting to the corporation the right to construct, maintain and operate in this city pipes, wires, etc., for the transmission of messages, sounds and signals, and the production of power, heat and light by the aid of electricity. He requests the passage of the order.

THE UNION IRON WORKS' people announce that reporters will not be allowed to go on the trial trip of the cruiser Charleston. A "manifold" report will be delivered to the newspapers. This has put the reporters on their mettle to obtain independent reports.

PETROLEUM has been found at Ukiah, Mendocino county.

Fine Crushing of Ores.

The Blake multiple-jaw crusher, in combination with the ordinary Black rock-breaker, can be used in the reduction of ores to a great degree of fineness. Good practical results are shown in their use on a large scale on the gold ores of South Carolina and iron ores in New York.

Without giving any details with respect to the Haile gold mine, South Carolina. Fig 1 of the cuts shows the multiple-jaw crusher, which is the main feature of the mill.

The crushing appliances of the system consisted of one 20x10 Blake breaker, the product of that going to a 30x5, product of the 30x5 going to two 60x2 multiple-jaw crushers, each with three jaws, receiving capacity of 20x2 inches. The product of the 60x2 multiple crushers, approximately of corn-grain size, was finer. The central spindle, carrying horizontal axis on which the wheels revolved, had a speed of 40 revolutions per minute. Each wheel of the mill, weighing about a ton, was 4 feet in diameter and 8 inches face. The distance from outside to outside of the wheels was 50 inches, and the tyres were of hard white iron, having a cross-section 8x8 inches. The segmental dies on which the wheels ran were of best chilled iron. The shallow pan holding the dies was

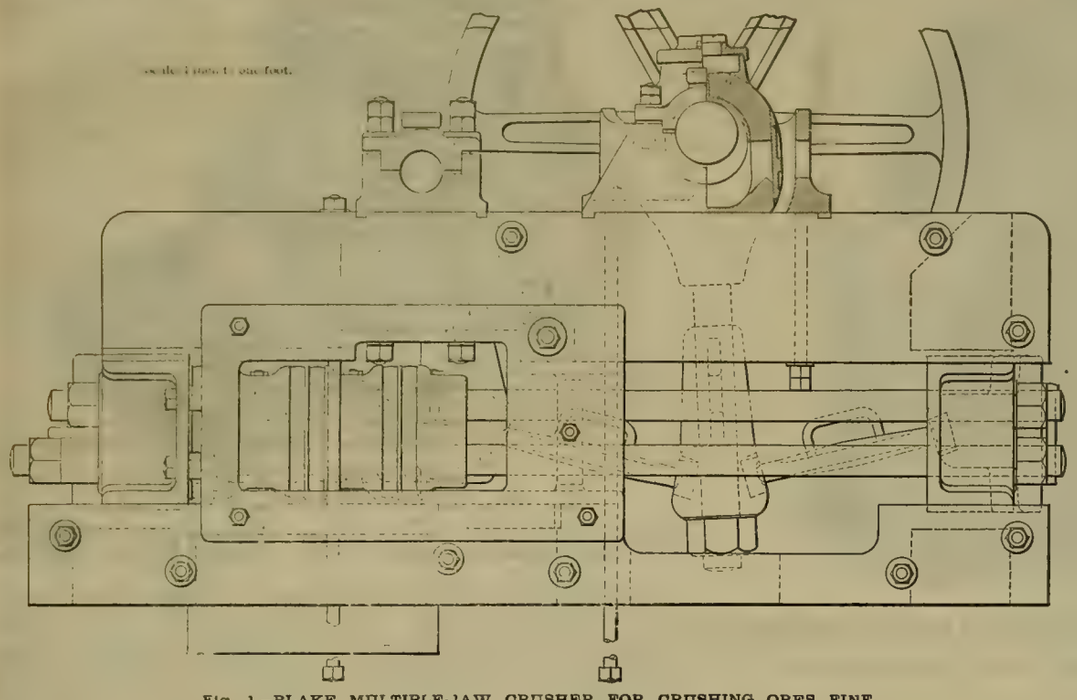

FIG. 1.—BLAKE MULTIPLE-JAW CRUSHER FOR CRUSHING ORES FINE.

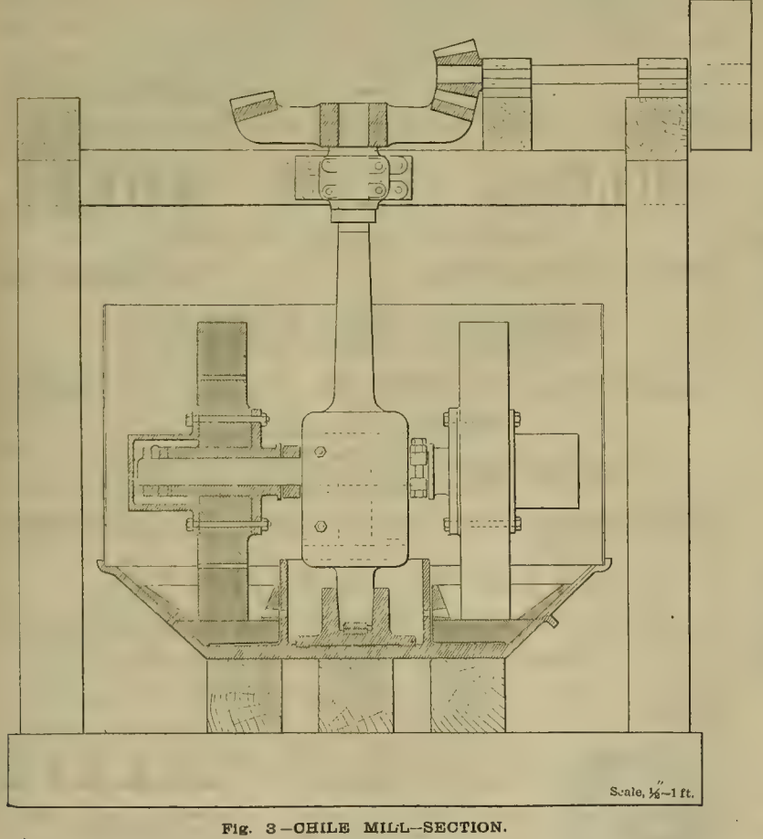

FIG. 3.—CHILE MILL—SECTION.

face, forming so many buckets which served to elevate the material which failed to pass the screens, and throw it on to an apron which carried it back to the mill. This screen was run in water, submerged to the depth of the rim—i. e., about 4 inches—and at the rate of 12 revolutions per minute.

No screens were used in the Chili mill itself; the crushed ore issued from openings on opposite sides and was, by the aid of water, discharged on to the inner periphery of revolving screens. The two Chili mills handled 7½ tons an hour.

Mr. Blake says: "I am without special items of cost of milling per ton of ore in the Blake mill at the Haile mine, and can only state in a very general way that it showed great economy of power and material after the introduction of the Chili mills. Its operations were not sufficiently great to determine the real facts with accuracy. Enough was shown by its working to prove that mills on this system for crushing and amalgamating or concentrating, or both, may in future come into general use, that their economy per ton of ore crushed, of power and material, is greater than that of the stamp-mill, and that there is no reason why they should not run with quite as much, if not with more certainty, and as continuously as the best stamp-mill ever built."

SAVAGE & SON.—An assignment for the benefit of creditors has been filed in the Recorder's office by John E. Savage and Richard Savage of the Empire foundry. The assignors state that they are unable to meet their obligations as they fall due and are insolvent. The total amount of liabilities aggregates $35,884.99, of which $33,537.46 are firm debts, $1850.90 individual debts of John E. Savage and $496 63 individual debts of Richard Savage. The principal creditors are Wm. T. Garratt, $1889; Huntington-Hopkins Company, $1808; C. R. Allen, $17,275; Hobbs, Wall & Co., $1166; and Holbrook, Merrill & Stetson, $8888.

MR. J. P. LAMBING has gone to Golden, Colorado, to build and operate one of his machines for working low ground, such as he has been operating at the Lambing mine, Amador county, for some years. We illustrated this machine in the PRESS not long since, and there is also a description of it in this year's report of the State Mining Bureau. There are many places where this hoisting or dredging apparatus is invaluable, as the gravel cannot be handled by any other means.

THE RAND ROCK DRILL CO. has issued a new illustrated catalogue, which, besides describing the various rock drills, compressors, fittings,

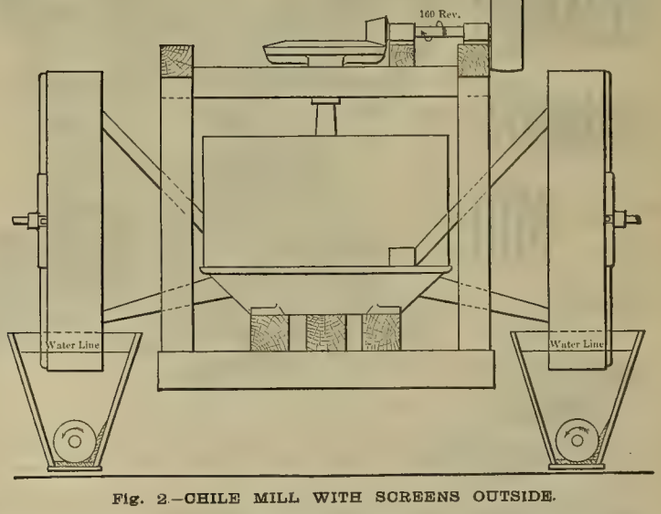

FIG. 2.—CHILE MILL WITH SCREENS OUTSIDE.

the different mills built upon the Blake system, it may be stated that, although it has proved possible to carry any hard and brittle material with crushers alone to a fineness such that all particles will pass a 30-mesh wire screen, still the economical limit of such crushing will be found somewhere between 14 and 20. If it is necessary to carry all the material to a fineness greater than this, the system must be supplemented with the arrangements. The material must be dry enough to screen readily.

Theodore A. Blake of New Haven recently described to the American Institute of Mining Engineers the mill built on this principle for elevated and screened through one-quarter-inch holes. That which did not pass the holes of the screens went to finer crushers. The material, one-fourth inch fine and finer, was elevated, screened through 40-mesh wire screens, and all that did not pass 40-mesh, that is, material between one-fourth inch and 40-mesh, went to the two Chili mills. (Figs. 2 and 3.)

The capacity of these mills, run as they were, was something wonderful—no one who has not seen one run as it should be can form an idea of the rapidity, economy and certainty of their work, when dealing with material already carried to one-quarter of an inch and surrounded by an inclosure of sheet iron 4 feet high, to prevent water and ore being thrown out by the splash of the rapidly revolving wheels. On each side of each Chili mill was a revolving tub-shaped screen, 8 feet in diameter and 18 inches face, turning on a horizontal axis extending from the side furthest from the mill.

The outer periphery of this was covered with wire cloth 35 meshes to the linear inch, of the coarsest possible steel wire, equal to 40 meshes with wire of ordinary fineness. The inner periphery of this tub-shaped screen, provided with a rim about 4 inches deep, was divided into six segments by wooden pieces across its

etc., contains much useful general information. The literature pertaining to drilling and excavation of ore and rock by machinery is quite scant, but in this catalogue they have compiled a great deal of material which will be useful to mining men. There are many illustrations showing the various methods of rock-drilling and the proper places for the holes, etc. Aside from its value as a trade catalogue, the little book will be found handy for reference in many particulars.

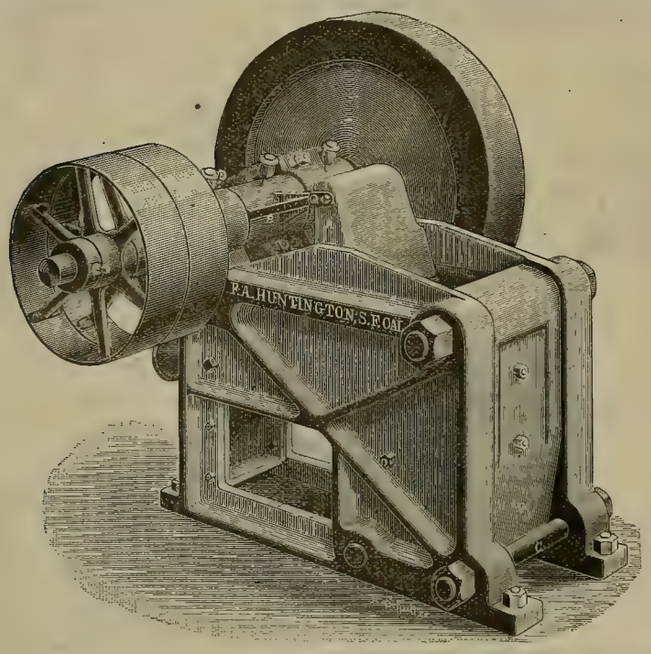
SOME very fine copper ore has been found at Golconda, Nev.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

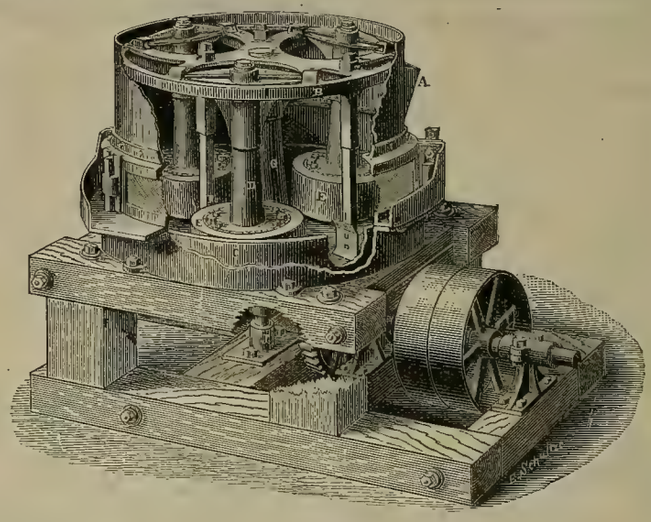
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

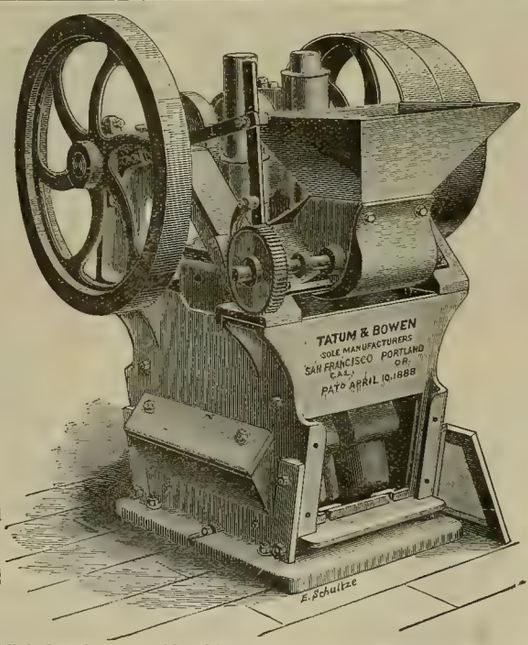
The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Two-Wheeled Vehicles.

This title is strictly applied and confined to conveyances commonly called "carts," but known also as "dog carts," "village carts," etc. One would not think the field of invention in this sphere very broad, nor the necessity for improvement very urgent. Yet in no field has the march of improvement been more marked, or the resulting comfort to the public greater, than has taken place in this simple class. The list of those who have turned their successful attention to this subject is a long one, and we are happy to say that California has kept abreast of the times, and that as good a cart can be had of California invention and make as anywhere in the country. D. W. C. Putnam of Petaluma was the pioneer in this State. He early caught the fever and brought out a cart which for all-round service has stood every test and is deservedly popular. Not long behind him came G. G. Buckland of Tulare, S. W. Metcalf and S. G. Thompson of Santa Rosa, H. Hortop of Rutherford and J. A. Bliz of Pleasanton. By this time the fever was raging and carts were invented and brought out by Wright, Fowler & Shaw of Napa; D. R. McLennan of St. Helena; G. P. Kimball, since deceased, of San Francisco, and better known as the inventor of the "Kimball C Spring;" Jacob Price of San Leandro; W. T. Adel of San Jose; Geo. W. Dutton of Tomales; B. P. Whitney of Potter Valley; Daniel Carmichael of San Jose; Page & Raynor of San Bernardino; Nelson Peterson of Antioch; Willis O'Brien of San Francisco; Creighton & Taylor of Smith's Flat; Geo. Larsen of San Leandro; Geo. E. Guerne of Santa Rosa; W. T. Goodman of Fulton; F. A. Knox of Woodland; J. A. Gallagher of Stockton; L. St. Ores of Guadaloupe; Newell & Litton of Fresno; T. S. Bayley of Alturas; J. A. Sneed of Marysville; K. A. Brigham of Gilroy; Peter Glazer of Redding; J. G. Kenyon of Port Kenyon; Joshua Sovereign of Woodland, and some others.

Given a vehicle made up of an axle, two wheels, a body, springs for the body, and shafts, there does not seem much latitude in arranging them. The wheels must be on the axle, and the body, springs and shafts must be, in some way, connected with it. But if they are arranged in the manner of the old carts, the rider will get that unpleasant horse-motion which has always made carts of no value as vehicles for pleasure or the lighter pursuits. The horse cannot be prevented from jogging, and then the cart body rocks back and forth with the up-and-down movement of the horse. This is the justly obnoxious "horse-motion." The secret in overcoming this motion is to give to the body, in one way or another, sufficient independence of movement to enable the rider, unconsciously, to counteract the shaft movement.

This motion is not present in four-wheeled vehicles, because in them the shafts are pivoted or hinged to the axle and can move up or down with the jogging of the horse, and not communicate this movement to the body of the vehicle. But in two-wheeled vehicles this hinge connection of the shafts is not possible, unless other connections are used to keep the body from turning over.

The idea in all these improved carts is to give the body an independence sufficient to enable it to keep itself steady, and then to limit this independence by yielding connections, so that there will be no danger of swinging too far. This independence is not, in all cases, applied directly to the body, but is sometimes applied to it through the springs, which may be pivoted and limited, or through the shafts which are pivoted and limited, or are divided and limited so that the front portion only of the shafts rises and falls.

In one form or another all these improved carts succeed in doing away with the horse motion to such an extent that, when compared with the old-time carts, it may be said to be wholly obviated. It is doubtful whether carts will ever take the place of buggies or other four-wheelers, but they certainly find a place in the community, serving their purpose well, and on account of their cheapness and finished appearance are much sought after as novelties, and become necessities after being tried.

A RICH gold mine has been found near Rocky Mount, Franklin Co., Virginia, which promises to pan out better than anything before discovered in the State.

What a "Storage" Battery Is.

How electricity can be stored is a puzzling question with those who see the useful work it can be made to do. Electricity is a force, explains the Philadelphia *Ledger*, more subtle even than light, and the effort to retain it seems as chimerical as that to bottle sunshine. Reflection, however, will show that the latter marvel has been accomplished and is being put into service all about us. The coal from which our gas is made is the direct product of the chemical action of the sunlight of former ages, which is stored up not indeed as sunlight but as latent chemical energy. The process is exactly similar in the case of electricity. It is not absolutely electricity that the motor car carries about with it, stored away under the seats. Practically there is nothing there but a chemical battery, similar to the familiar cells of the galvanic battery seen oftenest in the telegraph-room, but differing from them in the important particular that these storage cells are double acting, so to speak, and that, while, like the chemical cell, they convert chemical energy into electrical energy, they are, beyond that, capable also of reversing the chemical process, under the influence of an outside electrical current, and thus converting electrical energy into chemical energy.

As long ago as 1860, M. Plante, a French scientist, after a long and careful investigation of the phenomenon known as "polarization" of chemical batteries, discovered that when two lead plates plunged in a bath of dilute sulphuric acid were subjected to the action of an outside electrical current, the water decomposed by the electric current set free oxygen in a "nascent" or newly born and very active condition at one plate, which would combine with the lead, while hydrogen was set free in little bubbles on the surface of the other. He also found that, when the current was stopped and the two terminals of the plates were connected together, the bubbles of hydrogen were reabsorbed and united with the oxygen of the oxidized plate to form water once more—that the oxide of lead was reduced to metallic lead, and that this reverse process was accompanied by the evolution of electricity. The process was of no practical utility at that time, and was exhibited by M. Plante to the French Academy of Sciences as a scientific curiosity.

The discovery came to no practical use for 20 years, when the dynamo-electric machine and the multiplied uses of electricity completely changed the surrounding circumstances. Then M. Faure, another Frenchman, took up the old discovery of Plante, and announced the important advance that it was not necessary to oxidize the plate originally by the electric current, that this could be more cheaply and very much more quickly done by chemical means, and the great problem was how to hold the oxide upon the surface. In order to do this he coated the lead plates with the oxide, and then inclosed them in parchment or other wrappings, which would allow chemical action to go on while preventing the scaling off of the oxide. The Faure battery was then presented to the world as the solution of the problem of storing elecricity. But the expectations of the inventor were not realized in that form. The parchment or textile covering, while tolerably efficient in holding the oxide to the metallic plate, was a barrier to the passage of electricity, and in spite of its use the plates were soon disintegrated by the chemical action and the battery became worthless.

Since 1880 the inventions to overcome these objections have been numerous, and the time has been too short to decide which, if any, of them has succeeded. As at present constructed, the storage battery consists of three parts, the "cell," the liquids and the plates. The cell is a vessel or box usually made of wood, lined inside with sheet lead, as the old tea-boxes were lined, except that it is made water-tight and is somewhat heavier. The liquid consists simply of dilute sulphuric acid. This was the fluid originally employed by Plante, and nothing better has since been discovered.

The plates are in two sets, positive and negative. The positive and negative plates alternate, each set being soldered together into a series, and then insulated from but fastened to the other series by a set of insulating bolts. The whole collection of plates is packed as closely together as the possible damage to the cell from alternate plates touching each other will admit, in order to reduce the internal resistance. They are of metallic lead, and when originally cast are in the form of agridiron, being perforated by numerous square holes, each side measuring about a quarter of an inch. These apertures are then filled with a composition whose principal constituent is litharge, which is a lower oxide of lead. The apertures are so formed as to securely hold the litharge in position, thus obviating the necessity for the use of parchment or other material, and offering very slight impediment to the flow of the electric current.

When a current of electricity of proper volume and strength, which may be procured from any source, but preferably from a dynamo-electric machine, is made to flow through such a battery, a chemical change occurs. The current in flowing from the negative plate to the positive decomposes the litharge in these cells, and the water of the surrounding liquid, oxygen, is removed from the litharge, producing metallic lead, but in the spongy form. Oxygen is removed from the water, leaving hydrogen which is held in the pores of the spongy lead. On the positive plate the free oxygen attacks the litharge, uniting with it and forming the "red lead" of commerce, which is an oxide of lead containing more oxygen than litharge. A portion of the oxygen also attacks the lead plate itself and oxidizes it. This process is continued until the spongy lead and the negative lead plate are no longer capable of holding on to the hydrogen, which then commences to escape.

The foregoing has reference to the charging or "storing" of the cells with energy. When the cell is doing its work the process just described is reversed. The oxygen of the positive plate leaves the higher oxide and unites with the hydrogen and the spongy lead to form once more litharge and water. This action evolves the energy in the form of electricity in amount proportional to the amount of energy originally put into the battery to separate the elements, and the electricity as given out may be put to useful work, whether of driving an electric motor or of lighting streets and houses. When the process is finished—when the spongy lead has become oxidized and the hydrogen reabsorbed, the battery is exhausted, but it is in the same condition it was before the charging was commenced. Again a current of electricity may be passed through it, again its elements will decompose, and again it will be ready for useful work.

In the course of time (how much time is an important question) the lead frame becomes so weakened by repeated oxidation and reduction that it is unable to support its weight, and crumbles under the strain. It will be observed, however, that in all these processes there is theoretically nothing lost, except a small amount of power inseparable from every transference of energy. The material of the battery can be recovered.

It is always to be borne in mind that the first force by which the cell is charged with electrical energy is mechanical force, whether in the form of a steam engine, a gas engine, a waterfall or some other source of mechanical power, and it is the cost of this power to which must be added the loss incurred in the use of a storage battery which makes up the chief cost of the storage battery. How much that cost of fuel and material is, is the one chief matter upon which we have not yet got precise or full information. It is said, however, to be less than the cost of maintaining horse-power.—*Chicago Journal of Commerce.*

Mining Share Market.

The past week witnessed renewed activity in the Comstock stocks, with decided and attractive fluctuations. On Friday, April 19th, the market made a sudden advance of from $1 to $3.50 a share, scaring a large number of the shorts to cover, after which prices declined rapidly until by the following day they had fallen off fully 30 per cent which was followed by another decline under a bear raid of about 10 per cent on Monday morning. The leaders, Mexican and Union, suffered the most in the decline, for in the other stocks there appeared to be good sustaining orders after a drop of from 20 to 30 per cent. Outside of some bears filling their shorts, the purchases at the higher prices were made by the "pool." After the first break there was some outside buying, but two more setbacks frightened many into selling. Among those who are in position to know, it is claimed that the market is in good position for more of a bull movement than heretofore had, which, if correct, will allow holders who do not want the earth to get out at a good profit. Experience has demonstrated that the average dealer wants everything, and in being too grasping loses all and then condemns everybody but the proper person—himself. The recent moves in the Comstocks are causing the Quijotoas and the Bodies to show more activity, but they fail to attract attention, owing to dealers having no confidence either in the mines or the way in which the stocks are handled. The Tuscaroras receded some, but reacted under strong points put out on the street, and glowing telegrams from one or two of the mines.

News of a reliable character from the Comstock is very difficult to get, and in its absence the feeling among outside dealers is unsettled, and feverish and in such a condition that they can be easily influenced in any desired direction. The conflicting reports are well illustrated by well-informed parties stating that in the Mexican upraise they run out of ore, while in Union water is coming in in the face of the crosscut. On the other hand, equally as well-informed parties say that in the upraise they have 12 feet of good ore, and in Union the formation of the rock indicates a near approach to the ore body. Our own advices, while not so good as desired, are of an encouraging character, with the prospects very favorable, but more work is required to demonstrate the value of the find in Mexican and what will be found in Union. From Hale and Norcross our advices continue very encouraging, as are those from Savage, Crown Point, Belcher and Seg. Belcher. Favorable advices are expected from Alpha, Yellow Jacket and Challenge. Crosscutting in Con. Imperial is to be started soon. In Sierra Nevada the east drift promises to open up a large area for active prospecting later on. In Potosi and Chollar more favorable news is looked for at an early day.

The ore yield of the Comstock the week ending April 20th aggregated 7181 tons, divided as follows: Con. Cal. and Va., 3016 tons, assay value, $29.10; Best and Belcher, 116 tons, assay value, $18.56; Savage, 490, assay value, $19.32; Hale and Norcross, 1012 tons, assay value, $28.40; Chollar and Potosi, 500 tons; Challenge and Confidence, 400 tons, assay value, $26.35; Crown Point, 907 tons, assay value, $21.16; Overman, 240 tons; Alta and Justice, 500 tons. The total bullion yield of the above was $155,000.

DR. C. C. PARRY, a distinguished botanist, is again on the coast collecting materials for a botanical monograph.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

WINANS' BOILER COMPOUND.—One very intelligent and capable engineer says: "Yes, that compound removes scale, but I do not want it; it makes my boiler leak," forgetting that the presence of the scale is the cause of the leak, for the reason that while the scale had been forming the additional heat that it had been necessary to use to maintain the required steam had weakened or burned the ends of his tubes; consequently, when it was removed the leaky places were made manifest. That boiler needed repairs then. After a little, although compound was refused, it became imperative to repair, and while that job was in progress, large quantities of scale were removed. As a proof that Winans' compound does not cause leaks or injure iron, many locomotive stationaries and marine boilers can be shown that have had a prolonged use of this article. When with one accord chief engineers, with first, second and third assistants, even down to water-tenders and firemen who do the actual work of cleaning the boiler, each and all declare that the results are good and they can see no injury, but on the other hand benefit, the maker and vender can offer and urge its use despite all prejudice to the contrary.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Savage, April 22, $7175; Nevada Queen, 22, $10,000; Confidence, 22, $16,967; Moulton, 15, $18,855; North Belle Isle, 18, $10,000; Bluebird, 13, $17,472; Lexington, 13, $12,000; Crown Point, 19, $7457; Con. California and Virginia, 19, $64,000; Lexington, 18, $28,000; Hanauer, 16, $3700; Queen of the Hills, 17, $1150; Hanauer, 17, $2100; Queen of the Hills, 19, $750; Hanauer, 19, $1700; Hale and Norcross, 20, $27,150; Justice, 19, $2722; Mt. Diablo, 19, $8954.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

THE CHINESE HYDRAULICKERS arrested at Omega for violating the anti-debris injunctions have been found guilty of contempt of court and fined $500 each, with the alternative of 500 days imprisonment. There are 20 of these men, and they have all been sent to jail.

GOVERNOR WATERMAN has made a written offer to dispose of his Cuyamaca ranch, including the Stonewall gold mine and mill, San Diego county, for $2,000,000. There has been some controversy on the subject, and it has been said he had refused $5,000,000.

THE San Jose Electric Road Co. has been granted three months more in which to put the road into working shape.

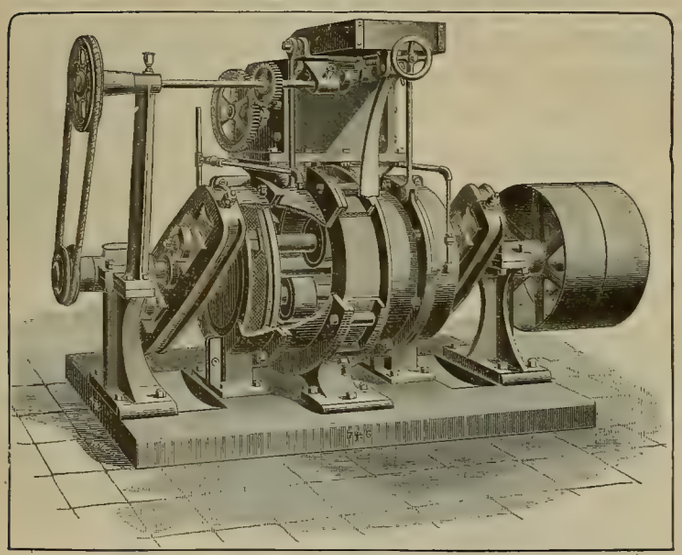
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, April 25, 1889.

Trade continues good for the season, with a decided increase in the volume of goods going out looked for in the next month. As a rule, retail merchants place chiefly assortment orders, not caring to stock up yet awhile. Indications point to a very active campaign this year; this is the more plainly seen in the putting into execution of many contemplated improvements, which will cause the disbursements of large sums of money; this has particular reference to buildings. In this city, the plans for many new and expensive structures are being mapped out; one by the Young Men's Christian Association to cost about $100,000. The same association will erect another in Oakland to cost $50,000. These buildings will require considerable iron. A canvass among iron-workers, while confirmatory of prevailing dullness, shows that there is a gradual increase in orders coming in, with the outlook very flattering for more activity soon. The money market continues easy, with the rate of interest for call, and short loans favoring borrowers. The call for money from the wool interest is increasing. There is an almost entire absence of any kind of speculative movement outside of the effort being made to galvanize mining stocks into new life. Remittances from the interior are good for the season. The following is the receipt of treasure by water the past week: Coin, $1150 from Port Harford; $710, Honolulu; $717, Portland; $46,903, Victoria, B. C.; $32,206, Seattle; $300, Port Townsend. There were two heavy consignments of silver bullion from Mexico, but the amounts could not be ascertained. The steamer leaving the past week for China took out for Hong Kong, Mexican dollars, 256,223; gold coin, $5231; silver bullion, $263,000. For Hiogo, silver bullion, $92,000.

To-day stocks were quite active, with a strong bear raid on the Comstocks after the 9:30 informal session, and a bull move in the Bodies. The Bodie assessment of 50 cents a share is delinquent on Saturday of this week.

SILVER—The market has shown a fair degree of steadiness the past week, ranging from 92½@92¾c, with some placed slightly higher. To-day's quotations, based on the London quotations of 42½d, are 92 to 92¾c. At 42½d the parity here is over 92¾c. The output of the mines on this coast is still light, with the outlook not at all favorable for any material increase in the near future.

MEXICAN DOLLARS—The market has ruled fairly steady at from 73¾ to 73¾c, but at the close, buyers are not disposed to take any large quantity, except at a concession.

QUICKSILVER—The market is very quiet, with quotations more or less nominal. Receipts the past week were 120 flasks, of which Haas Bros. received 75, and Knox & Osborn, 45.

TIN—The market for pig is reported quite strong at the advanced quotations. Tinplate is easy, with only a fair demand reported. The shipments the past week to British Columbia were 10,045 lbs. pig, and 193,536 lbs. tinplate. There was shipped by sailing vessel to New York, 33,394 lbs. of tin scraps.

LIME—Receipts the past week aggregated 7551 barrels, and the preceding week 4552 barrels. The consumptive demand is reported to be good, but the outward movement is quiet.

BORAX—The market is steady. Receipts the past week aggregated 944 cts., and the shipments 56,612 lbs., of which 24,576 lbs. went to Cedar Rapids, Iowa, and 22,136 lbs. to Chicago.

COPPER—The market is quiet, with a weak, unsettled feeling reported. There was shipped the past week to New York, 915 lbs. copper and 179,180 lbs. copper ore.

CHROME ORE—The market is quiet, but steady. There was shipped the past week to New York, 431,880 lbs.

IRON—The market for spot is barely steady, but for prompt shipment it is strong. There was received the past week 300 tons of pig from Puget Sound.

COAL—Receipts the past week were as follows: From Seattle, 7207 tons; Coos bay, 2050; Departure bay, 700; Nanaimo, 852; New York, 100; Baltimore, 1901; Australia, 4980. Total, 17,790 tons.

A decline of $1 a ton is reported in the yard prices for Scotch splint, Greta and Sydney. The market for all kinds is weak and easy; 1901 tons of Cumberland came to hand the past week. Its receipt will probably not cause any decline.

Eastern Metal Markets.

By Telegraph.

NEW YORK, April 25, 1889.—The following are the closing prices the past week:

	Silver in London	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 3-16	92½	$13 75	$3 67½	$20 70
Friday	——	——	——	——	——

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER

The EXPLORERS' and ASSAYERS' COMPANION.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

MINING SHAREHOLDERS' DIRECTORY.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company—Location and principal place of business, San Francisco, California. Location of Works, Placer County, Cal.

NOTICE—There are delinquent upon the following described Stock, on account of Assessment (No. 12) levied on the 19th day of March, 1889 the several amounts set opposite the names of the respective shareholders, as follows:

NAME.	No. Certificate.	No. Shares.	Amt.
Blaney, W E	284	20	$ 1 00
Bogart, O H, Trustee	420	10,000	500 00
Chase, Q A, Trustee	419	3,814	190 70
Gray, H W, Trustee	181	500	25 00
Horton, Thos R, Trustee	51	5 000	250 00
Horton, Thos R, Trustee	315	5,000	250 00
Hall, H E, Trustee	372	1,000	50 00
Rosekrans, H M	39	600	30 00
Taylor, J N	102	1,000	50 00
Taylor, J N	330	40	2 00
Waller, L P F, Trustee	276	300	15 00
Waller, L P F, Trustee	367	3,000	150 00
Winter, T P, Trustee	396	500	25 00
Winter, T P, Trustee	397	500	25 00

And in accordance with law, and an order of the Board of Directors, made on the 19th day of March, 1889, so many shares of each parcel of such stock as may be necessery, will be sold at public auction, at the office of the Company, 327 Pine Street, Room 9, San Francisco, California, on Tuesday, the 16th day of May, 1889, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

H. BOGART, Secretary.

Office, 327 Pine Street, Room 9, San Francisco, California.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Iron Railroad Ties Wanted.

Some time ago an official of the Erie railroad is reported to have said:

"Railroad ties need renewing every three years. In building a new road the estimate is 2700 ties for each mile. It is safe to say that it will require 300 ties per mile per year to keep a road in repair. From 12,000,000 to 15,000,000 new ties are required by the railroads of the United States every year. In building the great Western railroads the contractors in many cases purchase outright the timber along the routes or as near to it as possible. In that case they pay from $20 to $25 an acre for the land. If they contract simply for the ties they pay from 10 to 12 cents apiece for them to the owner of the land for all the ties taken out. The average price paid to the tie contractor is 35 cents apiece, although we have paid as much as 50 cents for the best oak ties. Hewn ties are better, in our estimation, than sawed ones, and we use no others. Some companies think as well of sawed ties as of the hewn ones. The theory of our people is that the hewn tie lasts much longer than the others. It is only within the past few years that hemlock has been used to any extent in making railroad ties, but we find that it can be used to advantage in many instances on sidings and sections of track where the traffic does not require constant repairs. This road pays to the tie contractors along the line about $400,000 a year. Stone, iron, paper, and even glass have been used in making railroad ties, with the hope that they could be practically adopted as a matter of economy in that department of the expenses of railroads, but none of them have yet been utilized with satisfactory results. The annual clearing off of a quarter of a million acres of timber to supply railroads with ties alone is something that should direct the attention of those who are interested in the important question of protection to forests to the finding of some practical substitute for wooden ties. Fame and fortune await the inventor who will discover such a substitute."

Geo. W. Thompson, formerly a rancher and partner with one of the proprietors of this journal in a 220 acre ranch near Oakland, who is now at Sag Harbor, N. Y., has made what he believes to be a practical and valuable improvement in metal railroad ties. The drawings and descriptions of the device are given on another page of this number of the PRESS.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. P.) from week to week and year to year.

Every Miner His Own Assayer.

A chemical for testing and ascertaining the value of all kinds of ore, by which every miner and prospector can make his own assays, anywhere in the mountains, at a cost of a little over 5 cents and in a few minutes' time. No apparatus or dangerous acid needed; a dry powder, which may be carried in the pocket. This, mixed with the ore and a little water in a teacup, produces an electric current, which separates the silver from the ore instantly, no matter how refractory. Try it; you will be delighted. Will save you many dollars for assaying. Package sufficient for 30 tests, with full directions, by mail to any address on receipt of $2; 6 packages for $10. Address, Prof. J. Herman, P. O. Box 1845, San Francisco, Cal.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

ADAM SCHILLING & SONS,

117-119 Main St., San Francisco.

Practical Machinists and Engineers.

Repairing of every description of Machinery promptly attended to.

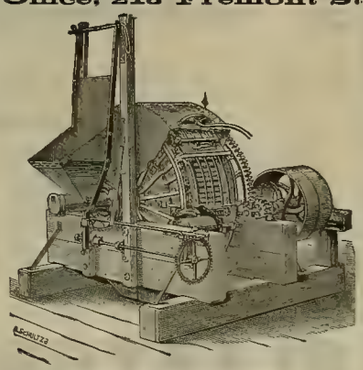
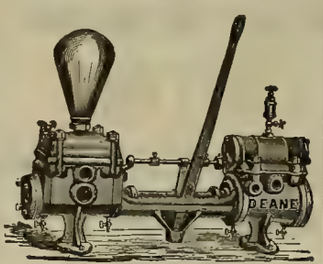
[ESTABLISHED IN 1855.]
Office, 213 Fremont St., San Francisco.


TUSTIN'S PULVERIZER.
—MANUFACTURERS OF—
MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.
Tustin's Pulverizer
WORKS ORE WET OR DRY.
ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.



SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.
DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

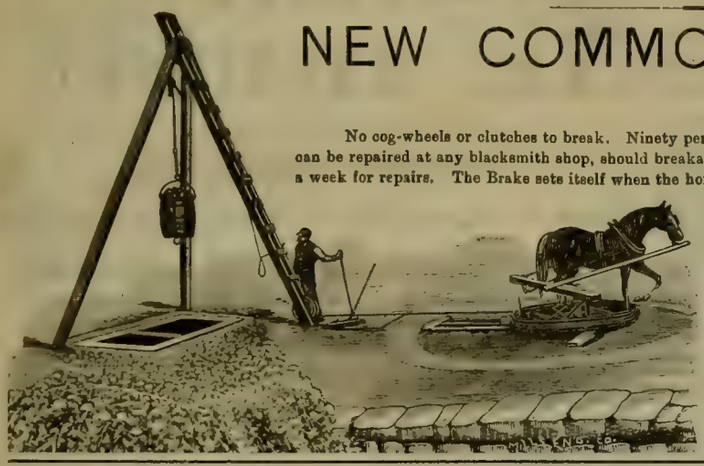
AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.



NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 225 and 227 First St., San Francisco.

PACIFIC IRON WORKS

1850. 1888.

BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

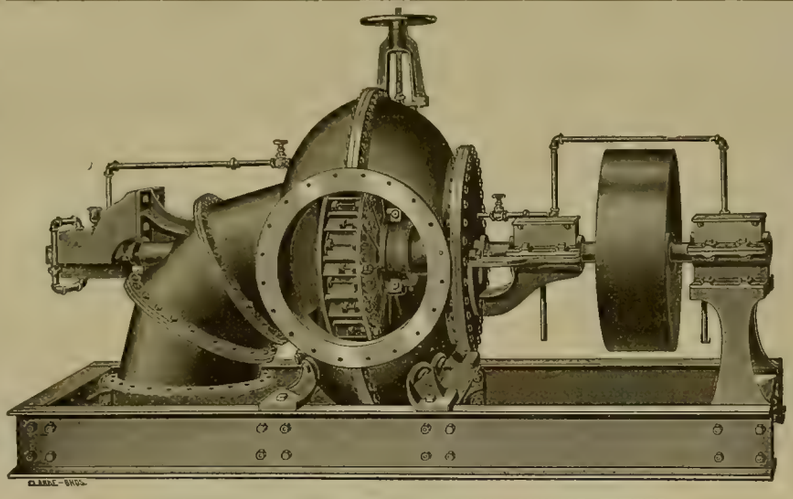
VOLUME LVIII. Number 18.

The Leffel Improved Water-Wheel for Mines.

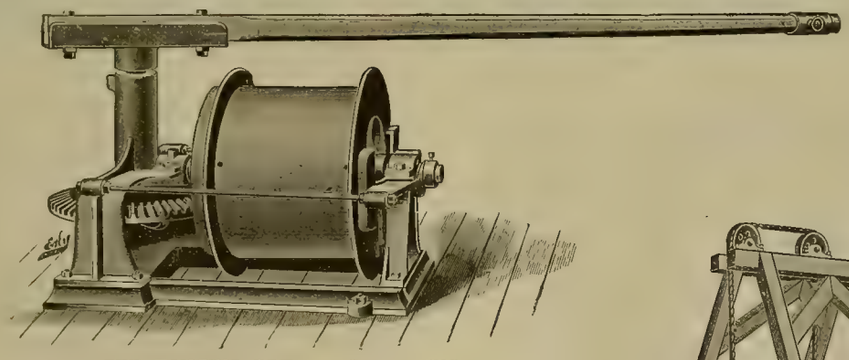
The illustration on this page of the Leffel Double Turbine water-wheel, for mining purposes, as mounted on iron frame and manufactured by Messrs. James Leffel & Co., Springfield, Ohio, is an improved form of the famous "Old Reliable" Leffel wheel, the result of many years of diligent study and practical experience. Its makers claim, that as now manufactured, this wheel gives more power using less water than any other wheel extant. There is in it a combination of two independent sets and kinds of buckets, one a vertical and the other a central discharge, each entirely different in its principle of action upon the water, yet each wheel or series of buckets receiving its water from the same set of guides at the same time. The water, however, is acted upon but once, since half the water admitted by the guides passes to one wheel, and the other half to the other wheel, being nicely separated and divided by the partition, or diaphragm, between the two wheels, the water leaving both wheels or sets of buckets at the same time and as quickly as possible. These two sets of buckets are so combined as to make really but one wheel; that is, both are cast in one piece and placed upon the same shaft. By this arrangement there is admitted the greatest possible volume of water, to a wheel of any given size, consistent with its economical use, at both full and part gates, and at the same time the greatest area for the escape of water is secured. The surface in the wheel is thus reduced to a minimum as compared with the quantity of water used, avoiding a very material loss by friction, which otherwise seriously diminishes the working power of a wheel; an arrangement, the value of which will be appreciated by those who understand the practical effect of the frictional surface in a water-wheel.



LEFFEL'S STANDARD DOUBLE TURBINE MINING WHEEL.

During the past few months new, extensive and convenient works have been built by the manufacturers. These have been fitted out with entirely new, expensive machinery, especially constructed for the sole purpose of imparting to the wheel the necessary accuracy in workmanship, and of reducing the cost of manufacture, so as to enable them to substantially cheapen, while really improving the machine. As may be seen from a recent catalogue issued by the manufacturers, among the most noticeable modifications and additions made in their wheels are the following: "The improved link for operating the gates; the process for lining the iron plates with brass or anti-corrosive metal (applied only when specially ordered); the combination of the toothed segment with the gate-arm in such a manner that the segment can be removed when the teeth become worn and a new one supplied; the spherical iron penstock; the use of steel gates or guides for some sizes instead of iron; and the improved method of casting solidly, in one piece, both wheels, by means of which the edge of the diaphragm can be made much thinner, and yet stronger, assisting also to separate more perfectly the due proportion of water to each wheel, while enabling the buckets to successfully withstand the shock of blocks, stones and other rubbish to which they are so often subjected. Half the buckets being good boiler iron, and the fillets retaining them improved both in form and strength, it is impossible to break or tear out any of them, as a result of which of the last 5000 Improved Leffel wheels put in operation not one has lost a single bucket."

There are now 11,000 of the Leffel Double Turbine water-wheels in successful operation in various industries, having been placed in almost every conceivable situation and under the highest and lowest heads. While all manufacturers of popular and superior machinery suffer in various degrees from imitations of their wares, it would seem that Messrs. James Leffel & Co. have been unusually unfortunate in this particular. They complain, for example, of the appropriation by other manufacturers of inferior wheels of the tabulated forms originated by Mr. James Leffel. These they have modified in some instances by raising the figures representing the amount of power furnished, in order to show an apparent increase of power over the Leffel wheel. These tables as originally arranged are only applicable to the Leffel wheel.



THE HOISTING DRUM AND GEARING.

The Davis Horse-Power Hoisting Whims.

In the initial stages of the opening or development of a mine, one of the most important factors which enters into the calculation of expense is the cost of the power required to sink to a given depth, or until such depth is attained as to justify the procurement of a steam or water power hoisting plant.

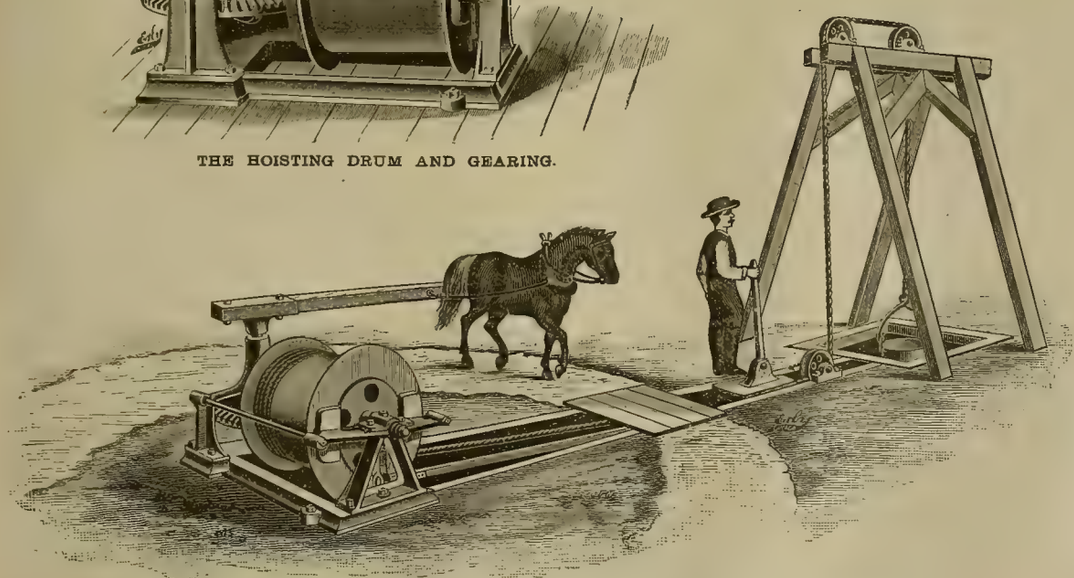
Many forms of horse whims, or, perhaps better, whims operated by horse-power, have been devised and used, but their construction and operation have been more or less unsatisfactory.

The hoisting whims illustrated on this page are built entirely of iron and steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences. An examination of the cut shows that the hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

Both the hoisting and lowering are regulated by one lever, and the operation is so simple that it can be readily handled by any person inexperienced in the use of machinery.

The bevel gear on the drum shaft is loose,

(*Concluded on page 320.*)



THE DAVIS HORSE-POWER HOISTING WHIM FOR MINING PURPOSES.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Rebel Creek Mining District.

EDITORS PRESS: — Having leisure time, I thought I would write you some facts concerning this mining district, which, in my opinion, ranks with any district in Nevada. There are several fine prospects in the district; among them the Penobscot mine, owned by Messrs. Lucas, Wolf & Gintz, is a very valuable piece of property. The Wild Deer mine, owned by H. H. McColley, is also very good property and can be worked to great advantage through tunnels. The Boston Globe Mining Company are in operation here. They have put up a mill but have not started to work any of their ore yet. The Ohio mine is about to put on a large force of men. This mine is owned by a Salt Lake company. The mine has been shipping its ore and the average has gone 900 ounces a ton. They are to put up a 40-stamp mill this spring. William Carruthers is the superintendent and is an experienced mining man. The Moonlight is another good prospect and is owned by F. P. Snapp. The Black Jack mine, owned by Andrew Shewsbury, is another very fine prospect—principally gold.

The Bismarck mine, owned by Elias Jones, is one of the leading mines in the district. The mine known as the Gold Hill, owned by Peter Cassady, has 2000 tons of ore on the dump which will average $70 a ton in gold. There is another piece of property owned by the same party, known as the Comstock, which is valuable.

There are over 500 locations here, and a great many of them show up very well. It is only a matter of time for this camp to be one of the leading camps on the coast. S. B. DYER.

Willow Creek, Humboldt Co., Nev.

Como, Nevada.

EDITORS PRESS:—The Eureka-Como Co. began overhauling and repairing their machinery on the first of this month; started their pumps on 22d inst. They have 80 feet of water in the shaft, over 200 feet of drifts, and all the surrounding country to drain before they can resume mining operations, but it is expected to accomplish this in about two weeks' time. They use two No. 9 Cameron pumps, one of them a plunger. At present the plunger pump is throwing the water to the surface, a distance of 250 feet, at the rate of 30 miner's inches.

About 30 men will be employed at this mine this summer, and it is confidently expected that important developments will be made before the season is over. Placer mining has commenced in the canyon below, with the water pumped from the Eureka-Como. S.

The Thrashers' Cook-Wagon.

An institution peculiarly Californian is the cook-wagon which attends our thrashing crews in pursuit of their vocation. The extent of our grain-fields calls for the location of the thrasher's outfit a mile or more, perhaps, from a human habitation. Traversing such a distance to and from meals was a serious loss of time or else a loss of available force to the thrasher, for the weariness of the tramp in the burning sun but added to the fatigue of the trying labor. Therefore in the interest of the thrasher and his crew, it is a benefit that the meal should come to the men and not the men to the meal. The rest in the shade of the stack at nooning recuperated strength instead of further exhausting it in tramping. On the part of the farmer's family, the relief from the killing work of boarding thrashers is too well known and appreciated to be described. The cook-wagon speedily established itself in general favor.

It was the happy thought of J. B. Greene of San Joaquin county which called the cook-wagon into existence, and the one which he constructed in the spring of 1876 was in constant use until last year, and is now on the farm of A. L. Cressey in Stanislaus county. Mr. Greene had been all his life a student of the art of invention, and had made other excellent strokes of inventive genius. He was born in Ohio in 1819, and was in early life thrown upon his own resources. He came to California in 1869, and became a farmer and thrasherman. His experience in 1874–5, with his men going to and from meals, turned his thought to an improvement in this respect. He conceived the idea of the cook-house which could be moved from place to place, the owner of the thrashing outfit boarding his own employes instead of quartering them upon the farmer, and to cover the cost he proposed to charge one cent additional a bushel for thrashing. In the spring of 1876, before harvest, he went out among the farmers and discussed the advantages and disadvantages of running a cook-wagon, and he found but two men who would agree to let him do their thrashing and board his own men. Still he was decided that it would be cheaper for the farmers, as well as a benefit to himself and his men, and he drafted plans for the cook-house, and it was built. Its value was speedily recognized and the cook-wagon became a part of every thrasher's outfit. They are all similar to the first one built by Mr. Greene.

Mr. Greene is now a farmer in Oregon, and in good health and prosperous. He has with him six sons, and others of his thirteen children are residents of this State.

The Work of an Astronomical Society.

[Address delivered before the Astronomical Society of the Pacific, March 30, 1889, by EDWARD S. HOLDEN, Director of the Lick Observatory.]

In the year 1820 the state of astronomy in England was somewhat as follows: The Royal Observatory at Greenwich was pursuing its regular routine observations of the positions of the sun, moon and stars under the direction of the Astronomer Royal, Pond, whose chief service to astronomy consists in the minute accuracy of his observations and in the faithfulness with which they were amassed and discussed. His controversy with Brinkley (astronomer of the Dublin Observatory) on the latter's determination of stellar parallaxes, cleared the way for the great researches of Bessel and Struve, on the same subject, which followed a dozen years later. The Radcliffe Observatory at Oxford was in operation, but no observations were published. The Cambridge Observatory was just founded. The observatory at Edinburgh was barely built and was not yet a public institution. The Armagh Observatory had no instruments of importance and was doing no work. Groombridge's private observatory at Blackheath was busy with his catalogue of 4243 circumpolar stars. Sir William Herschel, the greatest of practical astronomers and the glory of England (then 82 years old) was resting from his labors. His son, Sir John Herschel, had not begun that long series of observations which has made his name illustrious.

On the continent, the magnificent labors of Bessel, Gauss, Olbers and Struve were laying the foundations of the science of to-day. The spirit of their methods made itself known in England and deeply affected some of the younger men at the universities—notably Babbage, Dean Peacock and Sir John Herschel. These three entered into a compact, which was most fruitfully carried out, "to leave the world wiser than they found it." One of the most important results of this resolution was the founding of the Royal Astronomical Society of London, an institution which has done incalculable good in fostering the science not only in England, but throughout the whole civilized world. It is not part of my purpose to trace the influence of this society and to show in detail what its work has been. I rather wish to quote here a few paragraphs from the "address of the society explanatory of their views and objects," which was circulated in the year 1820, at the time of its foundation. And I wish to do this for two reasons; because first, the need of such an association in our own midst is much the same as that felt by Herschel and Babbage in England 60 years ago; and secondly, because the program of this society may point out to us along what lines we should proceed to make our own newly formed Astronomical Society equally useful in its own sphere.

The times have changed since then, no doubt. The immediate problems of astronomy are different; but the spirit of the methods by which they are to be attacked and solved is eternally the same; and the need for co-operation and concentration of forces is more and more pressing as the complexity of processes becomes greater and greater.

* * * * * * * * *

In our own case we must remember how various are the opportunities and attainments of our various members and try to lay the foundations of our efforts so broadly that every class will find a sphere of action in our program, a stimulus in our proceedings, and a support in our friendly association.

The few professional astronomers in our midst will here lose that sense of intellectual and professional isolation which is a drawback and a danger.

Nothing that is clearly conceived is too technical to be placed before an assemblage of intelligent men, and the very effort to explain gives a lucidity to the original conception which it might otherwise lack. There is a moral force, too, in knowing that one does not need to wait for sympathetic appreciation, but that it is to be found every day and all around one.

The opportunity to communicate the results of one's work readily and quickly is of the highest value; and "the end of all observation is communication."

By far the greater number of our members will be amateurs, and here again we must recognize the fact that there are many classes with many different opportunities and means for work and study.

Some among us already possess telescopes of no inconsiderable power. In 1820 there was no refractor in Europe more powerful than the five-inch telescope, with which Herschel and South observed their double stars.

It should be the aim of the society to point out the directions in which such instruments can be used, so that either some useful result will be attained for the science, or so that at least the maximum amount of pleasure and personal profit can be had by the owners. I presume there are few amateurs who have not experienced a sense of disappointment in the use of their telescopes. It is not that the heavens are less glorious, nor that the observer is less devoted and enthusiastic, but it is because he often comes to feel that there is an aimlessness in his work which he finds to be disheartening. If at this moment some word or hint can be given to him which will show him how to employ his time and energies to some real advantage either to science or to himself, the old enthusiasm will return and the labor will again become delightful. It is precisely such words and such hints that he may expect to find here among his colleagues.

There is an important class of our amateur members whose photographic experience and skill can bear the most useful fruits if they are directed toward certain astronomical ends. We also have professional astronomers among us whose photographic knowledge is second to none. The association which this society makes easy and puts into an organized form has already led to important results in the observations of the solar eclipse of last January by photographic means, and will, no doubt, continue to be fruitful. There are many other fields of research open to this method of observation.

We have other members, also, who have no apparatus for observation, but who have the ability, the leisure and the desire to forward astronomy by computing the observations of others. There is a boundless field for such amateurs, and I am not sure that their efforts, if rightly directed, may not be of more real importance than any others. The Lick Observatory alone could provide the observations to keep a score of computers busy, and this work could be so selected as to be of all grades of difficulty and to employ every variety of talent.

Finally, we have among us those who have joined as learners; who are here to listen, to observe, to read and to study. They in turn should find in our meetings what they seek for and require. Their reading and their study can be guided, and it is among them that we may look for the workers after the next few years. Every class of talent and opportunity ought to find its profit either in our meetings or in our publications.

One word with regard to the conduct of our meetings. My own experience in scientific societies has led me to think that their meetings should never consist of mere lectures, no matter how interesting. There should be discussion, questions, remarks, interchange of ideas, contact of active minds. Let each member feel that he has a part to bear, both in the actual meetings and outside of them, among his associates. In one word, let our society be a live one—active, intelligent, modest, competent.

It has a doubled interest in its two-fold place of meeting. The astronomers of the Lick Observatory can promise that the meetings held at Mount Hamilton shall be interesting and fruitful. The meetings held in San Francisco can also be full of interest.

One of the chief uses of the society will be to make an astronomical library available to the amateur observer. We have already made a beginning in this direction. It is not necessary that our collection should be very extensive. A complete astronomical library would contain perhaps 20,000 volumes. But it is desirable that we should own a full set of the most important astronomical journals. The progress of the science can be traced in their pages from day to day, and their past volumes give its history.

I have thought it worth while to give in a list which follows the titles of the more important astronomical periodicals, and I have ventured to add the names of some 20 or 30 books which our members would do well to own personally. It is not necessary to buy all of them at once, but the possession of one will lead to the desire for another, as the scope of observation or of reading is enlarged. The society library should begin by owning these volumes. It will grow subsequently as our wants develop.

CLERKE: History of Astronomy in the XIX Century, 2d ed., 8vo.

DELAMBRE: Histoire de l'Astronomie, 4to, — vols.

If our own publications are valuable and worthy, they will bring to us through exchanges many works of prominent value.

This brings me naturally to the question of what and how much we ought to publish. On this I shall give my own opinion freely, from my personal point of view. It may easily be that my ideas on this question, which are rather positive, require correction. If they do, the experience of the society will be sure to show it.

It seems to me, then, that we should be extremely careful to make our publications fully worthy of the society. Any observation faithfully made and properly recorded well deserves a permanent place. Our very constitution, as a society of amateurs, will usually prevent us from presenting those long series of observations which can be amassed by professional observers in fixed observatories. But we should be careful not to make our publications a vehicle for the expression of mere unsupported opinion. A theory should always be accompanied by its vouchers. I would give more for one careful measure of a double-star, for one faithful observation of a comet, than for pages of speculation regarding the origin of the Solar System. Such speculations have their place in science, no doubt, but to be valuable they must follow after years of work. We should make our papers a record of actual work accomplished. There is room, too, for *resumes* of the work of other observers, and for papers relating to the best methods of making our own observations. Important papers in other periodicals may well be translated and printed here. The pages of our journal should be truly representative of the work and thought of the society in general.

It would be easy for the Lick Observatory staff to contribute enough material to completely fill such a journal, but it appears to me that, in general, the work of our observatory should appear in abstract only, and that the observations and communications from the amateur members of the society should always constitute the greater part of the publication. At the same time, the observatory can serve a very useful end by furnishing a series of abstracts of work done and in progress, and by printing notes on work proposed, especially if it is such that our members can co-operate in it.

It will be a source of pride to us, if after many years we can look back over what has been printed by the society and see that every part of it is the record of useful work faithfully done.

It is for this reason that it seems to me we should not attempt to print at any regular intervals, as monthly or quarterly. Let us keep our papers until we have enough material to form a number of 8, 16, 24 pages, and then issue and distribute this to our members.

It is tolerably certain that the time has not yet come for us to perform another function of an astronomical society. I refer to the foundation and to the bestowal of the medal of the society as a reward for astronomical work of the highest class. It is certain, however, that in the future, if such a medal were founded and if it were bestowed only for work of the highest class, as I have said, and never under any circumstances to one of our own members, that the responsibility of the award would constitute an important stimulus to the society itself, which would have to judge of the merits of the various works proposed to be rewarded, and that such awards, if always bestowed with judgment and discretion, would soon make the voice of our society respected everywhere. In fact there is probably no way in which the society could do more good and in which it could be more quickly influential than by the bestowal of its medal upon those astronomers whose works fully deserve it. And there is probably no way in which a mistake of judgment would so quickly discredit us as in the bestowal of our highest award upon insufficient scientific grounds or for personal reasons.

It is probably quite time that I should leave these general considerations and come to the more special questions of the work which our members may reasonably expect to do. In any particular case this depends very largely upon

the time available for such occupation, upon the instrumental equipment at hand and upon the individual aptitude and ability. I have already said that for those of us who are willing to calculate the observations made by others, there is an endless variety of work to do of all grades of importance and difficulty. For those who have only the leisure to interest and divert themselves with observing, there is a rational and useful method to follow instead of a random one which will inevitably lead to disappointment. For those who are willing to spend a very little time and money there are many fields, both old and new, needing cultivation. Let me mention a few of these fields, speaking very briefly of each one.

A very cheap telescope will serve to photograph the sun, provided it be of tolerably long focus. It is highly desirable to obtain enlarged pictures of the solar spots, and to repeat in this country the solar photographs of Janssen, which are taken with extremely short exposures—say from 1-1000 to 1-2000 of a second of time. A series of careful counts of the number of new groups and new spots can be made with a very small telescope, and will be very useful. If any one of the society will charge himself with the necessary measurements, we, at Mt. Hamilton, will undertake to furnish daily photographs of the sun on a scale of 4½ inches to the solar diameter, for the purpose.

I believe that much can be done by studying the moon's surface with comparatively small telescopes. In such studies, I think it desirable to confine the attention to very limited areas, and to study and draw these over and over again under every possible variety of illumination, until the telescope and the observer can do no more.

In this way it may be that only small areas will be covered, but it is certain that our knowledge can be materially increased. The observation of the occultations of stars is most useful, provided the position of the observing station and the local time are accurately known. The Lick Observatory time-signals can be readily made available for this purpose. Probably little can be added to our knowledge of the surface features of the planets by observations with the smaller telescopes.

It is, however, well worth the labor for several of our members to maintain a series of observations of the eclipses of the satellites of *Jupiter*. There is nowhere in America, I believe, such a series maintained. The results of this work will be directly comparable with the observations on which the present tables are founded, and constants of reduction can be determined by which these observations can be employed in conjunction with long series already obtained elsewhere.

In this case, as in so many others, our great distance in longitude from the centers of observation will give to our work a peculiar value We are eight hours west of Greenwich and three hours west of Washington, and there is no astronomical establishment between us and Japan, and no active observatory between California and Australia.

Photographs of the planets and neighboring stars of about the same brilliancy on the same plate may very likely be of use in comparing their relative brightness.

Should a bright comet appear, no chance should be lost to photograph it, to study the changes in its head and to map the position of its tail among the stars.

The observations of Gothard on nebulæ by means of long-exposure photographs have proved that even comparatively small telescopes (provided with driving clocks) and properly used are capable of giving the most brilliant and important results. It is at least possible that the Zodiacal Light, the Milky Way, the twilight arch, the Aurora, can be photographed. I know of no direction where the skill of amateur photographers could be better spent than in experiments upon these subjects. The problem is of the same nature as the photography of the faint outlying streamers of the Solar Corona.

The field in which amateurs can render the greatest service, however, is in the observation of the variable stars. If these are to be observed by the eye, the use of a mere opera-glass or of a very small telescope is usually sufficient to fix the time of maximum or minimum light with accuracy, by comparisons with neighboring stars which do not vary. Professor Pickering has already presented to the society a set of printed instructions for making such observations. If the observer has a photographic telescope or camera, the most elegant and accurate method might be to allow the star's image to *trail* over the plate. When the trail is weakest the star has reached its minimum. A scale of time can be put upon the plate by capping or uncapping the lens at known instants. If the star is too faint to trail on the plate while the latter remains at rest, a very simple clock-work motion can be devised which will cause the telescope to follow the star toward the west at a slow rate. This rate can be so chosen by experiment as to make the *trail* of suitable brightness for measurement.

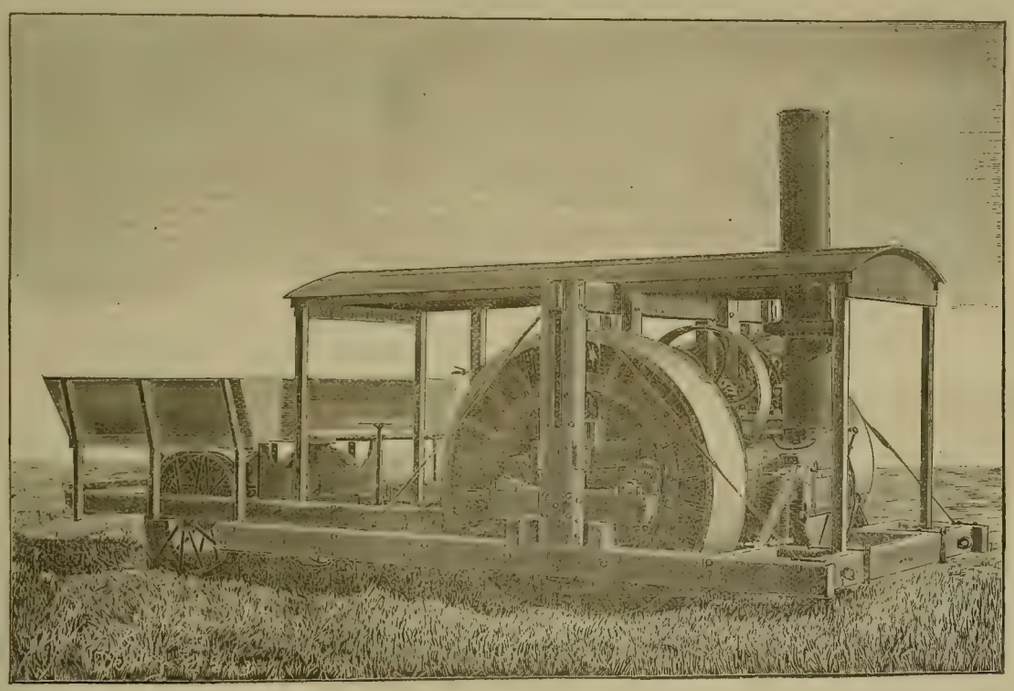
There are scores of other researches of interest and importance which I have not time to mention and which are well within the reach of amateurs. One competent sextant observer, acting in concert with the Lick Observatory, could render a real service to the geography of the State, with very little expenditure of time and money, by determining the latitudes and longitudes of important points. If such an observer were to fix the positions of the eclipse stations occupied by the various parties on the 1st of last January, he could thus make a positive contribution to science. Mr. Keeler of the Lick Observatory has just completed a determination of the position of Norman for this purpose.

I believe the radiant points of the brighter and more slowly moving meteors can be accurately fixed by photography, and at any rate the experiment is worth a trial. Statistics of the number of telescopic meteors in different parts of the sky and at different hours are very much needed and are extremely easy to obtain.

I have thus hastily gone over the principal lines along which we, as a society, may hope to work with success. If we undertake all or any of the work thus indicated, and if we carry it on with faithfulness and industry, we may be sure that our efforts will be a veritable aid to science. Whatever we do, let us do thoroughly. Whatever we say, let it be well considered. Let us clearly understand the objects for which we are organized, and let us pursue these with entire modesty and with entire confidence. The scope and membership of this society is such that it can have no antagonisms and rivalries with any other. But we may look forward to a career of real usefulness, not only to our members, but to the science of astronomy. In our own time and way we may hope to make advances in this path, and we are sure that we can diffuse information in its regard and help to increase the intelligence, the activity and the pleasure of all our membership.

EDWARD S. HOLDEN.

Lick Observatory, February 15, 1889.



LAUFENBURG'S TRACTION ENGINE.

Industrial Notes From Los Angeles.

Our correspondent at Los Angeles has found much to interest him in his circuit of the industrial enterprises of that city. Although none of the manufactories are running full handed at present, a deal of work is being turned out. The Baker Iron Works, located near the old S. P. Depot, employ 65 men. Their line of work consists of mill, mining, pumping and hoisting machinery, oil and well-boring rigs and tools, street cars, gears, wheels, axles, shafting and pulleys, while they are sole agents for various engines, boilers, pumps, etc., in which they do a large business. These works are the most extensive in the city.

The Union Iron Works, on First street, employ from 35 to 50 men, and turn out the usual line of work supplied by our leading foundries and machine shops. The establishment seemed to be in full operation at time of our correspondent's visit. Booth's Fulton Engine Works, on Alameda street, employ at present from 20 to 25 men. Engines are here made a specialty. The company are now putting in for mine-owners at Acton, on the S. P. R. R., a 10 stamp quartz-mill, which will be in operation soon. The Stearns Manufacturing Co. employ 30 men while running with a moderate force. This company manufacture engines, windmills, tanks, etc., and also special lines of furniture. Llewellyn Bros., at the Columbia Foundry, employ 15 to 25 men, and at present are directing their principal attention to architectural castings, building fronts, etc. They have the lead in this particular line of work. The East Side Planing-mill of Chas H. Creciat is a worthy institution, where 20 to 25 men are employed in a general line of sash and door work and other material for builders. On the east side there is also the sheet-iron manufactory of Lacy, Ward & Co., where a good force is employed. The Los Angeles and Pacific Furniture Companies employ each a large force, as do the iron works of Fruhling Bros. H. P. Gregory & Co., 117 N. Los Angeles street, handle an extensive line of woodworking and pumping machinery, besides engines, boilers, air-compressors, belting and mill and mining supplies of all kinds. P. R. Keith is manager of this institution. The Los Angeles Planing-mills often employ 60 to 75 men, but at present are running with a force of 30. The work of this factory is shipped largely to Riverside, Pasadena, San Pedro, Santa Monica and other places tributary to Los Angeles, and is also used in the local market. S. C. Dodge is president; Thos. Hughes, vice-president. The Kerchoff-Cuzner Mills and the Nuille-Nicoll Planing-mills are two other of the leading sash, door and blind factories of Los Angeles, where much work is turned out.

NATURAL SOAP.—There are in Nevada several deposits of mineral soap, one of which has been worked for some years. Similar deposits occur in Wyoming and Dakota. The soap is formed by natural combinations of soda, borax and mineral oils, and in some localities hot springs assist the process. In Owens and Mono lakes, the waters of which are full of borax and soda, there are numerous oily grubs which die and are washed ashore, and the oil in them becomes combined with the minerals in the water and forms deposits of soap on the shore, an inch or two thick in a year. Some of these natural soaps are cut up and sold as found, but they are oftener used in combination with other soaps.

Laufenburg's Traction Engines.

The cut of Laufenburg's traction engine on this page should attract more than ordinary interest, as it is made from the boiler and machinery of a portable engine that was used in running a Pitts separator. The new system of using the Combined Harvester that had its inception, and was brought to its present state of proficiency in the city of Stockton, has caused hundreds of portable engines and separators to be laid aside as useless farm machinery. Mr. M. Laufenburg of Stockton, a noted inventor of labor-saving farm implements, conceived and advanced the project of utilizing these portable engines by converting them into traction engines. The directors of the Stockton Combined Harvester and Agricultural Works encouraged the project by giving him the facilities of their immense works. It was looked upon as chimerical, but the crowning result has been consummated and a portable engine has been transformed into a traction engine that has been put in practical use this season. Grain sown on land plowed by this traction engine will, it is expected, be harvested by a Houser combined harvester propelled by the same engine, which will also haul the sacks of wheat to the railroad station. Thrashing straw will be used for fuel, which, taken in connection with the result of 20-horse power being equal to 26 horses, makes the cost of seeding and harvesting 50 per cent less than that of horse-power. Besides, the engine with electric lights can run day and night, thereby doing the work of 48 horses. We herewith give a succinct description of the mechanical features of the traction engine. There are no intermediate gears through which the power is transmitted. The traction wheels are driven by a pinion on countershaft, which revolves with gear engaging the pinion on the crank-shaft of engine. Thus the application of power is direct and not through a system of complicated gears which are liable to change their bearing by wear and break. The journals, which carry flange-wheels to control position of traction wheels and main gears, are provided with a device to regulate and parallel the face of cogs on the gear pinions and main gears, and natural wear can be taken up at all times. The main traction wheels, although high, carry the weight of engine and boiler on journals on a level with the line of draft when pulling a load. Thus the transportation of weight from traction to lead wheels is avoided, which is not the case when the weight of engine and boiler is journaled in hub of wheel center, more especially when a high wheel is employed.

What to Do With Our Boys.

Industrial schools for boys are a good commentary on our system of training. There is a tendency to draw a distinction between the boy who walks the streets with books on his way to school and one who carries a dinner-pail on his way to the shop where he is learning his trade. The high-school will probably turn out a graduate who feels above his father and mother, whose daily toil has educated him, and who is ill-prepared to buffet with the waves of this turbulent world. He has a training which would be useful had his parents money enough to start him in life. On the other hand, the boy who has a useful trade is less limited when he seeks employment; his training in the shop, too, has given him a knowledge of the world and self-reliance which the book-student will have to obtain when he seeks his own livelihood. We do not decry education, but we think many of the ornamental studies might be omitted and the time given to some useful pursuit. The German princes are all obliged to learn some trade; this enables them to sympathize with the masses and ennobles labor. In this country manual labor and work on the farm are shunned because boys feel that there is a discount on these employments.

Our schools should teach that some of the greatest of Americans worked on the farm—Elihu Burritt, the learned blacksmith, Robert Colyer; such men should be held up as models. Garfield's career from the tow-path to the White House, Grant the tanner, Lincoln the rail-splitter, and other heroes who chopped away the obstacles to their success, should be the models for the guidance of our youth.

We believe the day is not far distant when the overcrowded professions and the lack of skilled mechanics will turn the attention of our educators to technical schools and agricultural colleges as the needed institutions for our American youth. One difficulty is the opposition of trades unions to apprentices, another the continual invention of machinery to supplant hand labor; but such schools as Cogswell's, by saving the time which would be wasted in apprenticeship, will probably spring up in all our large centers of population.

UNCLE SAM'S PENSION-ROLL.—The number of pensioners on the rolls on June 30, 1888, were: Civil war, army, invalids, 323,029; widows, etc., 90,882; navy, 3815 and 2083 respectively; war with Mexico, survivors, 16,060; widows, 5104; war of 1812, survivors, 806; widows, 10,787; total, 452,557, and $79,646,-146.37 disbursed to them.

THE postal authorities have adopted Ventura as the name of the postoffice at San Buenaventura, and the *Democrat* says the next Legislature will be asked to change the name of the old town to the abbreviated Ventura.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

POTOSI.—Amador *Ledger*, April 27: The Potosi mill, running on rock taken from the North California mine, near Drytown, was shut down last Friday, and all work in the mine suspended. The rock that was run through was taken from near the surface, and we are told it did not pay, yielding only about $2 per ton, which was hardly sufficient to meet the expenses. Ore taken from the tunnels and drifts some time ago paid well, some of the ore going as high as $20 per ton. This company, composed almost exclusively of residents of Amador county, spent $20,000 in the development of this property, having levied 12 assessments. In the Pioneer district, at Mace's mill, mining matters are moving along at a slow gait. There are from 10 to 20 men prospecting. A gentleman named Bingham, lately from Arizona, has taken up what is called the Sand lead, a peculiar formation, carrying gold, but whether in paying quantities remains to be tested. He is talking of putting up a roller quartz-mill to work this ore. Fifty tons of rock taken from the old Mexican claim in Shober's field were hauled to the Moore mill and crushed lately. The result was a little over $5 per ton, which was hardly up to expectations, The seams of quartz are small, and often rich, but no large deposits of pay ore have been met with as yet. Four men are at work on the Middle Bar mine, on the Mokelumne river. This, together with the prospecting operations at the Morley or Wetzlar mine, is about all the work that is being done in the Middle Bar region at present. There is again some talk of starting up the old Hardenburgh claim. At the Kennedy mine a tunnel has been run into the Oneida hill a distance of 500 feet, and at this point a crosscut west has been driven 150 feet, and all this has been accomplished in the short period of one year. Most of the work has been done by contract, and it has cost on an average something over $3 per foot. The crosscut is being pushed ahead in the expectation of striking a west ledge.

CHINESE IN QUARTZ MINING.—Amador *Ledger*, April 27: It is with deep regret that we learn that the Allison mine, above Big Bar bridge, is run almost exclusively by Chinamen. We are told that 13 Chinamen mine and mill the rock, with a white man as foreman. This is the first instance that has come under our notice of the introduction of Chinese in quartz mining in Amador county. This new departure is to be regretted not so much because of the 10 or 12 white men who would otherwise be employed at this mine on the river, but because it may prove the entering wedge to the employment of the Mongolian in other mines in this county.

LAVEZZA.—Amador *Dispatch*, April 27: This property is owned by Chas. Lavezza and Lorenzo Arata, and is northeast of the Reed and Askey mine. A shaft 200 feet deep has been sunk, and a tunnel 500 feet in length taps the ledge 200 feet deep. An upraise connects the shaft with the tunnel. The average width of the ledge is two feet, and the ore averages $10 per ton. These enterprising young men have built a five-stamp mill, and being in a position where they could not run by water-power, secured a small engine to run it. The mill has now been running three weeks, and the owners are well pleased with the outlook.

NOONER.—A shaft is being sunk on this property from which they will drift after reaching a certain depth, in search of quartz. The Petty boys have struck a ledge of quartz near the Mokelumne river, above the Allison mine, which prospects well. They are now sinking a shaft on it. Near the surface the ledge seems to be broken up, but in all probability will unite at a greater depth.

DRYTOWN.—The machinery for the Drytown Consolidated is about all on the ground; the carpenters are through with their work. The North California mill has closed down for the present; prospecting the mine will be continued.

Calaveras.

A GOOD GRAVEL CLAIM.—Calaveras *Prospect*, April 27: The Benson gravel claim at Central Hill is turning out first-rate. They have four feet of gravel, and it is said to be worth $10 to the man, and gold can be seen anywhere in the gravel. The parties owning the claim have been trying to open it for some time, and have only lately accomplished the undertaking. Calaveras mining interests are looming up in great shape.

CHAPARRAL HILL.—A mine known as the Chaparral Hill mine, situated near Albany Flat, which is the property of the Calaveras Con. Mining Co., will be opened by that company in a few days, and will be superintended by Mr. Lawson, formerly superintendent of the Calaveras mine at Robinsons Ferry. It has always been the impression among miners in this section that there are no quartz mines in the Bear Mountain district, but the discoveries that are being made there from time to time will probably undeceive them. The McLean mine, situated in that district, is prospecting well and will no doubt, when thoroughly developed, prove a valuable property. Work on the Calaveras mine at Robinsons Ferry has been resumed, and we understand that lumber is being hauled there for building purposes. It is altogether likely that large reduction works will be erected as soon as practicable. The mine is in the hands of men of large capital, and it may be fairly presumed that no expense will be spared to thoroughly develop it.

MINE SOLD.—Angels *Record*, April 30: Last Tuesday the Nevill mine was disposed of to Hayward & Hobart, for the sum of, it is rumored, $250,000. This mine is considered one of the leading mines of the State, and no doubt under the new management will soon identify and equal the other bonanza yields of the State. In consequence of the change, the mine suspended operations for a few days, but have again resumed work.

ANGELS.—*Mountain Echo*, April 27: It is said by those who ought to know that the Angels mine never looked more promising than at present.

WHITTLE.—It is reported that an immensely rich strike has been made in the Whittle mine, situated near Albany Flat. The shaft in which the discovery was made is somewhat over a hundred feet deep, and the vein is nearly three feet wide. We are reliably informed that the Lane and Tulloch mine, near this place, is making an excellent showing. The lead is getting wider and the ore richer as the tunnel is driven into the hill. One of the owners informs us that the ore yields an average of about $10 per ton.

Contra Costa.

TAR.—Contra Costa *Gazette*, April 27: At the tar mine, work at San Pablo is going on actively. The derrick is about up, and Supt. Anderson will commence boring next week. A large vein of coal and bituminous rock has been found (a sample having been sent to this office). Quite a flow of tar can be seen. At the bituminous rock quarry a large gang of men will be put to work in a few days. The success of the mine looks flattering.

El Dorado.

PROSPECT.—Georgetown *Gazette*, April 27: We are pleased to learn that the Ben Franklin mine, a new prospect a short distance below town, is showing flattering prospects. It is a 3-foot ledge, and a shaft is being sunk which has reached a depth of 30 feet. The quartz frequently shows gold without the aid of a glass. There are about 75 tons of this quartz on the dump which the owners believe will pay well for milling.

Inyo.

GOLD-QUARTZ.—Inyo *Independent*, April 27: Last week when sinking on a lead vein at the White Hill, Barnes & Kehoe encountered quartz. The seam is about two feet wide and was taken out to give room. After a good deal of the quartz had been thrown over the dump Kehoe happened to pick up a piece of the rock and saw gold in it. Further investigation showed that the ore thrown away carried gold, Many samples have since been crushed in a mortar and prospected and all of them carry gold in big paying quantity. A shaft is now down on the ledge to a distance of 38 feet and the ledge gives evidence of widening out as it goes down. A thin seam of clay divides the quartz from the lead vein, and this is about three feet wide, being a mixture of clay and seams of lead. Some of the ore is carbonate of silver. The location of the mine is such as to afford the best possible facilities for working.

AT THE MINIETTA mine, Lookout district, a good paying business is done in working over tailings from the mill. The pile on tailings is estimated to contain about 4000 tons. The stuff carries 17 ozs. silver per ton and 40 per cent lead. The lead hinders the silver from amalgamating. Recently machines were put in operation that separate most of the lead from the tailings; the lead is then worth enough to pay all expenses of the operation and leaves a profit of about $3.50 per ton. After this operation the silver amalgamates readily and about 82 per cent of the assay value is recovered. The parties who are operating say it pays very well. For some time past John Barnes, of the Keeler, has had men working a mine adjoining the Lucky Jim, at Darwin. A few days ago a body of ore was struck in the mine. It will take some time to determine how extensive the deposit is.

CERRO GORDO.—Dunphy & O'Keefe have struck a big vein of ore at Cerro Gordo. The mine is an extension of the Union ledge, which yielded many millions of dollars in former years. The vein is described as being three feet wide, of solid galena, and is opened a considerable distance. Thirty tons of ore was recently sent to be tested at the Reno reduction works. The ore can be taken out in large quantities and very easily. There is every indication that this is likely to prove as big an ore body as the great find in the Union mine.

LEE DISTRICT.—Jerry Fitzgerald recently found some immensely rich ore in Lee district. One chunk of the ore is almost pure silver; the metal can be cut in shavings with a pocket knife, and these will curl over like wood shavings. Jerry says that one ton of such ore would make him a nice little stake. Several miners have gone out from Darwin to look at Jerry's claim and they all seem to think he has a good thing.

LOOKOUT.—Several mines over about Lookout are reported to be turning out a good deal of ore. From the St. John mine teams are now hauling ore to Keeler to the amount of a carload each train. The ore is reported to carry 102 ozs. of silver per ton and 40 per cent lead. Gunn & Fitzgerald are the owners of the St. John mine. Hon. A. J. Gould is taking out ore from the Gypsy Queen mine at Darwin.

ORE.—Bush & Lent have a good body of ore in the Alvord mine, near Big Pine. The ore prospects high in free gold. As soon as the concentrator is ready for work at the Maxim mill a lot of the ore will be worked. In addition to free gold the ore carries a great deal of sulphurets, and the gold in this would be lost unless concentrated.

Los Angeles.

MONROVIA.—Pasadena *Star*, April 27: Many conflicting reports have been circulated here regarding the Monrovia mines, and in order that we might be able to place the truth before our readers, the writer hereof went to the mines a few days ago and easily succeeded in digging out the important facts. These mines are located about a mile and a half eastward of Monrovia, on land owned by the Bliss Bros., which is a portion of the original Azusa de Duarte grant, and in a spur of hills separated by a deep canyon from the mountain range. We found seven men quietly working, some sluicing, others driving a tunnel in the direction of the Mojave desert. There was no excitement and no occasion for any. The company doing this work consists of 12 men. Jas. Dewey of Alhambra is the business manager, and A. Miller of Pasadena is the expert miner in charge of the work. The company is said to be backed by sufficient capital to push the work for months, and we were informed that it is the intention to keep things moving until gold is found in paying quantities, or it is evident that it does not exist there. We were shown some fine specimens of gold. The largest piece was about the size of a grain of wheat, and in all there were several dollars worth of the precious metal, but we were given to understand that the company has not yet cleared expenses. They are simply working quietly away in hope of finding something better, and everybody will rejoice if they succeed. Many miners have visited this spot, and all have expressed a goodly degree of faith in the indications, and none have gone away without looking pretty thoroughly over the surrounding country, and some have returned for further investigation. Gold is found in every shovel of dirt, but water is a scarce article. An inch pipe conveys all that is now used, but plenty of water can be secured in the Van Tassel canyon three miles eastward. It is very evident that many years ago a large amount of work was done here. Water was brought in a large open ditch from Saw Pit canyon, a distance of nearly three miles, but no one knows what amount of gold was secured, why or when work was discontinued.

Mariposa.

COULTERVILLE.—Cor. Mariposa *Gazette*, April 27: Our mining outlook is very encouraging this spring. The Rittenhoff mine, situated about 1½ miles below town on Maxwell's creek, has been sold, the deeds made, signed and recorded, and the new company is in possession, with Dan Wagner in charge, and active work will commence before the middle of May. The company has incorporated under the name of the "Tyro Mill and Mining Co." It is reported as a sure thing that the famous Cook property has been sold, and will soon pass into the hands of the purchasers. These mines will be worked by water-power from the Big Oak Flat ditch, which goes with the mines. Quartz Johnson is here with his face wreathed with smiles, he having negotiated the sale. The Bondurant mine is being worked and shows good ore and plenty of it. This is the only mine on this side that is productive just now. The Red Cloud mine is still idle waiting for its new owner to take charge and go ahead.

Nevada.

OPENING ANOTHER MINE.—*Transcript*, April 25: L. Duterte, a prominent San Francisco capitalist, is now the sole owner of the Grafton quartz mine, which is the adjoining location to the Eaglebird or Diamond Creek mine above the town of Washington. Mr. Duterte has gone up to the claim to put a force of men at work developing it.

TO RESUME WORK.—Mr. Chenoweth expects to soon resume work at the Washington quartz mine on the South Yuba near Edward's Crossing. Captain Richards will continue in charge of the operations.

Plumas.

QUARTZ TOWNSHIP.—Plumas *National*, April 27: The Gold Lake Mining Co., owners O. B. Dolley, Matt Willoughby and Ben Jones, has struck a 2½-foot ledge which prospects immensely rich. The rock is reported worth from $400 to $800 per ton. They are sinking a shaft on the ledge and the rock continues as rich as when first struck. A mill will be erected immediately. Gallagher & Matthews are opening a quartz mine on Squirrel creek. The ledge is from three to six feet wide, and good paying ore. They have started an incline, and the ledge improves in richness as they go down. They expect to build a mill this summer. Bell & Stratton on Poplar creek, are still taking out slugs in their placer claims. The boys have struck a bonanza.

Shasta.

DODGE MILL.—*Democrat*; April 24: A new Dodge mill is being erected on the Little Nellie mine on Slick Rock creek. F. H. Deakin last Saturday purchased the well-known Wiser place, situated on the old Shasta road, 1½ miles this side of Shasta, for $4500. He also purchased the White Oak and two other mining claims adjoining. The proprietors of the Mammoth mine in Old Diggins, last week had 15 tons of ore from that mine worked in the new Dodge mill on the Texas and Georgia mine. The mill worked the ore up to 90 per cent of the assay. If this is true, it is a splendid recommendation for the mill, as heretofore this ore by a free-milling process has not yielded 50 per cent of its assay value. Jack Wallace sent out a pack train of burros under charge of Fred Ten Eick and Charley Nolan, on a prospecting tour through the upper end of the county. It will be gone several months. Another pack train went out yesterday on the same errand in Siskiyou county. Prospecting is becoming active in all the three counties of Shasta, Trinity and Siskiyou, and we anticipate great activity in mining operations this summer.

Sierra.

MARGUERITE.—*Mountain Messenger*, April 27: Fred Morris, Supt. of the Marguerite quartz mine, was here last week on his way below. He has been up to the mine with E. J. Post, a mechanical engineer, to look at the situation and determine what course to pursue to keep the mine free from water, of which there is about 50 inches to contend with. Mr. Plant is connected with a firm at Sutter Creek which, among other things, makes the Knight water-wheel, one of which is in use at the mine. Mr. Plant saw no reason why the mine should not be easily kept free from water. We understand that it was decided to put in a 17-inch direct-acting plunger pump of eight feet stroke. A pump of this kind running at a speed of ten strokes a minute should raise far more water than has yet been encountered. To run this pump it is proposed to employ a water engine. It is the intention to remove the pumps put in by Mr. Humbert, and also the Leffel wheels and the wire rope by means of which power was conveyed from the wheels to the pump. The new pump and engine are expected to be at work soon after July 1st; in the meantime everything will be made ready for the reception of the new plant. Water from the old Dutch Co.'s ditch, now the property of the Marguerite Co., will be used for pumping and raising ore.

THE WALLIS CONSOLIDATED CO. are thinking of sinking a shaft on their claims above Cornish Ranch. Plenty of water has enabled the Bald Mountain Extension Co. to clear out the dumps at the new tunnel.

THE RED OAK Co. has put on three shifts and will push their tunnel rapidly from this time until the channel is tapped. For some reason the workmen at the Gold Bluff mine have been laid off. Presumably the suspension of work is only temporary.

WILLIAM TELL MINE.—Sierra *Tribune*, April 26: A two-stamp mill has been erected and is at work in the river just below the old Hoosier ledge, now called the William Tell, above town, and owned by residents of this place. Persons who ought to know say that the William Tell is sure to be a big mine. It is claimed that the little mill can crush one ton of ore per day. If this is true, there is big money in it for the four owners with only two stamps. The rock will pay all of $50 a ton. It only requires one man to run the mill, while the rest can be working in the mine. While in conversation with Frank Cook this week, he said to our reporter: "There will surely be a big mill pounding away over at that place yet. They are working their prospect just as a new prospect should be worked—by going at it on a small scale and gradually making improvements as the mine gets better. This business of putting up a 40-stamp mill before you know just what kind of a mine you have is no way to do."

Siskiyou.

AT SALMON RIVER.—Yreka *Journal*, April 25: The Ball Bros. of the Gold Ball Mining Company, have lately been taking out very rich quartz from the Mountain Laurel ledge at Salmon river, near the old Klamath ledge, and the latter also prospects exceedingly well. In the Mountain Laurel rich deposits of gold are found in the casings or hanging-walls as well as in the ledge itself, one quartz specimen shown us being at least half gold. The company have expended about $33,000 in opening this mine, and a year ago felt greatly discouraged, but would not sell out now at any price. They have over 10,000 tons of quartz on hand and in sight that will average over $20 to the ton, and their ledge averages three feet wide, with every indication of permanency. Their 16-stamp mill is kept running steadily and successfully. Mr. Pullen is finding some deep water where he is putting in his dam in Klamath river, Cottonwood mining district. He has gone in about 200 feet above his old dam of last year and will run down outside of his old wing, thus taking in the ground which he did not get worked out last year, and as much more new ground. He has a large force of men at work and is making things "hum." Jillson & Co. catch enough water in their reservoir at Cottonwood to hydraulic an hour or so at a time before the supply is exhausted. Wm. Jillson is getting along nicely putting in a wingdam at the lower end of the Pope ranch on east side of the Klamath river. He finds the water quite shallow.

KLAMATH RIVER.—Work on the Keweenaw mine, Klamath river, is going on rapidly, and the outlook is very flattering. If any reliance at all can be placed on reports, this ought to be one of the richest placer mines in the county. On the east side of the river is Carson gulch, at the mouth of which a wingdam was put in a good many years ago and a large amount of money taken out. The following year another dam was put in a little lower down and $12,000 taken out. This was less than one-third the amount taken from the other wing. On the west side of the river are two gulches which paid handsomely. One is known as Dutch gulch, the other as Printer gulch. It was in the latter that the large nugget weighing 109 ounces and $5 was picked up. This nugget was on exhibition at Washington at last accounts. The mouth of this gulch is immediately above the dam Osborne and Dee are putting in, hence it is reasonably supposed that there should be a large deposit of gold in the river just below, and we are informed that "colors" can be obtained from the top dirt at the edge of the water. The ground will probably be 12 to 16 feet deep, and, from this indication, will pay all the way down. Amos, Davis, Deyson and Goodrich are getting quartz from their ledges near the Anderson ranch, Klamath river, and expect to commence hauling rock to the mill this week, Experts from below call it $12 rock, though in smelting the rock it will probably run much higher.

San Benito.

QUICKSILVER.—Hollister *Free Lance*, April 27: A few days ago Messrs. W. F. Dalzell and N. C. Briggs with their wives took a trip up to the Gypsy mines above Lone Tree. They found the retorts had been filled, and the process of obtaining the metal from the ore was going on. The ore proved to be exceedingly rich and the retort yielded 67 pounds to the run. This at a little over 50 cents a pound makes the mine already a good paying property. It will be remembered that a few months ago S. F. miners bonded this property and sank some shafts expecting to find some good prospects in the vicinity. Their attempts proved to be failures, owing, it is believed, to the fact that they either did not prospect far enough, or else worked in the wrong direction. At any rate the old company, which consists of Griffith & Dalzell and the Woodie Bros., are striking good ore in large quantities and are making it pay. What this mine needs is an expenditure of at least $25,000 in running new shafts, levels, etc., and building reduction works.

San Bernardino.

THE SEARLES BORAX WORKS.—Inyo *Independent*, April 29: Searles' borax works is a big institution. The buildings cover about two acres of land a little south of the Inyo county line. The borax field appears to be inexhaustible. When a crop of borax is gathered, at the end of a year the same ground can be gone over again and the supply is renewed and as great as the first. In boring for artesian water a large vein of borax was passed through at a depth of 300 feet. At the works are machine shops, blacksmith, carpenter and cooper shops. Everything from a fish-hook to a prairie schooner can be made at the works. Water for domestic use is conveyed seven miles in pipes from the mountains; the quality is excellent and the supply abundant. Within the limit of Inyo county a tract of land is cultivated that yields an abundant supply of fruits and vegetables. Oranges and bananas are grown. A visitor who was recently at the works says that a thermometer exposed to the sun showed a temperature of 140. The buildings at the works are constructed so as to secure as much comfort as possible in a warm climate. From the works to Mojave the distance is 80 miles.

Trinity.

EAST FORK.—Cor. Trinity *Journal*, April 27: Capital is just as hungry as the labor it buys, and one or two successful starts in this district, in milling her abundant supplies of paying ore, will bring prosperity to the patiently-waiting prospector, the long-suffering dealer in supplies, staggering under his load, willingly borne for the general good. Stiller, Krumpe & Co. are having about 60 tons of ore from the White, Red and Blue (names cost nothing here) crushed by the Golden Chest Mining Co., which will probably turn out light, as the immensely-rich assays of that ore have shown the wealth is in the tellurides that cannot be saved by the free-milling process. The returns from their 15 or 20 tons of rock from their Mountain Bell will show up better. The stopes of the Golden Chest are looking well, and they are accumulating ore for a big run next month; the ledge in the No. 1 tunnel is of fair grade, but has been troublesome on account of the intervening Horse. Still they are now 60 feet under-

ground and gaining depth, and more regularity to the ledge as they penetrate. The Yellow Jacket people are beginning to show new life, and the fine prospects of that district would seem to indicate the prime necessity of continuing "that wagon-road."

KNOW-NOTHING CREEK.—*Aurora*, April 27: James Griffith, a former Canyon Creek boy, now employed at the Know-Nothing creek mines, was in town the first of the week and says that camp is in a very prosperous condition and all signs point to a successful summer's work. Work is progressing steadily on the Know-Nothing mine owned by Hansen, Black, Bennet & Riley. A four-stamp mill is running on good ore and the mine is developing well. The last cleanup was very satisfactory.

Tuolumne.

RIVER CLAIM.—Tuolumne *Independent* April 27: Preparatory work has begun on J. K. Moffitt's river claim for the summer run. Only a few men are at present employed, but the force will be gradually increased until the river falls, which is generally in July, when operations will be rushed along full-handed until again brought to a close by the rising waters in the fall.

NEVADA.

Washoe District.

ALTA.—Virginia *Enterprise*, April 27: The mill is running steadily. Are sinking from the 925 level in ore of good quality. An upraise from the level below will be connected in the ore stopes.

SAVAGE.—On the 400 level the joint west crosscut has been advanced 18 feet in soft vein material. There is considerable water coming from the face, and the ground requires close timbering from No. 1 and No. 2 west crosscuts. Are stoping ore of good grade from the main north and south drifts, and are extracting ore from the old stopes. On the 500 level, from the upraise in No. 2 west crosscut, have started a west drift midway between this and the 400 level; this drift was advanced 32 feet. Expect to encounter the downward continuation of the 400 level ore body in this drift for the same purpose. Are also extending No. 3 west crosscut, which has been advanced 30 feet. Are extracting ore from the old stopes, also from the east crosscut, 600 level. During the week have hoisted 460 tons of ore, have shipped to the Rock Point mill 488½ tons and have milled 480 tons; average battery assay, $20.52. Have shipped $7175.77 in bullion.

HALE & NORCROSS.—On the 400 level the stopes in the north drift from No. 1 west crosscut continue in excellent ore. The winze in the south drift from joint west crosscut is now down 20 feet in ore of good quality. From the top of the south upraise have extended a drift south, which connected with the north drift from the 300 level of the Chollar. This connection greatly improves the ventilation of this portion of the mine, and enables them to drift north from this point to intersect the upward continuation of the 400 level ore body. During the week have hoisted 1200 tons of ore. Have shipped to the Nevada mill 1057½ tons, and have milled 937 tons; average battery assays, $31.60. Have bullion on hand, previously shipped this month, amounting to $64,000.

CROWN POINT.—In stoping east on fifth floor of 400 level, the quantity and quality of quartz has increased since last report. Have commenced extracting ore from the old stopes above No. 1 crosscut and started a south drift from No. 1 to No. 2 crosscut, 400 level. The north drift on the fifth floor has encountered o'd ground, and are now raising on the streak of ore in sight. The other openings show no change. Have shipped to the Mexican mill during the week 854 tons of ore.

BELCHER.—The 200 east crosscut is out 213 feet and has stopped. The west crosscut is out 153 feet, and, having reached the west mole, was also stopped. Have started two more crosscuts 100 feet farther north, one east (No. 2) and one west (No. 2) opposite each other. The 1100 west crosscut is out 102 feet, having advanced 48 feet during the week. The material in the face consists of quartz and porphyry, the former assying from $6 to $8 per ton.

CONFIDENCE.—The joint Challenge and Confidence north drift from east crosscut No. 1, on the 1300 level, is in 10 feet, having been started during the week. Have shipped during the week 40 the Brunswick mill for reduction 308 tons of ore, the average battery sample of which shows a value of $26.83 per ton.

CHOLLAR.—North lateral drift, 558 level, has reached the Hale and Norcross south line. The north lateral drift, 850 level, is out 135 feet. The face is in hard porphyry.

POTOSI.—The south drift, 850 level, is out 197 feet. The face is in hard porphyry. The south drift, 930 level, has been repaired a distance of 498 feet south of the shaft.

CHALLENGE CON.—There was shipped to the Brunswick mill for reduction 56 tons of ore, the average battery sample of which shows a value of $26.83 per ton.

OVERMAN.—Extracted 244 tons of ore and shipped to the Vivian mill 323 tons, 660 pounds of ore; stopes yielding the usual quantity of ore of fair grade.

SEG. BELCHER.—The 1100 west crosscut advanced 47 feet during the week and is now out 285 feet. The face continues in soft porphyry.

JUSTICE.—The mill is running steadily. Are putting up a new double hoist engine to explore the mine at a greater depth.

SILVER HILL.—Drifting southeast southward and northeast on the 260 level. The northeast drift is an old drift.

BULLION.—Will soon commence to drift north on the ledge on the 760 level from the new station.

ALPHA.—Crosscutting east on the Imperial line on the 500 level; also crosscutting west.

BALTIMORE.—Drifting west on the 225 and 338 levels, and saving ore on the dump.

EXCHEQUER.—Drifting north on the 500 level and crosscutting west.

NEW YORK.—Crosscutting west on the 800 level.

SCORPION.—Crosscutting west on the 300 level.

Aurora District.

THE DURAND.—Walker Lake *Bulletin*, April 27: A three-foot ledge of high-grade ore is said to have been recently uncovered in the Durand mine, Aurora but that the great influx of water precludes the possibility of working it with the pumping machinery now in use. Efforts are being made to procure pumps of sufficient capacity to drain the mine, in which event Aurora will emerge from her present dull condition.

Hawthorne District.

PAMLICO.—Inyo *Independent*, April 27: The Pamlico mine, near Hawthorne, is producing some wonderfully rich ore. Recently a sack weighing 124 pounds yielded $8200. Seven sacks yielded $14,000. The vein is thin and the ore is found in bunches. The mine is owned by Messrs. Knapp & Forbes and has already paid them a large amount.

Morey District.

MILL TO START.—Belmont *Courier*, April 29: M. J. O'Brien informs us that Supt. Cohen arrived at Morey from New York on the 19th instant. Mr. Cohen will soon start up the company's mill at that place on ores from the mines of Morey district. All the mining properties in that section of Nye county are looking well. Mr. O'Brien is confident that Morey will be a lively camp next summer. He also informs us that a number of miners are chloriding in Revelle district, and that some of them are encountering good ore.

Palmetto District

PROSPECTORS.—Walker Lake *Bulletin*, April 27: There are many prospectors at work in Palmetto district, and several promising discoveries are reported. The district attracted a good deal of attention in the early sixties, but was neglected and almost abandoned until recently. A few of the early prospectors never lost faith in the district, remained and struggled with it, and appearances now indicate that their reward is at hand. John Kinsella is one of the fortunate prospectors in Palmetto. He has taken out and shipped some rich ore and is reported to be making money fast.

Pioche District.

REDUCTION WORKS.—Pioche *Record*, April 20: A material advance toward completion is noticeable during the past few weeks. The improved weather permits work to be forwarded more rapidly, and with the present rate of progress the dry, concentrating plant will be in operation early in June. The two main buildings are practically finished, a small addition only is necessary to connect them with the old leacher building. The dryer is in place and the mason-work about the dust-chambers, and the dust-flue connected with them, which extends 75 feet or more up the hillside, is finished; likewise, the dust-chambers connected with the Bruckner roasters are about completed, and it is thought the masons will finish their part of the work by Tuesday next. W. Culverwell started teams for Eureka early in the week to bring in two Bruckner roasters from the old Geddes Bertrand mill at Secret canyon. The roads are now in good condition and he expects to get them in without delay. The machine shop at the Raymond works has finished the necessary shafting, etc., for the plant, and it will be put in next week. The boilers and engine are in place, and the woodwork of the bins, pipes, etc., connected with the dry separator, is going ahead. When finished, it will represent a model reduction plant capable of handling any character or grade of ore produced hereabout, and in large quantities. It will also stimulate outside prospect work, since it will furnish a paying market for ores of different classes which cannot now be profitably disposed of.

Silver King District.

TO DEVELOP.—Pioche *Record*, April 20: Nothing has been going on at Silver King district for some months past, but from D. McCarter, who was in town early in the week, we learn that Dave Felsenthal and others of Taylor, who have interests in the district, have sent out mining supplies and propose to develop their properties. Ore of a low grade is plentiful, and the advisability of putting up a small furnace is under consideration. The line of the projected railroad, via Bristol Pass, runs within ten miles of the district.

Sunrise District.

TO DEVELOP LOCATIONS.—Virginia *Chronicle*, April 26: This morning four miners left for Sunrise district to develop locations made last year. On the waste dump of an old shaft on one of the locations ore assaying $150 per ton was found. This shaft will be reopened to ascertain the extent of the ore vein supposed to be located at the bottom. The shaft is about 290 feet in depth and timbered with cedar cut in ravines adjacent to the mine. Gold predominates in the ore found in the district, which is located about 24 miles northeast of the Comstock.

Tuscarora District.

BELLE ISLE.—*Times-Review*, April 27: North drift from west crosscut, 250-foot level, extended 12 feet.

COMMONWEALTH.—225-foot level: Winze has been started and sunk 7 feet. Average assay of ore in the bottom $501.28 per ton. South drift from No. 2 crosscut has been extended 15 feet, all in the vein, assaying $11 to $18 per ton. North drift from bottom of No. 1 winze is in 51 feet and opening up in fine ore. South from this same point the ore is high grade but is not so wide. 300-foot level: South drift from No. 1 west crosscut has been extended 13 feet. North drift from same point has been run 15 feet. Assays from the face of drift return $44 per ton.

NAVAJO.—South drift, from the 350-foot level crosscut, extended 21 feet; rock somewhat harder. No. 7 upraise, same level, advanced 8 feet. South drift on intermediate 250-foot level has been extended 16 feet, showing some high-grade ore. The usual quantity of ore has been sent to the mill.

GRAND PRIZE.—400-foot level: West drift, from north crosscut, extended 22 feet; face showing a large vein of low-grade ore. East drift No. 2, from same crosscut, extended 18 feet without change. Face of south drift advanced 18 feet, and west crosscut from south drift 18 feet.

NORTH COMMONWEALTH.—South drift, 225-foot level, extended 24 feet; will connect with the drift from the Commonwealth line in the coming week. South drift, 100-foot level, extended 20 feet. The face continues all in vein matter carrying some high-grade ore.

NEVADA QUEEN.—The mill has run steadily and is working well. Shipped bullion valued at $10,364.75. Concentrator is working all right; 290 tons of ore received and 135 tons concentrates sent to the mill. At the mine the stopes are yielding fully as well as at any time since starting the concentrating plant.

DEL MONTE.—North drift, on the 225-foot level, extended 22 feet, the face looks favorable for ore. North drift, 100-foot level, extended 24 feet. The face continues to show some high-grade ore, neither wall showing in the drift.

NORTH BELLE ISLE.—North drift, 500-foot level, extended 8 feet; rock black and hard in the face, with the usual flow of water. Stopes yielding some medium-grade ore.

ARIZONA.

SOUTHERN BELLE.—Prescott *Courier*, April 27: The Boaz Co. is operating a 20-stamp mill and four concentrators on the Southern Belle mine, about midway between Walnut Grove and Bradshaw districts and about 30 miles south of Prescott. Supposition is that the company is making money. It is proposed to add 20 more stamps to the mill, so we learned from Mr. Rankin, a member of the company. The Hillside mine is in fine condition. The vein is not large, but it furnishes plenty of ore that works $1000 a ton in silver. N. C. Sheckles, a man who has devoted money, time and talent to developing mines in Bradshaw district, has worked up a scheme that promises great things to our section. It is nothing more nor less than the working in proper manner of the Tiger and other great mines by the capitalists who have examined the properties and are satisfied with them. All our people hope that old owners of the Tiger will see the necessity of prompt action in the matter. Frank Kuhne of Walker district reports great activity among miners there. The Copper Basin Co. is moving right along, treating ores and planning for the future. Shipments of bullion are frequent. Mrs. Randolph and Mike Ryan, owners of the Goodwin lode, Turkey creek district, are shipping very rich silver ore.

LOWER LYNX CREEK.—Prescott *Courier*, April 25: The Idaho mine, which is near the Happy Jack on Lower Lynx creek, carries from 10 to 18 inches of pretty good silver rock; 1276 pounds of it have just sampled $105.07. The owners are Dunlap & Tipton. They have a 20-foot shaft and propose to go deeper. As the mine is near Prescott, cost of bringing the ore here is light. John F. Blandy, M. E., arrived recently from Walker district. From him the *Courier* learns that the Dixie Co. and Frank Kuhne are employing a great many men. Mr. Williams, superintendent at Copper Basin, is running the smelter with, we hear, good success. The old chimney of the Senator is yielding plenty of ore. The Howard mill is kept running night and day. United Verde continues to ship bullion. Placer miners keep on sending in "dust." As water will soon give out, they are working hard just now.

COLORADO.

THE GUNNISON SMELTERS.—*Dispatch*, April 27: The Tomichi smelter at Gunnison is still idle. It is not in contemplation to start it up again before the commencement of shipments from Lake City in some bulk. The domain of this smelting point includes White Pine and Tomichi, Pitkin or Quartz, Gothic, Irwin, Crested Butte, Lake City, Ouray and Telluride. The two last smelting superintendents at the Tomichi or Gunnison works were Schlapp and Rapp, both of whom came from the Pueblo Smelting and Refining Co. Mr. Schlapp is now in Australia at the head of a large smelter. Mr. Rapp is with the Anaconda in Montana. Both gentlemen share the views of the writer that with an increase in roasting capacity and of capital for the purchase of enough ore in summer to last during winter months or snow blockade of mines, the Tomichi smelter can be made to pay handsomely. The necessary difference in the haul of ore to Gunnison City from the haul over Marshall Pass, the nearness of excellent coke and limestone are great advantages. By the roasting of pyrites, carrying silver and gold, the smelter will have to secure enough of iron to dispense with the purchase of iron ore at Leadville. The many smelting failures at Gunnison are no criterion. The last six months' run at the Tomichi proved the possibility of profitable treatment of ore by smelting at Gunnison.

IDAHO.

CŒUR D'ALENE MINES.—Wardner *News*, April 27: The prospects for mining during 1889 are better and brighter than in any previous year in the history of the West. It is a significant fact and one worthy of notice, the amount of foreign capital at present being put into American projects and investments of all descriptions. This desire on the part of foreigners speaks trumpet-tongued of the faith they have in all our industries; and when we see a similar desire existing among Eastern men to become interested in this portion of the great Northwest, it is sufficient proof that they recognize the vastness and undoubted possibilities of our mining regions. A glance at what has been already accomplished in our mountains cannot fail to prove satisfactory, while a further investigation will show the marvelous opportunities still offered to the enterprising and ambitious. Speculators are on the alert and are unusually sanguine, and the general impression exists that better times have come to stay, and the outlook is more satisfactory than ever.

VIENNA.—Ketchum *Keystone*, April 27: Late news received from Vienna states that the explorations now being made in the works of the Vienna mine are exceedingly encouraging, and the prospects of opening up another rich ore chute in this noted mine is daily expected. From the same source of information we learn that the Solace mine, near the Vienna, which is being worked under a lease by Jacobs, Davis & Bollew, is contantly improving and ore is being extracted valued at from 600 to 800 ounces silver per ton.

SILVER.—Idaho *World*, April 27: Samuel Boorn informs us that another silver-bearing ledge has been discovered near Garden valley, across the river from McBride's ranch, and about a mile up in the hills. The discovery was made by Edwin Smith, who, with Mr. Boorn, made the first discovery out there several weeks ago. This last discovery is about five miles from the one first made, by Boorn & Smith. Both ledges carry good silver ore at the surface. The first carries pay for a distance of 600 feet.

LOWER CALIFORNIA.

CAMP ALAMO.—San Diego *Sun*, April 25: A letter from A. G. Rockfellow at Camp Alamo, or as he interprets it, Camp Cottonwood, gives a very graphic picture of life in the gold-fields. A few ledges have already been discovered that must prove bonanzas to those who shall be so fortunate as to become their future possessors, while many more are being brought to light of sufficient promise to make this a famous quartz mining district by and by. While ledges are being discovered all around us, placers are also being brought to light that are a marvel to the oldest foreign miner in the country. In the grass roots, over hundreds of acres, they are found of sufficient richness to excite the cupidity and enlist the muscle of hundreds of stalwart men—and women too—men of almost every nationality, the women being aborigines. The pay dirt which is nearer the very surface than any other portion of the ground, is skimmed off with a shovel, thrown into a wagon or in sacks on burros, and hauled or packed to the nearest water, where it is either panned out or washed out in a miner's cradle. The natives, male or female, are great experts at panning, for which purpose they use a wooden bowl. While a small amount of gold is also extracted by the dry wind-mill method, by far the greater portion is collected in the miner's rocker or cradle above referred to. Of these there are about 200 in use in these mines. But these modes of mining are to be of but short duration, for the amount of ground skimmed over in a day by 100 earnest workers is an unpleasant surprise to those looking for permanence. Besides, water for even this kind of work is becoming scarce. The same is true of gulch or arroyo mining. In the rivers and creeks it may be prosecuted later, but to great disadvantage, as there is no water for piping or sluicing—enough for the rocker only.

MONTANA.

FROM CASTLE.—Cor. Montana *Mining Review*, April 27: The work of sinking 200 feet on the Cumberland has been completed and fine sand carbonate was found at the bottom of the shaft, below water. Fifty feet more of sinking has been contracted for, 22 feet of which is already down, all the way in ore of a high grade. One specimen assayed 1090 ounces. Of course confidence is restored to the camp by these developments. The Hensley Bros. started work on the American and Yellowstone last week and will start the smelter up again soon. A steam hoist is to be put on the American and whims on the Yellowstone and California. The Hidden Treasure, Hamden and Powderly are being worked, also the California, all good mines. A new strike was made on the Iron Chief this spring, after a winter's work by the owner, and another valuable property is added to the many in the camp.

ANACONDA.—Butte *Inter-Mountain*, April 27: The only rumor of any importance is to the effect that the Anaconda will rebuild its lower smelter which was destroyed by fire. This report came up from Anaconda yesterday, and on investigation a reporter of the *Inter-Mountain* traced it to engineer McFarland of the Anaconda Co. Mr. McFarland went East about two weeks ago and has just returned. It is understood that he has told some of his friends privately in Anaconda that the company had let a contract for an iron building to replace the smelter destroyed by fire and that it would be built at once. While this report is second hand, there is no doubt whatever that it comes as stated.

UTAH.

REVIEW.—Salt Lake *Tribune*, April 27: The receipts in this city for the week ending April 24th inclusive, were to the total value of $124,013, of which $25,134 was bullion and $98,879 was ore. The week previous the receipts were $28,834 in bullion and $29,411.80 in ore, a total of $58,245.80. The Ontario product for the week was, from ore sales, $11,655.01; bullion, fine ounces, 34,329; an approximate total of $45,984.01. Seventy shares of Ontario stock sold in New York last week, on the 16th, 17th and 18th, at the uniform price of $35. The regular monthly dividend of $75,000 is announced, payable in New York April 30th. The Daly output for the week was in ore $8424.84; sulphides, $51,354.91; fine ounces of bullion, 9013.63; a total, approximately, of $68,793.38. The regular monthly dividend of $37,500 is declared, payable next Tuesday. Base bullion receipts for the week were to the value of $13,794. The Hanauer smelter bullion product for the week was of the value of $11,350. Ore receipts in this city for the week were to the value of $37,279 by Wells, Fargo & Co., and $61,600 by McCornick & Co., the latter including $37,300 Crescent and $750 Queen of the Hills.

WASHINGTON TERRITORY.

OKANOGAN MINES.—Ellensburgh *Dispatch*, April 25: There is a tremendous rush to the Okanogan mines from Eastern Washington, the means of transportation being inadequate to accommodate the number desiring to be "first on the ground." The mining country to which this refers was formerly embraced in the Moses Indian reservation, and was thrown open to settlement over two years ago, the first settlers to avail themselves of its advantages being from Ellensburgh. Miners and ranchers had been over the country prospecting and exploring it as thoroughly as the embargo placed upon it by the Government would permit, and had discovered rich and extensive mineral-bearing ledges and also fine agricultural lands and stock ranges, abundantly watered and well supplied with timber. It was a fair land to look upon and an attractive country for the pioneer whose neighbors were becoming too numerous and near, serving notice upon him to move further to the front or bide with civilization. The ledges have since been uncovered, revealing the precious and baser metals, and development, although retarded by limited means, has shown permanent veins of great merit. Capital is now coming to the assistance of the miner, and the tide of immigration has set toward the mines of Okanogan in a manner that is certainly gratifying to those who desire to see the great Northwest settled, and its wonderful resources developed.

MECHANICAL PROGRESS.

Evolution in Mechanics.

To the ambitious and progressive mechanic of the present time, the study and knowledge of the history of the mechanical arts is one of the pleasantest and most interesting of pastimes. Nor is it alone for the purpose of following out the line of progress that has been made, that this study is of interest. It serves as an encouragement, and lends a new value to the efforts that are being made toward the perfection of that great art that has done more than aught else toward the elevation and advancement of civilization and business enterprise.

To the young mechanic, also, this study is of especial value and should be carefully followed out, as it will prove a valuable assistant and the source of interesting information, that will assist materially in the practice of his profession.

There is very little, even in the sacred history of the world, which takes us back to the earliest period of man's existence, that does not show, even at that early period, when man is supposed to have first inhabited this earth, some appreciation of the art of mechanics. Probably among the first articles of manufacture were agricultural implements and the necessary tools for their production. We may infer this from the fact that upon this depended the existence of the first inhabitants. We may also infer that as the products of the land were increased by this means, there became a necessity or a desire to branch out into lines of production, and the manufacture of other articles, that, while perhaps not absolutely necessary to their existence, in the primitive stage which then existed, was yet necessary to the advancement that has since the time of Adam been the object and aim of mankind.

Something of an idea of the inventive genius with which mankind is endowed may be gained from the fact that nothing in the line of manufacturing or mechanical appliances then existed, and whatever we of the present day enjoy in this line is wholly due to the growth and evolution of that genius, which must have then existed and which has taken thousands of years to develop, and which is yet but imperfectly wrought out, every year opening up new ideas and advanced stages of perfection. This establishes the fact that man is an inventive genius, and we will now try to follow out as nearly as possible to what purpose he has employed that gift.—*The Practical Mechanic.*

ELASTIC FOUNDATIONS FOR DYNAMOS, ETC.—As dynamos and steam engines are being introduced more and more into private houses and in neighborhoods where the vibration occasionally accompanying their operation is objectionable, some means of preventing the trouble is of special interest. In a recent communication to the Societe des Ingenieurs Civils, M. G. Anthoni describes a method of overcoming the difficulties caused by vibration and noise from engines, and the point upon which he lays special stress is, in the case of machinery, the increase of the mass of the system to be isolated and its carriage by an elastic body, such as rubber. A large trench is dug out, at the bottom of which is placed planking surmounted by a covering of sheet iron, on which are distributed a number of rubber cylinders, constituting at the same time an elastic and electric insulation. On the top of these cylinders there is placed a second plate of sheet iron riveted to a framework so as to give stiffness to the whole. On this is built a foundation in the usual way, provision being made for the foundation bolts, and sufficient space being left to properly allow of periodically cleaning the trough of any extraneous matter without disturbing the elastic support. The foundation need not be of masonry, and in some cases it might be advantageous to replace it by a caisson filled with sand, which may be easily transported. The trench surrounding the foundation is covered at the top by a plank forming a border, but so as to allow of horizontal movement. The steam and exhaust pipes are given a spiral turn at their upper ends so as to permit of their being elastic under the movement which takes place, and so as to avoid the springing of joints.

THE COMING STOVE MAKER.—"I predict the day is coming," remarked Charles H. Filley, vice-president of the Excelsior Manufacturing Company, St. Louis, "when as much inventive ingenuity will be exercised in the manufacture of stoves as in any other manufacturing industry. There is no limit to the possibilities of heat properly applied, and the stove of the future will be as far superior to the stoves of the present, as stoves now are to those of 50 years ago. It will not be many years until the successful stove manufacturer must be an inventor or else quick to secure and utilize the invention of others."

CAST-IRON JOINTS.—A writer in a foreign paper says he is of the opinion that a permanent and durable joint can be made between rough cast-iron plates by the use of mineral asbestos with sufficient mixed white lead to make a very stiff putty. This will resist any amount of heat, and is unaffected by steam or water. His attention was first called to it by a German chemist using it for mending or closing cracks in cast-iron retorts that were used for the distillation of oil and gas from cannel coal. The heat being applied to bottom of retorts and the temperature of iron maintained at a bright red heat, after a time the bottom of the retorts would crack, the larger portion of the crack being downward toward the fire. The method the chemist employed was to prepare the mixture and place it on top of a brick, then place the brick on a bar of iron or shovel and press the cement upward to fill the crack in the iron, holding it for some time until it had penetrated the cavity, and somewhat set. Of course, during this operation, the cap was removed from the retort so that no pressure of gas or oil forced the cement outward until set.

ARTISTIC WORK IN IRON.—A lecture was delivered recently at the South Kensington Museum, by Mr. J. Starkie Gardner, on "Iron and Artistic Ironwork." The lecturer began by tracing the development of ironwork used in mediæval architecture, and stated that Greece was the first country that seemed to have shown any appreciation at all for iron as a material capable of artistic use. It was also the first country that discerned the difference between art and ornament. Unfortunately, all we knew of Greek art in iron work was from Roman and Greek historians and geographers who traveled during that period. We found them, one after another, speaking in the most rapturous terms of the ironwork of Greece, and comparing it in value to the work in gold, silver and ivory. We must, therefore, recognize the fact that the Greeks were very expert blacksmiths. Of Roman ironwork we had the most complete knowledge. They revivified the work, and brought it nearer to the use we make of it at the present time. Britain, about the fifth century, was conquered by the Saxons, and the latter found that art in ironwork already existed in this country. We had examples of what early British ironwork was like in Guildhall and other places in London. The difference was in no respect great from that of Rome, except that the Britons were rather more expert than the Romans.—*Glasgow Engineer.*

OUR TIN RESOURCES.—The extraordinary demand for cans to put up fruit and vegetables on the Pacific Coast has led to the organization of a company with a capital of $1,000,000, nearly all contributed by Englishmen, to develop the California tin mines and make tin-plate. Another company, with similar purposes in view, is also said to have been organized to develop some of the tin mines in the Black Hills. Last year it is said that one hundred million cans were used on this coast. Great Britain has 203 tin-plate mills, employing, it is said, 100,000 men. It is a mere matter of a few years when the bulk of this business will be transferred to the United States, and some $30,000,000 which now goes out of the country every year in the purchase of tin-plate, will be kept at home and divided among our own miners and mechanics. When that time arrives, tin plates will be greatly reduced from their present price by American competition.

AN IMMENSE BUSINESS.—Some idea may be formed in regard to the immense business which the Westinghouse Company is doing from the fact that the Pond Company of Plainfield, New Jersey, with a large plant, are using their best efforts to supply the Westinghouse Company with lathes and other tools required by that company, who are now engaged in fitting up numerous plants in various parts of the country. The Pond Company has found the demand ahead of the capacity of their works and have just negotiated with F. E Reed of Worcester, Mass., to assist them to the extent of building no less than 200 lathes of various kinds.

ENORMOUS DEMAND FOR RAILROAD MATERIAL, ETC.—The iron and steel makers throughout America and Europe are contemplating the possibility of enormous expansion of demand for iron and steel all over the world for railroads, mills, etc. Bowthian Bell, the great British ironmaster, so predicted at a recent dinner of England's great iron-makers. Railroads are wanted everywhere. South America is filling up with English, French and Germans, who are trying to carry their trades and industries with them. Enormous quantities of steel rails and railway material are also wanted in India, Africa, Japan, etc.

THINGS MECHANICAL THAT WILL NEVER BE SETTLED.—The *Engineer* says that among them are the following: Whether a long screw-driver is better than a short one of the same family. Whether water-wheels run faster at night than they do in the daytime. The best way to harden steel. Which side of the belt should run next the pulley. The proper speed of line shafts. The right way to lace belts. Whether compression is economical or the reverse. The principle of the steam injector.

TO HARDEN METALS.—A powder for hardening metals is thus described in an English patent specification. After extracting the color from the cochineal insect, 100 parts of the residue are mixed with 202½ parts of phosphoric acid, and sufficient nitrogenous organic substance to give 32½ parts of nitrogen; the mixture is then evaporated, dried, and 50 parts of soot added. Sheet iron may be hardened by heating in contact with this powder in hermetically closed boxes.

SCIENTIFIC PROGRESS.

The Air We Breathe.

Nothing in the entire material world is today so little known to positive science as the air that surrounds us. It is fairly well known that 80 parts in 100 are of a gas called nitrogen, and 20 parts are of oxygen, but why its constitution is that of an elastic gaseous mixture, and not a chemical compound of these same gases, we can find no solution. The same gases form nitrous oxide and nitrous acid, with intensely active qualities, capable of condensation as liquids and of explosive expansion as gases again. The neutral element, nitrogen, which in the air is not condensable; which is an asphyxiating body if breathed into the lungs, and a non-supporter of combustion, is, at the same time, if chemically combined with this same oxygen, the most powerful of alteratives if not of destructives.

Are we sure that four-fifths of the vast aerial volume that surrounds the earth is so absolutely neutral as has been admitted or assumed? Is there no change of its volume or constitution possible, analogous to the changes by which oxygen unites with many other elements under the processes of oxygenation, acidification or combustion? Nitrogen is not obtained from the air by any process of separation, or combination with another element, as oxygen is separated. It is obtained only from pre-existing natural compounds, the nitrates of potash, or soda chiefly. The animal organizations to which nitrogen is a necessary element, do not assimilate it by absorption from the atmosphere; they must be fed with nitrogenous food, and must derive their requirement from pre-existing combinations of nitrogen. To breathe it in the common air, is to offer the oxygen of the air only to the assimilating power of the vital forces; the nitrogen, which is an absolute necessity to sustain the animal system, can only be obtained through the action of the digestive organs, fed with animal or vegetable nitrates or nitrogenous compounds.

As the air readily yields its oxygen, its ammonia, its compounds of carbon with oxygen, and all other volatile constituents than nitrogen itself, is it not reasonable to examine the constitution of this refractory and immovable 80 per cent of the aerial volumes, to see whether it has no capacity as yet undisclosed and no element as yet undefined?

As at present defined, the air is primarily important as a vehicle or sustaining body to distribute and supply other compounds, as oxygen and hydrogen in the form of water, and the many other gaseous or liquid compounds of subordinate gases. Much of the solid matter of the earth has had, and may again have, a gaseous form, but all these were impurities of the air, and were necessarily eliminated in order to prepare it as a medium for sustaining animal and vegetable life. Nitrogenous and ammoniacal gases are rather impurities than otherwise, and the nitrogen is in no case derived from or returned to the nitrogen of the atmosphere. In short, atmospheric nitrogen is not the nitrogen of animalized bodies or of native mineral nitrates, and it is never a gas of sensible properties or of capacity for assimilation or chemical combination.

We cannot burn the oxygen and hydrogen out of the air and leave isolated nitrogen. Theoretically, we produce certain "products of combustion," being compounds of carbon with oxygen, but not any form of nitrogenous residuals. We cannot find any nitrogen after the fire, although we may have a local atmosphere of asphyxiating carbonic acid or carbonic oxide.

In applying a powerful blast of cold air to a body of incandescent fuel, we furnish much more oxygen than the fuel unites with as carbonaceous combustion, and the outwardly delivered products of such combustion are much less in volume than the inwardly delivered quantities of air and gas, or of air alone. There is always much condensation, and also much excess of heat over the theoretical equivalent derived from the carbon consumed. It is possible to light the fire of an air-blast with a very small relative volume of carbonaceous gas, and to burn the combined volumes with the flame and without residuals or products, such as are derived from carbonaceous combustion. There is no carbonic acid or carbonic oxide gas produced when pure hydrocarbon gas is burned with 70 to 100 parts of dry air, nor is there any nitrogenous or other residual, nor any solid carbonaceous fuel required, although the heat attained reaches 3500°.

It cannot be unknown to metallurgists, whose works require the highest degree of heat, that the most perfect melting heat is that of the air-blast upon incandescent carbon, and as free from actual carbonaceous combustion as possible, the presence of the incandescent surface and the action of a powerful blast being the principal conditions. It cannot be a wholly new principle to assume that the heat is chiefly derived from a burning air-blast.

The common air, with its admitted proportions of oxygen and passive or neutral nitrogen, is in reality a compound of oxygen and *pyrogen*, the gaseous form of heat itself, and which is evolved as heat and converted into sensible heat of the greatest intensity by the blast of air delivered upon a surface of incandescent carbon.—*Lorin Blodget.*

A SCIENTIFIC ODDITY.—The model of an earthquake is a unique piece of apparatus that has been constructed by a Tokio seismologist. Patiently and laboriously following out the accurate records of a modern seismograph, Prof. Sekiya has succeeded in shaping a long coil of copper wire, so as to represent, with the utmost precision, the intricate path described by a shaken spot of the earth's surface. The model magnifies 50 times the ground's absolute motion during 72 seconds, and resembles a ball of twine unwound and thrown down in a confused heap Numbered tags show the progress of the shock for each second of time.

Why Sixty Seconds Make a Minute.

Why is our hour divided into 60 minutes, each minute into 60 seconds, etc.? Simply and solely because in Babylon there existed, by the side of the decimal system of notation, another system, the sexagesimal, which counted by sixties. Why that number should have been chosen is clear enough, and it speaks well for the practical sense of those ancient Babylonian merchants. There is no number which has so many divisors as 60. The Babylonians divided the sun's daily journey into 24 parasangs, or 720 stadia. Each parasang or hour was subdivided into 60 minutes. A parasang is about a German mile, and Babylonian astronomers compared the progress made by the sun during one hour at the time of the equinox to the progress made by a good walker during the same time, both accomplishing one parasang. The whole course of the sun during the 24 equinoctial hours was fixed at 24 parasangs, or 720 stadia, or 360 degrees. This system was handed on to the Greeks, and Hipparchus, the great Greek philosopher, who lived about 150 B. C., introduced the Babylonian hour into Europe.

Ptolemy, who wrote about 140 A. D., and whose name still lives in that of the Ptolemaic system of astronomy, gave still wider currency to the Babylonian way of reckoning time. It was carried along on the quiet stream of traditional knowledge through the Middle Ages, and, strange to say, it sailed down safely over the Niagara of the French revolution. For the French, when revolutionizing weights, measures, coins, and dates, and subjecting all to the decimal system of reckoning, were induced by some unexplained motive to respect our clocks and watches, and allowed our dials to remain sexagesimal, that is, Babylonian, each hour consisting of 60 minutes. Here you see again the wonderful coherence of the world, and how what we call knowledge is the result of an unbroken tradition of a teaching descending from father to son. Not more than about 100 arms would reach from us to the builders of the palaces of Babylon, and enable us to shake hands with the founders of the oldest pyramids and to thank them for what they have done for us.—*Max Muller.*

EFFECT OF DRAINAGE ON SOIL TEMPERATURE. Because in working the soil in sunny weather the surface becomes quickly dried, which is not the case when there is no movement of the soil, leads to the impression that if the soil becomes more thoroughly aerated, either by cultivation or by underdrainage, and the formation of air spaces by the withdrawal of any water that may exist in the soil, it must as a consequence become warmer and so more liable to injure any growing crop. This is an erroneous impression, as can be demonstrated by the continual stirring of the soil on one plot and leaving the same without stirring in another, in which case crops will endure dry weather longer in the first case than in the other. While the surface in the first case may appear to be dry and hot, a little below the surface will almost always indicate a fair degree of moisture and no greatly unusual degree of heat. Loosening of the soil seems to set into activity a capillary action that draws moisture from below, and so in reality renders the soil more moist. In recent years tests have been made with the thermometer, and it is found that the soil temperature of underdrained land is but a little higher than where it is not drained. This was tried at the Canebrake Experiment Station, Alabama, during the months of August to December inclusive, and the temperature in no case was increased over two degrees, which might easily be attributed to the passage of warm air. But no injury can result so long as the soil moisture is in reality increased.—*Ex.*

AN EXPERIMENT WITH THE MEMORY.—Starting with the word Washington, write down 100 words just as they occur to you. Let your second word be the one which Washington naturally suggests to you. Possibly it will be capitol. It may be president. Take the word which first comes into your mind. In the same manner let the third word be suggested by the second, the fourth by the third, and so on. Be careful that the third word is not suggested by both the first and second. Drop the first entirely, and let your mind go from the second alone to the third. Having written this list of words, you will have furnished yourself with a cheap but very useful mirror of your mind. If you are able to use this mirror you may discover some very serious defects in your mental processes. You may discover that you think along certain lines too frequently. You may discover that you are using superficial principles quite too much to the neglect of more important laws of mind. You will thus be led to avoid certain linkings and to encourage others of a more philosophical nature.—*Chautauquan.*

THE EARTH'S CURVATURE.—The surface of the earth in one geographical mile "falls away" or departs from a straight line 8.04 inches.

USEFUL INFORMATION.

The First Sleeping-Cars.

It seems that the first car for the sleeping-car business was built under the supervision of Mr. T. T. Woodruff at the Wason shops, Springfield, Mass., in the early part of 1857. Mr. Woodruff and his associates built this car without a fixed arrangement for its use or even a prospect for a contract for operating such cars. The privilege to use these cars was by the inventor offered to several railroads free, for an indefinite time, if any road would be at the expense of building and introducing them to travel, but without effect. However, the money, credit and labor were furnished as follows: O. W. Childs of Alton, Ill., furnished some cash and indorsed some paper; John Miller of Alton, Ill., and George R. Dykeman of Alton furnished some money. T. T. Woodruff of Watertown, N. Y., having no money, gave his own labor to the extent, including patents, of one-fourth interest, the other three gentlemen holding a fourth each. The total cost of the first car was between $5000 and $6000.

Trial trips were made in the latter part of 1857 over several railroads—the New York Central, Buffalo & Cleveland, Michigan Central, Chicago & Alton, Terre Haute, Alton & St. Louis, Cincinnati & Indianapolis and Pittsburg, Fort Wayne & Chicago—without any encouragement being given to its adoption. Finally the Pennsylvania Railroad Company put the car in service on that road, where it was subsequently burned.

The first berth fare collected was by G. R. Dykeman. It was a Spanish 25 cent piece, and I have heard him say that he would give $100 for that quarter. The four pioneers named subsequently became quite wealthy and closed out their interest to the Pullman Palace Car Co. early in 1870. Geo. R. Dykeman is the only one of the four living. It is said that Jonah Woodruff ran as conductor between Philadelphia and Pittsburg 365 days in 1858 without the loss of a single trip.

But 30 years have elapsed since the first sleeping-car began to run, and only see what has come out of so small a beginning.—*Railroad Gazette.*

FIRES IN OLD ROME.—From a work on "Ancient Rome in the Light of Recent Discoveries," it has been ascertained that the police-firemen of the Eternal City had their hands pretty full. Rome seems to have harbored many incendiaries, and to have been singularly inflammable, even after most of the buildings were of stone or marble. There were no insurance companies in those days to tempt to arson, but there was a system which operated in the same way. When a citizen was burned out it was the custom of all his friends to make him handsome presents, and so it happened that a poor man might easily find his fortunes improved by the destruction of his dwelling. Such a custom, of course, was absurd, and this alone led to the appointment of officers who appear to have exercised functions closely akin to those of our fire marshals. Prof. Lanciani is puzzled by the burning of many of the Roman temples and public buildings, in the construction of which no wood was used, and he instances the destruction of the Temple of Apollo. Possibly some phenomena of the great fires in Chicago and Boston might help to clear up this mystery. It was shown in those conflagrations that when a body of fierce heat had been created by the burning of naturally inflammable structures, those which were thought fireproof may then take fire and burn, and quite possibly this is what happened in Rome. No doubt it was the case on the memorable occasion when Nero, desiring to secure more land for his palaces, and to reconstruct the city, caused it to be set on fire in several places at once, after having thoughtfully provided a quantity of wooden booths for the shelter of the citizens he had resolved to burn out. Great fires in those unlighted streets must have been enjoyed far more by the Roman thieves than by the Roman police-firemen. How the latter fought the fires is not known, save that they had no steam fire engines. Plenty of water they certainly did have, for no city was ever so magnificently supplied with aqueducts as Rome, and yet she used the Tiber as a sewer.— *Fire and Water.*

PRACTICING WITH THE BOOMERANG.—An exhibition of boomerang-throwing was recently given by a party of Australian natives at Munster before some German scientific men, who are endeavoring to discover the cause of the boomerang's curious flight. The instruments used were of two sizes, the larger being a slender crescent about two feet long, 2½ inches wide, and one-fourth inch thick, made of an exceptionally heavy Australian ironwood. This boomerang was jerked up into the air about a hundred yards, when it flew straight away, then turned to the left, and returned in a curved line back to the thrower, whirling around constantly and whizzing unpleasantly. One badly directed projectile passed through a spectator's hat and with a cut as clean as that of a razor. We have not heard what conclusions the German scientists have come to, or whether they have satisfactorily solved the problem; but, according to a German manufacturer, who has made some 11,000 toy boomerangs, the mystery of the movement lies in the shape, the boomerang having a sharper curvature in the middle, with unequal length of the two arms, which must be made of equal weight by unequal thickness. The peculiarity of motion is said to be due to the difference in the length of the arms, which diverges the curve of rotation from the circular.

EXPERIMENTING WITH SOILS.—The necessity of experimenting with soils to ascertain what elements they require is well shown by tests at the Kentucky experiment station. An illustrated report of these forms a feature of the *American Agriculturist* for March. The pictures show the entire crop of cornstalks and grain grown on one-tenth acre plats manured with nitrogen, phosphoric and potash alone, and in various combinations. The striking result is, that on potash alone the yield was at the rate of 80 bushels of ears per acre and nearly three tons of fodder, whereas on a complete fertilizer furnishing all three elements, the yield of both grain and fodder was much less, and it was still less where the other elements were applied, showing conclusively that the great want of this particular soil was potash. Similar experiments at the Massachusetts experiment station, which have been continued for several years, show the same result, and are also finely illustrated.

THE LATEST APPLICATION of the velocipede principle has been made by a sportsman, who made a sled to run upon the ice, which he propelled by means of foot pedals, the same as a bicycle. The wheel which is rotated by the pedals is fitted with steel spurs, which take hold of the ice, and it may be revolved at various ratios of speed to that of the pedals. The resistance of friction is so slight that it is said very high rates of speed are attained by it. When the wind is favorable the propelling-wheel is lifted off the ice and a canoe mast and sails used instead.

HOLLOW POROUS EARTHENWARE used in a Chicago auditorium ceiling was thoroughly, although accidentally, tested recently. A coping stone, weighing nearly two tons, fell from the outer wall of the auditorium building, cut its way as with a chisel through the tiling of the first intervening floor, and stopped on the next, where it was allowed to remain on exhibition for several days to show the strength of the material. When the hole was patched up, the floor was as good and strong as new, not having been disturbed in any other part.

A HANDY LUBRICANT.—Persons who are annoyed by a creaking door do not always have oil at hand, or do not care to use it for fear of soiling the hands and the woodwork. But nearly everybody carries a lead pencil. If the hinges are rubbed with the point of a pencil the creaking will cease, graphite or plumbago being one of the best known lubricants.—*Iron.*

GOOD HEALTH.

REGULARITY OF HABIT.—One of the most difficult of all the minor habits to acquire is that of regularity. It ranks with that of order. The natural inclination of most persons is to defer until the last possible moment, or to put off to another time, where this can possibly be done. Yet habits of regularity contribute largely to the ease and comforts of life. A person can multiply his efficiency by it. We know persons who have a multitude of duties, and who perform a vast deal of work daily, who set apart certain hours for given duties, and are there at the moment and attend rigidly to what is in hand. This done and other engagements are met, each in order, and a vast deal accomplished, not by strained exertion, but by regularity. The mind can be so trained to this that at certain hours in the day it will turn to a particular line of duty, and at other hours to other and different labors. The very diversity is restful, when attended to in regular order. But let these be run together, and the duties mixed, and what before was easy is now annoying and oppressive, and the exact difference between many is just at this point. There are those who confuse and rush, and attempt to do several things at once and accomplish little, while another will quietly proceed from one duty to another, and easily accomplish a vast amount of work. The difference is not in the capacity of the two, but in the regular methods of the one, as compared with the irregular and confused habits of the other.

THE INFLUENCE OF THE ELECTRIC LIGHT UPON THE EYES.—Some very interesting statements regarding the influence of the electric light on the eyes were recently made at the Russian Medical Congress by Dr. Lubinsky of Cronstadt, says the Chicago *Inter-Ocean*. During the last ten years he has had the opportunity to observe 30 cases of diseases of the eye in young seamen who were obliged to serve in the vicinity of the electrical apparatus. The symptoms of the disease, which Dr. Lubinsky calls photo-electric eye inflammation, are quite unique. They appear only during sleep; the patient is suddenly awakened during the night by a copious flow of tears which pour from the eyes, accompanied by a vehement pricking pain. At the same time there arises an unusual aversion to light. Upon examination of the patient there is found a swelling of the eyelids and a strong flow of blood from the corner of the eye. On further examination of the inner eye it is discovered that the entry-points of the optic nerves in the skin are reddened and the arteries of the same filled to excess. These evidences of illness are modified within one and a half to three hours, the patient again renews his interrupted sleep, and awakes the next morning perfectly well, save possibly for a slight weariness of the eyes, such as is experienced after a long reading by lamplight. That sleep is an absolute necessity for the appearance of the disease is evinced by the fact that the persons who have submitted their eyes to the rays of the electric light in the morning and have fallen asleep after dinner were then attacked with the disease, but were free of the same the following night. So long as the person is not in a state of sleep there is no evidence of the appearance of the disease, and he is able, during the evening before, to read and write. Even if the exact nature of this peculiar disease is veiled in darkness, it is nevertheless clear that it is accompanied by a strong flow of blood to the nerves of the eye and an inflammation of the cornea.

BRIGHT'S DISEASE IN AMERICA.—An Albany physician declares that Americans suffer more generally from Bright's disease and nervous disease than any other people, and he says that the reason is that Americans sit down so persistently at their work. He says: "Americans are the greatest sitters I ever knew. While Englishmen, Germans and Frenchmen walk and exercise, an American business man will go to his office, take a seat in his chair and sit there all day without giving any relief to the tension of the muscles of the back. The result is that these muscles surrounding the kidneys become soft and flabby. They lose their vitality. The kidneys themselves soon become weak and debilitated. If Americans would exercise more, if they would stand at their desks rather than sit, we would hear less of Bright's disease. I knew of a New York man who had suffered for some years from nervous prostration until it was recommended to him that he have a desk at which he could stand to his work. Within a year he was one of the healthiest men you ever saw. His dyspepsia and kidney trouble had disappeared and he had an appetite like a paver!"

MARRIAGE STATISTICS IN ENGLAND.—It is said in the *Pall Mall Gazette* that each year 15 people out of every 1000 marry. Of each 1000 men who marry, 861 are bachelors and 139 widowers, while of each 1000 women only 98 have been married before and 902 are spinsters. Twelve marriages out of every 100 are second marriages. The average age at which men marry is about 27, while the average at which women marry is about 25 years. Out of every 1000 persons, 602 are unmarried, 345 are married and 53 widowed. Over one-half of all the women between 15 and 45 are unmarried. Married women live two years longer than single ones. If the mother dies first the father survives 9½ years, but if the father dies first the survival of the mother is 11½ years as an average. Two thousand four hundred and forty-one births occur in England daily—about 33 for each 1000 inhabitants. February is the month in which the greatest number of births occur, June the month in which occur the fewest. The average number of births for each marriage is 4.33. In every 1000 births 11 are twins.

DISORDERS OF THE LEFT SIDE.—Dr. Henry Duchenne has drawn up a list of the disorders which especially affect the left half of the body, and concludes therefrom that it possesses a biological inferiority to the right. He says obliterating arteritis affects the left Sylvian artery oftener; tubercle affects the left lung oftener; calculous nephritis and renal cysts the left kidney; ovaritis the left kidney; orchitis the left testicle; varicocele the left spermatic veins; neuralgia, chorea, hysterical anæsthasia, the left side; cancer of the breast the left mamma.

TELEGRAPHY AND FINGER-NAILS.—A correspondent mentions that two telegraph operators, a male and female, both otherwise healthy subjects, are being treated in Berlin for a newly developed ailment, namely, the dropping off one after another of the finger-nails. Prof. Mendel attributes this curious affection as the result of the constant jar caused by hammering and pushing with the finger-ends in working the Morse system of telegraphy.

VACCINATION IN PARIS.—In Paris, where vaccination is but feebly enforced, the annual mortality from small-pox averages about ten in 100,000 inhabitants, and in the Canton of Zurich since the compulsory ordinance was repealed the mortality has risen from eight per 100,000 to 85. On the other hand, in the German cities, where vaccination is compulsory, the mortality is 1.44 per 100,000, and in London only 0.6.

POISONED BY GREEN FLANNEL.—A young daughter of Milton Blake of Keene, N. H., became seriously and mysteriously ill. Finally it was suggested that the illness might be due to the new green flannel dress she had been wearing. A piece of the goods was analyzed by a chemist, and found to be heavily loaded with arsenic. The girl had been poisoned.

DEATH FROM LIME-JUICE.—Mary Ellen Sullivan, a three-months-old baby, died at her parents' residence, 204 Van Ness avenue, recently, from the effects of an overdose of lime-juice, which had been administered by her mother.

ELECTRICITY.

MODERN ELECTRICAL THEORIES.—As time passes, and the heretofore unconnected links are supplied and put together in the chain of evidence to support our hypotheses on the nature of electricity, says the *Electrical World*, the truth is forced upon us that the theory which at the present time may be said to be an established one among men of science is fairly accurate, and certainly comprehensive enough to embrace all the phenomena which are known. In discussing the modern views regarding the electric current, Prof. H. A. Rowland shows that a few striking phenomena, taken together and reduced to one primal cause, point quite conclusively to the necessary existence of some medium by which electrical action, whatever its nature may be, is transmitted, this medium being placed in a state potentially which it did not possess before the electrical influences were applied to it. Prof. Rowland points out very forcibly that we have to consider not only actions which go on within the conductor, transmitting the so-called manifestation of force, electricity, but that that peculiar state is equally existent beyond the limits of the conductor in space; and, indeed, that electrical disturbances are transmitted into space far beyond what is generally supposed to be the case, due entirely to the transmitting medium, the ether. "The electric current is an unsolved mystery," says Prof. Rowland, "but we have made a very great advance in understanding it when we know that we must look outside at the disturbances in the medium before we can understand it."

DETERIORATION OF COPPER BY ELECTRIC CURRENTS.—M. Firmiu Larroque has been investigating the question of the deterioration of copper under the long-continued action of electric currents. His experiments have been four years in progress and would seem to fairly establish the fact that the action of long-continued currents is to cause a great alteration in the molecular structure of the copper. M. Larroque takes 36 strips of copper each ten millimeters in width and three millimeters in thickness. Some are bent into spirals, some into zigzags, some are annealed and some hard-drawn. A constant current is sent through each strip; in one set it is continuous, in the other it is alternating (75 reversals per second). The strips are suspended from a frame and kept stretched by weights of ten grammes, the loss of elasticity being measured by the elongation of the spirals. For the first eight or nine months nothing was observed, but after that slow elongation set in, the effect being more marked with alternating than with continuous currents, with large currents than with small. From the fact that all the specimens of copper wires which have deteriorated in this manner present many of the properties of ordinary electrolytically deposited copper, it might be useful to investigate the effects of long-continued currents on conductors, built up by electrolysis. It might be reasonably assumed that there would be no further tendency to alteration of texture in this case.

THE VALUE OF BRAINS.—There is romance in the announcement that the four leading Edison companies are to consolidate into one general electric company, with a capital of $12,000,000. What a proof this gives of the value of first-class human brains! Here is a business aggregation that springs from the ingenious wits of one man. A few years ago Thomas Edison was a poor and obscure telegraph operator. To-day, by devising machinery of advantage to the human race, he is a millionaire and the means by which others acquire immense wealth. Yet no one is injured. The new fortunes come from traits of observation and mechanical wit that lay hid in the brain of one poor, wise man. There are mines of the mind that are richer than any which the geologist finds in the mountains.—*Dover Democrat.*

IMPROVEMENT IN THE ELECTRIC-WELDING PROCESS.—The ordinary methods of electric welding, by passing the current through the points to be fused together, are not convenient for all purposes, and Professor Samuel Sheldon of Harvard University suggests what he believes would be better for many cases. The pole of a powerful magnet strongly attracts or repels the electric arc, which may by this means be driven out sidewise into a point very similar to the point of flame projected from an ordinary blowpipe. At the end of this point the heat is intense, being sufficient to melt large copper wire instantly and to fuse any of the metals. It would serve admirably for welding, and a slight alteration would fit any arc lamp to perform the double function of lighting and welding.

WELDING CUT-BALE TIES.—This thing has been made possible by the electric-welding process, and the Thompson Electric Welding Co. has perfected a machine for this purpose. By its use cut ties can be easily united, and the pieces that accumulate at the compresses, which are so well known in the South, can be very quickly made up into proper lengths for use.

JAPAN is taking up the subject of electricity with the same promptness which she has shown toward other branches of applied science, and a society for the furtherance of electrical research has been formed there with a membership of 800.

Passing Events.

The celebration of the anniversary of the inauguration of George Washington as the first President of the United States, has occupied public attention this week. In all the larger cities there were appropriate ceremonies, New York taking the lead. In San Francisco the day was celebrated by a general holiday, a procession, literary exercises, etc.

Considerable prospecting is now going on all over the State, especially in Shasta, Trinity and Siskiyou counties. These northern counties have been more or less neglected for years, but of late have come to the front, and still afford a broad field for the prospector to work in.

Owing to numerous accidents on the cable-car street roads in this city of late, there is a public demand for additional safety appliances. There is a good opportunity for inventive genius in this direction. A number of guards have been devised, but none as yet seem to meet the requirements of the roads which have steep grades.

There seems to be a generally revived interest in mining matters in the southern part of the State. This is not only apparent in quartz mines, but in the development of clay beds, stone quarries, oil and gas wells, bitumen, etc. Many of these substances are now being eagerly sought for, since there is now a market for such products.

Proxy Voting at Mining Elections.

The failure of the last Legislature to pass a more stringent law defining the voting by proxy at corporate elections has awakened renewed attention to the suit now in the Superior Court of this city of Coll Deane et als. vs. the Challenge Consolidated Mining Co., Roger Johnson and J. M. Nougues, attorneys for plaintiffs.

This action was commenced on Dec. 24, 1888, to enforce the provision of Sec. 312, Civil Code of California, which provides that only bona fide stockholders shall vote at corporate meetings. A practice has prevailed here of issuing all the stock of a mining company to a few individuals as "trustees" and permitting it to stand as issued on the company's books, while the stock itself has been transferred by indorsement to bona fide owners and scattered throughout the country, notwithstanding which the few stockbrokers in whose names it appeared to stand on the books of the company were permitted to vote either in person or by proxy at the annual meetings and thus control the elections of officers without having any individual responsible pecuniary interest therein. This practice has been upheld by the claim that the Supreme Court of California had sanctioned it when it decided that for all the purposes of an election the company need look no further than its books to see who was entitled to vote, and in consequence thereof a demurrer to the complaint was introduced in this case. On Jan. 11, 1889, the demurrer was overruled, and thereby the principle contended for by plaintiffs was established. Among the better informed it is claimed that Judge Wilson's decision will, no doubt, be sustained by the Supreme Court.

The Celebration.

The celebration of Washington's inaugural was carried out in this city very well indeed. The main feature was a procession in which the Government troops, State militia and civic societies participated. It was well arranged, started promptly, and was, altogether, one of the best we ever had here. The shipwrecked sailors from the Vandalia, who walked in the procession, were cheered all along the line. One of the most interesting features was arranged by the California Pioneers. After the Veterans of the Mexican War came a band of vaqueros. The next picture consisted of a representation of an emigrant train crossing the plains. Five emigrant wagons and three pack mules performed the allotted parts. The first was a thoroughly broken-down old wagon, covered with white canvas, in which a number of men were seated. On a piece of calico were the words: "Californy or bust."

Behind came another equally dilapidated looking turnout, drawn by four oxen. It bore the legend, "Pike county, by gosh." A third was drawn by a team of three horses and on the front seat a woman and a number of children were seated. A string of pack mules, laden with flour-bags, shovels and frying-pans, came next. At the hind strode prospectors in their red shirts and high boots. A scout with his gun across his saddle-bow rode beside them.

There were then some floats representing mining days. On the first were a number of miners seated round manzanita bushes in front of a tent and playing cards.

A second represented a mining camp, with rockers, pans, etc. The third contained a big bear inclosed in a cage, and he attracted a tremendous amount of attention along the route.

The main body of the pioneers followed, the majority marching as courageously as if they had only arrived on the coast in 1889 instead of in 1849. To a large proportion of the crowd on the streets these representations were entirely novel, showing that we have outgrown the era of mining as far as early customs connected with surface mining are concerned.

THE Plumas-Eureka Mining Company has declared a dividend of 50 cents per share, aggregating $72,312, payable immediately. This makes a total of $2,495,313 paid to date.

The Davis Horse-Power Hoisting Whims.

(*Continued from page 313*)

and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other machines, occasioned by the breaking of the gear teeth when throwing them in and out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature that greatly increases capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact and can be packed for transportation by mules. Their cost of erection is very slight, two men in half a day being able to put one in place, ready to work.

With each machine working drawings are furnished, showing in detail the proper construction of gallows-frame and foundation for hoisting whim.

The capacity stated below is nominal. In actual trial the No. 1 whim has hoisted 1200 pounds with one horse and single line without undue exertion on the part of the horse.

No. 1—Capacity with one horse and single line, 800 lbs., 75 feet per minute. No. 2—Capacity with one horse and single line, 500 lbs., 125 feet per minute. Dimensions of hoists Nos. 1 and 2—Drum, 22 inches in diameter, 18 inches long; bed plate, 3 feet 10 inches long by 2 feet 8 inches wide; ½ inch wire or 1¼ inch hemp rope is the proper size of rope to use.

Weight of machine, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

The Joshua Hendy Machine Works of Nos. 39 to 51 Fremont street, this city, are the agents for the sale of these whims, and they assure us that they are prepared to furnish them at a lower price than any other form of whim of equal capacity now offered in the market.

A Peculiar Sand.

W. E. Bainbridge showed us this week some sands from San Bernardino county, in which there are many garnets and other small and brilliant stones. He informs us that an examination by parties in Boston reveals the existence of very small diamonds, and he is going back to see if larger ones can be found. Some of the garnets are as large as a pea, and the small ones are very numerous.

This sand is found in a sort of conglomerate filled with fossils. It is in layers and in the decomposed material numbers of the garnets and small stones are found. On one side of the deposit the country rock is slate and on the other sandstone. The sand comes from the conglomerate after it is washed.

Mr. Bainbridge brought up a lot of this sand thinking that from its sparkling and brilliant nature it could be utilized for a finish to fine wall paper. He had no idea there were any small diamonds until he heard so from Boston, where the sands were sent for examination. But now he will make further search to see if some larger ones may not be found.

DEATH OF CYRUS PALMER.—News has been received of the death of Cyrus Palmer at Westfield, N. J. Mr. Palmer was very well known in San Francisco. He came to this city in 1849, and continued a resident here until he went East in 1883 on business for the Golden State and Miners' Iron Works of this city, of which association he was an active member. He was one of the founders of the Miners' Iron Works, afterward consolidated with the Golden State Iron Works. He served with credit in two terms of our State Legislature. Mr. Palmer was a popular man among his associates, being of a genial nature with generous attributes. His death was probably due to heart disease, as he has been subject to attacks resulting from heart trouble.

THE Jay Gould mine in Montana has produced bullion to the amount of $773,000 and divided $365,000 among stockholders. The dividend rate is not large, but the dividends come around as regular as the months.

Mexican Mining Districts.

Birimoa.

In last week's PRESS we gave the results of an interview with Mr. Alex. H. Dubois concerning Mexican mines and miners. This week the subject is continued. Mr. Dubois informs us about many camps which are scarcely ever heard of here. He has prepared for the PRESS a map of these districts, which we shall publish next week with further descriptions of the mines.

Ten miles south of Canelas is the important mining camp of Birimoa.

Here there are strong veins, which, however, are barren, except where intersected by cross-veins, thus forming two valuable and important mines. Santo Nino has a chimney of ruby silver ores, frequently massive pyrargirite. It was extensively worked about 1850-60 by M. M. Careaga, a Spaniard, then owning Juliana and other mines in Topia. It produced several million dollars, of which a large amount was net profit. Most of the ore was exported. It is not worked at present. The San Francisco, also a large chimney of ore on another intersection, small on top, but increasing downward like a sugar-loaf. So far, it is only moderately developed. The owner is D. Eraclio Amador. In 1886, I sampled 500 tons for sale, consisting of one-half pyrite and one-half quartz, and found an assay value of 85 ounces troy silver and 3 ounces troy gold per ton. These ores were being sold to small leaching works in the same camp and worked very roughly, and yet with fair result (as to the silver), although the crushing was through a No. 4 or 5 screen. A slight amount of copper in said pyrite will account for the docility of the ores.

Lately, I understand, another mine adjoining the San Francisco, and probably on the same vein, has produced large quantities of rich exporting ores worth $300 to $400 per ton, mostly Ziegelerze carrying silver chloride.

Many other mines in the same camp are at present unworked or worked only on a very small scale. This is a very likely camp for legitimate work by real mining parties. The main drawback is lack of water, and fuel is rather expensive. Water is abundant, and perhaps water-power available some five to six miles away over rugged ground.

Northwest of Topia, 40 miles on Sianori river, is

Sianori, an Old Spanish Mining Camp.

The mines are gutted above water level. They are now worked by D. Eraclio Amador. There are steam pumps on the Xicotencatl mine, which is 400 feet deep. The ores are copper-silver glance, mainly worked by stamp and Frue vanners in a mill originally (1886) steam-power. There were 10 stamps, 4 Frue vanners, 2 pans and settler, I hear, the mill now enlarged and moved by water-power. Here there is a very deep valley and very bad roads; indeed, the worst met with in 20 years' traveling in Mexico in the mountain mining camps.

Other valuable mines are the Animas and others on the same lode, rich ores of copper-silver glance and argentite carrying some gold. The mine is gutted above water level. This camp, which was completely abandoned after the expulsion of the Spaniards, was taken up by D. Zeferino de Anitua (Sombrerete and Topia), who cleaned out the old mines, but found them gutted above water level and was unable to handle the water, which was quite abundant. Subsequently Amador placed a steam pump in the Xicotencatl mine and reached 11 rich pillars, which produced $200,000 of exporting ores besides some 6000 to 8000 tons good milling ore worth $50 to $80 per ton, which, proving rather rebellious, has been worked up by concentrating on Frue vanners. Xicotencatl is still being worked and produces considerable fair ore.

This is a very important camp; in fact, one of the best left by the Spaniards, who had not had time to work it out when expelled. It is worthy of serious enterprise in mining below water level. Water is abundant in the mines.

The water-power is sufficient. There is a good ditch several thousand feet long with large fall. The river is treacherous, rising suddenly many feet and destroying all on its passage.

Small Mining Camps Worthy of Investigation.

Southeast of Sianori is a small mining camp, La Galana, with superficial workings by gambusinos on numerous veins, frequently producing very rich ores bearing gold and the silver minerals proper; these are either exported or ground in arastras.

North of Sianori we find the Fresno mine, a large deposit of $30 to $40 free-milling silver ore, mainly worked by gambusinos; and the Ciruelo mine, also an extensive deposit of silver ores, intermingled with lead sulphurets fit for concentrating.

West of these is Norotal, where we find the old Spanish mine, Villamoros, of great repute. I am informed that it has been lately partially drained out and abandoned, as no ore was found in sight; true, no development work was attempted. Do people actually suppose that the natives will abandon a mine as long as pay ore is in sight?

Near this we find the Cinco Senores mine, a half-developed prospect on a deposit consisting of a large fissure vein some 60 feet in width (in the red porphyry), and in this we distinguish several bodies of quartz carrying rich fahlers ($2000-$2500), pyrite ($250), and rarely pyrargyrite; also bunches of galena ($50 per ton);

these ores are fit for jigging. A "fault" checked the further development of this mine, which is likely on investigation to prove a valuable property, susceptible of being worked by levels on the deposit. This mine is worthy of attention; besides, the Norotal district contains many mineral veins well worthy of serious investigation.

Quebrada Honda Gold Mines

Further west yet Quebrada Honda is an almost abandoned mining camp, with several strong veins which have at surface yielded rich gold ores. Veta Grande is a body of quartz standing out boldly and shows some gold. On this is an old shaft full of water and said to be 200 feet deep. I saw a few years ago average $25 gold ore broken from superficial workings, now full of water, on a branch of the Veta Grande. This ore, besides the gold, carried argentite and haematite rich in silver.

A New Camp on Virgin Ground.

Turning to the north one day's journey brings us to the Ferry on the Humaya river at Embarcadero. Crossing here, we proceed up the San Fernando creek and soon reach an undeveloped mining camp of great possibilities if properly developed. This is called San Fernando.

La Providencia is a prospect 60 feet in depth on a lode 15 or more feet in width, the average assay value of which I found to be 20 ounces silver and $5 per ton consisting of galena, blende pyrite, and evidences of fahlerz in a greenish-gray felsitic matrix showing some quartz. Near the bottom of the workings veins of massive fahlerz from half an inch to one inch in thickness assaying 480 ounces silver and 8 ounces gold per ton have made their appearance. The bulk of the output would dress (by jigging) to about one-sixth of clean sulphurete.

A very favorable location for reduction works lies within 2000 feet from the mine, sufficient water for a large establishment being available, and plenty of fuel, the fire-wood and charcoal being cheaply obtainable. Timber is also available, and the base of supplies, Culiacan, within reasonable distance.

In the immediate vicinity exist numerous strong veins, some of them somewhat developed by prospect shafts, all carrying base ores, mostly pyrites, copper pyrite, blende galena, and some fahlerz, all of which usually show good assay values in gold and silver.

There is an abundance of limestone within seven or eight miles for fluxing purposes.

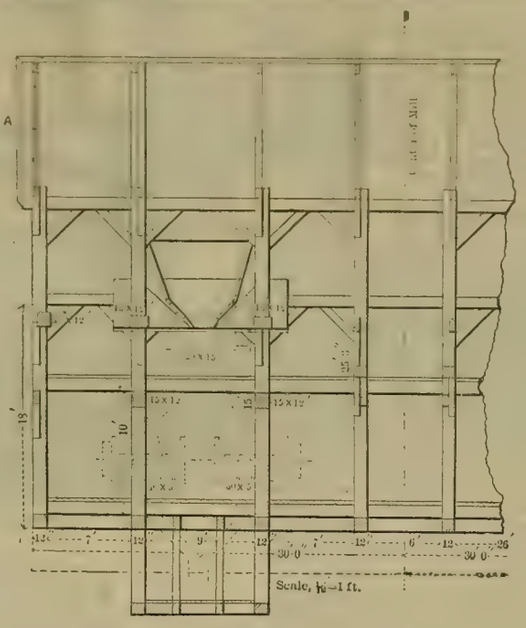
The San Fernando district is virgin ground, not even well prospected, and invites enterprise.

THE Port Townsend *Call* says that a Castle Rock man procured a bushel of the best English coal at Seattle and sent it to experts in Portland as a sample from his own mine. After some time the reply came: "The sample of Cowlitz river coal you sent us is worthless, and we would not advise you to ask much for your mine." When informed that the "worthless" coal was a good imported article, the "experts" had very little to say.

WHEN the addition to the Treadwell mill at Sitka is finished the mill will be the largest in the world, 360 stamps.

The Blake System of Fine Crushing.

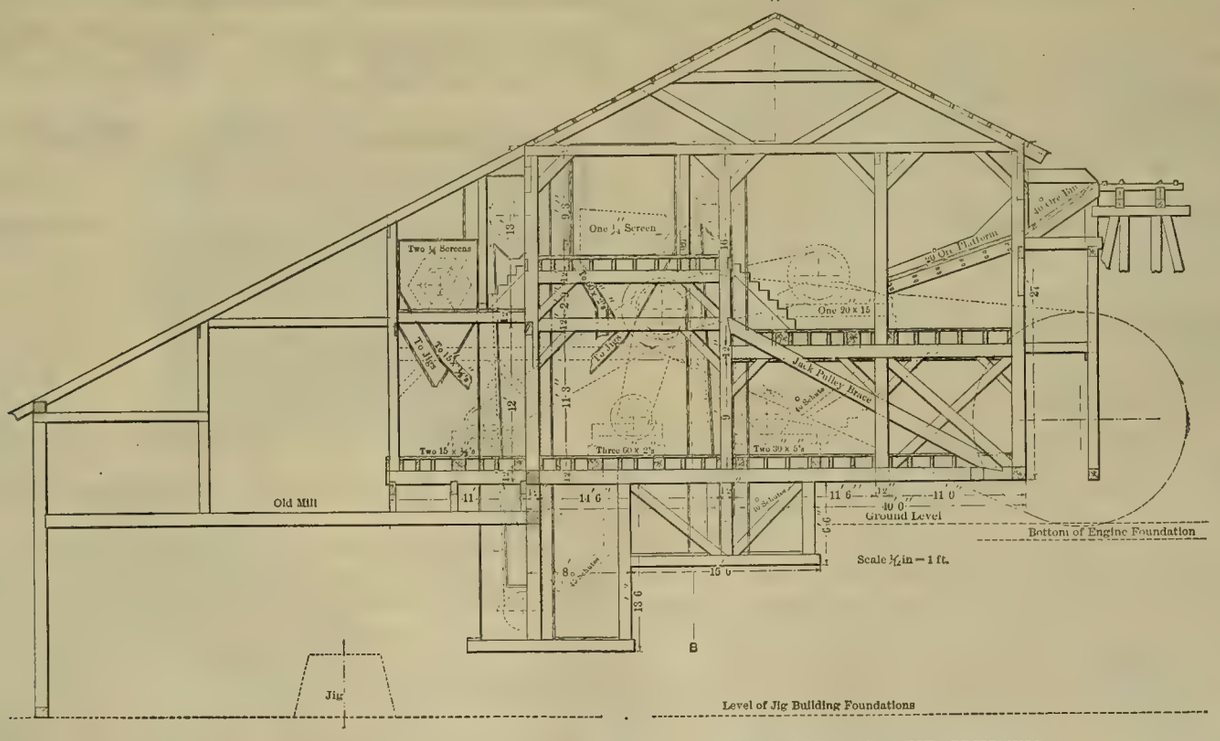
The PRESS of last week was published a description of the Blake system of fine crushing of ores, in which Blake multiple-jaw crushers and Chile mills are used. In 1886 plans and machinery for the second mill on this system were furnished to the Chateaugay Ore and Iron Co., Lyon Mountain, N. Y. Illustrations showing the design of this plant are herewith presented. This was a complete crushing and concentrating plant, the crushing being done entirely by Blake crushers, and with a daily capacity of 600 long tons, from 15 inches down to one-fourth of an inch, and it was built in accordance with plans shown in the figures. The iron-ores of this company are known as being among the best, if not the best, Bessemer ores in the country. The deposit or vein of magnetic iron-ore is enormous, and the output from this mine often exceeds 1500 tons daily. The richer portions are sorted out and shipped; the leaner ores, consisting of magnetic iron-ore in grains, disseminated through a tough quartz-ose and feldspathic gangue, are sent to the mills for concentration. In order to effect this by jigging, with best results, it must be reduced to a size to pass a one-fourth-inch or five-sixteenths-inch round hole. The jigs used are those known as the Conkling, with an annular revolving sieve and central discharge, said to be the invention of Mr. Hooper of the American Graphite Co. and improved in some details by W. B. Hodgson. The concentrates pass into a hutch, from whence they are taken out by belt elevators. The capacity of one of the jigs, as run at Chateaugay, is 100 tons of crude ore in 24 hours, or five tons per hour.



SECTION OF LINE A—B OF BLAKE MILL.

The elevation of this mill in the accompanying plates shows very clearly its construction. The ore is brought to the mill by rail in side-dumping cars, carrying on an average 7½ to 8 long tons. It consists of two groups or systems of crushers with elevating and screening appliances, each group being an exact duplicate of the other, a jack-pulley on main line shafting being placed centrally between them. Power is derived from a 250-horse power engine, with three 100-horse power steel boilers. Each group consists of the following crushers, all of Challenge pattern, one 20x15, crushing from 15 inches to 2 or 2½ inches.

Product of each 20 by 15 is divided, going to two 30 by 5s. Product of 30 by 5s is elevated and screened; that passing a ¼-inch round hole is finished product, as far as crushing is concerned, and is carried to the jigs. The "coarse," 1½ to ¼ inch, goes to three 60 by 2 Multiple crushers, each with three jaw openings 20 by 2 inches. Product of these is elevated in No. 2 elevator and screened, formerly through holes ¼ of an inch in diameter, now through five-sixteenths holes. That passing through the five-sixteenths screen holes goes to jigs; that going through eleven-sixteenths inch holes goes two by two fine crushers. Each by ½ crushers has 7 jaw openings, with 7 openings each 15 by ½ inch. Material not passing eleven-sixteenths inch holes, but going out the end of screen, goes back to the 60 by 2 Multiple crushers. Product 15 by ½ fine crushers is elevated and screened, material not passing five-sixteenths holes returning to them. Each group of crushers has three Conkling jigs. In the PRESS of next week we shall give a plan of the mill with an account of the results accomplished.



SECTION ON CENTER LINE OF MILL FOR ORES ON BLAKE SYSTEM OF FINE CRUSHING.

A Miners' License.

Up in British Columbia the Mineral Act requires miners to pay a license, and the miners of Kootenay district petitioned the Legislative Assembly to repeal the section bearing on this, but that body did not pay any attention to it.

Moreover, the following amendment to the Mineral Act has been passed: "Every person engaged in mining for miners's other than coal shall take out a free miner's certificate, and any person who mines or WORKS FOR WAGES as a miner in any mining claim, or on any bedrock flume, bedrock drain or ditch, without having taken out and obtained such license, shall, on conviction thereof in a summary way, forfeit and pay a penalty not exceeding twenty-five dollars, besides costs."

This seems to be an absurd arrangement, especially as other workingmen do not have to obtain a license to do their work. The policy is a poor one by which to develop the mineral resources of any country. When it is more settled and developed, any industry may be able to stand such restrictions; but while they are trying to open new districts and mines, and induce capital to come in, such measures as this retard the whole business. If the laws now in vogue concerning gravel mining in California had been enforced 30 years ago, before the agricultural or quartz-mining possibilities of the State were known, we would not have one-tenth the population we now have, and California would be more than 30 years behind its present condition. The British Columbia people cannot afford to call for such an unjust and foolish license tax on a class which is productive and engaged in developing material resources.

THE terra cotta works at Elsinore are daily turning out 3000 feet of pipe.

SHOP NOTES.

Graphite Lubrication.

In the development of the world's history, the time has arrived, it would seem, when a change is to come about in the mode of lubricating machinery, carriages, wagons, etc.

This change is to be brought about by substituting graphite for oil or grease in whole or in part.

For more than 50 years it has been known that graphite was one of the best lubricants extant, but no way has been discovered to hold it in position and utilize it as a lubricant except by mixing it with oil or tallow, and yet its use in this form has gradually been growing for the last 20 years; and it is now quite extensively used in oils for heavy bearings, and particularly for packing-boxes for railroad cars.

A few years ago the process was invented and patented for holding graphite in its position in a journal-box, thus furnishing dry lubrication.

Like all other useful inventions, the graphite bushing or journal-box was greatly in advance of the times, and after being invented the invention came near to being lost to the world for want of recognition. Graphite bushings and boxes could not be sold; in fact, they could not be given away with an agreement that they were to be put in use and used. Scientists were against the invention, engineers condemned it, and capital could not be found to introduce it; and while it was successfully introduced in the block trade in the fall of 1877, and on machinery in the fall of 1883, and on carriages and wagons about the same time, we are informed that its progress in actual use has been very slow. Graphite bushings went into use in the block trade in 1877, but the difficulty then presented itself of getting a box into use upon a machine in a mill or factory, and the first one put to use was in the factory of the Norfolk & New Brunswick Hosiery Company at New Brunswick, New Jersey, and was started Nov. 20, 1883. On the 5th of March, 1884, the company, by their superintendent, issued the following certificate:

"We have one of the graphite-boxes in use on a fancy move of our cards since Nov. 20, 1883. We oiled it a few times after putting it on, but it has been running since Nov. 28th without oil at a rate of about 600 revolutions a minute, and about ten hours per day. The bearing surfaces at this date are found to be in good condition, without showing signs of cutting or beating." From this single bushing the graphite-boxes on machinery started, and mechanics and others using machinery can see how the revolution is being brought about of discarding oil and substituting graphite in its place.—*American Engineer.*

Pointers for the Mechanic.

Never work with a dull tool.

Take time to sharpen and put your tools in good order; it saves time in the end.

Above all, never use a dull or badly "set" saw. It will ruin your work, sour your temper and make you disgusted with the whole world.

If you are varnishing or polishing a piece of work, have the room or shop warm, exclude draft and dust, and don't be in too big a hurry.

If you are polishing in the lathe, see to it that all dust and dirt are removed from the lathe-bed before you commence work.

It is better, when possible, to polish all turned work in the lathes. It always has a better appearance for it.

In making patterns for castings, if you have no experience you had better consult some person who has had experience. Patterns are difficult things for amateurs to make if they do not understand the principles of molding and founding.

White pine or mahogany makes the best work for patterns. Lead, brass, copper, and sometimes plaster of paris, are used for making patterns; especially is this so for small, fine castings.

Shellac varnish is the best material for coating patterns.

Beeswax may be used for stopping up holes or to cover defects in patterns if it is coated with shellac varnish afterward. The beeswax will "take" the varnish readily, and will not cling to the "sand," like ordinary putty.

Shellac varnish may be mixed with a little lampblack to give it body and make a black pattern.

Sometimes pattern makers use stove-polish, for "black lead," as it is called, to finish their patterns. It is applied nearly dry, then polished with a brush.

Wood used for patterns must be of the very best finish, straight grained, free from knots or shakes, and well seasoned.

A clean pattern gives a clean casting, and much labor may be saved by making the pattern the right size, and smooth and clean.

After patterns have been used they should be kept in a dry place, as damp will distort and otherwise injure them.

Always make a drawing of patterns before making. Much time and labor will be saved.

Put on your best workmanship when pattern-making.—*Universal Tinker.*

THE MACHINE SHOP is one of the promoters of civilization. The acts of politicians are subordinate to it. Without the aid given by machines many of their schemes would fall dead; without the locomotive, the printing press and the telegraph, they could not speedily reach the ears of men who move in certain lines of thought. The ability to design a machine which will execute with automatic precision any given form requires a special development of brain-power, and this development is by no means confined to the operator, but is shared by many persons. One machine leads to another, and as a consequence the intelligence of men turning out machinery of a high class is very marked, although they are unknown, for the most part, except locally. The machinist speaks through the work of his hand and brain. He adds to the population of the world when he sends forth a machine capable of increasing its working force; he frees his fellows from the bondage of mere handwork, and sets them higher problems to solve. In every way he advances the cause of his race, and leaves the world richer by his labors.

Mechanics' Associations.

There have been some movements of mechanics of late years in the direction of forming educational associations or societies, but such movements have been quite too few. The most noticeable of these movements has been in the instance of the stationary engineers, who, to the number of several thousand, are engaged in educational work that has and will show good results. No one who is at all familiar with the inside working of the engineers' associations will deny this.

Besides the engineers, the iron-molders have done something in the way of industrial organization. Their progress will be watched with interest, because, as a body, foundrymen have made great progress during the last 10 years in the way of getting better theoretical and practical knowledge of their trade.

But the stationary engineers and the iron-molders are but a small portion of the skilled workmen. There ought to be mechanics' educational societies in every manufacturing town in the country, modeled, perhaps, something after societies that have a central association, with subordinate branches here and there. While there should be but little machinery in the organization of such associations, and that of the simplest kind, all experience shows that there must be some. Nothing of consequence can be done except it be done decently and in order, and in every association there must be some rules that are inflexible. Men cannot join together for any purpose, and succeed for any length of time, unless there are some fundamental principles that all agree to recognize. On the contrary, more than one promising society has been strangled by too many rules—smothered by machinery, as it were.

A trouble of the skilled workmen of this country, in the way of educating themselves, is a lack of independence in the matter. In all other things they have plenty of independence, but, curiously enough, when it comes to improving themselves in a way to make it possible to rise in the world, they expect some one else to supply the facilities and run the machinery for them. A man prizes what he works hard for, and knowledge that costs something—some self-denial, for instance—to get, is apt to be used to advantage. If mechanics want educational associations, they will have to plan them and support them, neither of which is a job of great difficulty or cost. If it is a matter of importance for mechanical engineers to travel hundreds of miles to discuss and hear discussed matters pertaining to their business, why should it not be of importance for mechanics to have places for meeting for similar purposes, without the expense of going away from home?—*American Mechanic.*

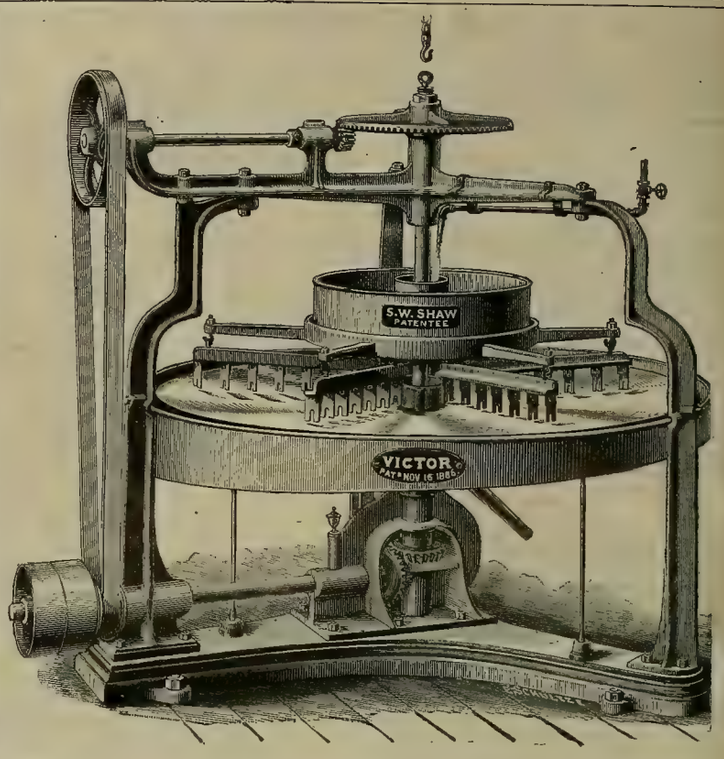
Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. ".) from week to week and year to year.

Every Miner His Own Assayer.

A chemical for testing and ascertaining the value of all kinds of ore by which every miner and prospector can make his own assays, anywhere in the mountains at a cost of a little over 5 cents and in a few minutes' time. No apparatus or dangerous acid needed; a dry powder, which may be carried in the pocket. This, mixed with the ore and a little water in a teacup, produces an electric current, which separates the silver from the ore instantly, no matter how refractory. Try it; you will be delighted. Will save you many dollars for assaying. Package sufficient for 30 tests, with full directions, by mail to any address on receipt of $2; 6 packages for $10. Address, Prof. J. Herman, P. O. Box 1845, San Francisco, Cal.



THE VICTOR CONCENTRATOR

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

54-INCH BY 16 FEET STEEL BOILERS IN 2 SHEETS.

STEAM USERS, ATTENTION!

The engraving represents our standard 54 in. x 16 ft. Boiler. These boilers are made of homogeneous STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are supplied with a small hand hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, he result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 54 inches diameter by 16 feet, with 46 3½ inch tubes; Shell, 5-16; Heads, 7-16.
1 Steam Drum, 36 inches diameter by 72 inches long.
1 Breeching.
1 Smokestack, 30 inches by 60 feet, Nos. 12 and 14 Iron.
300 feet galvanized strand for Guys.
1 C. I. Front, complete.
1 Foundation Plate for front.
1 Set Grate Bars for coal or wood.
1 Back Bar Bearer.
1 Ash Cleaning Door and Frame.
1 Back Arch Plate.
1 Set Binder Braces and Bolts for Brickwork.
1 Stand for back end of Boiler.
1 Steam Gauge and Syphon.
1 Glass Water Gauge, complete, with column and 3 Gauge Cocks.
1 Safety Valve.
1 Stop Valve.
1 Feed Valve.
1 Blow-off Valve.
1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds. Total weight of Boiler and fixtures, 17,000 pounds.

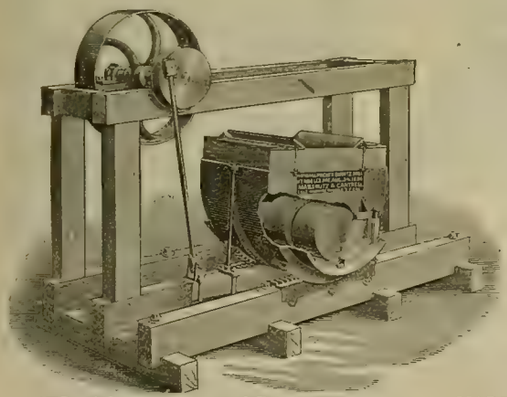
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

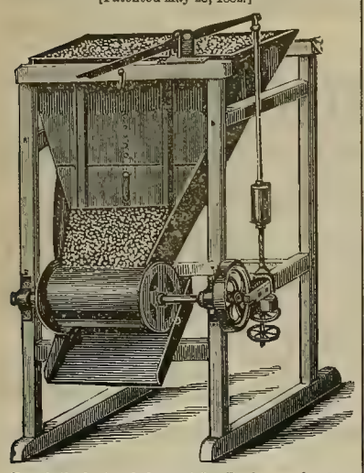
THE ROLLER ORE FEEDER
[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

401,867. WINDMILL.—Geo. P. Thurston, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WINDMILL.—G. P. Thurston, S. F. No. 401,867. Dated April 23, 1889. This relates to that class of windmills known as "power-geared," the patent covering several forms of constructions and combinations of devices.

GANG-PLOW ATTACHMENT.—E. H. Farmer, Gilroy. No. 401,397. Dated April 23, 1889. The attachment is applied to what is known as the "walking gang-plow," having a pair of wheels which support the front end of the frame, and a trailing wheel which, while supporting the rear end of the frame, is allowed to turn freely when it is desired to turn the plows around. The invention consists of a means for temporarily fixing this wheel at any desired angle with the line of travel of the plow.

SAW MILL SET-WORKS.—W. A. Campbell, Portland, Oregon. No. 401,876. Dated April 23, 1889. This improvement to the set-works of a saw-mill carriage consists in a retarding-clamp or friction brake applied to the set-shaft or head-block set-screw and in the novel construction and arrangement of the same and the means for relieving it. The object of the invention is to prevent any overthrow which might take place while rapidly setting the blocks.

CHIMNEY OR STACK PROPELLER AND GOVERNOR.—James A. Robb, San Jose. No. 401,516. Dated April 16, 1889. This invention relates to a windwheel driven by the upward current of air within the stack or chimney, and a governor in connection therewith whereby its speed and power may be controlled, and a means for rarefying the air within the stack. The chimney is formed of iron, and upon the sides which are exposed to the sun are fixed glass disks or lenses, the object of which is to receive and concentrate the heat of the sun's rays inside the stack so as to rarefy the air within the stack and increase the upward draft. The propeller is actuated by the upward current of air.

CABLE GRIP.—Samuel F. McDill, S. F. No. 401,895. Dated April 23, 1889. This invention relates to a means for adjusting the jaws of cable grips and thereby compensating for the wear of said jaws so as to take them up from time to time as this wear occurs. The invention is specially designed to be applied to that class of grips wherein the cable is seized between two jaws, one of which is above the other, either one or both of said jaws being movable. The invention consists of a screw-shaft turning in a slot at the lower end of the grip-lever, a nut fitted upon said screw-shaft and connected by links with the parts which carry the fixed jaw of the grip with gears by which this screw-shaft is rotated, and a shaft extending up beside the grip-lever and having a ratchet and pawl mechanism whereby it may be turned. By the construction devised by this inventor, it is possible for the gripman to adjust the jaws at all times, whether the car be moving or stationary, and without delaying or stooping to get at the screw and nut, as has been heretofore necessary in such cases. The device is quite ingenious, yet simple in operation.

ORE-GRINDING MILL.—Joseph McKenzie, El Dorado, El Dorado county, assignor to De Witt C. Morgan. No. 401,964. Dated April 23, 1889. This is an improvement in that class of ore-grinding machines known as "centrifugal crushing mills," in which the grinding rollers are suspended from a rotating driver by a pivot or hinge connection, and are adapted by centrifugal force to swing outwardly to the rim of the pan. It often happens that a piece of ore will swerve a roller from its course, and it takes a few moments to have it return to its work when centrifugal force alone is relied on. When the rollers do not act constantly against the rim of the pan, their shoes are apt to be worn unevenly. To overcome these disadvantages, this inventor has applied peculiarly arranged springs. These springs hold the rollers out to their work positively, and yet allow them to yield sufficiently, according to circumstances; but after yielding from any cause they are thrown out again immediately and with certainty, and the operation does not have to depend on centrifugal force alone.

PLUG FOR SINKS, TUBS, ETC.—Wm. R. Smith, S. F. No. 401,976. Dated April 23, 1889. The invention relates to the class of plugs for stopping up the discharge-holes of sinks, tubs, basins and other similar vessels or receptacles. The improved plug is a tubular piece with the bottom open and the top closed, with a chain attached. In the sides of the plug are made openings of various shapes. The plug is seated in the discharge-hole and can be lifted and lowered down therein. When fully down, the top finds a seat in the plate of the discharge-hole and serves as a stopper. To let the water out of the vessel the plug is raised, whereby the apertures come above the plate and the water passes through them and out the open bottom of the plug; but the foreign matter is stopped by reason of the apertures straining the water, and it collects on the outer surface of the plug. The plug cannot be raised all the way out of the hole, and is also so arranged that when raised it remains so until it is desired to close the hole again.

ROTARY PULVERIZER.—Miles B. Dodge, S. F., assignor to Parke & Lacy. No. 401,878. Dated April 23, 1889. This patent covers improvements in that class of pulverizers in which the ore or cement is crushed or pulverized in a rotating cylinder or chamber by means of mutual attrition of particles, assisted by pieces of iron or other material which is contained in the chamber with the material to be crushed. The interior of the machine is hexagonal in shape, and the sides are formed of bars laid side by side, with small spaces between for the escape of the pulverized material. These bars are laid in independently, and, by peculiar mechanical devices, they are forced against each other and securely backed in place, and at the same time may be easily removed and replaced whenever necessary.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

WEST AMERICAN OAKS.—We are indebted to Prof. Geo. Davidson for a copy of *Illustrations of West American Oaks*, a beautiful quarto volume just coming from the press of the Bosqui Company. The 24 full-page plates are from drawings by the late Dr. Albert Kellogg and the text is by Prof. E. L. Greene. The publication was rendered possible by the generosity of Capt. Jas. M. McDonald. There is prefixed a brief but most appreciative sketch of Dr. Kellogg's life and work by Prof. Davidson. We shall have more to say hereafter of this elegant and valuable monograph.

For New Subscribers—Something New and Rare.

PACIFIC COAST RELIEF CHART.

PHOTO-FACSIMILE.

With subscription paid one year in advance for this paper, and 10 cents to pay postage and mailing tube, we will send a fine Photoplate Relief Chart of the Pacific Coast, embracing California, Nevada, Oregon, Washington Territory, and part of Montana, Idaho and Utah. Photographed from a topograph'cal relief model in plaster (5 feet 3 inches by 5 feet 6 inches in size), made recently by Isaac Winston and Prof. Geo. Davidson (the latter Chief of the U. S. Coast Survey on this Coast for the past 20 years).

While it does not take the place of an ordinary map, it illustrates, comparatively, the elevations and depressions of the principal mountains, valleys, rivers, lakes, ocean and bay-shores of the Pacific States and Territories, and makes a permanently useful, handsome and desirable picture for either library, office or home.

The charts are 19x24 inches, well suited for framing, if desired. It is as handsome, and even more durable, than an ordinary photograph. Seldom is so choice an article offered as a newspaper premium. Sent to old subscribers on the same terms on paying one year in advance of current date. Subscribe and secure this permanently valuable chart.

Address Publishers of this paper, No. 220 Market St., S. F.

Printing Business For Sale.

A splendid paying business, already established, for a good business man with a small capital. He can step into it in the morning and count his profits at night. Everything in first-class order. Steam Engine and Electric Power. A first-class and well established newspaper and book and job printing business. It has at this time a large and profitable patronage. Parties seeking to invest will find this property in perfect order. Failing health compels the proprietor to offer it for sale at a great bargain. Location of plant and address, 379 Tenth, corner Franklin St., Oakland, Cal.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company—Location and principal place of business, San Francisco, California. Location of Works, Placer County, Cal.

NOTICE There are delinquent upon the following described Stock, on account of Assessment (No. 12) levied on the 19th day of March, 1889 the several amounts set opposite the names of the respective shareholders, as follows:

NAME.	No. Certificate	No Shares.	Amt.
Blaney, W E	284	20	$ 1 00
Bogart, O H, Trustee	429	10,000	500 00
Chase, Q A, Trustee	419	3,814	190 70
Gray, H W, Trustee	181	500	25 00
Horton, Thos R, Trustee	51	5,000	250 00
Horton, Thos R, Trustee	315	5,000	250 00
Hull, H E, Trustee	372	1,000	50 00
Rosekrans, H M	31	600	30 00

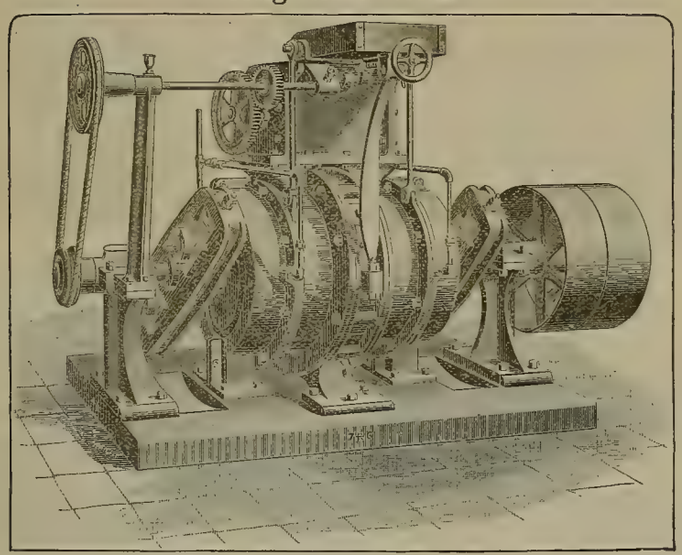
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, May 2, 1889.

General trade in commercial circles, the past week, was fairly active. All business appears to be controlled by a conservative spirit, which, in itself, is commendable. Among iron-workers and contractors in general, business is reported to be dull, yet they entertain hopeful feelings regarding the future. The banks continue to report an easy money market, with outside money offering fairly free. The opinion prevails that the demand for funds with which to move the crops will be very heavy, variously placed at from $15,000,000 to $25,000,000. Last year, at this time, large sums of money were tied up in old-crop wheat, whereas this year there is very little, but this year more money is tied up in other directions, which probably offsets the lessened amounts on wheat.

Treasure imports by sea the past week aggregate $228,128.

The London *Money*, April 13th, compiles a table of the gold and silver movements in England for the first quarter of this year, from which we learn that the gold imports aggregated £4,172,363 against £2,434,199 for the like time in 1888, and the silver imports aggregated £2,290,608 against £1,843,176 in 1888. The exports for the first three months of the year aggregated as follows: Gold, £3,259,243; and silver, £2,823,199. For the like time in 1888, the exports were as follows: Gold, £3,259,243; and silver, £2,470,126.

SILVER—The market showed more strength up to Monday, with an advance paid, but toward the close values are weaker with 92 to 92¼c, quoted in sympathy with a decline in London. To-day's cable came through at 42 1-16d per ounce. The market is reported to be quite dull.

MEXICAN DOLLARS—The market is quiet but steady at 72¾ to 73¼c. Imports are only fair, but fully up to export requirements.

QUICKSILVER—The market is said to be steady, with only a fair call reported. Receipts the past week were as follows: Forty-five flasks, Parrott & Co.; 205, Haas Bros.; 32, Bradford. Total, 277 flasks. There was shipped by sea to Mexico, 310 flasks.

BORAX—Receipts the past week aggregated 1139 ctls., and shipments, 445 ctls. to Chicago, and 205 ctls. to Kansas City. The market is quiet, but steady.

LIME—The market is fairly active, but not up to expectation. Some slight cutting is reported. Receipts aggregate the past week 5651 barrels.

TIN—Tinplate is dull at a slight decline for spot. Pig is stiff. For shipment, tin is obtainable at quotations, with bids slightly lower. English advices indicate that the market will not probably go lower, but may possibly advance for plate, owing to better prices for steel. The exports by water the past week aggregated to Mexico, 95,770 lbs.; Victoria, 311,516 lbs., and 5006 lbs. pig.

IRON—The market for prompt shipment from England is very strong, owing to the advance in iron being more proportionately than is the decline in freights to this port. The quantity on passage is said to be small, but the stock here is large and well held. The consumptive demand is disappointingly small.

COAL—Imports the past week were as follows: From Tacoma, 6300 tons; Australia, 6234; Coos bay, 450; Seattle, 2955; Departure bay, 6900; Nanaimo, 3187; Baltimore, 1207. Total, 27,233 tons. It is claimed that the market is working into better position for sellers, still consumers, as yet, do not express any anxiety regarding higher prices. The consumption of steam is increasing, but that of house coal is light. Egg hard is marked up for spot. For prompt shipment $6.62½ is bid for Australian. A bid of $6.75 for August and September is reported, but not accepted. Outward freights in Australia are reported to be strong.

Eastern Metal Markets.

By Telegraph.

NEW YORK, May 2, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	92	$13 50	$3 65	$20 70
Friday	42 3-16	92¼	13 50	3 65	20 70
Saturday	42 3-16	92¼	13 60	3 65	20 70
Monday	42½	92½	13 60	3 65	20 70
Tuesday	42½	—	—	—	—
Wednesday	—	—	—	—	—

NEW YORK, May 2.—Borax and quicksilver are unchanged. Late foreign advices make the tone in copper somewhat smoother. There are no large operations to note. Pig lead is easy, with a fair trade. Four hundred tons sold at $3.62½@3.65, early May delivery. Refined petroleum, barrels, $6.85; plain cases, $8.85.

Mining Share Market.

Trading in mining stocks the past week was fairly active, with the bulk of the business done in the Comstocks being cross orders from the pool so as to manipulate for a lower range of values. Prices continued to shade off with slight reactions up to Monday, when a small jump was made, only to be followed by another decline, with another jump yesterday (Wednesday) morning, succeeded by lower prices than at any time during the week. Evidences are not wanting that the pool is concentrating stocks, and to better aid them strong bear points are put out, such as Col. Mackay and the "Young Mining Magnate" will leave soon for the East, a light water supply in the Carson river, large sums of money will be required to move the crops, that Senator Jones and D. O. Mills will, soon after arriving here, leave for Alaska, and last, but not least, so as to help things along on the bear side, assessments are being levied. The bulls, on the other hand, say that even if Col. Mackay and Flood do leave, they still have here Finlay of the *Post* and Spring of the *Report*, besides which they ought soon to be in ore in some of the Gold Hill mines, also in the Mexican crosscut and in the Union drift, not crosscut, besides other favorable re orts looked for in the middle mines at an early day, with Hale and Norcross expected to pay a 50-cents-per-share dividend, provided the bullion produced is not mysteriously spirited away by unlooked-for expenditures. The Tuscaroras and Bodies have been more active, with higher prices for Commonwealth, Bodie and Mono. The movements in Commonwealth are made on a milling proposition, but what those in Bodie and Mono are grounded on is not known.

Confidence will pass the dividend this month, but Con. Virginia will declare a 50-cent dividend to-morrow, Friday.

The Brunswick mill, Virginia City, has stopped crushing ore from the Challenge and Confidence mines, and is running on ore from the Yellow Jacket mine, and this, too, in the face of the Santiago mill, which was fitted up to run on ore from the latter mine being idle. Official information from the first two mines report that while ore-crushing is suspended, more active prospecting work will be done in them.

Kentuck and also Gould and Curry levied assessments the past week, each of 30 cents per share.

The ore yield of the Comstock last week aggregated 7213 tons, divided as follows: Con. Cal. and Virginia, 3001 tons, assay value, $27.15; Best & Belcher, 116 tons, assay value, $22.85; Savage, 488, assay value, $20.52; Hale and Norcross, 1057 tons, $28.40; Chollar and Potosi, 500 tons; Challenge, 66 tons, assay value, $26.83; Confidence, 308 tons, assay value, $26.83; Crown Point, 854 tons; Overman, 328 tons; Alta and Justice, 500 tons. The total bullion yield of the above was $155,000.

To-day's (Thursday) stock market opened weak and lower, which was followed in the informal session by quite a jump in the Gold Hill stocks under a reported improvement in Belcher, and a report that D. O. Mills, Senator Jones and Newland will be on the Comstock by the 5th or 6th.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

SUNSET TELEPHONE TELEGRAPH CO., April 27. Capital stock, $3,000,000. Directors—George S. Ladd, John I. Sabin, Louis Glass, W. G. Oliver, Monroe Greenwood, Percy T. Morgan and David Gage.

WOODBRIDGE CANAL AND IRRIGATION CO., April 29. Object, acquiring water rights on the Mokelumne river and other streams in San Joaquin and Calaveras counties. Capital stock, $3 0,000. Directors—M. B. V. Watson, B. A. Laws, N. E. Green, B. D. Beckwith and Thomas Creighton.

AMERICAN OPERA-GLASS NOVELTY CO., April 29. Object, dealing in opera-glasses and spectacles. Capital stock, $25,000. Directors—S. Blumenberg, Emil and Boniface Kehrlein, Alexander Mann, Jr., and W. J. Glasson.

PACIFIC WRITING TELEGRAPH CO., May 1. Capital stock, $2,500,000. Directors—M. L. Hoadley, H. W. Brown, John F Murray, E. L. Campbell, L. W. Storrer, J. B. McChesney and Thos. H. Barry.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, April 27, $69,292; Hanauer, 26, $3750; 27, $3350; Hale and Norcross, 29, $8276; Nevada Queen, 29 $19,000; Savage, 25, $7175; Hale and Norcross, 25, $64,000; Crown Point, 29, $15,375; North Belle Isle, 29, $10,000; Alice, 25, $26,064; Alice, 27, $26,064; Bluebird, 27, $15,440; Moulton, 27, $13,152; Lexington, 27, $12,848.

THE Fresno *Expositor* says: Pixley is an anomalous railroad town. It consists of but three buildings, all of which are fine brick edifices. The condition upon which lots are disposed of is that none but buildings of this character shall be erected.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

R. G. BAILEY—San Francisco.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth: 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II and III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthat-; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S.F.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 166 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & Co., S. F.

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, post-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

New Catalogue for 1889 now ready.

GUTENBERGER'S ROLLER ORE CRUSHER.

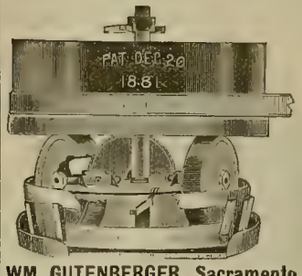
Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gearings, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.



Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working. The first ore crusher used in Durango, Mexico, was built at my shop in Sacramento, and under my patent.

☞ Any Infringement on this Patent will be prosecuted to the full extent of the law.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

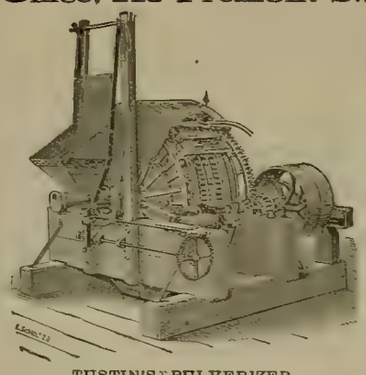
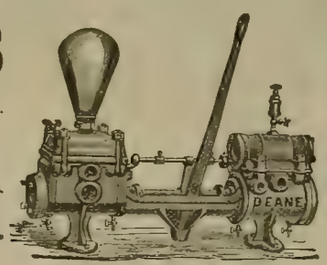
PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
—ALSO—
HOMOGENEOUS STEEL, SOFT and DUCTILE,
SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.
ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 218 Fremont St., San Francisco.
—MANUFACTURERS OF—


TUSTIN'S PULVERIZER.
MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.
Tustin's Pulverizer
WORKS ORE WET OR DRY.
ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.



SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.
DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

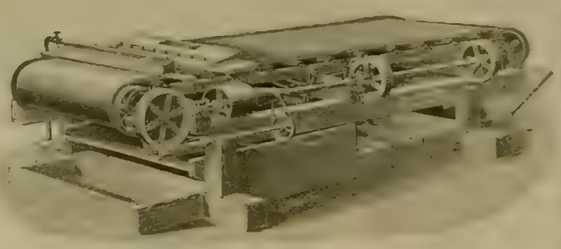
IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

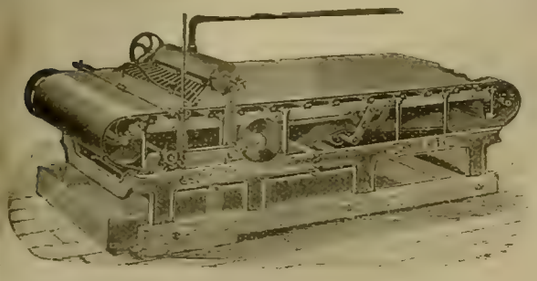
THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS: Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00).



THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

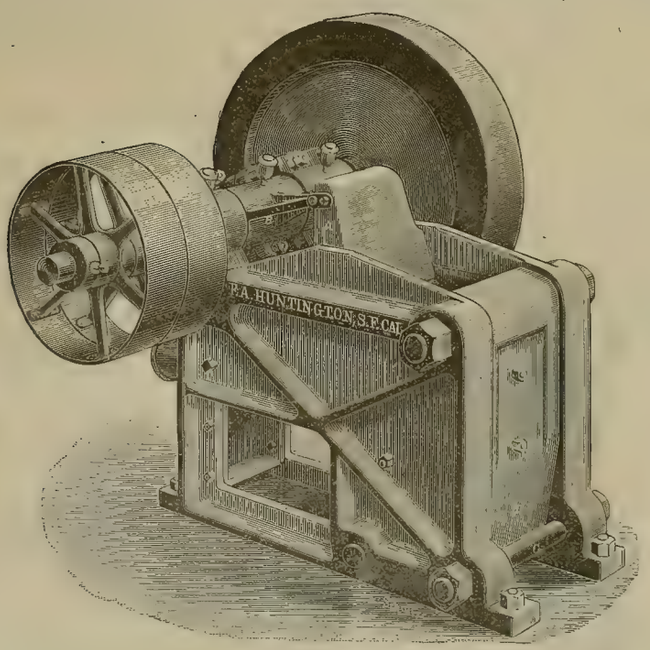
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

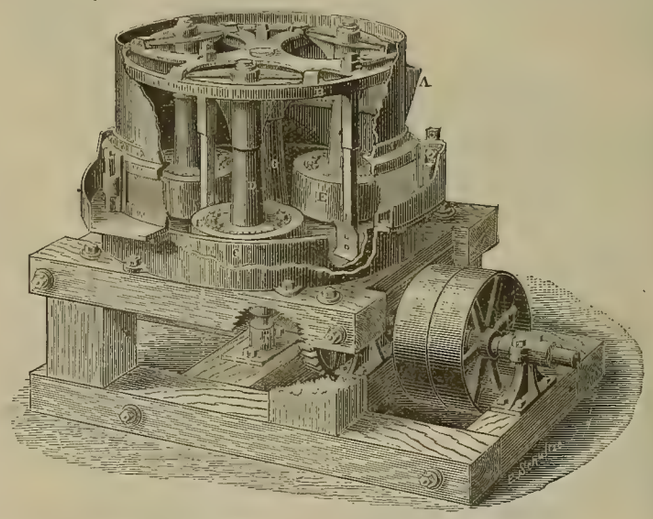
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

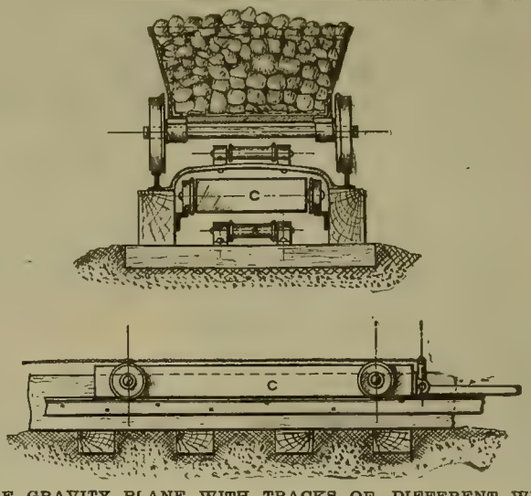
METHODS OF PASSING CURVES ON GRAVITY PLANES FOR MINES.



SINGLE GRAVITY PLANE WITH TRACKS OF DIFFERENT WIDTH.

Wire-Rope Haulage in Mining.

On inclined or gravity planes, operated by the gravity of the descending load of ore, when the cars have to go around curves, the difficulty of passing curves is solved by two efficient and simple methods. In one device, shown in the accompanying engravings, the rope is taken around the curve by means of a series of wheels about 24 inches in diameter, placed outside the track. The car, in turning a curve, brings the rope between the rails; but after passing, the rope is guided back into the grooved wheels by the timbers *C*, placed in front of each pulley.

The guide-wheels are sometimes placed between the rails and a few inches to one side of the center line, as shown in one of the cuts. These wheels are, of necessity, smaller than the preceding, and are held in a slightly inclined position to the horizontal by the bearings *E*. The rope is attached to the car at the same level as the grooves of the wheels. In passing a curve, the rope is drawn to the center of the track and falls back into the grooves when the curve has been rounded. Either of these systems may be employed with advantage, the determination of the more efficient being a matter of location.

In the gravity inclines of the valley of the Monongahela, as described by J. M. Silliman before the American Institute of Mining Engineers, the single-track system is modified so as to employ two tracks of different gauge, the narrower being placed within the wider, as shown in the accompanying cuts. The wider track is for the pit cars, while the narrower serves as a roadway for what is termed the balance car *C*. The latter is so proportioned in weight that it is sufficient to raise an empty car, and light enough to be elevated by the descending loaded car. To the balance car is attached a safety-lever *E*, as shown. When the rope breaks, or through any means becomes slackened, the lever *E* drops, and, coming in contact with the ties of the roadbed, prevents rapid and dangerous descent.

Pacific Coast Men-of-War.

The cruiser Charleston, built by the Union Iron Works of this city, is now on her trial trip in the Santa Barbara channel, south of Point Conception, where there is a clear course of very smooth water. She is reported to have behaved very well on the trip down, and the vacuum pumps, concerning which there had been some adverse criticism, worked satisfactorily. In crossing the bar at the entrance of this harbor very rough water was met—the result of the recent storm—but the vessel passed through this all right, proving herself a good sea boat. In a few days the result of the speed trial will be known.

The Union Iron Works have been awarded the contract for the new coast-defense vessel at the price of $1,628,000. The new vessel will be a departure in design from any vessel in the navy, and will be the most formidable vessel for her displacement of any in the world. She approximates the Monitor type, and will be of 5000 tons displacement in cruising trim. She is to have a length of 256 feet, with a breadth of 49 feet. She will be protected by a belt of steel armor 16 inches thick over the engines, boilers and magazines, and eight inches thick forward and aft. The specifications call for 5400-horse power. The specifications provide for two ordinary tubular marine boilers of 1500-horse power. The remainder of the 5400-horse power required is to be supplied by coil boilers.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Klamath River.

Its Navigability and Its Mines.

[Written for the PRESS by J. H. CROSSMAN, late assistant in the field of the California State Mining Bureau.]

As it is reported that the members of the U. S. Debris Commission are about visiting the Klamath river and its tributaries in pursuance of instructions from the Department, a description of this region may not be uninteresting to the readers of the PRESS, particularly as the result of their examination will not be made known to the public for some time.

The Klamath river is estimated to measure approximately from source to mouth 362 miles, inclusive of its contour lines. It takes its rise in Oregon, coursing in a southerly direction, passing through Siskiyou county, California, entering Humboldt and forming a portion of the boundary line between Del Norte and Humboldt counties. It is during the flood season a raging torrential stream of considerable magnitude, but late in the summer not much more than a purling brook and fordable in many places. Notwithstanding the immense area of the watershed of the main trunk and its numerous tributaries, of which Shasta, Scott, Salmon and the Trinity are of considerable magnitude,

At Its Mouth

The river expands to a width of three-quarters of a mile, where its flow is retarded by the ocean currents and tides, forming by deposition of the river debris a bar which at a low stage of water is often crossed by horsemen on the "land spit." This bar at times practically closes the river to navigation of vessels either large structions in its bed, would prevent reaching a or small. Even could this obstruction be removed by Government aid, the navigability of the river for more than ten miles up from its mouth would be impracticable without locks, which would be inoperative from the immense quantity of drift timber, trees and trunks brought down the river during the flood season. The rapid current of the river, its unusual grade of a mean of ten feet per mile, its numerous falls, rapids, shallow depths and rocky obhigher point; even a canoe at any season requires frequent portages, canyons alternate with bars; short pools of still and apparently dead water, with powerful under-currents and eddies, engulf the hapless mariner or unsuspecting bather. In some places the rapids approach the dignity of veritable cascades or falls, the water in its descent being precipitated over mammoth rocks, tumbling and tossing in a sea of white glittering foam. The river, as a rule, is rock-bound. Its banks are formed of bare sterile rocks, jagged and forbidding, which reach to a hight of several hundred feet before vegetation is seen on the high bars or terraces of older river channels, of which there is usually a series of three, one above the other, and several hundred feet of vertical hight between them. It is in these channels that

The Auriferous Gravels

Are found, which are peculiarly adapted to work by the hydraulic system, they having all the requisites of dump and head of water from the numerous tributaries of the Klamath. The river in its course passes through extensive canyons with precipitous walls; one above Orleans Bar, 65 miles from the mouth, is three miles in length. In places the soft rocky structure of the walls and banks is from the erosive action of the water has caused extensive slides of large areas. In fact this process is constantly going on, and the river as constantly changing its contour lines. The trails instead of coursing near the river-bed seek the high bars on the mountain slope. No reliable estimates have been made of the mean of the

Flood Rise of the River

From low-water mark. It varies from 5 to 102 feet, owing to the expansion and contraction of the river channel. Fifteen feet, however, may be taken as an approximation. For instance, at a point above Martin's Ferry, 45 miles from the mouth, in a narrow gorge, the river has been known to reach a point 102 feet above the low-water bench mark in 24 hours. Above the mouth of Cotton Wood creek, the rise is not over 2½ feet. Below this point the waters of Cotton Wood creek, Shasta and Humbug swell the stream and bring the average up to 7½ feet. Below the mouth of Scott river this is increased to 12 feet. At Happy Camp is a still greater rise. Below the mouth of the Salmon the rise is 15 feet, thence to Orleans Bar and Martin's Ferry, which we have described.

Its Width

From its source to Lower Klamath lake is from 70 to 75 yards, thence from the mouth of Scott river 75 to 90 yards; from mouth of Scott river to Happy Camp 100 yards. To Martin's Ferry the width varies from 70 to 100 yards, expanding and contracting until its mouth is reached, where, as stated, it is three-fourths of a mile from bank to bank in flood season. Its depth varies from two to eight feet in the upper portion of the river and from three to ten feet in the lower, with deep holes and pools; but the numerous riffles and rapids lower the average.

The Grade is also Variable,

But the mean, from source to mouth, is estimated at ten feet to the mile. The flow or velocity of the stream varies from four to ten miles per hour; the mean, seven miles. This has been approximately ascertained at several points on the river, and may be considered nearly correct. At a point ten miles above the mouth, the velocity is much less.

Agricultural Lands.

From the mouth of Scott river to the ocean there are essentially little or no agricultural lands to speak of unless on the high bars or benches several hundred feet above the river-bed, where an elevated system of terraces have been formed by the erosive action of the water which has repeatedly cut deeper channels through its bed in which the present river runs. The mountain slopes and terraces are heavily timbered, and the tablelands form good pasturage for stock. Perennial streams and springs are of frequent occurrence, and enable the miner to work profitably the old river channels filled with rich auriferous gravel. These streams affording heavy pressure-heads of water and abundance of fall for the debris. The river proper runs through

Narrow Gorges and Canyons

For the greater portion of its length. Hydraulic mining has been prosecuted for quite a number of years. What few isolated spots of agricultural land that occur on low points and river bars have been patented as mineral land, and either worked as agricultural or for its mineral product, as the owner deems best—"no kicking about debris or slickens here."

So far as the agricultural resources of that portion of Siskiyou, Trinity, and Humboldt counties are concerned, through which the Klamath, Trinity, Salmon, and the lower portion of Scott river flows, they are not equal to the support of a respectable tribe of Digger Indians, and were it not for the salmon, which was the principal food of the aborigines previous to the white man's advent, the red man would have had a poor show. The main source of breadstuff and supplies is drawn from Etna (the principal town of Scott Valley, a rich agricultural section, situated on the upper portion of Scott river), Eureka and Arcata of Humboldt county, and packed in on mules over the precipitous ranges of mountains that surround this section. The region is essentially mineral. The product of its mines, if industriously worked and the ban of the anti-debrite removed, so that capital could safely invest, would support a large and thriving population and add to the wealth of our State and nation.

The Klamath river and its four principal tributaries—the Shasta, Scott, Salmon and Trinity rivers—drain in California approximately 10,500 square miles, and in Oregon 10,000 miles, or about 20,500 miles in all.

The rain-gauge shows a mean of annual precipitation for the past five years of 46 2-5 inches, the maximum 52¾.

The Trinity River

I am largely indebted to Mr. W. S. Lowden for the following facts: The entire length of this river, from source to mouth, is about 165 miles. The upper forty is of no importance as a mining section. From Trinity center to its mouth (distant 125 miles) the river has an average grade of 15 feet to the mile; average width, 150 feet at low water and 600 feet at high water. At low water the river is two feet deep and at high water 25 feet. The rain-gauge shows an annual fall of 40 inches. The area of land drained by the Trinity river in Trinity county is 2637 square miles. The amount of agricultural land in Trinity county that could by any possibility be damaged by the debris of the mines does not exceed 150 acres and is not worth over $3000.

There is a section of the Trinity river in length about 20 miles in the vicinity of Weaverville (above and below) that has a grade of 12 feet to the mile, but as it passes through the canyon below the North Fork, the river attains a grade of 20 feet to the mile.

From the foregoing facts may be seen the absurdity of the Act passed by our Legislature in 1872, declaring the Klamath river a navigable stream from its mouth to Orleans Bar, a distance of 65 miles. This, together with the decision of our courts adverse to hydraulic mining in California, has prevented capitalists from investing in the hydraulic mines of that section through which the Klamath and its tributaries flow, and materially retarded its progress and prosperity. Until the Act declaring the Klamath a navigable stream has been repealed by a future Legislature, and the class of mining referred to is recognized by our courts as a legitimate industry, neither hydraulic nor any other class of mining in our State will become favorite investments. Notwithstanding the obstructions thrown in the way of the miner from adverse legislation, there are in operation on the Klamath river, according to the annual report of our State Mineralogist for 1888, some 47 hydraulic, 22 wingdams, 23 drift, and 7 sluicing claims, giving employment to nearly 1000 miners directly, and an army of farmers, mechanics, packers, butchers, traders, etc., indirectly.

The law relating to navigable streams in substance is as follows:

"The State of California in the enabling Act admitting her into the Union, stipulated that the title to all navigable waters should vest and remain in the United States. The Legislature of California by an Act declared the Klamath river a navigable stream from its mouth to Orleans Bar, a distance of 65 miles, hence the title vests in the United States."

The Debris Commission recently appointed by the Secretary of War to investigate this subject in order to, if possible, devise ways and means whereby our mines could be worked without detriment to any other industry, are now in session, and purpose visiting the Klamath river at an early date. A favorable report from this body of engineers would go far toward remedying the evil and remove the cloud that now hangs over this great industry.

A Point in Leaching Ores.

On the Withdrawal of Silver from Argentic Solutions Through the Action of Insoluble Sulphurets.

EDITORS PRESS:—Being engaged in making a chlorination test with sodium thiosulphate on raw silver ores (assaying 320 ounces silver per ton) in preparation for raw chloridizing (and in which I had found on the previous day 65 per cent soluble in hypo, filtering after 15 minutes' contact), I happened to be called away just after subjecting the test to the action of a solution of hypo, thus letting it stand over night. After 16 hours' contact, on filtering off the solvent and assaying the washed and dried residue, to my great surprise I found that a chlorination of only 12 per cent was indicated. On repeating as usual, the test (after 15 minutes' contact) assay of the residue showed a chlorination of 70 per cent.

Surmising that the presence of undecomposed sulphurets in the ore treated was the cause of the *drawback* of the silver from a soluble to an insoluble form, I forthwith instituted an experiment, with the view of ascertaining whether such a reaction would actually take place under such conditions. Eight hundred milligrams fine silver were dissolved in nitric acid, evaporated to siccity, the argentic nitrate dissolved in water and precipitated by sodium chloride, and after decanting off the supernatant fluid the precipitated argentic chloride was dissolved in an excess of a solution of pure sodium thiosulphate (about 100 cubic centimeters), and after filtering said solution more, one per cent hypo solution was added, making up 250 cubic centimeters. This last addition was made in order to preclude the possibility of any insoluble compound being deposited. I then added four grams of elutriated sulphurets (concentrates) containing only three millograms of silver and consisting mainly of galena, blende and pyrite, leaving the same in contact with the argentiferous solution during 16 hours, under repeated shaking of the bottle in which they were contained.

The sulphurets were then collected on a filter and washed with weak hypo and with cold and hot water, dried and scorified, and on cupelling the resulting lead a button of silver 282 millograms in weight was obtained!

I am unaware that any such "drawback" has yet been noticed in the practice of leaching ores with hypo. Some of the anomalies in the practical working of the leaching process might be due to analogous reaction.

It might be suggested that the main utility of cuprous hypo be the prevention of the same; also that the silver separated in this case would have been easily soluble in cuprous hypo.

ALEX. H. DUBOIS.

Mining at Volcano.

EDITORS PRESS:—The mining season is about closed and the water season will be gone before the cleanup. The Volcano gold-gravel mining will soon have to stop for want of water. For the chances they have had, the results are good. The Jones mine is being worked under a bond, and out of it several thousands have been taken. It is turning out a valuable claim. The cement and gravel is very rich.

What is wanted here is capital to open our claims. As I need, for instance, to "bottom up" a rich hole, a small donkey engine to handle the water and gravel, I will give a working share to any one furnishing such power, or I will agree to pay for the same when the money is taken out of the claim. The dry season will be favorable for working the claim. I have had this property of mine for 25 years and have invested $7000 in it, believing it to be a No. 1 claim. I would be very glad to be able to obtain one of the horse-power hoists such as you recently illustrated as made by the Risdon Iron Works. Parties who last worked this rich "hole" say it went $10 a carload. I have the gold in the claim, and will take it out as soon as a favorable water season permits. I own my own water ditches and flumes and can easily put the property in good shape with slight financial assistance.

P. W. PECK.

Volcano, Amador Co., Cal.

GOATS IN A MINING SHAFT.—A correspondent writes us as follows from Amador City: A band of goats grazing near the main shaft of the New London mine became scared, and in attempting to escape two of the animals fell into the mine, which is 1200 feet in depth. One of the miners happened to be coming up on the "skip" and had reached the 500-foot level when he was struck by one of the falling goats and had his arm broken. By good luck the man retained his grip on the cable and thereby saved himself from a horrible death. Had he fallen from the "cage" he would have been precipitated to the bottom of the shaft, 700 feet.

The Mining Bureau Appropriation.

We have previously mentioned the fact that State Controller Dunn has said he would refuse to draw his warrant for $100,000 for the benefit of the State Mining Bureau and $350,000 for the erection and maintenance of the Southern California Insane Asylum, on the ground that the Acts making the appropriations failed to specify the fund from which the money was to be drawn. He also said that before he would draw his warrants a decision of the Supreme Court to that effect must be rendered.

Since then the Attorney-General has rendered the following opinion, which is directly the opposite to the one given by Mr. Dunn, and which will result in the appropriation for the Southern California Insane Asylum also being made available:

S. Heydenfeldt, Esq., Trustee State Mining Bureau, San Francisco—MY DEAR SIR: I have examined the Act making an appropriation for the support and maintenance of the State Mining Bureau for the forty-first and forty-second fiscal years, approved March 14, 1889, and have arrived at the following conclusions:

First—It is not necessary that the Act should contain a direction to the Controller to draw his warrant in express terms; but an implied authorization is sufficient, such as is contained in the words: "That at least 70 per cent of the appropriation shall be used for geological work in the field, and not more than one-half of the said sum appropriated under this Act shall be expended during the forty-first fiscal year." This all necessarily implies that the Controller must draw his warrant.

Second—It is not necessary that the Act should say that the money named as appropriated is appropriated out of the General Fund, or out of moneys not otherwise specifically appropriated. The appropriation of $100,000 is a specific appropriation, and the object is stated. Although no fund is expressly stated in the Act, from the necessity of the case the appropriation must come from the General Fund. It cannot be any specific fund, for there is no authorization of the Legislature to divert it, and to divert money from a specific fund would require an Act of the Legislature. The General Fund consists of money received into the Treasury and not specifically appropriated to any other fund. The appropriation is made by the Act; what is necessarily implied is the same as expressed, and the money must, therefore, come from the General Fund. The case of Redding *vs.* Bell (4 Cal. 333) does not apply for the reason that in that case there was no specific appropriation as in this case, and besides, that was a case of mandamus, where, of course, it was necessary to allege in the complaint that there was money not otherwise appropriated by law out of which the amount in question was directed to be paid.

Third—The appropriation is available.

Very truly yours,

G. A. JOHNSON,
Attorney-General.

Make no Mistakes in Concentrators.

There is a popular move all over the mining field to want concentrators. Miners who never had or knew anything about concentration, have come to the conclusion all of a sudden that in order to make their low-grade ore profitable they must have concentrators. We are glad to see miners coming to a right understanding of their business, but at the same time it is a very easy matter to overdo the thing and bring reproach on yourself and the mining business. It is not every concentrator that is a success, in fact there are more failures than successes. Irwin had two signal failures, losing thousands of dollars, before a success. And in all kinds of milling machinery, Gunnison county, like the older counties, has her share of monumental folly. We were counting up the other day and a low estimate is that one million of dollars has been ruthlessly wasted in one process and another, as the old wrecks of mills in every camp will testify. Had that million been spent in actual development of mines before any effort was made to make home treatment of ores a success, it would have been a great deal better.

If you have got concentrator on the brain and must have one, the first thing you want to do is to secure the services of a first class man, who understands the business, and they are few and far between. Then find out if you have a mine or mines that will produce enough ore to run continually whatever capacity you decide to build. Do not depend on other people to mine and ship you the ore, but do a little custom work when it comes along. Next find out what particular process or table is adapted to save the most of your mineral. A good idea is to send a ton or more ore to concentrators already in operation, and experiment with it. By all means do not build your concentrator before you find your ore.

Concentrators are all right and is the proper method for the dressing of ores, making them profitable to ship where mines are a long distance from the ore market, but it is a very easy matter to get in a lot of worthless machinery, expend several thousand dollars making experiments, and then give the whole thing up in disgust. We propose to frown down any such enterprises that may be attempted in this vicinity.—*Elk Mountain Pilot.*

OLD WORKS.—In cleaning out the old works of the Senator mine and extending the drift south, a body of very high-grade gold ore was encountered yesterday. It was struck at a depth of 250 feet, and assays give a value of over $400 per ton. The ore has been gradually increasing in value as the work has progressed southward from the new double-compartment working shaft.—*Prescott Courier.*

The Wrecks in Samoa.

We reproduce by our photo-plate system a series of views by Taber, the eminent photographer, of the late disaster to the German and American war-ships in the harbor of Apia, Samoan Islands. The first view shows the remnant of the battered bow of the Eber, all that held together of a once noble vessel. The wreck of this ship was so sudden and complete that out of a crew of 78 officers and men, only five were enabled to save themselves. To the right is the stern of the Trenton, the flag-ship of Amiral Kimberly and the American squadron. After heroic attempts to save her she was driven aground by the fury of the hurricane. In her loss of life she was extremely fortunate, only one man being reported lost. In the middle distance the hull of the Adler is seen, and in the background the shore of the harbor.

Our second view is of a portion of the harbor of Apia, showing a part of the town on one side and the debris and wreckage left by the hurricane on the beach on the other.

The third picture shows the German corvette Adler as she was left high and dry on her beam ends on the beach. While she fared better than her consort, the Eber, she is nevertheless represented as a total wreck. Her casualties were 20 men killed and drowned.

DIED FROM EATING WILD PARSNIPS.—Sebastian Merdam, a farmer of St. Joseph, Minn., was recently engaged in plowing. Four of his children were playing in the field and found the roots of wild parsnips which were plowed up, and all ate of them. They soon became violently sick and three died in terrible agony. Medical aid was summoned, but arrived too late. Another girl, three years old, who also ate the poisonous roots, it is thought may recover. The three children were buried in one grave at St. Joseph.

THE Grass Valley *Tidings* says the famous Idaho mine there has paid $650 a day for the past 20 years.

Getting Rich by Small Inventions.

The New Jersey man who hit upon the idea of attaching a rubber-erasing tip to the end of a lead pencil is worth $200,000.

The miner who invented a metal rivet or eyelet at each end of the mouth of coat and trousers pockets, to resist the strain caused by the carriage of pieces of ore and heavy tools, has made more money from his letters patent than he would have made had he struck a good vein of gold-bearing quartz.

Every one has seen the metal plates that are used to protect the heels and soles of rough shoes; but every one doesn't know that within ten years the man who hit upon the idea has made $250,000.

As large a sum as was ever obtained for any invention was enjoyed by the Yankee who invented the inverted glass bell to hang over gas jets to protect ceilings from being blackened by smoke.

The inventor of the roller skate has made $1,000,000, notwithstanding the fact that his patent had nearly expired before the value of it was ascertained in the craze for roller-skating that spread over the country a few years ago.

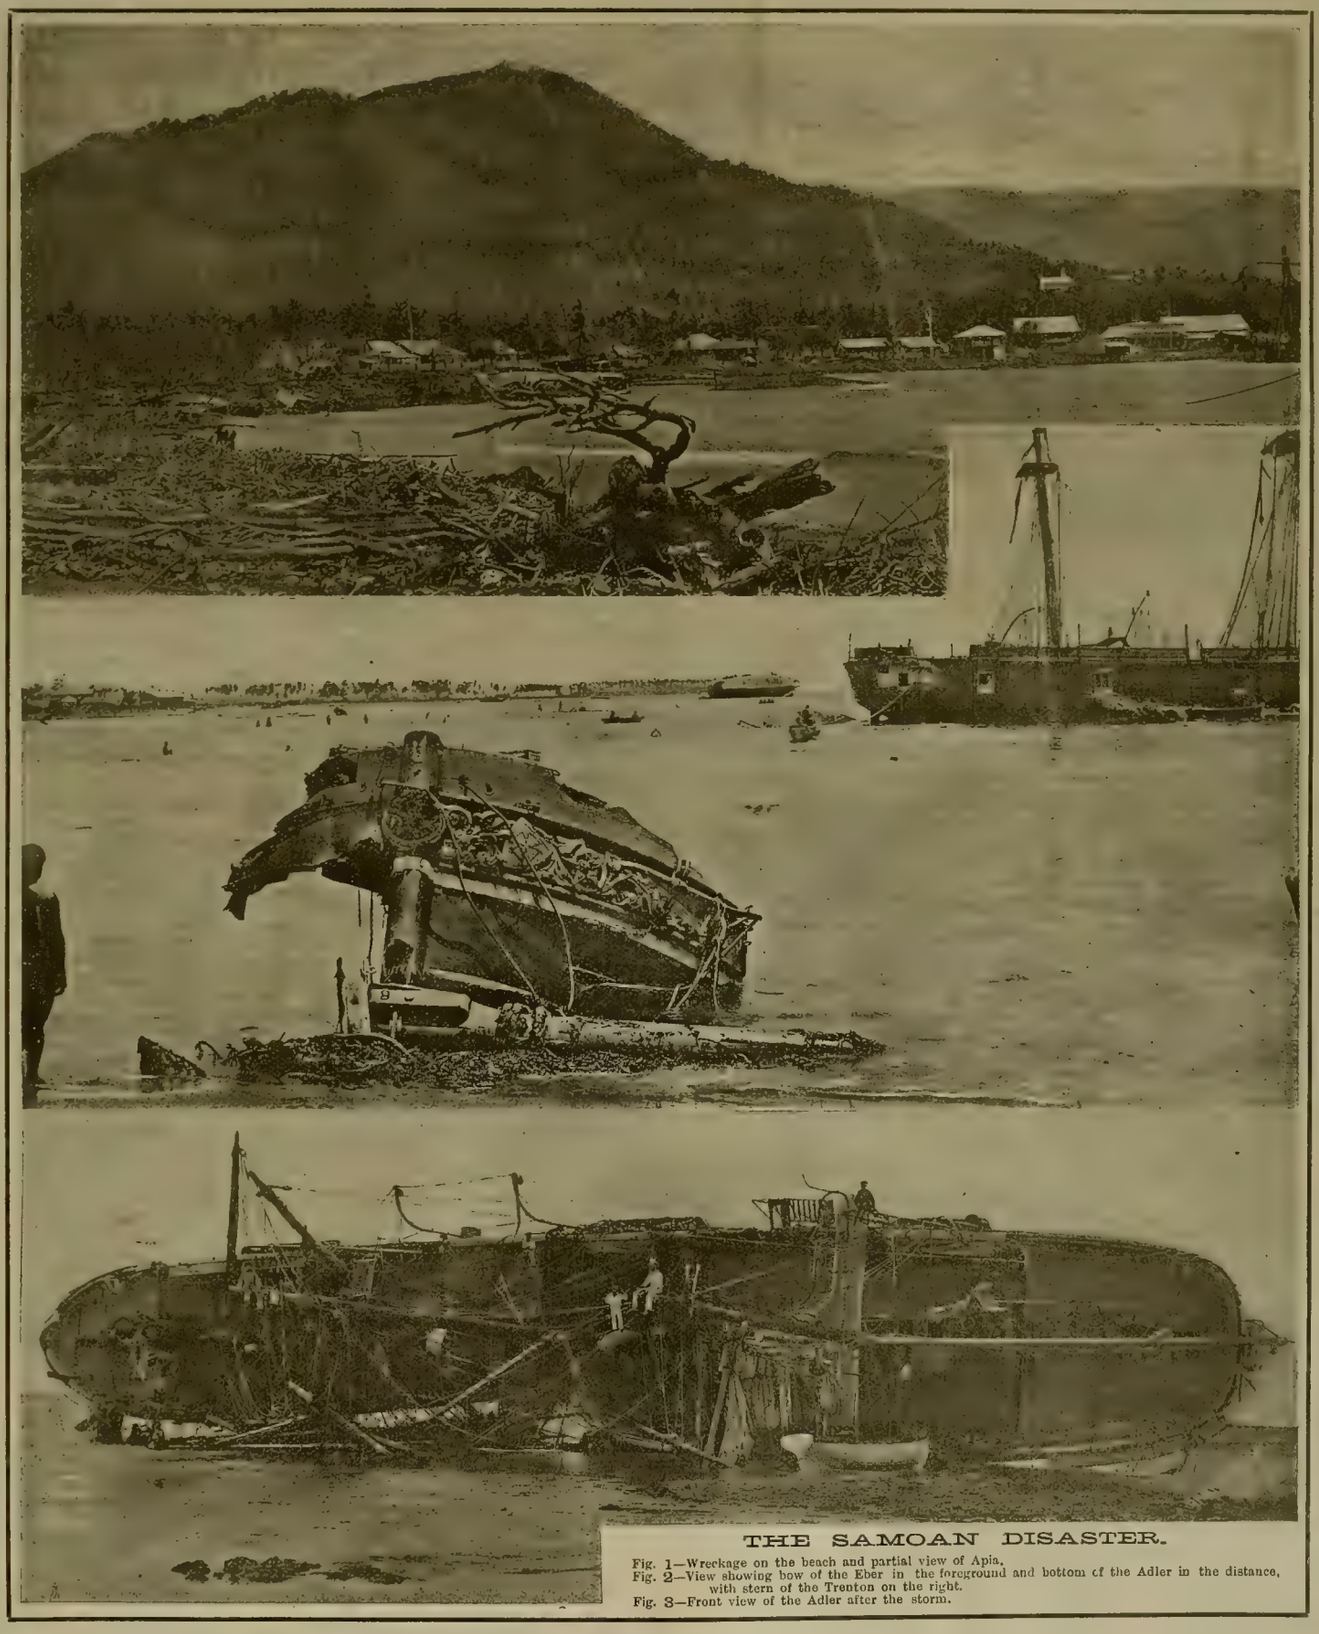
The gimlet-pointed screw has produced more wealth than most silver mines, and the Connecticut man who first thought of putting copper tips on the toes of children's shoes is as well off as if he had inherited $1,000,000, for that's the amount his idea has realized for him in cold, clammy coin.

The common needle-threader, which every one has seen for sale, and which every woman owns, was a boon to needle-users. The man who invented it has an income of $10,000 a year.

A minister in England made $50,000 by inventing an odd toy that danced by winding it with a string.

The man who invented the return ball, an ordinary wooden ball with a rubber string attached to pull it back, made $1,000,000 from it.

The person who invented the most recent popular toy, "Pigs in Clover," will be rich before the leaves turn this autumn. He was poor last November.—*Pittsburg Press.*



THE SAMOAN DISASTER.

Fig. 1—Wreckage on the beach and partial view of Apia.
Fig. 2—View showing bow of the Eber in the foreground and bottom of the Adler in the distance, with stern of the Trenton on the right.
Fig. 3—Front view of the Adler after the storm.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

QUARTZ.—Amador *Dispatch*, May 4: About a quarter of a mile east of Jackson, on J. McMann's ranch, is a ledge of quartz which runs nearly north and south. Years ago a shaft had been sunk 10 or 12 feet deep on the claim, and abandoned. Lately a young man named Purdy, while prospecting there, discovered a pocket of rich ore about 10 feet below the surface. From this place he took out a tub of decomposed quartz, which he values at about $200. He now has a shaft 30 feet deep on the west side of the ledge and occasionally breaks into and prospects the ore, which so far continues flattering.

GOVER.—The Gover has more, and a better quality of ore, than they have had for years. They were working by the side of a wall supposed to be the hanging-wall, but when they broke through into it found 10 feet of high-grade ore.

Calaveras.

AN OLD MINE TAKEN HOLD OF.—*Prospect*, May 3: An Oakland company has taken hold of the Hoozier mine, above Jesus Maria, and several men are now at work. There is a 10-stamp mill on the premises and machinery to prospect the mine thoroughly. A tunnel will be run about 300 feet to tap the vein at a depth of 200 feet. This mine has been worked at different times for 20 years.

THE CASSINELLI CLAIM BONDED.—Tom Goodwin has bonded the Cassinelli gravel claim on Central Hill to a San Francisco Co. and work has been commenced already. Several other claims will be opened in a short time, and we predict that the bullion product of the county will be increased considerable the coming year by the opening of the Central Hill gravel deposits.

PUMPED OUT.—The Mitchell gravel mine at Vallecito is being worked now in a manner that will insure success. Last week the mine was drained of water, and now the proprietors can run their drifts and take out the rich deposits of gravel and not be bothered with water. Pumps have been running for about three months to clean out the mine.

Colusa.

SULPHUR CREEK.—Cor. Williams *Farmer*, May 1: Our little village, Sulphur creek, once enjoyed the busy life of a thriving mining camp, when the Buckeye quicksilver mine was in full blast, but is now resting in quiet repose awaiting the return of business activity and enterprise. The boom is fast approaching, but mining interests in these parts have taken a fresh impetus. The Manzanita gold mine that has been worked for quite a number of years by different companies is now about making preparations for extensive work; although the ore is somewhat refractory it is now handled very successfully under the able management of Mr. Northey, the present superintendent. We understand the above-named gentleman has been called East by his company to consider the practicability of adding 20 or 30 more stamps to the ten already in place, when the hundreds of tons of ore on the dumps of the old Cherry mine are proposed to be worked; this ore, being free milling, can then be worked very profitably. The Clyde and Keely mines, about five and one-half miles northwest of Sulphur creek, are making hurried preparations for early work. The Clyde is a well-known mine in this locality, and contains some very valuable deposits of rich ore. H. M. Cooper, Esq., of your city, the present proprietor of this mine, we understand intends moving his mill lower down the creek, where the ore can be worked to a better advantage by taking it through a tunnel that will tap the shaft in about 100 feet from the mouth and about 70 feet down from the surface. The Keely mine, immediately adjoining the Clyde, is now the property of J. W. Brim, who recently bought it and has already commenced excavating for his milling machinery, and as soon as his five-foot Huntington mill arrives operations will begin and continue night and day as long as water lasts.

El Dorado.

GRAVEL AND QUARTZ INDUSTRY.—Georgetown *Gazette*, May 2: The cheering reports of developments all along the line of the ancient gravel deposits in the vicinity of Volcanoville, which are being made by miners of little capital, and under trying difficulties, are slowly but surely establishing undoubted evidence of the belief that there exists beneath the great depth and width of volcanic ash and cement in that region channels of gravel as rich in gold as are the gravel beds just over the river on the other divide. The perseverance and pluck of our prospectors on the El Dorado side will yet break through the rim at the bottom of the main channel which holds the wealth sought for; then will capital look this way for investment. The same we may truthfully say of our quartz mines. The zone or belt containing the rich mines in Amador and southern El Dorado traverses northward the vicinity of Kelsey, Garden Valley, Georgetown and Volcanoville, on through Placer, Nevada and Plumas counties. Slowly and steadily the work of deep development is creeping up this way, gaining a hold here and there, with just enough encouragement to inspire now and then a capitalist to venture the development of a prospect. Our prospects are good, prospects which, if they were located farther south on the lode line, would, to say the least, be thoroughly developed. Let us encourage capital to come and develop our prospects. If you have faith in your mine, give the capitalist ample time to test it. If it is a good mine, he will be willing to pay a reasonable price; if it proves worthless, he has done all that in reason can be asked or expected of him.

Fresno.

HILDRETH.—Cor. Fresno *Expositor*, May 1: The 600-foot level of the Abbey mine is driven ahead to cut an extensive ore body, which is being developed on the fourth level. The 700-foot level is producing considerable good ore. The winze from this level is going down rapidly and the ore continues to improve. The upper stopes are still producing large quantities of high-grade ore. No. 1 tunnel, through which the mine was originally worked, will be driven ahead to facilitate the workings of the surface ground, which contains large bodies of rich rock. The mill is running day and night at present. The Morrow mine continues to improve as depth is attained. The shaft is still going down, disclosing a fine regular ledge of fair ore. The shaft is down about 150 feet. Considerable water was encountered last week, which seems to come from the ledge, which is a very good sign of a continuous vein. The mill is running steadily on ore from the mine. The intention is to build a mill at the mine as soon as there is sufficient water to run it. At present the ore has to be hauled to the Frances & James mill, a distance of two miles.

MILL CREEK.—Cor. Fresno *Expositor*, May 1: Your correspondent visited the 99 mine a few days ago. The mine was discovered some years previous by Mr. Rider and others, who sold it to the present owners, a company of gentlemen from Visalia and this vicinity. They have a tunnel some 800 feet, and are now sinking a shaft which is 70 feet below the surface to connect with the tunnel. While blasting the other day the side of the shaft was jarred so as to cave off, leaving a ledge visible, which Mr. Stiles informed me he had tested and found to be rich with gold and some silver. There are two more mines located near by which will soon be opened up.

Inyo.

THE CASEY MINES.—Inyo *Index*, May 1: H. A. Mullins of Paris, Ill., is a principal stockholder in the Casey mines near Laws, and came from the East a few months ago. He confirms the good report of the tapping of the lode with the prospecting tunnel and reports later developments as exceedingly encouraging. Should present prospects continue as favorable as promised, the owners, the Inyo Gold Mining Co., will early arrange for mining and milling on an extensive scale.

NEW MINING CO.—Inyo *Independent*, May 4: A new mining company has been incorporated to be known as the Butte Valley M. Co. The mines of the company are in Butte Valley, in the southeastern portion of Inyo county. The principal place of business of the company is Santa Ana, Los Angeles county. The capital stock is $300,000 and is divided into 300,000 shares of a par value of $1 each. The directors of the company are John G. Kimball, D. M. Tomblin, George L. Morgan, O. R. Scholl and Milo Page.

Mariposa.

HORNITOS.—Mariposa *News*, May 4: Mr. Stone, a mining man from Calaveras, has bonded the Moore Hill mine from its owner, J. Craighn, and gone to work on it with a small force of men. The ledge is from 6 to 8 feet of good milling rock with a steady streak running uniformly 16 inches and paying $13.50 per ton.

Napa.

QUICKSILVER SHIPMENTS.—*Calistogian*, May 1: During April, quicksilver was taken from the mines and shipped from Calistoga, as follows: Napa Consolidated mine, 481 flasks; Sulphur Bank mine, 180; Bradford mine, 99; Gt. Western, 30; total, 790 flasks. The continued large shipments from the Napa Con. are beyond the expectations of all who knew anything about the property years ago. Four hundred and eighty-one flasks make a fine month's work for the mine.

Nevada.

PARTIALLY FLOODED.—*Tidings*, May 1: Monday night, Edwin Abram drilled three "holes" in the "raise" he was running to connect the Lone Jack and the Omaha shafts. At 10:20 P. M. Abram blasted, when a considerable volume of water rushed in. The blast had rent the rocky barrier between the "raise" and the Lone Jack shaft. There was another "raise" close by and Abram rushed into it with an alacrity not even equaled by the rushing water, shouting an alarm as he ran. The other men in that part of the mine were at supper and quickly placed themselves in safety. A Mr. Harris and son, less alarmed or more dignified than the others, were slow in moving and were caught by the water, which rose around their persons to a hight of three or four feet. The raise which tapped the Lone Jack is about 100 feet above the bottom of the mine. The lowest levels were flooded and the water rose to a hight of 25 feet in the shaft.

RICH ORE AT THE CHAMPION.—*Transcript*, May 2: For several years the owners of the Champion mine of this district have been expending money and labor in the development of the property, and now they have bright prospects for realizing largely from the investment. The drift on the 500-foot level is in 60 feet and shows a four-foot ledge, the most of which old miners say will mill $100 per ton. This ledge is improving in size and quality with each day's work on it. The Champion bids fair to soon become one of the leading producers of the county.

MACHINERY FOR THE KENTUCK. — *Transcript*, May 5: During the past week there has passed through this city a quantity of machinery from San Francisco consigned to the Kentuck mine across the river from Goodyear's Bar. The machinery, including the boiler, is made in sections. The mine is up on the mountain-side a mile and a half from the wagon-road and everything has to be carried on mule-back and over a rough and narrow trail. B. F. Rouse is superintendent of the Kentuck.

DRIFT MINE.—Nevada *Transcript*, May 4: The work of reopening the Manzanita drift mine by sinking a shaft and a bedrock tunnel will be commenced without further delay, now that the negotiations for a transfer of the control of the property to S. Wheeler and Geo. G. Allan have been consummated by Messrs. Gowell, Heath and the other stockholders selling their interest to these two gentlemen.

GOLD TUNNEL.—The men who have been prospecting for some time past at the old Gold Tunnel mine, which was many years ago regarded as one of the richest claims of this district, have made important developments. A new and large ledge of high-grade ore has been found, and it is made apparent that the pioneer owners worked only on a smaller and less valuable body of ore. It is confidently anticipated that before the summer is over the Gold Tunnel will be giving employment to a large force of miners. A gentleman from the neighborhood of the California quartz mine near Graniteville says it is currently reported there that Messrs. Foley & Co. have sold the property for something like half a million of dollars. There is a conflict of statements as to whether the mine has really changed hands or not.

Shasta.

GRIZZLY GULCH MINES.—Cor. Shasta *Democrat*, May 1: Your correspondent lately visited the rich strikes in the Grizzly Gulch mining district. Excitement is running high, and prospectors are flocking to the front. The Iron Mask mine, owned by a San Francisco company, is yielding rich ore. G. H. Knox's mine, adjoining the Iron Mask, presents, already developed, a chute of ore 150 feet in length and three in width that will average $30 to the ton. Last Monday the Pluto mine, owned by Messrs. Purdin, Weser & Watson, passed into the hands of a San Francisco company for a handsome sum, and at present negotiations are being made for the Hoodoo and Mascot mines, owned by J. P. Bowder and E. Flanagan. The Red Bluff and the Mammoth mines, owned by C. A. Weser & Co., are also a center of attraction, the Red Bluff prospecting as high as 25 cents to the pan in the ledge. Six years ago there was but one mine on Grizzly gulch, and good prospectors who frequented there thought that no other good mines could be found. To-day there are not less than 20 located and prospected quartz claims in that locality, and most of them promise, by surface prospects, to turn out well.

Sierra.

THE BUFFALO.—*Tribune*, May 3: The mine looks better every day and the owners are confident of a big cleanup. The company have about decided not to clean up until the water falls short, as they would have to lose two days at least if they should, and water is too precious to them to let that much go to waste. There will be an engine to run the mill by July. Frank Cook and a gentleman from San Francisco went up to the mine Tuesday and brought down some rock with them. It was most all decomposed. The reporter was shown it and without any exaggeration whatever, we could see gold all through the dirt with our naked eye. A handful of this decomposed matter was horned out and a perfect string of precious metal was obtained. The principal stockholders of the Buffalo are residents of Sierra City.

NORTHERN BELLE.—The Northern Belle mine, a short distance back of the Marguerite mine, is looking well. The four-stamp mill has been completed and was started up Monday. Free gold can be seen in nearly all the rock and a good cleanup after a few weeks' run can be depended upon.

San Diego.

JULIAN.—Cor. San Diego *Sun*, May 4: The approaching season will be the most favorable in every respect relative to mining and mines in this section of any preceding year in the history of Julian. A gratifying assurance is the number of prospectors daily arriving, the larger number evidently intending to remain, as they are much pleased with the future prospects of the camp. Prospecting in the vicinity of Banner will receive an impetus heretofore unknown, and the fact will be fully demonstrated that Banner and its surroundings will compare favorably with any gold camp on the Pacific Slope. The prospective point at present appears to be in the vicinity of the Chariot mine.

THE OWENS MINE is in the immediate vicinity of Julian, and formerly was quite a paying institution, the old shaft being some 300 feet in depth, and while under the supervision of I. James, since deceased, unearthed some of the richest gold quartz ever before produced at Julian. The old shaft has been abandoned and a new one started on the same vein. The mines are down something over 100 feet with flattering prospects. In this district several other mines are being worked, the miners say with some degree of success.

THE CINCINNATI BELLE.—This property, owned by W. Fredericks, is at Banner, and is the best paying mine for its size in this district. The main shaft is down some 68 feet, but at present is full of water, unless very recently pumped out. Parties must not draw the inference that this is a wet mine; on the contrary, it is too dry if anything. The heavy rains caused the filling of the shaft. It is evident that negotiations have been going on between Eastern capitalists to perfect a sale, if the parties can agree on the price.

THE FRACTION MINE is the extension of the above, and is nearly as rich. It is owned by McGhear & Rolland, and at the present good ore for milling is being taken out. At the Ready Relief mill, which will shortly have a good-sized crusher, Mr. Rolland informed me that he usually pounded out his richest metal in a hand mortar.

Tulare.

BARTON MINE.—Tulare *Times*, May 3: Joseph H. Thomas of this city spent several days of last week visiting the Barton quartz mine on Rattlesnake creek, 25 miles east of town. He says the mining ground can easily be traced for 1¾ miles by the country rock that crops out for that distance, but that is the beginning and the end of all indications of gold. Several shafts have been sunk along this line, and everywhere traces of gold can be found, though the peculiar formation containing the gold is not discovered until a shaft has been sunk on the lead 10 or 12 feet. The rock containing the gold is not quartz, but is of a sandstone formation, which will dissolve in a short time after being placed in water, and can then be run through sluice-boxes, and the gold saved. Mr. Thomas does not believe the rock or sandstone to be very rich, but is of the opinion that if water was handy it would pay $2.50 per day to the man. Water is scarce, and can only be obtained for working the "rock" during the rainy season; yet there is water that can be utilized if the ore were transported a distance of a mile and a quarter.

NEVADA.

Washoe District.

UTAH.—Virginia *Chronicle*, May 4: On the 600 level, the double compartment incline upraise from the end of the main south drift is up 120 feet. Formation, vein porphyry and quartz.

CON. CALIFORNIA AND VIRGINIA. — During the week 1182 tons and 1850 pounds of ore were shipped to the Morgan mill, 1846 tons and 1760 pounds to the Eureka. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $27.60. Bullion valued at $72,600 on hand in the assay office. Shipped to San Francisco during the week bullion valued at $90,247.39.

OCCIDENTAL.—On the 300 level in the north lateral drift, 35 feet north of the south winze, an incline upraise is up 253 feet. Formation, clay and porphyry. On the 450 level the north drift is extended 160 feet from the north incline winze. Formation, ore and porphyry. Will finish excavating for battery foundation for new mill next week.

NORTH OCCIDENTAL. — On the 300 level, west crosscut No. 2, 100 feet north of the south line, is advanced 44 feet in quartz and porphyry. On the 400 level the north lateral drift is extended 183 feet; formation, quartz and porphyry.

BEST AND BELCHER.—During the week there has been crushed at the Thompson mill 17 tons 1600 pounds of ore, the average battery assay of which is $24.20 per ton. Have shipped to the office in San Francisco bullion valued at $7569.

CONFIDENCE.—Shipped 160 tons of ore during the week. Pulp assays show an average value of $27.87 per ton. The raise above the 300 level is in ore. Ore shipments from this mine and Challenge were suspended April 30th.

UNION CON.—On the 1465 level at a point in the north lateral drift 220 feet north from the south line of the mine, west crosscut No. 1 is advanced 83 feet in a formation of porphyry and clay showing some water.

CROWN POINT.—Shipped during the week 833 tons of ore, battery sample assays showing a value of $21.07 per ton. The hanging-wall in the stopes above the 400 level flattens and the ore is much narrower.

BELCHER.—The 1100 level west crosscut entered ore May 1st, which shows an average value of $100 per ton. The ore does not extend to the top of the crosscut and is evidently the apex of a body.

OPHIR.—On the 1465 level, from the south drift from the east crosscut, 90 feet in from the main south drift, a west crosscut is advanced 70 feet and is now in quartz which shows value.

HALE AND NORCROSS.—During the week shipped 1018 tons of ore showing a value of $31.42 by battery sample assays. Bullion valued at $88,000 shipped so far on April account.

MEXICAN.—On the 1465 level the north drift from west crosscut No. 1, 61 feet east of the upraise, is extended 30 feet in a quartz and porphyry formation of low value.

ALTA.—Sinking a winze in ore below the 925 level. The ore in the bottom is above the average grade. Crushing and concentrating the usual amount of ore.

SIERRA NEVADA.—On the 520 level from the shaft station, an east drift is advanced 210 feet and is in porphyry showing some water.

SAVAGE.—Shipped during the week 474 tons of ore showing a value of $19.79 a ton from battery sample assays.

GOULD AND CURRY.—On the 450 level the northeast drift is extended 125 feet. Formation, porphyry and quartz.

BULLION.—On the 760 level advancing a south drift from the bottom of the winze sunk below the 640 level.

CHALLENGE.—During the last week shipped 89 tons of ore showing an average assay value of $27.87 per ton.

JUSTICE.—The mill is running steadily on ore. The new hoist plant will be completed next week.

CHOLLAR AND POTOSI.—Shipping daily to the Nevada mill 70 tons of ore from the joint stopes.

SCORPION.—Still advancing an east drift from the 520 level of the Sierra Nevada shaft.

SEG. BELCHER.—The 1100 west crosscut is in 325 feet. The face is in soft porphyry.

ALPHA.—The joint 500 level east crosscut at the Imperial line is in vein matter.

EXCHEQUER.—Advancing a north drift and west crosscut on the 500 level.

ANDES.—The upraise above the 350 level will soon connect with the 175.

IMPERIAL.—Advancing the joint Alpha line crosscut on the 500 level.

BALTIMORE.—No change in explorations in progress on the 225 level.

NEW YORK CON.—Crosscutting west from the 800 level lateral drift.

SILVER HILL.—Drifting northeast and southwest on the 200 level.

OVERMAN.—Shipped 242 tons of ore during the week.

YELLOW JACKET.—Resumed shipping ore May 1.

Bristol District.

LEACHING TAILINGS.—Pioche *Record*, April 27: Chas. L. Roe was in from Bristol yesterday. He says he will be ready in about two weeks to begin steady work in leaching the tailings there. A test of 35 tons worked last week shows that by proper roasting the tailings and ore of the same class can be worked to a high percentage. There is no question but that the work will prove profitable.

Eureka District.

NOTES.—Eureka *Sentinel*, May 4: Charley Broy has been hauling ore from the Eureka tunnel during the week. We learn that there are about 100 tons of ore to come from there. The tunnel in the Diamond mine will be completed in about a week. The Tributers in the Phœnix mine have about 30 tons of ore ready for shipment. The Hugenot mine on Prospect mountain, under lease, is yielding some good ore. A number of men are now employed at the Eureka Con. furnaces in making repairs, and it is thought they will commence smelting about the first of June.

Jefferson District.

DEVELOPING.—Belmont *Courier*, May 4: The mine-owners in Jefferson district are busy developing their properties and some good ore is being encountered. The Harrison mill is running and producing silver bullion.

Tuscarora District.

BELLE ISLE.—*Times-Review*, May 4: North drift from west crosscut, 250-foot level, extended seven feet, showing a good width of vein; ore, low grade. Have started a drift south from the same point.

COMMONWEALTH. — 225-foot level: Upraise to connect with No. 3 winze made seven feet, exposing fine ore. Intermediate drift from No. 1 winze extended 11 feet, still in ore. South drift from No. 2 west crosscut advanced 17 feet, showing good ore. No. 1 winze sunk nine feet, developing very fine ore. 300-foot level: South drift advanced 17 feet in the vein; north drift extended 14 feet, showing low-grade

ore. A few miners have been put to work stoping in the different openings of each level. The mill is now running 20 stamps on ore from the mine, everything going nicely.

DEL MONTE.—North drift, 225-foot level, extended 19 feet. The face shows seams of spar carrying iron and giving low assays. North drift, 100-foot level, extended 17 feet, showing some high-grade ore. At this point a crosscut has been started to determine the width of the vein and has been extended four feet, showing better ore than was found in the main drift.

NEVADA QUEEN.—The stopes are yielding good concentrating ore. Two hundred and seventy-five tons of concentrating ore have been shipped. The concentrator is working well. The mill has been turned over to the Commonwealth. Shipped bullion to the value of $18,340.98. Another shipment of the cleanup is yet to be made.

NORTH COMMONWEALTH.—A joint crosscut has been started east from the 225-foot level station, in favorable looking ground. South drift, 100-foot level, extended 25 feet; the face shows some high-grade ore; neither wall has yet been cut by the drift.

NAVAJO.—South drift, 250-foot level extended 15 feet. A drift has been run south 10 feet on the vein, from the top of No. 7 upraise, 350-foot level, showing fair ore. The usual quantity of ore has been sent to the mill.

NORTH BELLE ISLE.—The stopes above the 300-foot level are almost exhausted of high-grade ore.

ARIZONA.

COPPER BASIN.—*Journal-Miner*, May 1: Thirty-five tons of copper has been shipped from Copper Basin. A rich ledge of copper is reported to have been struck recently near Lee's Ferry. Ore is commencing to arrive again in large quantities at the sampling works. J. M. W. Moore has nearly a carload of $300-ore ready for shipment from his Amulet mine. J. N. Rodenburg left for the Bradshaws yesterday, to work some claims owned by him there. James Akers and Harvey Helm came in from the Trap Rock mine yesterday, with a lot of ore for the sampling works. Frank Alters has sold his one-fifth interest in the Catoctin mine to Wm. Ronald for $2000, the deed for which has been recorded. The Lynx Creek Hydraulic Works have closed down for the season for want of water, after a very successful run of three months. J. R. Liston, who owns a good mine in the Bradshaw country, is in town purchasing supplies, and says that they are having a genuine mining boom out there. N. L. Griffin of Lynx creek says that Dixie Mining Co. is pushing work rapidly on its property in the above district, and have very flattering prospects for success. James O'Hara, who owns some good mines in Martinez district and in other places in the county, is in Prescott. He says he will soon commence taking out ore from a claim near Copper Basin. J. J. Williams made an experimental run of his little water jacket furnace to-day, at the sampling works. It worked to perfection. The furnace is a portable one, and has a capacity of from three to five tons per day. The engine used to work the blower is of two-horse power capacity.

BRITISH COLUMBIA.

ON THE FRASER.—Kamloops *Sentinel*, May 1: An English company has applied for 45 miles of the Fraser river to dredge for gold. The limits applied for extend from Boston Bar to the foot of Cornish Bar, five miles below Hope. In these limits there are 20 miles of canyon which cannot be worked. It is to be hoped the application will be granted, as the work will incur a large outlay of capital. It is the intention of the company to build a steamer, dredges, scows, and other necessary plant at North Bend, and mine down stream. Should the company be successful—and there is no reason to doubt that they will—it will give an impetus to this system of mining that will be the means of employing a large number of men, and will bring the rivers of the province into prominence both at home and abroad. Other companies have tried pumping, dredging, coffer-dams and diving years past without success, and it is to be hoped the proposed scheme will, if undertaken, be more fortunate in reaping a rich harvest for its promoters.

YIELDING $20,000 A YEAR.—Donald *Truth*, May 1: The Perry Creek Gold Mining Co.'s ground is now producing dust at a monthly rate that will aggregate about $20,000 a year. The company has labored and overcome many difficulties, but are now reaping a small reward for their perseverance. A letter from Foreman Dow to Secretary Jacoby states that the tunnel is still in the old river-bed canyon, which is very narrow in places. The bedrock and rimrock are quite smooth. The quality of the gold taken out is coarse. The yield for April is expected to average fully as large as that of the three previous months, as good-looking ground is being worked. The total yield for January, February and March was $4797.

COLORADO.

GOLD BELT.—*Ouray Plaindealer*, May 4: All along the gold belt, both in the upper and lower quartzite, nothing but the most flattering reports are daily received. A great many prospectors are busy with pick, shovel and gold-pan on both sides of the river along the contact for miles. As the snow decreases the field of operation is extended. The extent of the field is as yet undetermined, but with the development and prospecting now in progress the treasure troves in this singular formation will be speedily brought to light. There is no telling how much of the precious metal these immense cavities in the quartzite contain. Suffice it to say, that enough work has been performed and ore extracted to satisfy the most skeptical that rich ore in paying quantities exists. Work all along the line on all the most extensively developed properties demonstrates that the quartzite can only be compared to a honeycomb, the cells being filled with soft, decomposed ore, rich in gold. Report of a rich find in the Puzzle was circulated Wednesday by disinterested parties, who were at the mine when a number of blasts were fired into the breast of the drift, which opened up a larger and richer cave than any heretofore found. American and Nettie working as large a force of miners as is practicable, and producing about four tons per diem. The Jonathan is making a good record as a producer, and is conceded to be one of the most promising properties on Gold hill. For the amount expended in development, the quantity of ore exposed and ready to be shoveled up and marketed at the pleasure of the owners, the gold belt surpasses any district in the State, and is well worth the trip to go up and examine.

IDAHO.

THE MINING OUTLOOK.—Boise City *Statesman*, May 4: The mining outlook does not appear to be as bad as many have supposed. The placer mining in Boise Basin will amount to but little this season. It is one of the poorest seasons ever known for placer mining in Boise county, but on Snake river, where there is now a good deal of mining, it is better for the low water. The bars where the gold is are more exposed and they have a larger surface of pay dirt which is easy to get at and will make the season on Snake river longer than usual. The Gold Hill mill is turning out $15,000 a month and the mine continues improving. The Washington mine shipped a good deal of ore last season, but will have a mill erected at their mine in less than 90 days, and the product of the mine will be twice or three times as much as last year. Jo Voshay, the superintendent, is on the ground and he will push the work with all necessary labor. John Brown, the superintendent of the Banner mine in Banner district, has been on the ground all winter and has done considerable deadwork and uncovered a good deal of rich ore. This mine and the other mines in the group are narrow and require heavy working, but the ore is very rich. It is quite probable that this mine will produce $100,000 this season. K. P. Plowman is building his mill over on Robies' creek, ten miles north of here, and will work the Thurman lead and ore from several new mines this side of Shaws' mountain, eight miles from this city. The outlook for the mines around Silver City, Bellevue, Hailey, and Ketchum is better than it was last year.

BUNKER HILL AND SULLIVAN.—Wardner *News*, April 29: The *News* is informed by Superintendent V. M. Clement that all work in the Bunker Hill & Sullivan mines will be suspended this evening and on Tuesday next all operations in the mill and other departments of that works will cease. This suspension will continue until a reasonable freight rate is offered by the Cœur d'Alene Railway Co., or until the W. & I. road, now in course of construction, is completed to Kellogg. Superintendent Geo. B. McAulay is anxious to have work proceed in the mines under his charge, but he positively states that if a reduction in freight rates is not made immediately he will be forced to stop all work in the Sierra Nevada, Stemwinder and Granite mines and concentrators.

HUNTER DISTRICT.—Since the first of last February, the date on which operations were resumed on the Hunter mine, a great deal of development work has been done, confirming the opinions already expressed concerning the vast resources of this most valuable property. The vein proper is between 30 and 40 feet in width, but the ore streaks vary from one to eight feet, several of which are found thereon, and there is every indication of encountering kidneys that will extend the full width of the vein. The mine is opened by four tunnels. The concentrator is located at the mouth of Hunter gulch. The main building is 65x100 feet and 60 feet in hight, with an ore-house attached 25x40 feet, and a sacking-house 40x57 feet. The machinery is run by water-power aided by a 20-inch Leffel water-wheel. The mill is from the works of Fraser & Chalmers, of Chicago, and contains the latest improvements in the methods of concentrating. The plant consists of 2 ore-crushers, 4 sets of Cornish rolls, 2 Heberly grinders, 12 jigs (which number will be increased immediately to 16) and 4 Frue vanners. One hundred tons of ore are being treated daily. An air compressor with a capacity to run 10 Sergeant power drills has been ordered and is now en route from the Norwalk works, South Norwalk, Conn. The mine and mill are under the able superintendence of C. C. Perkins, a gentleman of large experience in his business,

MORNING.—Chloride Hill is one of the loftiest and grandest elevations found in the Cœur d'Alenes, and looks proudly over the town of Mullan. Foremost among the developed properties stands the Morning, which is now conceded to take its rank among the best mines of the South Fork. Work has been commenced on the concentrator; everything for the works, including the building, will be erected by the Utah & Montana Machinery Co. The site for the mill is conveniently located near the railroad track south of the town. Martin Curran, one of the best practical miners in the country, is superintendent of the mine.

GEM.—The Gem mine, owned by Campbell, Finch and others, is at present a scene of busy operations, and as work progresses most encouraging developments are made apparent. In the upper tunnel three shifts are employed in sinking an incline on the ledge, which shows to the full width of this working. Wednesday, May 1st, work will be commenced on the concentrating mill, which will be built under the direction of R. K. Neill, who has acquired a reputation for the erection of such works second to no one in the West.

BLACK DIAMOND.—A very promising claim called the Black Diamond, owned by W. J. and Geo. E. Hughes and Tim Maher, is located about six miles from Mullan. They have a tunnel in 150 feet, with a crosscut from its face run in a northerly direction 47 feet. Assays run 84¼ ounces silver and 59½ per cent lead.

SILVER CLIFF.—An extension of the Black Diamond on the east, called the Silver Cliff, is owned by J. D. Young. He has a tunnel in 170 feet showing two chutes of ore.

THE SILVER WING.—Challis *Messenger*, May 3: A one-half interest in the Silver Wing mine, a one-half interest in the Queen of the Hills, a four-ninths interest in the Shamrock, a four-ninths interest in the Herschel, on Ramshorn hill, and the Greyhound mine, formerly called the Keystone, on Keystone hill, all in Bayhorse mining district, together with all ores on the dump, have been sold by Owen Long and George Clark to A. J. Crook & Co., and the deed was placed on record on the 26th ult. Consideration $25,000. The Silver Wing mine adjoins the Skylark on the east, is one of the best little mines in the county, and has been a constant producer of a reasonable amount of high-grade ores ever since its discovery, which dates back some eight or ten years. The other properties all have good showings, and with sufficient development work, will, from every indication, prove to be mines and a valuable investment to the purchasers.

MONTANA.

THE MOUNTAIN LION.—*New Northwest*, May 4: The Mountain Lion working shaft was still in vein matter Tuesday, not yet having struck the footwall. The vein is so far demonstrated to be 13 feet wide at this point. There is considerable stratified ore in it, aggregating about two feet, some of very good quality. There is now over 800 feet of development on the Lion, and over 500 feet of shafting and tunneling yet to be done by the Syndicate. The work is being expeditiously, durably and economically pushed by Mr. Gable.

THE CHAMPION.—"Everything is looking first-rate" is Supt. Ed. Mills' report of the Champion yesterday. The 350-foot level is in 30 feet, with 4 feet of ore. A carload a day could be sent up readily if there was ore-house capacity to hold and teams to handle it. As it is, ten carloads will be shipped this month. The ore so far shipped has netted over $1200 per car at Butte and Helena.

NOTES.—Mr. Alex. Sloan is now shipping 20 tons of iron ore per day to the Helena smelter, from Avon, which he hauls from his mines about nine miles from Avon. He has a contract to deliver 2000 tons, and the smelter will take all he can furnish, it making a very desirable flux. There seems to be an illimitable deposit of it, and it is procured so far by plowing it up and filling it into wagons.

THE RUBY-AMERICAN PROPERTIES.—Dr. H. L. Hoyer obtained, a few days ago, the final signature that completed the titles to the Ruby and American locations, and has commenced operations. These locations are on Gospel Mountain, between the Champion and Lion properties. They prospect very well in the representation shafts sunk on them.

THE FRANKLIN.—Supt. Benjamin Franklin, who is running the Jumbo tunnel for the Franklin Co., reports the tunnel in 650 feet, with 260 feet vertical depth at the head. He has 13 feet of a vein filled with quartz and porphyry, with 40 inches of ore in place in the head of the tunnel, and all quartz to the right.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, May 4: The output for the week ending May 2d was 40 bars of bullion, containing 62,522.81 ounces silver and 91.77 ounces gold.

BI-METALLIC.—The company commenced grading this week, and the foundation is already started for an addition to the cooling-room. The force of men which has been at work constructing the tramway have been released, having completed that useful piece of work. It is thought the cable will be started this week. The mill is treating an average of about 60 tons of ore per day now, and the Granite road is constantly lined with teams hauling the ore from the mine to the mill. The engine for the tramway arrived this week, and is now being placed in position.

ORO FINO DISTRICT.—J. M. Siegfried, a well-known prospector and miner in this district, returned Monday from a trip to the Oro Fino district, and reports great progress in mining affairs in that section. There are now in all about 100 men employed in the Champion, Mountain Lion, and on other mines and prospects, and all are satisfied that a long season of prosperity is in store for Gospel mountain.

HATTA.—Another shipment of two carloads of ore will be made from the Hatta this week. They intend sending it direct to Omaha. It was expected that the company would be able at the recent meeting of the stockholders to raise sufficient money on the machinery to continue developments, but it was found impossible to do so.

NONPAREIL.—Work has been resumed on the Nonpareil, on Boulder creek. A shift of men is now sinking the shaft, and the property will be opened up as rapidly as possible. The indications are very flattering, and there seems but little doubt that it will develop into a valuable property.

OREGON.

THE WINTER MINE.—Bedrock *Democrat*, May 1: Dr. Marotte came in from the Winter mine near Sparta last Sunday. He says the mine is making a grand showing. In the tunnel at a distance of over 200 feet the ledge averages two feet wide and the ore is rich in gold. He has a force of men employed pushing development work and will continue for some months to come.

THE MINES OF POCAHONTAS.—The Nelson M. Co. are working their immense hydraulic claims with a large force of laborers employed, and the present indications are more favorable for a good run than the outlook a few weeks since. The Auburn canal, the main supply of water for the mines, is carrying a large amount of water and the late rains and snows in the mountains will be of great advantage in keeping up the supply. Messrs. Carpenter & Co., and other mine-owners of the Pocahontas district, are preparing to commence the season's work, but do not expect as long a run as usual.

FROM CRACKER CREEK.—Deputy U. S. Mineral Surveyor Emil Voigt, from Cracker Creek, reports the mining outlook of that section good; also placer mining at Sumpter progressing under favorable circumstances. The claims of Archie Downie, which are probably the best equipped mines in that section, are running under a full head of water and giving most favorable indications for a prosperous season.

NEW MEXICO.

CARLISLE.—Silver City *Enterprise*, May 4: The Carlisle mine is doing as well as usual. Several carloads of high-grade ore are being shipped from various mines of the district. These shipments will bring the mines into notice. Such shipments do more for a camp than expert reports. The Rain-in-the face mill is running steadily.

SHERIDAN.—The old Sheridan mine is producing a sufficient amount of ore to keep the mill running steadily. The ore is of a good grade, and is more than paying expenses. The Beatrice mill started up last Tuesday, and is running well and doing good work under the immediate supervision of Captain Davis, the resident manager. The "Carlisle Mining Co." is the name of the new corporation which is now running the Cooney Silver Creek mine. The mine is under bond, and will probably be sold ere long. It is a fine property. The south extension of the Smith & Ailman lead on the east side, is being worked under a lease by H. J. Hankins. The results obtained thus far are very satisfactory, and "Hank" is to be congratulated on his good luck. The Bell and Stevens' ten stamps are pounding right merrily on ore from the Golden Giant and Skillicorn mines. Sam Green is the presiding genius, and the results from the refractory ores from the district attest his skill as a thorough millman. The Major mine, the property of M. B. Tallant, is opened by a shaft 38 feet in depth. The crevice at the bottom is from five to eight inches in width, and offers a fine milling proposition. In this, as in every mine or prospect in the district, there is increased value in both quality and quantity as depth is gained.

ZINC ORES.—Buyers of zinc ores hitherto have demanded that ores of that character to be made available, should not carry silver. This difficulty has been obviated, and now there is not a pound of zinc ores in Hanover district but can be placed on the market with a profit to the seller and smelter. The St. Louis sampling and testing works are in the field, and are purchasing zincs carrying silver and testing them successfully.

UTAH.

PARK NOTES.—*Record*, May 4: Ore shipments are increasing in magnitude. Negotiations are being made to incorporate the Glencoe group and push developments on this promising property. The Little Mac group, between the Ontario and Massachusetts, is being cleaned up preparatory to being worked by leasers. Jas. McCune will start up work on his leased property, the Wasatch, in about a week, and he expects to be shipping ore from it before long. Dividend No. 155 on Ontario stock, being $75,000 for April or 50 cents a share, has been paid. This makes the total of Ontario dividends to date, $10,125,000. The Jupiter leaser sare pushing work with favorable results. It is understood that negotiations are going ahead looking to the resumption of work on the Massachusetts property. The Anchor tunnel has reached a point under the shaft and crosscutting for the ledge has been started. Several Heber and Midway persons have lately returned from a prospecting trip to Uintah county and they report finding a ledge some 50 miles from Ashley which can be traced for miles. Assays from the new find show 50 ounces silver and 39 per cent copper—peacock copper—to the ton. There is strong talk among these men of going back there again to organize a district and develop the mines. Undoubtedly this is a rich strike, particularly as regards the copper, and local mining men are becoming interested in it.

ORE AND BULLION SHIPMENTS.—The Ontario bullion product for the week was 31 bars, containing 17,791.02 fine ounces of silver. During the week the Crescent shipped 137,910 pounds of first-class ore and 151,000 pounds of concentrates. For the week just ended the Mackintosh sampler received 526,600 pounds of Ontario ore, 458,680 of Woodside leasers, and 174,510 of Daly ore; total, 1,159,790 pounds. The first of the week, 22 bars of Daly bullion, 20,460 fine ounces of silver, were shipped from the Marsac mill. Besides this, several large lots of silver sulphides, the result of treating the ore by the Russell lixiviation process, have been shipped from the Marsac to eastern refineries.

THE MAMMOTH MINE.—Cor. Salt Lake *Tribune*, May 3: The Mammoth mine in Tintic mining district has, under the able supervision of Major Reno, become one of the largest ore-producing mines in the Territory. When he took charge, nearly two years since, the mine was in a poor condition. Under the management of Major Reno the mine has paid in dividends the sum of $70,000, besides for improvement the large amount of $65,000, while for a considerable time previous it paid but $10,000. Superintendent Reno has tendered his resignation, to take effect on May 1st. He will be missed by his employers, in the management of whose valuable property he has been eminently successful, and by the employes under him, for whose safety in the mine he was ever watchful.

THE COKE A SUCCESS.—Salt Lake *Tribune*, May 3: An experimental run of practical proportions has been made at the Germania smelter with native coke from the Castle Gate mines. The test was made during a 30-hour run, nothing short of which could be considered an effective settlement of the question as to whether we were able to supply coke from Utah mines that would bear the heavy work of the smelters. The question is settled beyond all controversy and the quality of the coke has been pronounced equal to that of Crested Butte or any other place. Thirty coke ovens are now in course of construction at the mines, and the owners propose to carry on the business on the large scale that this important article justifies.

WASHINGTON TERRITORY.

CONCONULLY MINES.—Okanogan *Outlook*, May 2: Latest reports from the Lone Star are that it is improving all the time. Jas. F. DePue has a claim in the lime belt, called the Manhattan, which has several tons of rich ore in sight. It is astonishing to all who visit this country to see the variety of mineral specimens found here in paying quantities. The owners of the War Eagle on Ruby hill are expected in, and it is understood they will resume operations on that noted mine at once. Jas. DePue has bonded the Manhattan mine in the lime belt to Dick Chilson for $4000. The Lone Star, three miles south of Ruby and about six miles from Conconully, has made a rapid jump to the front. An assay recently made shows $74 in gold and $60.74 in silver. The New Hope, Madge and Powderly claims, located near Golden in the Wanicut country, have been incorporated in Chicago under the name and style of the Consolidated Mining Co. R. H. Bliven of Ruby exhibited to us some samples from the Catelpha, Washington Belle and American Belle, situated about three miles below Ruby on Arlington hill, which are creating quite a stir among mining men here. The samples were in limestone between perfect walls. These ledges have always been thought barren, but from several test assays gold is found in paying quantities.

MECHANICAL PROGRESS.

Indian Crucible Steel—Miniature Steel Works.

The *East Indian Engineer* furnishes the following very interesting account of the primitive mode in which crucible steel is made in India:

The industry is still carried on to some extent. The works are conducted in some location favorable for obtaining charcoal. In the village here referred to the business affords employment for about 16 families of smiths, and is altogether in the hands of a Mussulman named Mahomed Routhen, who holds a monopoly of the right to collect charcoal for the purpose in the jungles of the estate, for which he pays 1000 rupees per annum. Beyond the convenience of its situation as regards jungles and the existence of tolerably fine red earth in the vicinity, the site possesses no special advantages. The modus operandi is described as follows:

"The process employed is very simple. Small quantities of iron are inclosed in a small earthen crucible with a few pieces of the wood of the avaram plant and two or three green leaves. A top is luted on, and when dry the whole is exposed to the heat of a small charcoal furnace till the iron is melted, a fact which the operator ascertains by picking up the crucibles in a long pincer and shaking them. The vessels are allowed to cool and then broken open, when a knob of steel is found at the bottom. Two sizes of ingots are made, weighing about 8 ounces and 10⅝ ounces respectively. The crucibles are made of a mixture of red earth and charcoal made of paddy husks kneaded together. They are shaped on a wooden plug about five inches long and two inches in diameter for the smaller size of ingot, and slightly larger for the other size, having a conical end which forms the bottom of the cavity in which the steel collects while fluid. The lid is of the same material and put on wet. It appears hardly to contract at all in drying, and a fairly air-tight vessel is consequently produced. The clay is not nearly refractory enough for the heat it is exposed to, as the crucibles are completely vitrified and spoiled at the end of a single operation

"The iron used is brought from the Namakal Taluk of Salem, and appears to be a rough description of wrought iron. For the smaller size of ingot it is cut into pieces weighing as nearly as possible ten ounces (a small piece is added to make up the weight, if necessary), and this quantity is placed in each crucible with ¾-ounce weight of pieces of the dry wood of the avaram plant. Two or three green leaves (the kind is a matter of no consequence) are placed on top and the charge closed up with a lump of clay carefully plastered all around. Great care is taken in putting in the correct proportions of iron and avaram wood, and the operators assert that, if less is used, the iron is not melted, and if more, it will not stand being worked afterward. The green leaves probably serve in some way toward retarding the drying of the lid and preventing it from cracking. The furnace consists of an inverted cone of earthwork about two feet in diameter, and the same in depth, the apex opening into an ash-pit below. At one side, and protected from the heat by a mud wall, is a small shed in which two bellows-men sit and work a pair of skin bellows most vigorously. The air is admitted into the furnace through a hole near the bottom. In preparing a furnace, some straw is first placed at the bottom below the air-hole, and charcoal is then thrown in to a suitable hight. On this, 25 of these conical crucibles are placed with the point downward, and when all are in position they appear to form a sort of circle and to be independent of the layer of charcoal below. More charcoal is placed above, and the furnace is then lighted through the air-hole. Fresh fuel is thrown on above from time to time, and one or two of the crucibles are occasionally lifted with long-handled pincers to allow the burning charcoal to fall through and replenish the supply below. The straw remains untouched by the fire throughout the process. The crucibles are given a sharp shake on these occasions, which is said to assist the process, and, toward its conclusion, allows of the operator's ascertaining whether the iron is melted or not.

"As the mouth of the furnace is open, the waste of fuel is enormous, and I do not believe that one-fourth of the charcoal used exercises any effect on crucibles. In the absence of good fine clay this fault seems irremediable, as there is no sufficiently refractory metal available from which a separate opening for the supply of charcoal to the furnace below could be constructed. After about an hour or an hour and a half, the feel of a crucible when lifted shows its contents to be liquid. The process is then considered to be completed, and the crucibles allowed to cool, after which they are broken open, and a knob of steel is found at the bottom of each. The ingots are reheated and hammered into oblong pieces, in which shape they are sold. All the crucibles do not remain absolutely air-tight during the process, the lids becoming cracked without affecting the result. I had the contents of one of these poured out through a crack, and was surprised to find the steel in a state of extreme fluidity, a thing which the heat produced hardly led me to expect."

The estimated cost of making 200 pounds of steel is about 31 rupees, and the value realized for the production about 36 rupees, the manufacturer netting a profit of 5 rupees, or about 16 per cent. The annual outturn of the manufactures in the village is about 14 tons.

The silver rupee is worth about 50 cents of English money; the gold rupee about $7.

Machinery and Hardware in Russia.

Mr. Mitchell, English Consul at St. Petersburg, says that, with the exception of a very marked increase in the importation of machinery for manufacturing textile goods, and in that of steam engines, a decline in machinery of every other description was perceptible in 1887. This was also noticeable in the case of cutlery, scythes and sickles, tools and other descriptions of hardware. The importations from Germany and Austria likewise showed a diminution under these heads, owing to the higher duties, though, perhaps, not in the same degree in some classes of machinery and tools. For instance, fewer portable engines were imported from Great Britain, but an increase in those obtained from Germany. It is the comparative cheapness of German hardware that drives our own nearly out of the Russian market. Thus, German crosscut saws are considerably cheaper, and therefore command a much larger sale than our own, which are, however, held in much higher esteem. Equally cheaper than our own in the Russian market are German edge tools and plain iron hammers, though English are often preferred, the difference in price alone making the latter inaccessible to the Russian purchaser at large. Works have been recently established in Russia for the manufacture of these articles.

Large quantities of locks, padlocks and other metal goods, as also tinned wire, are imported from Germany, and are sold at lower prices than those of English make. Manufactories for these articles are also being started in Russia, and, owing to the high duties which will protect them, they will be able to compete with similar German products. In order to mislead, the German manufacturer, we are told, while not generally pirating English trade-marks, has printed in English on his comparatively inferior goods, "best quality," "warranted best cast steel," packed up in the same style as the English wares. These find greater favor than they otherwise would. It must be observed, however, that Russian wholesale dealers in German cutlery, tools, etc., require them to be made up as English goods in paper, and with labels closely resembling those used by our own manufacturers. Some classes of American hardware, such as locks, saws, axes, tools, spades, pitchforks, etc., also compete successfully in Russia with our own products of a similar kind, as they are in most cases cheaper and more novel and varied in make.

JUDGING IRON BY FRACTURE.—Much is sometimes made of the appearance of a fracture on a piece of iron, as indicating its quality; and a practiced eye may, indeed, discriminate between coarse and fine metal by examining the broken ends of a bar. But, nevertheless, little dependence is to be placed upon the supposed difference between iron showing a "fibrous" and that which exhibits a "crystalline" fracture. The same break will not infrequently show patches of each appearance, and that in instances where it is perfectly certain that the texture is uniform. Probably in such cases the difference does not lie so much in the iron itself as in the manner in which it is broken. Where, for example, the fracture is of the nature of a crossbreak, the place will have a crystalline appearance; but when it runs along the grain, like a tear, it will look fibrous. In other words, the so-called "crystals" appear to be merely the ends of fibers, which, when drawn into points, would have presented a "fibrous" fracture. And, in general, the causes producing one sort of break or the other seem to be external rather than structural. For instance, when a piece of iron is broken suddenly, as by a blow, or is nicked and then bent cold, the resulting fracture is almost always crystalline; but when it is pulled steadily until rupture takes place, or is bent without nicking, the break generally presents a fibrous appearance. In this respect, indeed, iron behaves much like pitch and other ductile substances, which, when drawn out slowly, will run to a point or break like a bunch of fibers; but if struck or jerked suddenly will crack with a smooth conchoidal fracture, corresponding to one of the crystalline surfaces or faces of the broken metal.—*Builders' Reporter.*

SHEET METAL HOUSES.—The "Societe Centrale d'Architecture" of Paris has just received a very curious communication. A system of building houses entirely of sheet iron has been discovered. The walls, partitions, roofs and wainscoting are composed of double metallic sheets, separated by an air mattress, which is surrounded by different substances non-conductive of heat. The great merit of this discovery is the non-combustibility of this building. The metal employed allows of the most varied forms of ornamentation, so that the general aspect may be made as pleasing as that produced by any materials hitherto in use.

"ARDENBRITE" is a new invisible lacquer recently introduced into London. It is so strong as to withstand weather, steam, smoke, sea-air or sea-water; and gold, silver, copper, steel, brass or iron does not tarnish when coated with it. As it is so fine as to be unseen on the most delicate instruments, the new lacquer has an extensive field of application.

SCIENTIFIC PROGRESS.

Perceptive Faculties.

We condense the following from the correspondence of the Germantown *Telegraph:*

All animated natures, as far as we can understand, have perceptive faculties, and reasoning from their vital necessity to the preservation of life alone, it seems to be a foregone conclusion that that portion of living beings too small, too remote, or too inaccessible for our powers of observation to give us ocular proof, must still have these perceptive faculties, modified to suit their several organizations. Hearing in man is of a certain compass. Our tympanum, though a very delicate membrane, is yet able to withstand extremely loud sounds without destructive impairment, and still to distinguish tones extremely soft and delicate. It is not probable, however, that the lower orders of nature can distinguish those sounds which we denominate "ear-splitting."

In our own cases we know that the sound of a 16-foot organ pipe is loud, low, but clearly distinct; its sound vibrations are sufficiently numerous, *i. e.*, close together, to affect our tympanum musically. We also know that a 32-foot pipe, which gives us the octave below the 16-foot, is absolutely inaudible to us, just because its vibrations are too few in a given time to make any musical effect upon our hearing. But as the vibrations of the two pipes are proportionally thus, as 32 : 16 : : 1 : 2, so when both pipes are sounded together we can distinguish the otherwise inaudible 32-foot, because the 16-foot comes in as both a coincident and an intermediate sound.

This example reveals the extent downward in the scale of sounds which is the limit of the human ear in perception. We can hear no lower tone. As sounds run up in the scale higher and higher, we find another point at which our tympanum ceases to act, because its construction and the material it is composed of cannot respond (vibrate) quickly enough to convey the tone to our perceptive faculties. This is the extent upward in the scale of sounds to which the human ear is capable. It varies in different individuals in proportion to the delicateness of the tympanum, which may be inherent, or may be created by musical education of the ear.

Having thus stated the facts bearing upon the effect of *sound* upon the *human ear*, it remains to draw conclusions upon the same effects upon the hearing of all animated creatures below us in the scale of beings. If our ears would probably be destroyed by sounds lower than a 32 foot pipe can produce, it seems rational to believe that insects must have a scale of vibratory nerves similar to our own, but of less perception to the low, and of greater perception to the higher, notes. If so, their faculties may begin just where ours leave off in the upper register, and as the class of insects diminish in size, so the scale or gamut of each must ascend higher and higher, because their more and more increasing delicacy of organization could neither withstand the boisterous low tones nor distinguish the intermediate ones.

Thus we can understand how an omnipotent power has created a world capable of containing a diversity of beings *similar* in perceptive faculties, but dissimilar in the capacity to receive them. It follows in this train of thought that all the other perceptive faculties throughout creation must for similar reasons be gauged to a higher and finer scale, as the individual is more delicately built.

In regard to sound and its perception by insects, the "country hallucination" of beating tin pans and blowing hideous noises to bring down a swarm of bees is exploded when we consider that the *concussion* upon their wings by the terrible sound waves created by the din, leads them to suppose that a thunderstorm with rain is approaching, and instinctively they drop to the nearest shelter. It is evident that their perceptive faculties are those of feeling, not hearing, and their expressive faculties take the form of instinctive action.

The day is fast approaching when the light of science will so shine in upon the intellectual faculties that all mankind shall see the truth in all things, and there will be but one opinion on all subjects by every one. In that day, there being no difference of opinion, contention of every sort will cease, peace will reign, happiness will be perfect, and the millennium will be omnipotent.

GYPSUM AS SAND.—Some 60 miles due north of El Paso, writes a correspondent of the St. Louis *Globe-Democrat*, lies a formation of pure gypsum, forming ranges of low, undulating hills, without a speck of a mixture, and of a dazzling whiteness. The gypsum occurs in the shape of a fine sand, and the district is some 25 miles long by 6 or 7 miles wide. The rays of the sun are so strongly reflected from a brilliant surface, that traveling across the country is almost impossible in summer on account of the blinding glare and the great heat generated. This gypsum range is generally known as the White Sands, and the White Oakes railroad skirts the eastern border. In one locality on the White Sands there is a natural basin-like depression, into which a number of neighboring gullies and valleys lead and concentrate, and this basin has, for the first time within the memory of man, been filled by rains, and over 300 acres have been covered several feet deep and transformed into a lake. As the bottom of this lake consists of the purest gypsum, which has been by the water cemented into a solid snow-white mass, it cannot drain off except by the slow process of evaporation, and when the midday sun shines with its full force upon the landscape, the effect of the reflection is dazzling and magnificent beyond description. There is, probably, no similar deposit anywhere in America.

A DELAYED INVENTION.—Professor Morse in 1832 discovered the first principles of the telegraph, but for want of means he struggled until 1837, a period of five years, before he could get sufficient assistance in money and mechanical skill to put up the first few miles of telegraph wire in a room. In 1837 many of the principles of the telegraph were as perfect as they are to-day, but pecuniary assistance could not be obtained to construct a mile of telegraph wire for commercial use, and Congress was also appealed to in vain, notwithstanding Morse & Vail had put up a wire in a room ten miles long in Washington in 1838, and operated it successfully. In 1842 Morse again applied to Congress for an appropriation, and on March 3, 1843, Congress appropriated $30,000 to build a line of telegraph from Baltimore to Washington, and the first message passed between the two cities on May 24, 1844, some 12 years after the first discovery of the telegraph. The rest is fully known. In this narration it should not be forgotten that Professor Morse did not "discover the first principles of the telegraph." They were communicated to him by Dr. Chas. T. Jackson of Boston, but Professor Morse is entitled to the credit of reducing them to practical use.

THE PROBABLE FUTURE OF PRINTING.—Some years ago it was publicly stated by R. H. Hoe that the newspaper of the future would be printed entirely, reading-matter, illustrations, and all, from photo-engraved plates. What the Hoe firm has since done in its experiments in this direction, of course I do not know, but there is a man in New York now working very nearly on this line who will soon have his invention in shape to patent. The principle upon which he depends is a "photoglyptic stereotype," as he calls it, in which the stereotype sheet is made directly by a camera, very cheaply, and with clearer and better results than any common stereotype can give, as the matter is photographed on to a matrix already curved to the shape of the cylinder by an arrangement of lenses which he has kept secret. You know the common matrix is made flat and then bent into a curve before the metal is poured upon it, thus naturally blurring and crushing the fine edges of the letters and the lines of the illustrations, so we seldom get a satisfactory picture from a rapid press.—*Chicago Press.*

A REMARKABLE METEORITE.—The heaviest purely metallic meteorite as yet known is the "thunderbolt" of the Arab Sheik Kalaph Ben Assab. This chieftain saw it falling in the Valley of Kalede, in Central Arabia, in the year 1863, and presented it to the Persian Governor of Bunder Abbas. The latter sold it, along with a formal attestation of the finder, to the English authorities, and it has since been chemically examined. It consists of 91.04 per cent of iron, 7.40 nickel, 0.66 cobalt, traces of copper, phosphorus and sulphur, and 0.39 of amorphous carbon. It contains no stony matter, and only includes scattered traces of troilite and graphite. Its weight is 120 pounds, and it is consequently the largest purely metallic meteorite or "holosiderits" known. The meteorite of Pallas, now in the St. Petersburg museum, is much heavier, but it contains many cavities filled with olivine, and is consequently a "syssiderite." It is the tenth meteorite which has been seen actually descending. It fell during a thunderstorm, and made a deep hole in the earth.

NO DANGER FROM LIGHTNING.—There is very little danger now of an oil-tank being struck by lightning. Formerly it was the custom to run the pipes along the ground for a considerable distance and then up over the edge of the tank. In nearly every case in the Pennsylvania region, where lightning struck a tank, the electric fluid ran along the pipes and jumped off the end of the conductor, which was always above the oil. The top of the tank being filled with gas, when the electric spark jumped off the end of the pipe it set fire to the gas and caused an explosion. Now all the pipes are run right into the oil instead of the ends being exposed in a vapor.

A SENSITIVE PLANT.—The Paris Academy of Science is just now excited over a plant called colocasia. This plant often exhibits a trembling or vibrating motion without any apparent cause, and as many as 100 or 120 vibrations have been observed in a single minute.

NATURAL GAS AND THE HAIR.—A scientist has promulgated the theory that natural gas will gradually turn blonde hair dark. He says the gas generates an ammoniacal vapor, which combines with the sulphur in the hair chemically and produces the sulphuret of ammonia.

BLACK SNOW.—Snow as black and dirty as if it had been trampled on recently fell at Aitken, Minn. It continued to fall in this condition for several hours before it became white. Lights were required at 4:45 in the evening.

USEFUL INFORMATION.

A NEW METHOD OF PRESERVING MEAT.—Experiments have been recently conducted at the Australasian Wool Stores, Melbourne, with a novel process of meat preservation, introduced into the Colony by Col. House of the United States, where, it is stated, the success of the method has already given rise to a flourishing trade in the exportation of fresh meat from that country. The process, by which flesh of all kinds may be preserved for an almost indefinite period, is exceedingly simple, consisting merely in the steeping of the flesh in a liquid preparation patented as "Beniana," the effect of which is to render the meat entirely unsusceptible of decomposition. By this means meat has been kept in a fresh state for over nine months, exposed to the influences of the atmosphere, and yet at the termination of that time has not shown any effect of the treatment, being in taste hardly distinguishable from the butcher's article. The company were shown samples of pork that had been thus preserved for over eight months, after having been kept in the liquid for less than 60 hours. The samples were declared by all present to be perfectly fresh and devoid of any undesirable effect from their immersion in "Beniana." Although the efficacy of this preparation has been well established in the United States, the patentees have conducted a series of experiments in Victoria, with the object of testing whether the effectiveness of the process was likely to be interfered with by different climatic conditions, but the result of these trials has been perfectly satisfactory. The liquid has been submitted for analysis to the Government analyst, who has certified that it contains no deleterious ingredients likely to prejudice the fitness of the meat for human consumption.

MAKING CELLULOID.—This interesting substance, which masquerades as genuine ivory in the shape of flour-triers, paper-knives, combs, brushes, buttons, etc., as highly finished four-ply linen in "dickies," collars and cuffs, and reaches its most striking form in the powerful explosive known as gun-cotton, is manufactured by the following process, according to a description in the *Inventor:* A roll of paper is slowly unwound, and at the same time saturated with a mixture of five parts of sulphuric acid and two parts of nitric acid, which falls upon the paper in a fine spray. This changes the cellulose of the paper into proxylin gun-cotton. The excess of the acid having been expelled by pressure, the paper is washed with plenty of water until all traces of acid have been removed. It is then reduced to a pulp, and passes on to the bleaching trough. Most of the water having been got rid of by means of a strainer, the pulp is mixed with from 20 to 40 per cent of its weight in camphor, and the mixture thoroughly triturated under millstones. The necessary coloring having been added in the form of a powder, a second mixing and grinding follows. The finely divided pulp is then spread out in thin layers on slabs, and from 20 to 25 of these layers are placed in a hydraulic press, separated from one another by some sheets of thick blotting paper, and are subjected to a pressure of 150 atmospheres until all traces of moisture have been got rid of. The matter is then heated to a temperature between 140 and 150 degrees Fah., after which it issues in the form of elastic sheets of celluloid.

HOW TO MAKE GLACE FRUITS.—From one of Rene Bache's letters to the *Post* we take the following, explaining how fruits are glaced: And, by the way, Boston's greatest confectioner told the writer the other day just how to make glace fruits, than which in the way of candy scarce anything is better, if anything is equally good. The recipe is worth telling, so that you may try it yourself if you like. The whole thing consists simply in dipping fresh fruits—grapes, figs, oranges, nuts, or what you will—into boiling sugar at a high temperature. They must be dipped but once and then laid in a cold place for a little while, after which they are ready to gobble. All depends, however, upon the temperature of the sugar syrup and its consistency. Probably you will have to make an unsuccessful trial or two before hitting it. Take granulated sugar and cold water in about the proportion of a pint of the former to half a pint or less of the latter. Stir up the sugar until as far as possible dissolved in the cold water, and set the mixture on a hot fire to boil. Drop a little of it now and then into a glass of cold water, and when it becomes really brittle the solution is ready. Leave the latter on the fire, and dip into it quickly the fruits, which should, thereupon be laid on plates, covered with greased paper, and put out in the cold. If the candy was at the proper heat, the things so treated will presently be found covered with a delicious crackly sugar coating—morsels fit for the gods. No flavoring is wanted.

A NEW DYE FROM SEAWEED.—Formerly iodine, bromine, magnesia and potash salts were the chief products of seaweed, which was also used, when more or less decomposed, as manure on land adjoining the seacoast (it yields upward of two per cent of ammonia). Some varieties were collected as articles of food in Scotland, Ireland and Norway, etc. (the species of the genus Ulva), and the large species of Laminaria, especially *L. saccharina*, can be made to yield mannite. Of late years, says the *Scientific American*, seaweed has been made into charcoal, and into a material for whip handles, and still more recently the curious substance algin has been produced from it, and is already in use as a stratum for photographic films, and for other purposes. From the substance algin, just mentioned, an acid called alginic acid has been produced, and by acting upon the latter with nitric acid a new light-colored dye, which is insoluble in water, but dissolves in alkalies, yielding a brown solution, has quite recently been discovered. The ammoniacal solution of this new product dyes cotton a fine Bismark brown, which is not removed by soap, and is said to be not only equal to aniline dyes of the same description, but to excel many of them. A curious feature of this new product is that, contrary to what is observed with aniline dyes, it will dye cotton but not wool, and that its acid solutions will not act as dyes at all.

INTERESTING EXPERIMENT IN AN IRISH FOUNDRY.—A new system has been discovered, it is stated, of coating iron with copper. At the commencement of the present year experiments were made at Fulton's Iron Works in Kilkenny, for the purpose of testing the efficacy of the method. A piece of iron, after being raised to almost a white heat, was then thoroughly sprinkled with a white-colored powder. It was next resubmitted to heat until the powder in its original form had entirely disappeared from the surface, when the iron was plunged into a quantity of melted copper and allowed to remain there for not longer than a second. It was then removed and allowed to cool. After cooling, it was observed to be completely covered with copper.

A NEW IDEA.—Now, the only way that I see that we practical horseshoers can protect ourselves is to let every one that is interested in the welfare of the horse endeavor to induce the congressmen of his district to interest themselves in drafting a law by which all mechanics shall be examined by a committee selected from the very best mechanics in the State. This committee should examine every applicant in his particular branch of business, and, if he is found to be well grounded in it, give him a certificate signed by them and stamped with the State seal. This is our opinion on this subject, but we would like to have the views of others.—*Ex.*

BEING TOO HONEST A FAULT.—A Yorkshire coal-dealer has hit upon one of the most novel as well as most effective schemes for advertising of the present century. He has a weighing machine which gives over instead of under weight; and, although warned by the authorities that it was as illegal as the one that does the other thing, he persisted in its use until a fine of 5s. and costs resulted, the bench expressing the opinion that it looked a little hard to punish a man for cheating himself to benefit his customers. He paid the fine, and has the bulk of the coal business in his parts.—*Grocers and Canners' Gazette.*

GOOD HEALTH.

THE TRUTH ABOUT THE MIND-CURE.—Now, in view of what has been done in curing disease by the aid of mental influence, the public has a right to demand that our physicians shall give us the benefit of this healing agency. Mental influence is a pleasant and inexpensive medicine; it cures in some cases where drugs fail, and it shortens the term of sickness and lightens its pain in many other cases; furthermore, it has no injurious incidental effects. But the mind-cure should be taken out of the hands of the untrained and irresponsible visionaries and the impostors who now practice it, or it will add a terrible amount of suffering and death to what it has already caused. These enthusiasts, carried away by their seeming successes in a few cases, insist that the mind-cure is the only treatment that is worth anything in all diseases and for all persons. They know too little about the nature of disease to recognize symptoms which indicate the fitness of this agency, too little of science in general to realize that a means suitable to remove one condition may be entirely inadequate or unsuitable to counteract another.—*Popular Science Monthly.*

DANGER FROM BITING THE FINGER-NAILS.—"A novel incident resulting from a habit of very common prevalence among nervous people was brought to my notice recently," said a leading physician of Philadelphia to a reporter the other day. "A young lady presented herself at my office and complained of a constant irritation in her throat. Two weeks previously she had been taken with a very severe attack of sore throat, which was treated by the family physician. Under his care, she said, the inflammation quickly subsided, but there still remained a sensation of irritation. Examination revealed a small, fleshy-looking object about the size of a kernel of wheat adherent to the tissues posterior to the left tonsil by the one end. The other parts of the throat were normal. The little mass could not be detached by a cotton-covered probe, but by the use of forceps it was easily removed and on examination proved to be a piece of finger-nail which had become imbedded in a cheesy deposit. A broken piece of the nail was also removed from under the mucous membrane at the same spot by a sharp-pointed probe. The lady then confessed to the habit of biting her finger-nails, and moreover could remember that a day or two previous to her throat trouble a piece of nail she had bitten off had become lost in her mouth, but after it had caused a fit of coughing she had forgotten all about it until reminded by the discovery."

WRINKLES.—The following paragraph would seem to do away with the old theory that wrinkles are produced by worrying: "It is customary to say that wrinkles come from worrying, but the truth is that most of them come from laughing," says a well-known physician. "To know how to laugh is just as important as to know when to do it. If you laugh with the sides of your face the skin will work loose in time, and wrinkles will form in exact accordance with the kind of a laugh you have. The man who always wears a smirk will have a series of semi-circular wrinkles covering his cheeks. When a gambler who has been accustomed to suppressing his feelings laughs, a deep line forms on each side of his nose and runs to the upper corner of his mouth. In time this line extends to the chin and assumes the shape of a half-moon. A cadaverous person, with a wax-like skin, is very apt to have two broadly marked wrinkles, one running up from the jaw and the other under the eye. These meet at right angles at the cheek-bones and look as though they formed a knot at the apex. The scholar's wrinkles form on his brow, while the scheming politician's come round his eyes, where they look for all the world like the spokes of a wheel."—*Mail and Express.*

A DANGER PECULIAR TO RESIDENCE IN FLATS.—The *Lancet* (London) raises its voice of warning to apartment-house occupants, which is worth considering. An ordinary householder has access to every portion of the building in which he lives, and should he suspect a defect, he can ascertain how far his suspicion is correct and remedy it. But in the case of flats, while the actual apartments rented may be free from all risk of evil, the tenant is, in point of health, almost entirely at the mercy of his landlord and of the occupiers of the basement, in so far as the drainage of the premises is concerned. If this latter be wrong, the whole mansion is apt to be filled with foul air from below upward. A number of cases have come under our notice in which tenants have only been too glad to pay what was demanded of them in order to get out of the premises with the least possible delay. While no one should take a residence without skilled advice as to its sanitary state, this precaution is more than ever necessary in the case of flats, where the entire premises, including, above all things, the basement, should be thoroughly overhauled.

LENGTHENING LIFE.—An English newspaper has been making collective investigation regarding the questions given below: "1. Does your experience suggest to you that the race of Englishmen is degenerating physically? 2. Do you think that the great advance in the healing art is responsible for keeping alive much weak life that will in time affect the whole race injuriously? 3. Do you think that the increased indulgence in physical sports has, on the whole, a good influence on health? 4. Has it ever struck you that probably the great attention paid to health in these days may be producing an anxiety about bodily ailments which is a disease in itself?" Answers have been received from a long array of practitioners, among whom are the names of eminent London physicians. The general view taken, according to the *Medical Record*, is that Englishmen are not degenerating, but that, on the whole, the race is improving in vigor.

A LETTER-CARRIER'S PRESCRIPTION.—A St. Louis letter carrier says there is no reason why a man should remain thin or have cold feet and corns. "I was that way myself once, but as a cure our old negro cook told me to wear a flannel or woolen waistband, that is to say, cover my body from chest to hip with flannel or woolen next to the skin, besides the regular winter or summer clothing, and keep the band on all the year round. I tried it some years ago, and at first I saw no change in my size or waist measurement, but suddenly I noticed I could not button the waistband and I moved the buttons. Before three months passed I moved the buttons four times." The extra covering causes great internal heat, which is carried over the body by the blood and aids digestion. The remedy for cold feet is to scrub them in cold water every night before going to bed for 60 days. There will be no further trouble.

THE HERB THAT HYPNOTIZES.—The deputy of Oaxaca, Mr. Perfect Carrera, has taken to the City of Mexico a plant that grows in Mixteca, which the natives call the "herb of prophecy." It is taken in various doses, and in a few moments a sleep is produced similar in all respects to, and we might say identical with, the hypnotic state—for the patient answers, with closed eyes, questions that are put to him, and is completely insensible. The pathologic state induced on whomsoever partakes of the herb, brings with it a kind of prophetic gift and double sight. Furthermore, he loses his will, is completely under the control of another to such a degree that the sleeping person would leap from a balcony, shoot, or stab himself with a dagger, at any moment, if ordered to do so. On returning to himself he remembers nothing of what he has done.—*Translated from La Luz.*

ENGINEERING NOTES.

PROPOSED SHIP CANAL ACROSS SCOTLAND.—The agitation in favor of canals and waterways, which has been waged in England for some time back, has at last extended to Scotland. The proposal is to improve the present existing canal between the Clyde and Forth, so that ships might be able to pass through. The canal was constructed a century ago, and is 35 miles long, extending from Bowling on the Clyde to Grangemouth on the Forth, and there is a branch of 2¾ miles to Port Dundas in the north of Glasgow. It rises 156 feet and has 39 locks. At the present time only very small craft can be passed through, not only because of the short locks, but also owing to the depth of water being but about 9 feet. It is proposed that it should be made suitable for deep seagoing ships. There are no great engineering difficulties in the way. The cost is variously estimated between £1,500,000 and £2,000,000 sterling, a sum which, it is thought, might be easily raised by a company. It is contended that being the shortest route between America and the Baltic, the Continent and the east coast of Scotland and England, the through traffic would be considerable. This may be true, but the gain in time would be reduced materially by the fact that vessels in coming off the Atlantic would require to sail up the long firth (Clyde), and would probably require, particularly if deeply laden, to wait on the tide to get to Bowling, which is some distance up the river, or the channel would need to be broadened and deepened, thus adding to the cost. For channel steamers going from Ireland or the west coast of Scotland, England, or Wales to the east coast of the Continent, the canal would be a decided benefit, for not only would their voyage be shortened, but the rocky and dangerous coast of the north of Scotland would be avoided. The canal passes through the coal and oil districts of Scotland—a fact which affords additional argument in favor of the scheme. Another consideration which carries much weight is the facility gained for the rapid passage of battle-ships from one shore to the other, rendering defense in time of war more effective. Looking, therefore, to principal "pros" and "cons," as stated, the question is worthy of serious consideration. The canal is the property of the Caledonian Railway Company, and they are taking no action meantime in the matter.—*Engineering.*

PROJECTED LARGE CANAL IN SWEDEN.—A new canal is at present on the *tapis* in Sweden, having for its object to connect the Kattegat with the large and important Lake of Venern. The canal will connect the towns of Uddevalla and Generaborg, and, if carried out, is sure to prove of very considerable importance for a large portion of Middle Sweden, where a number of iron-works are located. The total length of the projected canal is about 12 miles, of which some four miles are lakes. It has been proposed to raise the level of the canal by three sluices above that of the Lake Venern. This would make the canal cheaper to build, but is otherwise attended by several drawbacks, and it may be preferable to incur the additional expense by not making it any higher than the Venern. The depth of water in the Uddevalla harbor and in the Venersborgvik limits the depth of the canal to 21 feet, which would admit of vessels of about 3000 tons passing the canal. The sluices would have to be about 350 feet long and 45 feet broad. From Vermland, Dalsland and upper provinces, an export of about 200,000 standards of timber is reckoned upon to pass through the new canal, which would also be the best route for about 100,000 tons of Swedish iron export, and would lower the rate of freight from several wood-pulp manufactories, etc. It is now the intention to collect the necessary funds to have the matter thoroughly sifted, financially, commercially, and from a technical point of view. It is considered necessary that the State should build and own the canal.—*Engineering.*

AN UNDERGROUND RAILROAD PROJECT just brought out in Philadelphia causes much excitement. The scheme involves the expenditure of at least $25,000,000. The corporation has been organized as the Broad & Market Streets Underground Railway Company. P. P. Bowles, manager of the Fairbanks Scale Co., is the president. Ex-Gas Trustee James E. Salter is the secretary and treasurer. The plans are for the construction of a four-track road. Two tracks are to be set aside for fast trains and the other two for trains that will stop at stations to be erected about half a mile apart.

THE FORTH BRIDGE.—At the Forth bridge works over half a million has been spent on machinery, staging, railways, steamers, buildings and lighting; £400,000 was spent on granite piers, and £1,300,000 in steelworks. Up to the present time 42,000 tons of steel have been used in construction, and a good deal more is ready for erection. As many as 4300 men have been employed on the works, but the average for five years has been 2300. The Forth bridge is at present the chief structure of its kind in the world, but its principle is being applied to still greater bridges.

THERE is a good deal of activity displayed in mining work from one end of the Comstock lode to the other, and all at important points.

Passing Events.

The cruiser Charleston, the first steel vessel ever built for the Government on this coast, is now off on her trial trip. At last accounts she was behaving very satisfactorily. The speed trial is taking place in the Santa Barbara channel.

The contract for building the powerful coast-defense ironclad has been awarded by the Secretary of the Navy to the Union Iron Works of this city at the price of $1,628,000. She will be about 5000 tons displacement. This will be the third large contract these works have obtained from the Government for warships.

An English company has applied for 45 miles of the Fraser river, in British Columbia, to dredge for gold. There is a canyon 20 miles long which cannot be worked in any other way. They will use steamers, dredgers and scows. The plan has been successful in Australia, but not in this country, thus far.

The heavy storms of Saturday and Sunday set the water-courses running again. Over four feet of snow fell in the Sierras, and the snow-plows were brought out for the first time in the month of May.

Shipping Concentrates.

Low-Grade Ores in Fresno County.

The Star Mining & Reduction Co., Mount Raymond district, Fresno county, made their first shipments of concentrates this week to the Selby Lead & Smelting Co. of this city.

The work being done at this mine is different from any in California. They have a hundred-ton concentrator, with rollers, jigs, and slime tables, all of which came from Denver. A Pelton-wheel utilizes the water-power for the plant.

The material is divided into eight grades by the machinery. The ore itself is a low grade, averaging 23 ounces of silver and 10 per cent lead. After concentrating it runs 60 per cent lead, 60 ounces of silver and from $3 to $4 per ton in gold. The ore is delivered at the concentrator, 7800 feet from the mine, by a Hallidie tramway for ten cents a ton. It is concentrated for about $1.25 per ton, and it costs about $12 per ton to team the concentrates to the railroad station at Raymond.

The mine is owned by a Montana company, of which Mr. Henry Kline is president, John Shopp vice-president, and Albert Kleinschmidt treasurer. The gentlemen mentioned are in the city at present. The company took hold of this as a concentrating proposition and are well satisfied that they have a valuable property.

In fact, they say if this claim was in Montana it would be considered worth there at least half a million dollars. They have a very complete outfit and have so far expended $110,000.

The ledge or deposit is about 150 feet wide. It has so far been worked by stripping and open cuts. They have a 60-foot face 60 feet deep, but are commencing a tunnel.

The facilities for working are excellent, there being plenty of water-power, an abundance of timber, etc. They have had to build shops, houses, roads, etc., but are now in good condition to work steadily. The concentrates have to be hauled about 35 miles to the railroad; but as soon as the railroad company are assured of steady freight they will build a branch road. They now ship one carload a day, but will soon put on night shifts, when they can ship two carloads of concentrates daily. Adolf Heberlein, an old Montana "concentrating-man," is superintendent and Mr. Wagner the business manager. Most of the company are from Helena, Montana.

In conversation with some of the officers this week, a representative of the PRESS was told that this is a much better proposition than the famous Bunker Hill and Sullivan mines, at Cœur d'Alene, Idaho, where they are making money on lower-grade ore. They have to wagon it as far as the Star Co. do, but have a mine with a shaft from which they have to pump water. It cost them $200,000 for development work alone.

In the Star mine some very large pieces of galena ore are found. The deposit is so large that it is easily worked. There are other properties in the vicinity, the owners of which have been waiting to see how the Star Co. is coming out. These claims will now doubtless be worked. No doubt there are many other places in this State where similar concentrating works could be located with profit. This company has expended its money without any fuss or noise, the stockholders having seen how profitable similar enterprises are in Montana and Idaho.

MINING BUREAU TRUSTEES.—The Governor has appointed the following trustees of the State Mining Bureau: W. S. Keyes of San Francisco, vice self; J. Z. Davis of San Francisco, vice self; S. Heydenfeldt Jr. of San Francisco, vice self; W. T. Garratt of San Francisco, vice G. W. Grayson; Geo. C. Perkins of Alameda, vice Geo. Hearst.

THE Mechanics' Institute has been appointed by the Secretary of the Interior a depository of public documents, and consequently the library will now receive copies of all publications of the Government issued for public distribution, without special application, as heretofore.

A THOROUGH test has been made here of black sand from the new find on the east fork of the Carson, in Douglas county, Nev. Although a color can generally be found, the results were unsatisfactory, proving beyond a doubt that it would not pay to work.

Latest Phase of the Copper Situation.

Col. R. H. Ranlett confirms the press telegrams that American copper-mine owners and the French copper syndicate were unable to arrive at an understanding by which the price of the metal would be sustained. So far as we are able to learn, the syndicate and American mine-owners had agreed upon a basis for mutual action, and the papers were all drawn ready for signing, but one person, said to be an Englishman, refused to abide by the agreement, which was to allow the French holders of copper to work off their holdings as fast as the market could absorb it without breaking values. So as to better facilitate them in selling, mine-owners were to restrict the output, and also not send to Europe more than 20 per cent of their production. With this agreement, which really was in the interest of the French, falling through, the Americans left for this country, it is claimed, in disgust, and vowing that any further movement or overture for an agreement to control the copper markets must come from European holders of copper and controllers of foreign mines. As it now stands, the situation warrants the assertion that low prices will obtain for copper both in this country and abroad. While not absolutely knowing, Col. Ranlett is under the impression that the price of copper in this country will range from between 10 and 11 cents a pound, against from 8 to 9 cents a pound in Europe. The difference in the price will be due to the duty of 2½ cents a pound on all copper imported into this country. American mine-owners, while keeping values up in the United States, can send enough to Europe to unsettle values there and keep them from going above nine cents a pound. At this low price heavy losses will not only be entailed on foreign holders of copper, but they will make it so unprofitable to work foreign mines as to compel them to shut down. Even at ten cents a pound in this country it is quite certain that few mines will cover expenses, while none will be able to pay much, if any, dividend owing to the increasing expenses as depth is made in mining. Copper mines, like silver mines, pay best near the top, while gold mines pay best deeper down.

RICH MINES AT MORENCI.—We have received from Morenci, Arizona, some remarkably rich specimens of the ores of the Black Dyke and Refugio mines. The ledge does not carry such ore as this all the way across, but it is well-defined, six feet wide, and assays rich for its full width. The owners, Messrs. Campbell, Muir and Jenkins, have five claims on the same ledge and three shafts from 75 to 200 feet apart, all showing the same character of ore. There is considerable activity shown at Morenci at present. We are informed that the specimens sent us are fair samples of the richer deposits in the ledge. The mines ought to be good paying propositions with ore half as rich as this.

THE steamship City of Paris of the Inman line has beaten the transatlantic record by making the trip from Queenstown to Sandy Hook in 5 days, 23 hours and 7 minutes. This is the first time it has been brought below six days and two hours. The vessel not only broke the record for the run, but for one day, making 511 miles. The longest run previously made in a single day was 505 miles, by the Umbria of the Cunard line.

THE TECHNICAL SOCIETY of the Pacific Coast is anxious to have arrangements made by which it can organize under the charter of the Mechanics' Institute and work in harmony with it. Sixty per cent of the Technical Society's members belong to the institute.

JULIUS LESZYNSKY asks the Superior Court of Los Angeles county for an order to restrain the San Jacinto syndicate from selling its tin mine for $1,500,000 to a London syndicate, on the ground that he has a contract to sell it for $1,000,000 and receive $100,000 commission.

A CONTRACT has been let to the Union Iron Works by the Portland Cable Railroad Company for engines, boilers and all the machinery necessary for their road for $58,000. The outfit is to be a duplicate of that of the Geary-street road.

A COMPANY has been organized to prospect for natural gas near Bakersfield, Kern county.

Mines and Districts in Mexico.

In continuing the interview with Mr. A. H. Dubois, further information is given by him concerning other Mexican mines. His description of localities will be clearer, now that we are able to present a map of various mines and districts on two of the Mexican States, which he has courteously drawn for the PRESS. Mr. Dubois says:

The San Nicolas Property.

Some 20 miles north of San Fernando, an easy day's journey, is the San Nicolas property, partially owned by Americans. This, we understand, is on the market. Having lately had occasion to examine said property, I am enabled to furnish the following information respecting it: The outcrops only of the deposit seem to have been worked under Spanish rule, and the property lay abandoned until 1882. This property consists of two adjacent claims 5333 feet in length on the San Nicolas lode. This lode courses N. N. E. (22° 30′ magn.) dipping 65° to W. W. N. The developments consist in an ample shaft down 334 feet, following the dip of the San Nicolas lode, reaching down 302 feet perpendicularly. A tunnel or level on the same lode is in 460 feet.

In 1882 MM. Lozaya and others located two adjoining claims on the site of the old Spanish workings and in the four subsequent years took out from superficial workings ores which, worked by Patio process, produced some $80,000 to $90,000 in gold and silver bullion. Then the two properties were sold to the parties who now own them on the strength of the worked-out bunch of ore, Lozaya retaining a part ownership in the property and the direction of the working. Mr. Lozaya is an energetic miner and skilful amalgamator from Guanacevi and made a mine out of the property, making it pay the expenses of development out of the ores which he derived from the same development work. When I visited the mine I found a gang of men breaking ores 68 feet above the bottom of the shaft. On sampling and assaying the output, consisting of some 15 or 20 tons, I found that (after hand-picking and rejecting one-fourth of the output) it assayed 121 troy ounces silver and 1 ounce gold per ton. This undoubtedly is considerable above the average ores furnished by the mine. The part rejected showed by assay 16 ounces silver and ⅜ ounce gold per ton. Little or no lateral development has been done on the lode through the shaft, as it is not yet connected with the level, and carrying up on men's backs the stuff broken from the lode is expensive, as good peons are scarce here, although drillers are plentiful.

The developments show that from 4 to 10 feet in thickness have been taken out as ores of the footwall of the deposit, the hanging-wall being nowhere touched. My impression is that the whole output, without sorting, taking from surface to the bottom of shaft, would not run under 30 ounces silver and $5 gold per ton, and that the dump or haban will assay 20 to 25 ounces silver and $4 to $5 gold per ton. The country rock is composed of porphyry and metamorphic rocks.

About 1½ miles below the mine is a location with water enough for a large steam mill should developments call for the erection of one. Fuel is abundant ($2 to $2 50 per cord), pine, oak and madrone on land controlled by the owners of the mine. The outcrops are traceable almost throughout the whole length of the claim, and some 400 feet north of the mouth of the San Nicolas shaft, I broke free-milling ores from the outcrops assaying 40 ounces silver per ton. Two more veins, the Conchas and Tacotal veins, course at a small angle to San Nicolas lode, one on each side, and seem to join it north of the shaft. Superficial workings on several places of the Tacotal vein show silver ores with free gold similar to those obtained from the San Nicolas, and a specimen which I broke from an open cut (near to San Nicolas shaft), in which the vein was exposed, assayed 51 ounces silver and 2½ ounces gold per ton.

The ores from the San Nicolas deposit consist of hard flinty quartz stained with brown hematite and greenish chlorite and carry coarse free gold, argentite, polybasite and oxidized lead ores, wulfenite, cerusite, etc., all stained with copper, besides red clay (a gouge of red clay lies on the footwall). The ores are reduced by Patio process at San Dario, some six miles distant from San Nicolas.

A Primitive Mill Moved by Water-Power.

The establishment at San Dario is located in an iron-bound canyon, through which flows a large creek, which is utilized as motive-power for four arastras moved by water-power.

It may not be out of the way here to describe these primitive mills used by the Spaniards. They consist of a horizontal turbine-wheel formed by a wooden ring 20 or 25 feet in diameter, carrying on its circumference wooden buckets, or rather spoons, inserted in mortises in said ring, the whole suspended from eight arms which traverse the vertical shaft of the arastra, a circular pit 10 or 12 feet in diameter paved with hard stones, which is built in the middle of the ring, and the grinding-stones or metapiles are attached to the two lower arms by means of chains or rawhide thongs lashed to wooden plugs driven into holes drilled in the metapiles. The water is led through wooden troughs inclined some 20° from the horizontal

and strikes the buckets, affording by its impact the motive power. This primitive grinder is very wasteful as to power, only some 15 per cent of the motive-power of the head of water being made available, a head of 10 to 15 feet being required. The arastras are charged with 1500 to 2000 pounds of ore broken by hand to about one-half inch and water is furnished gradually as the ore is being reduced to pulp. Each charge requires 24 to 30 hours to reduce it to the desired degree of fineness.

Here the gold is extracted during the grinding by means of silver amalgam, of which 20 pounds is added to the arastra, and when sufficiently enriched in gold, is collected, washed out and retorted. Quicksilver is sparingly added as may be required to keep the amalgam pasty. In many cases copper amalgam is used instead, and seems to be preferable to silver amalgam, especially if the character of the ores be such that the copper in the amalgam be dislodged by silver from the ores. This is usually the case when the ores carry argentite, silver chlorides or bromides, obtaining thus as final product, gold and silver amalgam free from copper.

When the ores are sufficiently ground, the resulting pulp is thinned by dilution with water, and tapped out into tanks, care being taken not to carry off the amalgam which is previously allowed to subside along with the coarser sand and sulphurets.

After allowing the pulp to subside in the tanks and drawing off the excess of supernatant water, this pulp is transferred to the patio, a yard provided with a tight-fitting wooden flooring, 3 to 5 per cent salt mixed into same, and after a couple of days standing, quicksilver and the amount of cupric sulphate required by the ore (here from three-fourths pound to two pounds per ton) is trodden into the pulp by oxen.

I found in the buddled tailings from ores carrying originally 60 ounces silver and one ounce gold per ton an assay value of 5½ ounces silver and 1 20 ounce gold per ton. I will here notice that although these ores carry a considerable amount of lead, the amalgam obtained by the Patio process carried none whatever.

These ores might be profitably worked by stamping the ores, concentrating on Frue vanners and subsequently passing the tailings from the vanners over a classifier in order to eliminate the then worthless sands, and collect the slimes in order to beneficiate these mixed with some little sand by the Washoe pan process, refraining, however, from attempting any grinding in the pan in order to obviate the amalgamation of lead from the ores and using cupric sulphate, and, if possible, no salt, or as little as would prove admissible.

At a distance of say ten miles up the same creek we find the San Ignacio mines, a valuable property owned by a wealthy Mexican, D. Remedios Rocha. This mine is opened out on a lode six feet and more in width, carrying quartz much stained with chlorite and steatite, and much gold, argentite and other silver minerals proper and free from base ores, excepting some little pyrites. The ores derived from this mine are ground in arastras moved by water-power similar to those described and the pulp beneficiated by Patio process. This mine has produced very considerable quantities of gold and silver bullion. From this, one day's journey brings us to the mining camp Copalquin, which is in a deep canyon.

INFRINGEMENT SUIT COMPROMISED.—At the instance of the parties litigant, Judge Sawyer in the United States Circuit Court has dismissed the suit of Richard F. Knox and Joseph Osborn against Tiburcio Parrott. The suit was brought to recover $150,000 damages for the infringement of a patent for the construction of quicksilver furnaces with draft openings on the opposite sides so as to draw the heat through the passing ore. Mr. Parrott compromised with the plaintiffs and paid the costs of the suit.

NEVADA NITER COMPANY.—The Nevada Niter Company, a San Francisco corporation, has purchased 380 acres of niter mines, or deposits, on the east side of Humboldt lake, about 14 miles below Lovelocks, Nev.

Rosenthal's Calculating Machine.

Eugene M. Rosenthal of San Jose has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a simple and effective machine for making calculations of all kinds, and especially for the calculation of interest. Engravings on this page show the general appearance of the machine and some of its details. Through the front wall or face of the case passes a sleeve which carries on its inner end a dial plate connected with it by an arm. On its outer end it has a thumb-wheel. Two more of these dial plates with thumb-wheels are arranged so that the three thumb-wheels lie one behind the other on the front of the case, and the dials are in corresponding relative position inside. The effect of the whole construction is such as to render each dial plate separately rotatable by means of the thumb-wheels on the front. It is also such as to provide for the arrangement of the various figures upon the dials so as not to interfere with the exhibition of each set through the sight aperture.

In the face of the case is made a sight aperture through which the faces of the dials may be seen. The outer dial plate has openings out in its outer portion at stated distances apart, and so has the middle dial plate, whereby the result is effected of being able to see through portions of the outer dial plates and see the figures on the inner one through the sight aperture.

By turning any one of the thumb-wheels the figures of the proper dial plate may be brought into view through the sight opening, and by manipulating each of the thumb-wheels any combination of figures on the several dial plates may be brought into position together and be exhibited through the aperture.

Secured to the front of the case directly under the sight aperture is a slotted guide plate (shown also in the smaller cut) in which is mounted a series of independent slides, each of which is operated by a projecting knob. These slides have a width sufficient and are adapted to conceal separate numbers of the rows of numbers on the faces of the dial plates, and as these slides are separately movable, but one need be moved down at a time, thereby exhibiting only a single vertical row of figures on the three dial plates, and thus avoid any mistake likely to follow from the confusion of so many numbers as would otherwise be exhibited through the sight aperture.

Each of the thumb-wheels is provided on its rim with notches, and these notches engage pawls mounted in a guide above and are operated by projecting knobs.

In the present machine, which is particularly designed for an interest calculator, the smallest or outer thumb-wheel is the year-wheel, and is provided with notches numbered consecutively, as shown. The next largest wheel is the month-wheel, and is provided with 12 notches numbered consecutively. The largest wheel is the day-wheel, and is provided with 31 notches consecutively numbered.

As an interest calculator the numbers on the dial plates are previously figured out—say, for example, on a basis of $100. The numbers are arranged on the dial plates in concentric rows. The outermost number of each row of the dial plate connected with the year-wheel represents the interest on $100 for a given number of years at a given per cent—say at five per cent. The next number of each row represents the interest for a given number of years on $100 at six per cent, and so on throughout the rows of the plate. In like manner the figures on the dial plate connected with the month-wheel represent the interest on $100 at given percentages for a given number of months; and the figures upon the dial plate connected with the day-wheel represent the interest on $100 at different percentages for a given number of days. The slides are suitably numbered, as shown, and represent the rates per cent, and these slides conceal the figures on each dial plate representing the percentages of these several rates respectively.

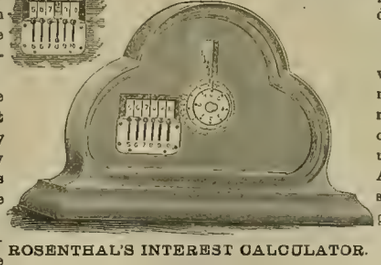
The operation of the device will be best understood by the following example: What is the interest on $155.15 for 2 years, 7 months and 13 days at 5 per cent per annum? First, raise the outer pawl, then turn the outer or year thumb-wheel around to bring its No. 2 notch under the pawl, whereupon drop the pawl into the notch, thereby holding the wheel. This represents the two years. Now raise the center pawl and turn the center or month thumb-wheel around to the 7 notch, and drop the pawl into it, thereby holding the wheel, and this represents the seven months. Then raise the inner pawl and turn the inner or day thumb-wheel around to the 13 notch, and drop the pawl into it, thereby holding the wheel, and this represents the 13 days.

Thereupon push down that slide of the series which is numbered 5, and which represents five per cent, thereby exposing a vertical row of figures on the three dial plates. The figures on the dial plates added together sum up 1310. Now multiply 155.15 by 1310, which gives a result, after pointing off the proper decimal, of $20.32, which is the answer. It will thus be seen that by turning the proper thumb-wheels to the proper notches representing the given time for which interest is to be computed, and then dropping the proper slide representing the given rates per cent, the dial numbers will be exhibited, which, when added, give a multiplier for the principal, thus giving the proper interest.

As many rows of numbers as may be desirable may be made upon the dial plates, and as many slides corresponding to these numbers may be made representing the different rates of interest. The machine is also applicable to the calculation of matters other than interest, but which need no detailed description.

The simplicity of construction of this machine is such that it is impossible for it to get out of order. There is nothing complicated at all about the manipulation and there is no possibility of error, as only the actual figures to be used in the calculation are in sight. Once set the figures and unerring mechanism does the rest. This little machine is quite ornamental in appearance and takes up very little room on a desk.

MAP OF MINES AND MINING DISTRICTS IN SINALOA AND DURANGO, MEXICO.



ROSENTHAL'S INTEREST CALCULATOR.

JAMES BRODIE, a well-known millwright, who has been for some years past engaged in mining in Sinaloa and Durango, Mexico, has returned to San Francisco for a time. He received an injury by some machinery falling upon him, and is here for medical attendance. At the same time he is perfecting an improved settler and quicksilver trap for which he is applying for a patent.

THE Ensenada *Lower Californian* says the picnickers are returning from the Santa Clara mines in droves, and other testimony is to same effect. Only capitalists who are able buy costly machinery and employ large forces of men can make anything out of the mines there. Five stamp-mills are going up.

Coast Industrial Notes.

THE Vacaville *Enterprise* declares that lumber is cheaper in that town than in San Francisco.

THE Santa Rosa planing-mill burned up April 16th. The sawmill adjoining was saved.

THE Santa Clara Land & Lumber Co. has been formed at San Jose with a capital stock of $60,000.

THE Fresno people require another $100,000 before they can commence actual work on their "mountain railroad."

A SHINGLE MILL at Chehalis, Wash., is kept busy night and day filling orders. The regular output is 35,000 a day.

THE managers of the several lumber and shingle-mills, near Sissons, are making extensive preparations for the summer's work.

A SEWER-PIPE factory at Butte will make pipes of cement imported in bulk from Chicago, and will be at work in a very short time.

THE new Deseret woolen-mills at Salt Lake City are ready to begin business. The manager says he expects to turn out 20,000 yards of cloth a month.

THE Oregon Railway and Navigation Company's new iron drawbridge over the Snake river, at Riparia, is nearly finished. It will cost $250,000.

NEVADA CITY has a new business establishment, the "Miners' Foundry," of which Messrs. Robert Martin, Wm. H. Martin and David Muir are proprietors.

THE Sissons Mill & Lumber Co. are pushing their railroad some seven or eight miles into the timber, and expect to do a rushing business after the tenth of May.

THE California Sewer pipe Company at Los Angeles, which uses the Elsinore clay, has a series of buildings 280 feet long, with three wings 140 feet long and 40 feet wide.

THE property of the San Francisco Cordage Company having been transferred to the Tubbs Cordage Company, the business hereafter will be conducted in the name of the latter company.

ACTUAL tests of the white kaolin deposits of the Daggett beds in San Bernardino county have been made lately, and the result is said to show that true porcelain may be made from them.

A COMPANY is being organized in San Diego for the manufacture and introduction of a new honey section paper box and other late improvements for saving and handling the honey crop of the Pacific Coast.

A QUARRY of brown sandstone has been found in Ventura Co., on land covered by the lease of the Ventura Asphalt and Bitumen Co. Its formation and position are such that it can be readily quarried and worked.

THE *Astorian* says: Timbermen from Deep river tell of trees there 180 feet to the first branch that will scale 12 M to a tree. There are thousands of acres of just such timber both sides of the river, and it is being snapped up.

THE company at Haywards which has the contract for cutting the trees from the 100-acre gum-tree ranch northeast of town, has nearly finished the work. It has some 4000 cords of wood left, which will be converted into charcoal.

ANOTHER planing-mill is being outfitted at Redding. The old foundry building on California street was recently purchased from Wm. Banks by Clover & Dean, who intend putting in an extensive plant for a sash and door factory.

JUDGE GRANT furnished the Mariposa Mining & Commercial Company with 15,000 feet of lumber recently, and has orders for 1,000,000 more. The company intend putting up a few stamps for prospecting the rock taken from the Josephine mine.

A VERY successful launch of a new schooner —the Bender Brothers—took place April 15th from Alexander Hayes' shipyard, at the foot of Sixth street. She is 84 feet long, 23 feet beam and has 7 feet depth of hold. She can carry 120,000 feet of lumber.

THE Colton Soap Company is putting up a natural soap made from a clay taken from a mountain near San Jacinto. The clay is first ground into a fine powder and then mixed with other ingredients and formed into cakes the shape and size desired.

PRELIMINARY steps have been taken to establish a cannery in Sonoma by the citizens of that place. A meeting was held and the following committee was appointed to take the matter in hand: Robert Howe, Robert Poppe, H. Weyl, S. H. Shaw and A. D. Lowell.

THE Oroville *Mercury* says: A good many buildings are to go up in town; the Golden Gate mine will employ about 300 men this summer; the Lumpkin Mill Company will build a flume or railroad from Lumpkin to Oroville, and numerous other enterprises are talked of.

THE Watsonville people are arranging to build a creamery. In connection with the creamery is a cold storage for eggs and fruit. The evenly low temperature necessary for the processes of the creamery can be made available without further cost for the storage of eggs and fruit.

AT Astoria, Oregon, the fishing boats report a small catch—six and eight to the boat. The traps are doing better. There never before was so much gear in the water at this time of year as at present. Every shoal place has seines on it, and there are traps everywhere. All the canneries but three have 60 boats apiece and upward.

THE sawmill of the Truckee Lumber Co. started up Monday and the mill of Lewison & Smith started April 9th. All the mills will soon be running on full time. There is a good demand for lumber and but little dry material on hand. The outlook for trade is flattering and the season is likely to be a prosperous one for everybody.

SAN FRANCISCO now makes nearly everything in the way of electrical supplies, from a wooden call button to a 20-horse motor. There are half a dozen manufactories of this sort here, the largest being devoted to making the general run of telegraph and telephone machinery, fire-alarm apparatus, electric bells and electro-medical apparatus.

THE Pipe Works at South Riverside have had some bad luck with their pottery kilns. They have a large amount of pipe stored away to cure, and cannot make much more until they complete the kilns and fire a lot of that already on their hands. They have a large force of men employed. Quite a village has sprung up around the factory.

THE Oakland Iron Works has just completed a three-ton locomotive for Remillard & Co., to be used at their brickyard near Pleasanton. It is the first locomotive ever built in Oakland. It is about 15-horse power, and its peculiarity lies in the fact that the cylinders are vertical and are set directly over the front wheels. It will run on a three-foot gauge road.

SOUTHERN CALIFORNIA experts in the manufacture of porcelain, stone, granite, earthenware, delf and similar articles have been making some rare and beautiful designs in that class of ware from raw material recently discovered in San Diego and San Bernardino counties. The discovery of the deposits is believed by local potterymen to be of great importance.

ABOUT 1000 tons of a new sandstone recently discovered at Ione will be used in the construction of the new building of the California State bank at Sacramento. The stone is described as being of different colors—red, white and brown—according to the depth at which it is quarried. It is soft enough to be easily worked when first taken from the quarry, and it readily hardens upon exposure.

THE influence of electrical science upon the industries of this city has been felt in a marked way during the past few years. It is estimated by those in the business that no less than 500 persons now gain a livelihood by employment in the different electrical branches in San Francisco. In the line of electrical supply work the compensation ranges from $3 to $5 a day, while an expert electrician can command from $300 to $500 a month.

THE Elsinore vitrified, salt-glazed pipe is a pipe made of clay of sufficient strength and quality to stand the fearful test of 3000 degrees Fahrenheit for weeks, in the kilns, until it is thoroughly vitrified, or in other words burned into what is practically glass. The glaze is a result of the soda in the salt combining with the silica in the clay and forming what is known as a soda-salt glass, which is a glaze and a part of the body of the pipe.

THE fruit-canners say that unless they have lower freight rates by rail, some of them will have to go out of business. The present Eastward rates make competition with Eastern packers almost impossible, and the uncertainty as to their maintenance makes the situation still worse. Eastern jobbing-houses are purchasing very little from California, and the market here is glutted with goods that should have been moved six months ago.

SALMON canning on the Sacramento river has been an industry filled with disappointments during the past few years, and from all reports there are no great things to be expected this season. The run has been small thus far, and the pack to date is estimated at less than 7000 cases, which is considerably behind the record of last year. The quality of the fish is very good, however, and owing to its being ready for market early, the pack is in active demand.

KNIGHT & Co. of Sutter Creek, Amador Co., have a contract to build a 30 stamp mill on the Cosmopolitan mine, near Drytown; also to build 10 additional stamps to the Wildman mill. They have also orders for a 6-foot water-wheel to go to Alaska, and two 4½ foot wheels for the Marguerite mine. Owing to their increasing business they are putting up a new blacksmith shop, 50x20 feet, with two forges, and a storehouse adjoining.

WE are informed by the general agents of the Giant Powder Company—Bandmann, Nielson & Co.—that their company has purchased an eligible site of land with unlimited facilities of water at Clipper Gap, near Auburn, in this State, where black powder works are now in course of erection with the latest improved machinery. In a short time the Giant Powder Company will be in the market with a superior common blasting powder and offer the same at reasonable rates.

A LUMBER-PILE made of boards, each 100 feet long and 6 feet in width, would be an unprecedented sight in the East, but a gentleman recently returned from a visit to the coast of the North Pacific ocean says that piles of lumber such as that are common at the mills on Puget Sound. "Boards 100 feet long and 6 feet wide, without a knot in them," he says, "are common cuts from the gigantic fir trees of the Puget Sound forest. These trees grow to the enormous hight of 250 feet."

THE steamer Pacheco brought from San Quintin, Lower California, to San Diego, on a recent trip, about 10 tons of abalone shells and meat, which were gathered at Santo Tomas. They were transferred to the steamer Newbern which sailed the same day for San Francisco. This constitutes the first shipment by the firm of Salorio Bros., who have recently begun the business under a concession granted by the Mexican Government. The shells are used in the manufacture of buttons, handles and jewelry, and the meat is shipped to China.

THE boiler works of Langford Bros., Eureka, Humboldt county, Cal., are quite busy. At present they are engaged in building a new boiler for the powerful ocean steam tug Mary Ann. This boiler is eight feet in diameter and 15 feet long, the largest boiler ever made in the county, and the only one of similar proportions and material ever made in California outside of San Francisco. Besides the building of the boiler for the Mary Ann, they have just retbottomed four boilers for Carson's mill. They have recently put in a new boiler to furnish steam for their own works.

THE Porphyry Paving Co., South Riverside San Bernardino Co., which had made all arrangements to commence work on a 10,000-ton contract in San Diego, and had secured satisfactory freight rates, has been compelled to shut down, owing to a clause in the contract providing that the material shall be obtained in San Diego county. About 30 men are thrown out of employment. The company have several contracts pending in Los Angeles, however, and one may be closed before long enabling the works to start up again.

A LARGE business in the shipping of bituminous rock from San Luis Obispo to Los Angeles is in prospect. Steamers running down the coast take many tons of the rock for street-paving purposes. A number of obstacles have arisen against the business which may severely cripple it. One of these is a claim of a royalty of $1 a ton on the patented process of heating the rock and another royalty of 50 cents a ton on the tanks or boilers in which it is heated. A suit is pending in the United States courts to test the validity of the patents.

VALUABLE deposits of bituminous rock are known to exist in the hills about Chino. Recent experiments prove that it is of the best quality. It contains a large proportion of sand. When subjected to fire it readily disintegrates and is easily molded into tough bricks of great elasticity. There is no residuum. Persons familiar with the San Luis Obispo and Santa Cruz rock regard the Chino deposit as fully equal, if not superior in quality. Los Angeles paving contractors are much interested in this rock. The deposit has not been developed to any great extent.

ONE of the growing industries of San Diego county is the manufacture of asbestos goods. At Pacific Beach are located works that cost several thousand dollars, where cement and roof and house paints are made. More machinery is being put in to facilitate the manufacture of these, and a kiln will at once be erected for the making of asbestos brick. The works will soon use a carload of raw asbestos each week. There are two large mines in the county, one near Elsinore, which was opened up some time ago; the other back in the mountains. The first is short fibered, the second very long, from which wire and cloth can be easily made.

THE report of the beet-sugar factory at Watsonville for last year is encouraging. The factory was in operation 61 days, consumed 14,077 tons of beets, and produced 1640 tons of sugar. One hundred and thirty-five men were employed; the average price paid for beets was $5.04 per ton; the cost of manufacturing the 1640 tons of sugar was $148 247; the sale of the product brought $172,817; the net profit was $24,570, which was five per cent on the capital invested. The capacity of the factory has been doubled, and as this doubling will not correspondingly increase the cost of operation, the profits ought in future to be much greater. The best of all the report, however, is that the farmers who raised the beets and sold them for $5.04 per ton cleared from $40 to $65 per acre. There are several million of acres in California that can be bought for half of $40 per acre, that will raise beets as luxuriantly as at Pajaro valley.

WITH each year's development, consumption of redwood lumber increases, and as the only belt of redwood timber in the world is found in seven California coast counties, and out of the seven only three remain with redwood lands for sale—Mendocino, Humboldt and Del Norte—in the other four the timber has all been cut and marketed, save a few private holdings to supply the local trade, the time cannot be far distant when the supply must necessarily cease. The amount of lumber in the redwood forests has been estimated by the Board of Forestry at 33,155,020,000 feet, board measure. It is calculated that 12,000,000,000 feet have been cut.

TOWLES' pulp-mill, at Towles' station, on the C. P. R. R., is now running to its utmost capacity and is turning out about seven tons of wood pulp daily, which requires the consumption of about ten cords of wood. Tamarack wood only is used. The wood is deprived of its roots and bark and is then fed into five large grinding machines which reduce the wood to a pulp. The pulp is ground in water, and after the water is screened of the particles of wood, it is run on to a felt blanket which passes around a number of cylinders. The wood fiber sticks to the blanket and is finally collected on a cylinder, from which it is stripped in sheets six feet long and three feet wide. It is then folded up and taken to the storehouse. It is shipped to the Stockton paper-mill, where it is pounded up, and about 15 per cent of rags is added to it. It is bleached and rolled into newspaper. The San Francisco *Chronicle* uses paper made from this pulp. About 20 men are employed in the mill. The deposit is of vast extent.

Fine Crushing of Ores.

In last week's PRESS we gave illustrations showing elevations of a Blake fine-crushing plant for the Chateaugay Ore and Iron Co., promising to show a plan of the mill and give an account of the results accomplished this week. The plan is shown on page 333. It is a half plan of sills and half plan of ground floor, with plan of engine-room and foundations; *x*, *y* show the inside line of old building sill. Total length; *x*, *y*, 60 feet; *z*, *y*, 11 feet; *y*, *w*, 40 feet. The scale is one-half inch to a foot. In connection with the engravings in the PRESS of May 4th, the details will be clearly understood.

The normal capacity of the mill on ore reasonably dry has been shown to be 30 long tons per hour. Grizzlies put in at the 20 by 15 crushers, the idea being to take out the fine wet ore and send it to the wet screens below. This was fairly successful, but soon, owing to the rigorous climate of that latitude, bringing heavy snows and severe cold, the fine wet ore would freeze in solid mass on the dumps or in the cars bringing it to the mill, and would fail to pass the grizzlies, but go to the crushers. It would pass the first two crushers well enough, giving no trouble, but by the time it reached the 60 by 2 multiple crushers the heat evolved in the crushing would thaw out the cementing ice, giving damp product which would not screen readily. In this way, or by imperfect screening, the actual product of the mill was greatly reduced, and notwithstanding the impossibility of sending the ore to the mill dry, or the absence of a sufficient supply of water to run the mill wet, and in that way obviate the difficulties of screening fine or wet and frozen ore, the mill has, since then (November, 1866), been running uninterruptedly night and day.

The actual amount crushed from September 26, 1886, to Jan. 1, 1888, was 122,814 long tons, or 137 551 short tons, at a cost of crushing and concentration of $42,200.55, or 34 36 cents per long ton or 30.67 cents per short ton, distributed as follows:

2018 tons of coal	$ 8,612 37
Labor	21 008 72
Oil waste, etc	2,374 30
Mill supplies, renewals and repairs	10,205 16
Total	$42,200 55

DISTRIBUTION PER TON OF ORE.

	2240 lbs. cents.	2200 lbs. cents.
Fuel	7	6¾
Labor	17	15½
Oil waste, etc	2	1.7
Mill supplies, renewals and repairs	8	7½
Totals	34	30.7

This economy is remarkable, and still more so when we consider the prevailing unfavorable conditions as regards successful screening of the ore. Had the ore been reasonably dry, instead of being generally wet, and during the winter months frozen, or if the crushing after the passage of the 30 by 5 crushers had been "wet" instead of "dry," and the screening in that way made perfect as it can be, the actual average daily product could have been increased, even doubled, and the cost of crushing and concentrating per ton of crude ore reduced to less than 25 cents.

WHEAT AND FLOUR.

A New Flour-Mill for Stockton.

The Stockton *Independent* of March 29th says that parties were at that time working up a project for a new flour mill in that city. It was remarked by an informant that when the Crown mills were established a well-known millionaire of San Francisco begged for an interest of $50,000 in the business, and that man is ready to-day to take $50,000 worth of stock in a new mill here. He is engaged in the foreign shipping business and knows something of the profits of flour-making in a grain center like Stockton. I am very sure that another big mill will be built here before many months have passed.

A man who has had many years' experience in the milling business in the West and knows what he is talking about, says a mill can be erected here and made ready to turn out 2000 barrels of flour daily, at a cost not to exceed $115,000. You see the price of roller machinery has fallen since these big mills were supplied with the new-process machines, and money will go farther in purchasing mill furnishings to-day than it would a few years ago. But, in addition to the cost of a fully equipped plant, the corporation would need a working capital of several hundred thousand dollars to be expended in timely purchases of stock and to carry the work along until returns could be had from sales of their products. It would be necessary, perhaps, to start with a capital of not less than half a million dollars.

"Is there a safe market for the product of three big Stockton mills?" was asked.

"Undoubtedly there is, for the Stockton mills have the world for a market. Stockton flour is to-day crowding into the best markets of the world, for the reason that it is the best quality manufactured. And the reason for that lies in the fact that we have the best grain in the world. A man employed in one of the local mills said the other day that these mills make more revolutions in a year than any other such establishments in the United States. To supply the demand for Stockton flour it has been found necessary to run these mills to their full capacity night and day during seasons when it was almost necessary to shut down for repairs. In a life of many years in flour mills this man said he had never been in a place where there was such a rush in the manufacture of flour. And it is well known that these mills are unable to keep up with the call for their flour, and often buy the product of other manufacturers. So it would seem that there is room here for at least one more big mill, and there need be no competition in the sale of its products, for there is a market for more flour than half a dozen Stockton mills could manufacture."

"People know but little about the profits of flour-making," continued the interviewed. "I have handled the products of local mills for many years, and know something of the business of manufacture. It was not many years ago when flour was made by grinding the wheat on stones. That was an expensive process, and necessitated the employment of many more men than are used in roller process mills. You may remember that the price of flour made by the stone grinding process was not much above the present figures. Bran then sold at $7 50 a ton, but now it is held at $15. Then bran had considerable flour in it, but there is no waste to-day and one can handle the stuff without getting much flour dust on his hands or clothing. While the roller process of manufacture has worked a revolution in flour-making, and wheat is always lower than in former years, labor remaining at reasonable figures, the price of flour is yet stiff, showing increased profit in manufacturing. It is a good business that will pay four managers $400 a month each and also pay handsome dividends on the stock, and I understand one of the Stockton mills pays such salaries."

From what a reporter could gather here and there it is believed that among the moneyed men who may be interested in the new mill are Messrs. Gillis, Garrett and Davis of the Steam Navigation Company; ex-Governor Perkins and one or more of the Spreckels family of sugar kings.

The Deficiency in the Australian Wheat Crop.

Mr. Brett, one of the best-known and most successful of colonial journalists, who has been commissioned by the New Zealand Government to represent Maori land at the Paris Exposition, recently arrived in this city on his way to Paris. During his stay here he visited a number of our best fruit and wheat growing localities, and contrasted the same most favorably with similar localities in Australia.

To a reporter of the *Call* he alluded to the present drought in New South Wales as something which presaged most disastrous results, particularly to the wheat crop of that country. He says the Government statistician there estimates the shortage as not less than 6,143,000 bushels on the average of crops for the last 20 years, incurring a loss to the farmers of fully $4,500,000.

This shortage will call for a large increase of imports over those of previous years. New Zealand can supply only a portion of this demand. In regard to the California supply, Mr. Brett said: "Your flour is popular there, but we in New Zealand have the advantage of proximity, and so long as the present rates are maintained here your shippers will be unable to land wheat in Australia for less than $1 39.

"The moment the English market falls, however, say to 39s, and provided New Zealand wheat should be selling at above 5s, say 5s 6d, then Californian growers could successfully compete with New Zealand growers; otherwise we have not much to fear.

"But the falling off is not confined to wheat alone. Oats have decreased to the extent of 7 bushels per acre, potatoes 3 09 tons and hay 75 tons per acre. There is opportunity for exhaust in these articles also."

The Wheat-Growing Problem of the World.

The British *Quarterly Review*, in a recent article on the future prospects of the British farmer, said that after so many years of unremunerative prices, many are disposed to regard their struggle with foreign and colonial competitors as hopeless, and it has been asserted that even if they had not to pay any rent, they could not grow wheat with profit. In 1883 the average price of wheat in England was considered very low at $1.31 per bushel, but the next year it fell to $1 11 and in 1886 to 96 cents, and in 1888 to the lowest figure yet recorded, 94 cents. At such beggarly returns no wonder the unfortunate husbandmen of Great Britain have at last almost decided to throw up the sponge, and are looking after other means of making a living. From the reports of 85 wheat-growers in 11 counties it appears that the average expense of cultivation is $42 68 per acre, and the receipts $42 per acre, or a loss of 68 cents, presuming wheat to be worth $1.12 per bushel; so that the loss during the past two years must have been very serious indeed.

In the Western States the expense is estimated at about $10 or $11 per acre, and in some parts even less, so that when the vast productive area of the United States is taken into consideration, the statement that North America produces one-fourth of all the wheat grown throughout the universe may not be so wide of the mark, although it need not be inferred that the American farmers make more than a bare living at such prices; in fact, one has only to casually glance over the newspaper to become aware that there is a vast amount of grumbling among them on account of the low prices obtained, and that the greater number of the farms are heavily mortgaged. The increase in the wheat yields of the United States will be readily seen from the following:

	Bushels.
1850	100,485,944
1860	173,104,924
1870	235,884,700
1880	445,000,000

At the present time only 15 per cent of the wheat is grown in the Eastern States, the New Englander finding it cheaper to import it than to raise it. The possibilities of the future may be faintly gauged from the fact that the present acreage in wheat is about equal to the State of Alabama, so that for many years Great Britain's breadstuff supply will be exported from this country, unless it can be purchased at a cheaper rate elsewhere. Concerning the long threatened competition from India, where labor is so cheap, it has not yet reached the proportion expected, the dirty condition of the grain affecting its sale somewhat, and its lower value by a few cents per bushel is made up by the extra freight charge over that on American grain. The first export of Indian wheat was 20 years ago, when the quantity was 559 000 bushels, which had increased in 1876 to 4,687,000 bushels, in 1881 to 13,896,167 bushels, and for the last six years the average export has been 35 530,000 bushels.

The average yield of wheat in India has been placed at 14 bushels, which, after allowing for the home consumption, means a surplus for export of 66 000,000 bushels. The relative condition of the two countries stands thus:

	United States.	India.
Population	60,000,000	260,000,000
Area, square miles	3,000 000	1,400,000
Miles of railroad	138,000	13 30,000
Wheat acreage	34,000 000	26,000,000
Average crop 1883-86. bushels	437,000 000	260,000,000
Export of wheat, 1887, bushels	432,000 000	39 012,000
Total exports, 1881-86, bushels	800,000,000	175,000,000

From this it will be noticed that the United States raises 7 bushels per head of its population, and India only 1 bushel; India has only 1 mile of railroad to 20,000 inhabitants, while this country has 1 mile to 435 people. What with the expense of irrigation, the terrible droughts that often devastate India, the crude method of conducting farming operations, etc., it may safely be asserted that in the immediate future, if indeed at any time, India will not prove a formidable factor in the European wheat markets. From the mighty and vast Empire of Russia will come the keenest rivalry in furnishing Britons with their daily bread. In 1886 Russia's foreign exports of breadstuffs were 86 150,000 bushels, which increased to 123,800 000 the next year, and in 1888 to 172,870,000 bushels, and it must be borne in mind that this industry can be almost indefinitely augmented without difficulty, while the Argentine Republic in a few years will export grain on a very extensive scale.

If the production of cereals is hopeless in Great Britain, their conversion into flour will be performed by British millers, since they have recently adopted the latest improvements in the requisite machinery, and they have the world's wheat supply offered to them. Their profits are not large, but sufficiently good to induce them to continue the business, and to employ labor. Even when the English market is glutted with American flour, the odds are on the side of the English miller. Cargoes off the coast are generally to be purchased on better terms than from the farmer or merchant, and the sovereigns fetch four times as much as they do here, and this disadvantage the American miller has so far failed to overcome. Not long ago a flour trust was planned in England, when several of the leading mills were inclined to join the combination, being stimulated by the success of the salt trust, but the serious drawbacks have so far prevented its being carried into effect.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. P.) from week to week and year to year.

Every Miner His Own Assayer.

A chemical for testing and ascertaining the value of all kinds of ore, by which every miner and prospector can make his own assays, anywhere in the mountains, at a cost of a little over 5 cents and in a few minutes' time. No apparatus or dangerous acid needed; a dry powder, which may be carried in the pocket. This, mixed with the ore and a little water in a teacup, produces an electric current, which separates the silver from the ore instantly, no matter how refractory. Try it; you will be delighted! Will save you many dollars for assaying. Package sufficient for 30 tests, with full directions, by mail to any address on receipt of $2; 6 packages for $10. Address, Prof. J. Herman, P. O. Box 1845, San Francisco, Cal.

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.
Ships under advances to smelting works in Boston, New York, Baltimore and Liverpool.
Twenty-one years' experience in Shipping Ores and Managing Mines.
Solicits Consignments of Copper Produce and Management of Mining Matters.
All business conducted on Cash Basis.
Purchase and shipment of Mining Supplies A SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety 529 Commercial St., S. F.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company—Location and principal place of business, San Francisco, California. Location of Works, Placer County, Cal.

NOTICE—There are delinquent upon the following described Stock, on account of Assessment (No. 12) levied on the 19th day of March, 1889 the several amounts set opposite the names of the respective shareholders, as follows:

NAME.	No. Certificate.	No. Shares.	Amt.
Blaney, W E	284	20	$ 1 00
Bogart, O H, Trustee	420	10,000	500 00
Chase, Q A, Trustee	419	3,814	190 70
Gray, H W, Trustee	181	500	25 00
Horton, Thos R, Trustee	51	5 000	250 00
Horton, Thos R, Trustee	315	5,000	250 00
Hall, H E, Trustee	372	1,000	50 00
Rosekrans, H M	34	600	30 00
Taylor, J N	102	1,000	50 00

Repairing of every description of Machinery promptly attended to.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 800,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

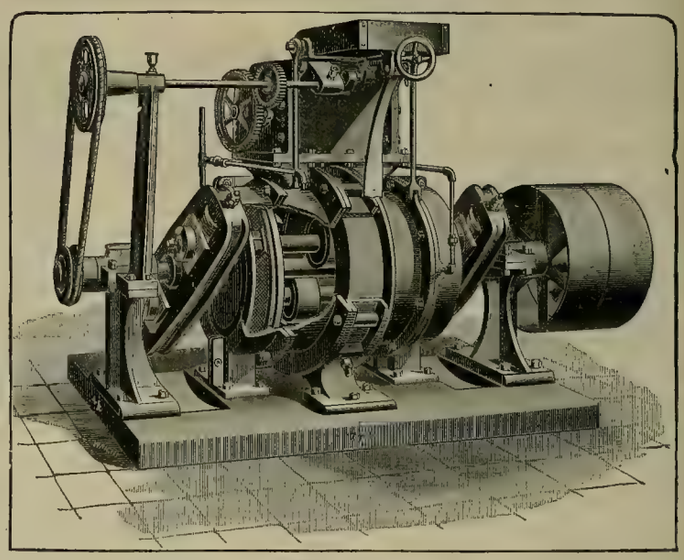
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

West American Oaks.

We have received, through the courtesy of Prof. Geo. Davidson, a copy of a monograph on "West American Oaks," the history of the preparation of which is as follows: Dr. Albert Kellogg, a distinguished pioneer botanist of this State, confided to some of his friends, before his death, all his papers on botany. They were incomplete and there was apparently no hope of their being finished or published. J. P. Moore and W. G. W. Harford consulted with Prof. Davidson, who addressed a letter to Jas. M. McDonald explaining the matter to him. The result was that Mr. McDonald cordially undertook to bear the expense of publication and gave his check for the required amount. He also asked for an estimate of the cost of publication of a similar monograph of the Coniferæ. Prof. Edward Lee Greene of the University of California wrote the text and the drawings were made from the originals by Dr. Kellogg.

Dr. Kellogg was one of the original seven founders of the California Academy of Sciences, and one of those mainly instrumental in giving it a reputable standing in the scientific world. He was an enthusiastic botanist, ardently devoted to research in the new field of the Pacific, and a singularly unselfish man, assisting with his knowledge and experience all who sought his advice.

In the sketch of the life and work of Dr. Kellogg, which Prof. Davidson has written for the monograph, occurs the following paragraph: "He was the embodiment of modesty in manhood. His heart was as gentle, as sweet and as innocent as a woman's. His speech was clean and refined; always for the right, the needy and the struggling. He was startled at an attack on religious purity, and then his words rose swiftly in force and directness. His soul revolted against chicanery, intrigue and petty meannesses of the trickster, the backbiter and the prevaricator, and his condemnation was unhesitating and piercing. He shrank from the charlatan and the sham; to him they were an unnatural growth in morals or science. His sense of justice and purity was so inborn that he instinctively knew the presence of the offender. His moral life charmed the young and innocent and was an example to the best."

The term "West American Oaks" is used for the work because all the oaks east of the Rocky Mountains have been published as East American oaks. There are now known to botanists at least 300 kinds of oak, of which 50 are indigenous to North America, north of Mexico. The 50 North American species are about equally divided between the eastern and western sides of the continent; and there is no oak common to Atlantic and Pacific America. The greater part of the species belonging to the Pacific States and Territories were more or less fully illustrated by Dr. Kellogg's pencil. The 24 different drawings of his in the monograph represent all the more important species of the extensive commonwealth of California particularly, as well as several others; and the editing of these plates has resulted in a virtual monograph of the Pacific North American oaks; so the volume may be found to contain about all which, up to this date, is known of our West American oaks. The plates are of lasting value. The engraver has been scrupulously faithful to the drawings; and no artist was ever more strictly and conscientiously true to nature than Dr. Kellogg.

The bibliography of the oaks is specially complete. The text is intelligently and plainly written and scientifically correct. Botanists everywhere owe a debt of gratitude to Capt. McDonald for his generosity in publishing this work. The work is a credit in every way.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & CO.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING APRIL 30, 1889.

402,382.—FLY-CATCHER—Albert Arents, Alameda, Cal.

402,400.—WRENCH FOR SAW TEETH—Frederick W. Cook, S. F.

402,404. — LUBRICATOR — W. H. Cooper, San Jose, Cal.

402,408.—RAILWAY TELEGRAPH—F. J. Crouch, Oakland, Ogn.

402,462. — GRAIN SEPARATOR — M. N. Laufenburg, Stockton, Cal.

402,471.—MOTOR—Hans M. Olsen, Sacramento, Cal.

402,189.—LAWN-MOWER ATTACHMENT—H. Peterson, Berkeley, Cal.

402,194.—STRAP LOOP — A. C. Reeves, Palouse, W. T.

402,479.—VARIABLE ECCENTRIC — D. L. Remington, San Leandro, Cal.

402,279 — PHOTOGRAPHIC PAPER—F. H. Rogers, Los Angeles, Cal.

402 208. — SNATCH BLOCK — A. Uren, Seattle, W. T.

402,496. — TENSIONAL SOUND BOARD — C. S. Weber, San Jose, Cal.

16,541.—TRADE MARK — Nushagak Canning Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VARIABLE ECCENTRIC.—De La Fayette Remington, San Leandro. No. 402,479. Dated April 30, 1889. This invention relates to the class of variable eccentrics especially applicable to engine-reversing mechanisms, in which the position of the valves is changed by varying the position of the eccentric which operates the valve rod; and the invention consists in the novel connection of the eccentric and the novel means for varying its position.

RAILWAY TELEGRAPH.—Frank J. Crouch, Oakland, Douglas county, Oregon, assignor one-half to C. P. Houston, Junction City, Oregon. No. 402,408. Dated April 30, 1889. This invention relates to a system of railway telegraphy and signals, and it consists of devices whereby communication may be made beween fixed stations along the line of the railway and between trains moving upon the track between the stations. The system also admits of intercommunication between said fixed stations, moving trains, and any points intermediate between the fixed stations by means of portable telegraphic or signaling apparatus. The details of this device are quite ingeniously arranged, varying considerably from anything of the kind so far invented.

GRAIN-SEPARATOR AND CLEANER.—M. N. Laufenburg, Stockton, assignor to Stockton Combined Harvester and Agricultural Works. No. 402,462. Dated April 30, 1889. The improved apparatus is for separating and cleaning grain after it has been thrashed. This cleaner may be used as part of an ordinary thrashing machine or may be employed as a supplemental cleaner attached to and working with the thrasher and separator, or it may be worked entirely independent if desired. When the wheat which is mixed with the barley, oats, cheat or other foul matter, is deposited upon the shaking table or screen in any considerable depth—as one-half inch or more—the wheat and heavier grain will seek the bottom by reason of the shaking motion and the lighter impurities will rise to the top. Upon this action Mr. Laufenburg has based the construction of his cleaner, in which the screens, while being continuous, are so constructed as to deposit the lower stratum of nearly clean grain upon an inclined plate, which returns it beneath the screen and grades and separates it at once from the grain which is only partly cleaned, this operation being repeated as many times as may be necessary; and by thus relieving the screens of a part of the work the inventor is enabled to greatly increase the capacity and perfection of the work of cleaning.

TOOLS FOR MANIPULATING SAW-TEETH.—Frederick W. Cook, assignor of one-half to H. P. Gregory & Co., S. F. No. 402,400. Dated April 30, 1889. The wrench which this patent covers is one of that class which are especially adapted and are used for inserting and releasing the insertible teeth of saws. The invention consists in a stock or bar having pins near one end for engaging the sockets in the saw-plate and bit-holder, and hinged or pivotally jointed on a line between the pins, whereby they may be brought, by the bending of the stock at the joint, closer together to engage the sockets and forced farther apart by the straightening of the stock to prepare the holder for the insertion or removal of the tooth or bit. The invention further consists, in connection with said stock or bar provided with its engaging-pins, and jointed, as mentioned, of a stop secured to the stock and adapted by coming in contact with the edge of the saw-plate to limit the movement of the stock and thus control the bending of its point to prevent too great separation of its pins and injury to the bit-holder. The object of the invention is to temporarily force the spring-limb of the holder into a position to permit the insertion of the saw-tooth or bit, or to release it, to provide for its removal, and the wrench is specially adapted for use in connection with those bits or teeth which are seated in a socket in the holder and held therein by a spring-limb of said holder.

MOTOR.—Hans M. Olsen, Sacramento. No. 402,471. Dated April 30, 1889. This invention relates to the class of motors adapted for the operation of pumps and other light machinery, and especially to that class in which a gear train operated by a weight is employed to actuate a crank-shaft which is connected by intermediate devices with the machine to be operated. The invention consists in a novel mechanism for automatically connecting the operating weight with the chain which actuates the gear train. The object is to provide a simple and effective mechanism for transferring the weights to the operating chain and providing for the automatic attachment of a second weight as soon as the first has about run down, so that the machine may be run for a longer time than with a single weight.

FLY-CATCHER.—Albert Arents, Alameda. No. 402,382. Dated April 30, 1889. Traps of all sorts, as well as sticky or poisonous paper, have been employed to catch flies; but if strings or elongated strips are suspended from the ceiling, the flies, if present in the room, will be attracted by these strings, notwithstanding the presence of eatables. Whether this be on account of the glistening appearance of the coated strings or for some other reason that cannot be explained, the fact remains that such strings will attract and catch the flies in a room in a short time. Mr. Arents' invention consists of one or more strings of suitable length suspended from the ceiling and a means for preparing, packing and suspending the strings. A string of ordinary loosely twisted twine, having a ring on one end by which to attach it to a hook on the ceiling or other elevation in the room, is placed in a small wide-mouthed bottle, with only the ring and a small piece of string left outside. In the bottle is any strongly adhesive compound which saturates that portion of the string in the bottle. When this is to be used, a pull on the ring will draw the cork (by means of a knot on the string), and when the ring is placed on the hook the weight of the bottle will cause it to descend, the coated string being thus withdrawn until the end is reached, and this is secured within the bottle by suitable means. The bottle then serves as a weight to keep the string extended and as a receptacle to catch any surplus material. The whole device is easily packed for shipment and sale.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

EUREKA MANUFACTURING CO., May 3. Object, to manufacture compounds from mineral and vegetable substances. Capital stock, $200,000. Directors—John D. Fry, Frank F. Woods, L. P. Drexler, George Crocker and Louis A. Garnett.

RATTLESNAKE G. M. CO., May 3. Capital stock, $50,000. This is an Oakland Co. Directors—J. C. Hickox, N. B. Smith, H. Molineaux, W. M. Towle, C. E. Wooley, Owen Brady, J. S. Dallas and C. F. Hickox.

CALIFORNIA ST. CABLE R. R. CO., May 3. This is a reincorporation of the old company covering its new routes. It is to be continued down California street to the ferry. Capital stock, $1,000,000. Directors—Chas. Mayne, Robt. Watt, Jerome Lincoln, C. N. Randall and C. Denervand.

HUTCHINSON SUGAR PLANTATION CO., May 6. Object, to cultivate sugar-cane and manufacture sugar in the Hawaiian islands and elsewhere. Capital stock, $2,500,000. Directors—John D. and C. August Spreckels, Louis Sloss, P. N. Lilienthal and Meyer Ehrman.

PACIFIC DEVELOPMENT SYNDICATE, May 8. Object, to do a general business in lands, mines, merchandise, railroads, wharves, sawmills, etc. Capital stock, $100,000. Directors—G. W. Osborn, H. L. Hyland, N. S. Keith, Robert A. Lewis and Irving Lawton.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Peerless, May 3, $4000; Justice, 3, $2785; Confidence, 3, $18,569; Crown Point, 3, $10,631; Best and Belcher, 5, $7300; Cons. California and Virginia, 5, $90,246; Hale and Norcross, 3, $7700; Hanauer, 2, $6400; 4, $2100; Crown Point, 7, $18,795; Confidence (for April), $83,972; Hanauer, 5, $2500; Navajo, 8, $6000; Cons. California and Virginia, 8, $72,207; total for April, $295,832; Justice, 9, $2789; Savage, 9, $8620; Peerless, 9, $12,200; Overman, 9, $10,272; Hale and Norcross (for April), $90,525; Savage (for April), $24,426.

A CHROME deposit is being opened on Jacilites creek, 20 miles west of Huron, Fresno county.

THE Standard Oil Company seems to be about to absorb the white lead industry of the country.

AT Scotia, says the Humboldt *Standard*, is the plant of the Pacific Lumber Co., one of the largest and best in the redwood belt. This company own about 10,000 acres of the best timber in the Coast Range. Their mill on Eel river, when running, will average a cut of about 93,000 feet of clear lumber every day. They estimate a cut of 1000 feet per day to each man employed in the mill. Some important changes have been made recently in the way of handling the logs and lumber as it comes from the saws and is received for shipment. Formerly all classes and sizes of lumber was carried by line rollers and trucks to a general dump, which was in the shape of an incline from both sides of a tramway to the yard below, where men stood ready to sort and pile it. Now it is separated as it comes from the edgers and placed on inclosed rollers and carried to the chutes and automatically dumped on to a rifle or table, just sufficiently high to be handled by the men without stooping. From the rifle the lumber goes on to cars standing on depressed tracks ready for shipment, or is trucked off and piled according to quality and size, or loaded on cars, as ordered, from six platforms. Some changes have been made in the saws that have proved successful. A third saw is now run on the pony instead of a clipper. By this arrangement larger logs can be sawed and the logs are now taken as they come on the train from the woods and handled on both sides of the mill just as they come. By these changes the mill is run with 27 less men, and instead of sawing 78,000 feet of lumber, 93,000 is sawed. In addition to the sawmill power, there is a detached shingle-mill with a capacity of 150,000 shingles per day, and another machine operated in the main mill with a capacity of 30,000 per day; also a shake and picket machine. Besides the above, a large amount of material for boxes is gotten out every day. Not a piece of lumber is allowed to go to waste, but every available particle of timber is turned to some account. Field's Landing is the shipping point at tide-water for the product of the mill.

CLAUS SPRECKELS, speaking of the beet sugar industry in California, says: "I believe that California alone can in a few years produce enough sugar to supply half the demand of the United States, and California, Oregon and Washington together can produce enough to supply the entire country. Then we will be independent in this as in many other things. We do not need to ask anything of any country. We can raise and manufacture everything we need, and then we keep all our money right in our country. This coming season we expect to turn out fully 4000 tons at the Watsonville factory. That was not really an experiment, as some think, for I was sure before I went in of its success. It is our intention to put up ten factories similar to that at Watsonville, and in furtherance of this plan have formed a company, the Occidental Beet-Sugar Co., with $5,000,000 capital. Last season I gave out seed all over California and farmers sent me samples of their beets. I had these all tested, and the result is that I have now a map which shows me exactly where the beets that yield most saccharine matter grow the best. To pay, beets should average about 14 per cent saccharine matter. Some of those about Watsonville last year ran as high as 24 per cent. We expect to get offers of land from different points on which to build our factories. We have not yet decided on any locations, but will take the matter up when I get back from the East. We will try and have one more factory equipped and ready for work next year. The factories will cost about $600,000 each, and each establishment will be able to turn out 800 tons of raw sugar in 24 hours, and in time will make fully 10,000 tons for the season. We will have to employ about 150 men at each factory. Large factories are better than small ones, for about the same labor is required to turn out 50 tons as 800."

THE Truckee *Republican* says: We predict that the season of 1889 will be the liveliest experienced for a number of years. The *Republican* has been told that the following improvements were to be made this year: Large ice works will be constructed by Brickell & Kruger, which will probably cost $40,000. Lewison & Smith talk of building a box factory at Coldstream to cost at least $5000. The new schoolhouse will be built, to cost over $5000. The Tahoe Ice Co. will probably construct a large ice pond and build another large house. There is talk of another ice Co. being formed with large works near Truckee. Another icehouse will probably be built at Boca. It is said that A. M. Wicks will build a sawmill near BRONCO. If these things are done, at least $100,000 will be expended in this vicinity this year.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

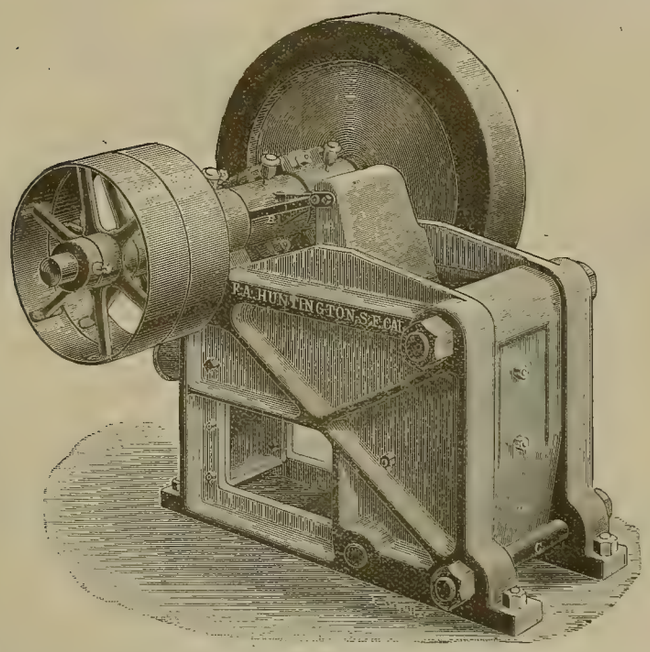
THE Yavapai Development Co. proposes to establish an ore reduction plant at Prescott, A. T.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

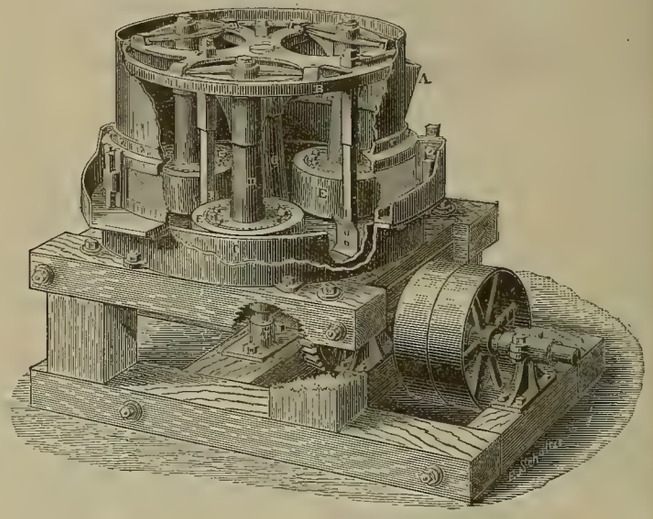
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted to capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

☞ SEND FOR CIRCULAR. Address:

MARKET REPORTS.

Local Market.

SAN FRANCISCO May 9 1889.

General trade continues slow, as does business with iron-workers. The letting of the contract to the Union Iron Works for building one of the vessels for harbor defense, insures in connection with the regular wants the consumption of a large quantity of iron for the next year or two. Money is reported easy, with the banks meeting all legitimate requirements at a fairly low range of interest. The savings banks have a large surplus and offer lower rates of interest. Merchants report collections from the agricultural sections light, but free from mining districts. The imports of treasure by sea the past week are reported as follows: Coin, $32,061; Mexican dollars, 41,500: from Alaska, in bullion, $62,155: from Mazatlan a little over $200,000 in silver bullion. The coast mines are turning out more bullion: the increase is chiefly in gold.

SILVER—The market held up well throughout the week, with free buying for shipment by the steamer to leave to-morrow for China. The bulk of the business is reported to have been executed on the basis of 92¾@92⅝c. At the close, the market is very strong at 92⅜ to 92¼c quoted, with sales at the highest figures. The strength of the market is due to an improvement abroad, and India bids being allotted at an advance.

MEXICAN DOLLARS—The market is poorly supplied, but then the demand is light, owing to fewer Chinamen returning home. Sales made for export by the steamer leaving to-morrow are reported to have been made at from 73¼@73½c, according to quality. Some were placed at a slight advance on the outside quotations.

QUICKSILVER—The market is stronger, with a slight advance reported. Receipts the past week were as follows: Forty-five flasks, A. Abbey; 53, C. S. Neal; 702, Thos. Bell; 40, Haas Bros. Total, 820. The exports by sea were as follows: Three to Victoria, B. C., and 10 to Auckland.

BORAX—The market is quiet, but steady. Receipts the past week, 1707 barrels.

LIME—The market is steady, with a fair home trade reported. The shipments by sea only aggregated the past week 175 barrels. Receipts the past week aggregated 4004 barrels.

TIN—The market for tinplate on spot is very dull and heavy, with more sellers than buyers. For shipment, there is some inquiry, with buyers and sellers apart. Imports the past week were 170 boxes overland.

IRON—The market continues inactive and hard to quote for spot. To sell, lower prices would have to be submitted to, but to buy, full prices would have to be paid. The market abroad is very strong and active. Imports the past week were 300 tons of pig from Irondale, Puget Sound, and 500 tons from Leith.

COAL—Imports the past week were as follows: From Tacoma, 6470 tons: Seattle, 3474: Victoria, 753: Irondale, 200: Coos Bay, 860: Australia, 1358: Leith, 2000; total, 15,115 tons. The market is reported substantially unchanged for shipment since last week's advices, but for spot it is heavy for house, with a weak tone for other kinds. Large buyers are only tempted by concessions.

Eastern Metal Markets.

By Telegraph.

NEW YORK, May 9, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 1-16	92	$14 25	$3 60	$20 40
Friday	42 1-16	92	13 75	3 75	20 35
Saturday	42 1-16	92	13 70	3 75	20 35
Monday	42½	92½	13 60	3 85	20 25
Tuesday	42⅝	92⅞	13 60	3 87½	20 20
Wednesday	42 9-16	92½	13 60	—	20 20

NEW YORK, May 9.—The copper conference held in Europe failed to adjust the future management of the depressing stock of Paris and London. The American delegates are returning. There are no definite rates here. Some lots of ingots are offered at 14@12¾c; casting brands, 12@12½c, free; 28,000 of the latter, 12c. Pig lead is steady, with a strong feeling. May, $4; August and September, $4@4 20; October, $4 25, with sales. Borax is steady at 8¾@9¾c refined and powdered, 7¾@8¼c concentrated. Quicksilver is in light demand. Sales at 57@58c. cases.

Mining Share Market.

Trading in Comstock stocks the past week was quite active, the first four days under an upward movement in Belcher due to a report of having run into ore. The move was so quick that few got out stock at the advance. Tuesday and yesterday Wednesday the market was heavy, and at times had the appearance of going to pieces, but did not, owing to a few well-directed bids. A slight recovery set in only to be followed by another sagging in values. Those in position to know, look for more active movements, based on the nature of the work going on in the leading mines of each group. While expecting this, they do not think that much ore will be uncovered, but a large number of assessments are sure to be run into before long. This latter opinion is confirmed by the monthly financial statement of the mines given below. In outside stocks the Tuscaroras have hung heavy, with lower prices except for Commonwealth. The Quijotoas were inactive, but fairly steady. The Bodies had another of their cat-like moves. There is a growing impression that the moves are made to put out stock ready for more assessments, probably in June. Of course, ore must be found to make it a success.

A gentleman who is well versed in mining affairs and withal a practical miner, has just returned from the Comstocks. He reports having inspected the Hale and Norcross mine, and says that the stock ought to command more money, judging from the extent and richness of the ore deposits. He also expresses himself favorably impressed with the joint Hale and Norcross and Savage crosscut.

Crown Point took out last month about $54,000 in bullion, and Con. Virginia a little over $207,000.

The following companies report having had balances on hand May 1, 1889: Con. California and Virginia $103,064.50 in cash and $133,378.71 in unsold bullion, with further shipments to be received. Occidental, $2233.68; Alpha Con., $10,164.90; Exchequer, $1919.95; Utah Con., $15,226.23; Locomotive, $224.64; Hale and Norcross, $5 1907.02; Gould and Curry, $2201.09; Mexican, $14,790.64; Andes, $7097.77; Sierra Nevada, $9654.83; Lady Washington, $23,170.18; Alta, $56 535.01; Silver King, $58,477.92; Peer, $1239.44; Crocker, $3427.90; Peerless, $7275 66; Mono, $25,985.21; Bodie Con., $38,210.74; Bullion, $21,605.44; Belcher, $16,372.59; Con. Imperial, $12,983.43; Navajo, $11,249.34, with bullion valued at $10 000 in transit: Independence, $1693.09; Standard Con., $5563.47; Caledonia, $10,222 34; Confidence, $61,659 94: Overman, $11,595.12; Benton Con., $94,472 82; Eureka Con., $4184.99; Julia, $5747.85: Justice, $6451.25 in cash and $5822 in unsold bullion: Scorpion, $6200.65: St. Louis, $2689 65; Syndicate, $8322.71: and Union Con., $3301.70.

The following companies report having had an indebtedness on hand May 1, 1889: Seg. Belcher, $17,357.47: Con. New York, $6691.48: Nevada Queen, $54,812.51, but bullion of the net value of $12,588 51 has been received since May 1st as a partial offset; Commonwealth, $70,799.85; Challar, $14,327.66; Potosi, $37,838 20; Bulwer Con., $1510.83; Best and Belcher, $7331.36; Weldon, $626.30; Holmes, $4002 48; Ophir, $2251.71; Savage, $21,125.28; Crown Point, $15 745; Grand Prize, $26,051.01; Challenge Con., $5680.20; North Belle Isle, $14,252.71; Belle Isle, $5617.21; North Commonwealth, $24,303.69; Del Monte, $6673.97; Kentuck, $2015.31.

The stock market opened to-day Thursday weak and low, advanced in the informa. session, but as noon approached weakened off under light business.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan: Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations: Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs: Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications: Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels: Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE owner of the Omega mine, Nevada county, has been fined $500 for hydraulicking.

WANTED.

A situation as Mine or Mill Superintendent. Am good assayer and understand concentrating of all classes of ores. Can put up and run any mining or milling machinery. Best reference. Address "J. A.," BOX 2517 S. F.

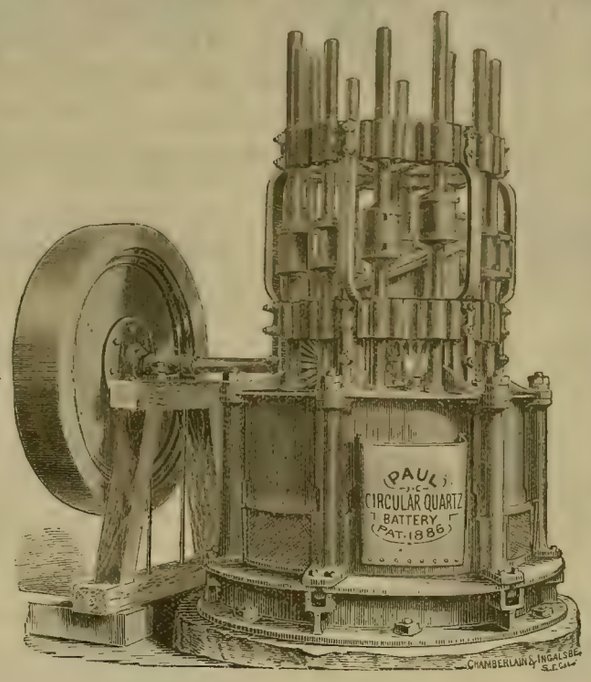
PAUL CIRCULAR STAMP BATTERY.

NOTHING EQUALS STAMPS! NOTHING EQUALS STAMPS!

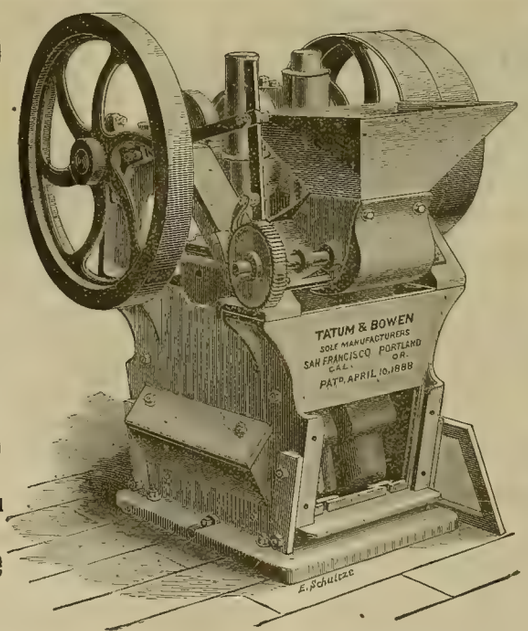


8 or 12 Stamps in One Mortar
Cost Less Than an Ordinary Straight Battery.

The total weight of a twelve-stamp battery is ten tons.
The largest piece is the Mortar, six inches thick, weighing three tons
The power required is 10-horse. Daily capacity, from 18 to 25 tons (according to ore, and speed you run).
These Mills are in active use at the Calumet Gold Mine, Middle Creek, Shasta County, and at the Gladstone Mine, French Gulch, Shasta County, Cal.
Parties desiring Quartz Batteries will do well to investigate this mill, which can be seen at the Works on a large practical working scale, and by model at the office. They will be sold on favorable terms. For particulars apply to

A. B. PAUL, Jr.,
Nos. 14 & 16 FREMONT ST., SAN FRANCISCO.

—THE—
PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective
Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an
IMPROVED ROCK BREAKER.
Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

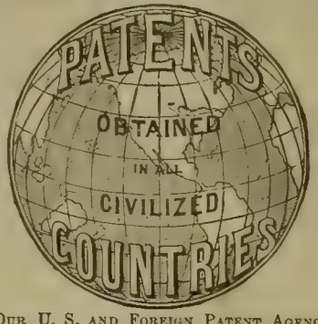
Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Exclusive Agents for the Pacific Coast of HEINE PATENT SAFETY BOILER and MACBETH STEEL PULLEY.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

COMPRESSED AIR and WATER POWER MACHINERY.

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts.

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

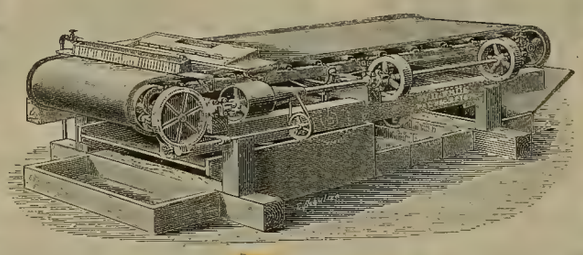
Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

Tuolumne County.

Considerable space in the PRESS this week is devoted to consideration of mines in Tuolumne county. On this page is given a photo-facsimile of Sonora, the county seat and the principal town of Tuolumne. Here, at an altitude of about 1900 feet, is located the famous bonanza mine which is fully described in another column. Tuolumne is famous for its "pocket mining" and a considerable part of the prosperity of Sonora is due to this branch of mining. A prominent example of a pocket mine is illustrated and described on another page.

Tuolumne county is bounded on the northwest by Calaveras; on the northeast by Alpine and Mono; on the south by Mariposa, and on the southwest by Stanislaus. The following paragraph concerning the county is taken from the last report of the State Mineralogist:

Like most of the counties lying along the main gold belt, Tuolumne covers a portion of the foothills and the westerly slope of the Sierra Nevada, giving to the whole county a rugged surface, and to the eastern portion of it a considerable altitude. In the Sierra Nevada, on the confines of this and Mono county, stands Mt. Dana, 13,227 feet high, with Castle peak, a little further north, and nearly as high. A remarkable feature in the topography and geology of this county is the basaltic mesa, known as Table mountain, which, running near and parallel with its northwestern boundary, extends for a distance of nearly 30 miles. This formation consists of a lava flow, which, having filled the channel of an ancient river, stands now, through the degradation of the adjacent country, an isolated mass, its top nearly level and its sides nearly perpendicular, the former more than 2000 feet above the bed of the Stanislaus which breaks through it.

Flowing through this county in a westerly direction is the Tuolumne river with its three forks, also the three forks of the Stanislaus, all large streams, the main Stanislaus and its north fork forming in part the boundary between this and Calaveras county. As these several rivers have many confluents, some of them considerable streams, this becomes a well-watered county. About the sources of the Tuolumne river are many small lakes, some very deep, and all remarkable for the purity of their water. As Tuolumne is well supplied with water, so is it also abundantly timbered, the more elevated portions of it being covere with pine, fir, spruce and cedar, and the lowest portions with scrub pine and oak. While gold mining continues to be in the county the leading industry, farming, viticulture, fruit-growing, lumbering and stock-raising are here important and growing pursuits, many of the inhabitants dividing their time between these vocations and mining.

SONORA, THE COUNTY SEAT OF TUOLUMNE COUNTY.

OWNERS of Six-mile canyon blanket sluices are making fair wages in concentrating the sulphurets contained in tailings flowing from the Nevada mill, now that its full complement of 60 stamps are dropping.

THE new mill, concentrators, etc., belonging to H. M. Van Name, Big Bug district, Arizona, were destroyed by fire last week.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Mines of Tuolumne County.

A History and Description of Prominent Claims.

[Written for the PRESS.]

Tuolumne county's history dates back to the summer of '48, when a party of Philadelphians began mining at Woods Creek, the pioneers being Rev. James Wood, James Savage, J. H. Rider and Charles Bassett. Following them came the Mexicans, and soon after the '49ers. Jamestown was first settled; then came Tuttletown, and in rapid succession the other well-known camps of the county. While the placers were the magnet that drew the miners by the thousands to this rich field, the quartz mines attracted attention at the earliest date by reason of their richness, the quartz yielding $100 to $300 a day per man by simply pounding it up in a mortar.

The record of the early days, with its high prices, deep drinking, heavy gambling, big strikes, frequent shootings, has passed into history, showing that "Old Tuolumne" was at the head of the swim.

Columbia.

This was first called American Camp. The diggings were discovered in March, 1850. The "Hildreth Diggings" attracted attention, and miners poured in from every point. The first miner, Capt. Arent, realized two and a half-pounds of gold from his first day's work. Thirty days after discovery 6000 men had struck camp. Then followed the famous "Foreign Miners' tax" of $20 a month, the effects of which were as surprising to those securing it as the passage of the Chinese Exclusion Act is to-day. The foreigners left in a body, and as they constituted the greater portion of the population, the diggings wore a deserted air, but the proven richness of this vast extent of placer ground soon drew a large mining community, who, seeing the need of a liberal water supply, incorporated the Tuolumne Water Co. and brought water into Columbia in May, '52. With this new stimulus the camp grew apace. Miners realized from $5 to $1500 a day per man. The fire of '54 left but little of the old camp, consuming a half-million of property.

Such was Columbia then, but "the days of gold, the days of old, the days of '49," have left little else save their history for Columbia. The population which once thronged its streets has long since departed, and the old stores and other evidences of past prosperity are but the relics of bygone days. Sonora now claims the prestige and Columbia has settled down to be a quiet mining town of a few hundred inhabitants. That Columbia will always remain as now is not to be believed, for it must be but a question of time until her numerous quartz ledges will attract the needed capital to develop and work them, when the town will awake from her Rip Van Winkle sleep.

Of the mines in this vicinity the following deserve examination: The Wine Spring, the property of Mr. Geo. F. McPherson, has a 2½-foot vein of quartz of the value of $20 a ton and sulphurets giving, when concentrated, $2000 a ton. No more beautiful site for a home and mine could be selected. Far below winds the Stanislaus, like a thread of silver in the distance, while the rugged hills stand out in bold relief on the opposite river-bank. While Mr. M. does not claim to be a rancher, his business tact enables him to realize $6000 a year from the surface of the soil in the sale of fruits, wines and farm products. His nine-stamp mill is hung up for the present. The Gem mine, Geo. Morgan superintendent, has a 10-stamp mill, on a 2½-foot ledge developed 100 feet, yielding $10 a ton by mill process. The Riverside mine has been in operation for 30 years, is developed 400 feet in depth, and keeps 20 stamps dropping steadily on its ores. The Shanghai, intersected by the Morgan, is a mine of good reputation. The old Shanghai carries a 2½-foot ledge of $16 rock, which has been developed to a depth of 250 feet. An excess of water made it necessary to drive a drain tunnel on the Morgan, which is now in 900 feet and will cut the Shanghai 300 feet deep; but as the vein pitches rapidly gives 400 feet of backs. As the tunnel is driven on the Morgan lode, the work shows up a big amount of reserves. Mr. Geo. Morgan is the fortunate owner of this property and invites capital to inspect it.

The Star mine of Mr. F. McPherson, a 2½-foot ledge cut 200 feet deep by a 300-foot tunnel, with a record of $100,000 in past workings, will bear investigation, as the rock taken out in the last workings, by its large amount of visible free gold, gives evidence.

Mr. Neubamen's Tiger mine and the Ham and Barney mine promise well. The latter will soon be put in operation by an English company. The Lavi, R. C. Davis superintendent, is opened by tunnel and drift 950 feet long, showing a five-foot ledge of $20 rock. The Experimental mine, which in the early days yielded 50 cents to $2 a pound, is now opened by an incline shaft 400 feet deep on the vein and by three tunnels of 150 to 200 feet. The vein shows an average of three feet; 15 men are employed, and the ten-stamp mill runs steadily on $5 rock. The Black Hawk plumbago mine of Mr Geo. Morgan is a deposit which has been cross-cut 100 feet. Four tons shipped to Liverpool sold for £4 a ton.

Sonora.

On the 7th of November, 1849, the citizens of Sonora met and organized a town government, the population at that time being 5000. Sonora was as famous in her early as she is in her present history in the production of large amounts of gold. In the history of Tuolumne, we find in 1850 nuggets of 23 pounds 2 ounces; 1851, chispes of 28 pounds 4 ounces; 1852, $1100; 1853, $1500; 1854, 16½ pounds; 1855, 30 pounds; while the past 30 days has seen $120,000 come out of the Bonanza mine as the result of the labor of six men, making the present equal to the past.

Within the city limits is the San Giuseppa mine, the property of Mr. F. Sutton. This property is somewhat noted from the fact that the gold is 9.88 fine, which is exceptional. The mine is opened by a shaft 130 feet deep, showing a 12-inch vein of sulphuret ore of $50 value. By the present method of roasting and arastra, but $35 a ton is saved.

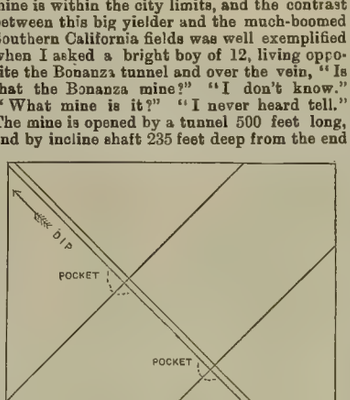
The Golden Gate is opened by a 250-foot shaft, opening up a three to eight-foot ledge of rock running from $10 to $22 per ton, the concentrated sulphurets yielding from $2000 to $6000 a ton. About 1500 tons have been extracted to date from the 300-foot chute. The Neil mine is opened by 1500 feet of tunnel and crosscut showing a two-foot vein of pocket and milling rock.

This property yielded in early days pockets from $30,000 to $60,000. The present work is intended to undercut the old line of pockets, when Mr. Neil expects to give the Bonanza boys a neck-and-neck race. Mr. Neil is also superintendent of the Monitor.

The Mt. Vernon ore running from $40 to $500 a ton, these properties will be started up the coming month by McKee & Co. of San Francisco. The Bull Pen is now down 250 feet on incline, and will crosscut the Bonanza vein. Ferguson & Smith are down 250 feet on incline immediately over the Bonanza, on a parallel vein. Drake & Cody are drifting on the south extension of the Bonanza, with telluride ore coming in, and are hopeful and expecting soon to reach a "bonanza."

The Bonanza.

This mine is now the center of attraction, having yielded within the past month as the product of six men's labor as follows: Feb. 17, 1889, $17 295 57; Feb. 21st, $40,295.42; Feb. 25th, $26,507.15; March 18th, $27,977.28; March 20th, $8000. Total, $120.075.42. This is all in free gold, besides a large amount of tellurium ore running according to Mr. Lou's Blanding's workings, $145,000 to the ton. In February one mass of gold was extracted which it was necessary to cut into three pieces to take it out handily, which gave $17,000, $12,000 and $10,000, or $39,000 as one nugget. The mine is within the city limits, and the contrast between this big yielder and the much-boomed Southern California fields was well exemplified when I asked a bright boy of 12, living opposite the Bonanza tunnel and over the vein, "Is that the Bonanza mine?" "I don't know." "What mine is it?" "I never heard tell." The mine is opened by a tunnel 500 feet long, and by incline shaft 235 feet deep from the end



of tunnel. The vein is about eight feet in width and is composed of porphyritic granite, with small stringers of quartz running near each wall and through the center on the course of the vein. The vein is traversed nearly horizontal by small seams stained with oxide of iron, called gold seams. At the crossing of these gold seams and the quartz stringers, the pockets are found. The present lessees confine their operations to the footwall and that section of the vein having metallic slate for walls. This mine has been operated irregularly since 1850, yielding in the neighborhood of $1,000,000. It was not until the present lessees, with one of their number, Mr. Oliver, an old resident miner in charge, that the working was got down to a system. At present the owners feel as confident of the future as they have reason to be jubilant over the past; but as Charlie Fitch expressed it, "Their luck hasn't spoiled them a bit." The lessees and men employed about the mine are all of that class that have the good wishes of the people of the town. That the coming months will give an income equal to that of the past is confidently believed by every one familiar with this most wonderful gold deposit of which all Tuolumne county is justly proud.

Bald Mountain Pocket Mines.

Within sight of Sonora are the numerous pocket mines on Bald Mountain. Here the pockets occur at the "crossings," as the miners term them; that is, where one vein crosses another, the gold usually being found on the footwall. A pocket ledge is sunk on by incline shaft until another quartz vein coming down through the slate cuts or crosses the vein, when a drift is run following the junction of the two veins.

Of the mines now in operation, the following is their yield in pockets to date:

Wilson mine	$ 75,000
Garrett mine	200,000
Austrian mine	80,000
Ford mine	100,000
Sugarman mine	80,000
Total	$535,000

Mr. Stewart of the Wilson is confident that "Old Baldy" has only given a foretaste of her mineral contents, and, with the other mines, is energetically driving ahead. "Hope springs eternal in the human breast" might well be changed to "Pocket mines' breast." Day after day, year after year, they delve away, hoping each day that the morrow will see them in bonanza. May they meet with the success they so fully deserve for their faith and labor.

Hyde Mines and Ranch.

This property is within seven miles of Sonora and 1½ miles of Soulsbyville. The mines are on the same vein as the Eureka Con. at Summerville. The mine is called the Golden Treasure, and consists of three parallel veins, which are cut at right angles by two intersecting veins.

On the crosscutting veins but little has been done to prove their character, but the croppings look fully as good as those of the other veins. A shaft 400 feet has been sunk on the center vein and drifts run at each 100 feet. The bottom drift shows a vein 26 feet wide at the end of the 210-foot drift, going $8 to the ton. The south end is four feet in width at the end of the 212-foot drift, quartz going $10 to the ton. The east and west veins are opened by separate shafts and tunnels. The ore being milled at the time of my visit yielded $18 a ton, and came from the east vein. The three veins are all within 75 feet of each other and are evidently one in depth. The mine is equipped with good steam-hoist and pump, Huntington mill and Victor concentrators. The rock mills exceedingly easy, the Huntington crushing 25 tons a day (24 hours). The mine has its own water for milling purposes. Water for power can be obtained free by piping one mile and 350 feet of fall obtained; or 1200 feet of fall can be secured by piping two miles and tapping the Tuolumne water ditch. About 1500 tons of quartz have been milled to date, leaving the stopes practically untouched. The mine takes in a ranch of 320 acres of exceptionally fine land most favorably located, while the "bottoms" are filled with pay gravel; some $1500 taken from a small gulch 300 feet in length gives sufficient "color" to this fact.

Within sight of the house is a fall of 200 feet, adding, if it were needed, the one element wanting to make farm-mining life on the Hyde property as pleasant as it is profitable.

Soulsbyville.

The Soulsby, W. Sherwood owner, was discovered in 1856, yielding up to date about 100,000 tons of rock of an average value of $35 per ton. The vein is opened by an 800-foot shaft on the 16-inch vein. The mine is equipped with a fine hoist and 10-stamp mill. The machinery in use is largely of the invention of the present owner of the property, and cannot but strike the visitor favorably in its strength, simplicity, absence of all unnecessary expense, and the effective manner in which it does its work. Mr. Sherwood's automatic brake is a feature which alone will pay for a visit of inspection. The mills and hoists erected by Mr. Sherwood for other mines are all that can be desired, and the owners congratulate themselves on their cheapness and general merit. The ores of the Soulsby mine are largely sulphuret. The quartz after crushing flows over battery plates, then on to Morris canvas tables, and the concentrates from the tables through settling-tanks, thus cheaply and effectually saving almost all of the gold. The sulphurets on the mine exceed $40,000 in value at this time. Mr. Sherwood is desirous of enlisting additional capital to open up known ore reserves and continue the mine in its old-time prosperity.

Parallel with the Soulsby is the Wheel & Perrin lode, which is now being opened by San Francisco parties. The ore will be worked in the Soulsby mill. This vein of 10 inches has been prospected to a depth of 110 feet, giving $54 to $60 to the ton.

Blatt & Gilson.

This property is owned by fortunate San Francisco merchants, with Mr. A. Trittenbach as superintendent. Their shaft is now down 200 feet on a two-foot vein, with a drift 425 feet long on the ore chute. The ore is free sulphuret, going from $5 to $60 a ton. Their 10-stamp mill has just been completed. The Gates rock-breaker is in use at this mill.

At the Hyde mines the Victor concentrators are condemned by the old amalgamator because "the concentrates have to work through a pinhole, which is all the time clogging, and the thing wants some one pottering at it all the time." Some of the concentrates were very clean, others are half sand. I am informed that the Victor is now free from these objections by reason of recent improvements.

Black Oak.

W. P. Scott is manager of the St. Louis Co. Their ore is of the same character as all of the mines of Soulsbyville, and carries about six per cent of sulphurets, which, when concentrated, give $150 to the ton, the mine yielding 20 tons of concentrates a month. The mine is opened by two shafts of 250 feet each on the three-foot vein of quartz running from $10 to $60 to the ton. The mill and mine are equipped with both steam and water power in every department, so that in the failure of one the other can be brought into use. The mill has ten stamps, six Frues and four Morris canvas tables. W. T. Coleman has purchased the extension of the Black Oak and is having it opened by shaft.

Cherokee.

The Lotta is opened by an 80-foot shaft and a 6 to 18 inch vein of rich rock, and is the property of Mr. N. Symons, whose modesty forbid us giving any further details. The ten-stamp mill of the North Star is way up.

East of Soulsbyville is the Independent, opened by 300-foot shaft on an 18-inch vein of $17 to $25 rock. The Draper has a 200-foot shaft on 15-inch vein of $30 rock. This is the property of Mr. John Leechman, who is also the owner of the Grizzly, 11 miles northeast of Sonora. This ledge is opened by a 40-foot shaft with levels 300 to 400 feet run on the four-foot ledge of $13 rock. The 20 stamp mill of this property was burned down last season.

The Buchanan mine is 28 miles northeast of Sonora. The vein is opened to 700-foot level by two shafts and tunnels, showing a vein of an average width of five feet. The mine is equipped with a 20-stamp mill and eight Frues. The sulphurets, which go from $100 to $250 a ton, are treated by the company's chlorination works.

Summerville.

The Con. Eureka—better known as the Dead Horse—is now the property of Messrs. Hayward & Hobart. The shaft is now down 700 feet on a 4-foot ledge of $6 rock. The 20-stamp mill and Frues are run by water-power of 600-foot pressure. The New Albany, the property of Dr. Jno. Walker of Sonora, is opened by shaft and tunnel to a depth of 800 feet on a 10-foot ledge of $8 25 rock, and has a 10-stamp mill. A recent crosscut on this vein shows up remarkably rich rock, and the doctor in consequence is open for congratulations, but declares "not for sale."

Quartz Mountain

Is one and a half miles south of Jimtown. The Heslep has been worked for 30 years. Ore is now coming from the 450-foot level, where the ledge is 12 feet in width of ore at this time, running $3 to the ton. The mine is equipped with hoist and 25-stamp mill run by water-power. The vein matter is mineralized slate, being parallel with and but a few feet from the "mother lode."

Whisky Hill

Is near Jimtown. The mines on this hill are upon the mother lode, but are all working on parallel strata of mineralized slate within 50 to 150 feet of the main vein.

The Gem mine, a six-foot ledge of $6 rock, is opened 150 feet by tunnel. It is equipped with 10-stamp mill run by water-power. The rock is mined and milled for $2 a ton. W. N. Harris is owner.

The Alabama is owned by Harris & Bell, and is in litigation. There is a 40-stamp mill now idle. There is a 7-foot vein of $4 rock.

Crystalline is opened by tunnel and crosscut 70 feet long, showing a 40-foot vein of $2 rock. The mine is equipped with 15-stamp mill run by water-power. The ore is mined and milled for $1 a ton, and they crush three to four tons to stamp in 24 hours.

Jimtown.

The Bonanza mine of J. Pereria has yielded $20,000 in pockets and is doing well now. The mother lode crosses Mr. Pereria's ranch and has been prospected across its width, showing 11 veins 3 to 40 feet in width, going from $3.50 to $5.50 a ton. This property is about sold to an English company, as are his Peoria gravel mines on Table Mountain, the latter being a tract of 528 acres of gravel deposit averaging 36½ cents to the cubic foot, where prospected. Its bottom has never been even reached.

Tuttletown.

The Patterson mill is running its 20 stamps on custom rock, the mine being shut down.

Chinese Camp.

Mr. Moffitt is waiting for the Stanislaus river to lower, when he will renew his river mining.

Tioga district, near the Mono county line, has recently interested Mr. Geo. Hearst in the mines of that section and the future is reported as promising.

The Tuolumne Water Co. and Woods creek ditch supply the mines with water at prices ranging from 5 to 15 cents an inch for 24 hours. Miners' wages in the county are $3 a day. Sonora is distant from Milton 35 miles and Oakdale 38 miles. Freight comes via Oakdale and passengers by way of Milton; the headquarters for all mining and smelting men being at that excellent hotel "The City," in Sonora.

The reader who has followed me through this article must see that Tuolumne is rich in mineral. Of her agricultural resources I have not space here to write; suffice it that no mountain county can excel it.

In Sonora

The county has a town affording every requisite to make life pleasant. There are fine residences, large stores, hotels, schools and churches, with a population ever ready to wel-

come the visitor and afford him every opportunity to gain all the knowledge desired of the county's resources. The photograph sent herewith gives a good general view of the town. (See page 353 for photo facsimile.) The county is fortunate in her newspapers, the *Independent Democrat* and *Banner*. Taking the county as a whole, she may boast of being the equal of any of the mountain counties. A visit to "old Tuolumne" will be both pleasant and profitable to miner or investing capitalist in search of mines. E. H SCHAEFFLE.

The Divol Bonanza.

Pocket Mining in Tuolumne County.

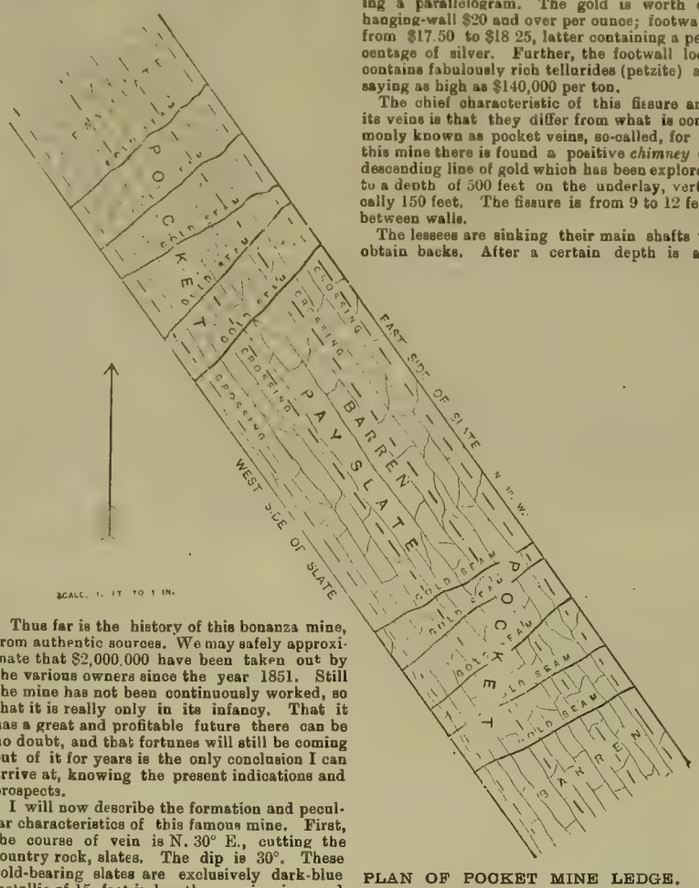
[Written for the PRESS by Abouta.]

A brief and correct description of this wonderfully rich mine at Sonora, Tuolumne county, will doubtless be read with interest by many of your subscribers, for it has, of late, become quite a topic of conversation, and the wonderment by mining men and others, for its apparently inexhaustible richness in the great productiveness of its golden resources. It may be best to first give its early history, from its inception, dating back to 1851, the date of the first discovery by Chilians. They mined the gulch, now the main street of Sonora, following up the denuded quartz and detritus, being in alluvium form, which by time and erosion of the quartz veins above had then filled up the gulch. Working upward to the hillside, they discovered the croppings of the vein, which was found immensely rich. They coyoted and gouged around and took out all that was in sight. Naturally the find created great excitement among the eager miners, who rushed there and would have dispossessed them of their claim had not they (the Chilians) taken in as partners two Americans. In short, the whole party was made rich, and thinking they had worked out the claim, sold out to an English company, who in their turn unearthed considerably more gold; they sold it or left it. Then a party of Mexicans became the owners. We have data that they took out $50,000 and left, or sold to Messrs. Edwards and Sexton. The latter were not very successful, and gladly disposed of the claim to Messrs. Clarke and Joe Bray, who worked it for nearly two years without getting very much pay, but being most indefatigable miners stayed with it; having good prospects of free gold to the pan, they made a strike in sinking and drifting of a few thousand dollars. By this time they began to determine the course of the chute or chimney, and kept following down on the crossings by sinking. Eventually they struck a bonanza. About this time James Divol became directly interested, he being at the time a partner of Joe Bray in other undertakings and now joined forces.

The three up to 1882 took out over a million dollars, and all extracted from the hanging-wall of the vein. After this date Clarke and Bray sold out to Divol; hence his name to the mine became as familiar as household words in the county. Divol now worked it alone, under the superintendency of Bray, taking out over $100,000 in a very short time. The mine became wet and somewhat expensive to work, which necessitated a steam hoist and pump. The machinery not being efficient, but only a makeshift, did not accomplish much. Divol sublet to Colby, another old pocket miner, who had been very successful on the same vein north of the Bonanza. In this case, however, his lease was not a success pecuniarily, although he was so near to a rich deposit that he actually set the foot of one of the timbers on a slab of gold of great value without discovering its proximity, and it was found lately by the present lessees, with the identical timber in question resting on its golden base. Divol again retook possession, and became associated with two gentlemen from San Francisco as partners, for certain stipulations, one of which was to put in a crosscut to drain the mine from the Creek level; that is, the adit tunnel, through which the mine is worked to-day. This tunnel was in a sense a failure, as it did not drain the mine by nearly 200 feet of bottom of incline shaft, where Colby left it full of water. This discouraged the owners and the mine was shut down till reopened by the present lessees.

But I must not forget to mention that before this a most expensive lawsuit occurred on some technical point in reference to boundaries. The case was ably defended on both sides by the best lawyers, Divol gaining the suit. Foremost among his attorneys was Judge E. A. Rodgers of Sonora, who not only won the case for his friend and client, but obtained subsequently a share for himself in this valuable mine. Rodgers proudly owns in the mine today, a testifying monument of his legal acumen and forethought.

We now have to speak of the mine under the tenure of Messrs. Dart, Oliver & Johnson, who went vigorously to work above water level and opened up the footwall vein, then unexplored ground. They reasoned that, as the gold had been so rich on the hanging-wall, the same line should be found in the lower vein. Facts proved the correctness of their theories, as they very soon took out $60,000 to $70,000. Their lease expired, but was renewed, with Messrs. Kiel and Harriman joining the party, and up to date these five gentlemen have actually extracted $250,000 so far from the two leases. Twenty per cent of this amount goes to the owners of the mine, Messrs. Divol, Rodgers & Bacon.



PLAN OF POCKET MINE LEDGE.

Thus far is the history of this bonanza mine, from authentic sources. We may safely approximate that $2,000,000 have been taken out by the various owners since the year 1851. Still the mine has not been continuously worked, so that it is really only in its infancy. That it has a great and profitable future there can be no doubt, and that fortunes will still be coming out of it for years is the only conclusion I can arrive at, knowing the present indications and prospects.

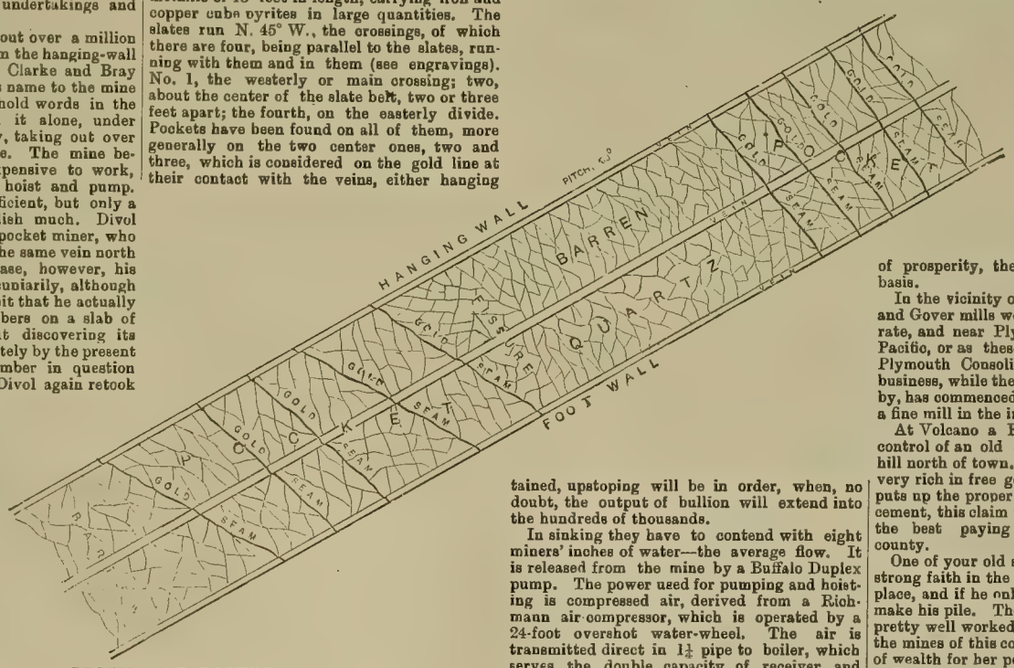
I will now describe the formation and peculiar characteristics of this famous mine. First, the course of vein is N. 30° E., cutting the country rock, slates. The dip is 30°. These gold-bearing slates are exclusively dark-blue metallic of 15 feet in length, carrying iron and copper cube pyrites in large quantities. The slates run N. 45° W., the crossings, of which there are four, being parallel to the slates, running with them and in them (see engravings). No. 1, the westerly or main crossing; two, about the center of the slate belt, two or three feet apart; the fourth, on the easterly divide. Pockets have been found on all of them, more generally on the two center ones, two and three, which is considered on the gold line at their contact with the veins, either hanging or footwall lodes. But there is another indispensable factor that produces these rich deposits called "gold seams." They are somewhat erratic in their distribution, often occurring in series of bunches when least expected There is no law governing them. They run at right angles to the crossings, and cutting into the veins vertically and in direct contact, and passing through the dyke in their course to the veins. Wherever they strike them, gold occurs, although all gold seams are not prolific. They must be free, not froze up, so to speak. If good, they always prospect in free gold, and sometimes show gold in the quartz. They are small leaders or feeders and will throw the gold generally in both main veins, but the center vein is barren; the hanging and footwall veins, bonanzas. The crossings show themselves by a small fine line or forming a cleavage through the dyke and filling matter of the fissures, which is diorite.

The gold deposit appears to be formed on the hanging-wall vein in concentric rings—richest in the center—which is almost pure bullion, and gradually weaker, till exhausted to the outer circle, which is then rich milling rock.

The footwall pockets are somewhat different in form, adapting themselves to a plane, forming a parallelogram. The gold is worth on hanging-wall $20 and over per ounce; footwall, from $17.50 to $18 25, latter containing a percentage of silver. Further, the footwall lode contains fabulously rich tellurides (petzite) assaying as high as $140,000 per ton.

The chief characteristic of this fissure and its veins is that they differ from what is commonly known as pocket veins, so-called, for in this mine there is found a positive *chimney* or descending line of gold which has been explored to a depth of 500 feet on the underlay, vertically 150 feet. The fissure is from 9 to 12 feet between walls.

The lessees are sinking their main shafts to obtain backs. After a certain depth is attained, upstoping will be in order, when, no doubt, the output of bullion will extend into the hundreds of thousands.



SECTION OF POCKET MINE LEDGE.

In sinking they have to contend with eight miners' inches of water—the average flow. It is released from the mine by a Buffalo Duplex pump. The power used for pumping and hoisting is compressed air, derived from a Richmann air-compressor, which is operated by a 24-foot overshot water-wheel. The air is transmitted direct in 1¼ pipe to boiler, which serves the double capacity of receiver and steam boiler, should there be any lack of water to run compressor. The receiver, etc., is stationed outside of adit or crosscut level 557 feet long, leading to the works within. Through the kindness of S. P. Dart, mining and civil engineer, I was furnished with two diagrams showing the veins, slate crossings, gold seams, etc., which explain my report.

The south extension of the Bonanza is 7⅓ acres, leased from I. S. Cady and worked by Drake and party. This mine has been well developed and steadily mined for the past four years, so far without any result, but at the present the outlook is very flattering, the shoot having been found. The surface was exceedingly rich; pieces of gold $2300, $500 and $400 were found in the early days, when the gold was worked by sluicing, which paid handsomely. This party is cutting out a station at the junction of adit level with incline shaft. The mine in general appearance is a photo-facsimile (minus the gold) to the Divol bonanza, so far as the same class of metallic cube slate, dyke, crossings, etc., are concerned; but the explorations so far have disclosed a disrupted condition of the slates, now becoming more regular, with good walls and veins which prospect. They expect in the next 100 feet of sinking to be in bonanza, when it is to be hoped that their long patience and perseverance will be rewarded with success.

Mining at Plymouth, Amador County.

EDITORS PRESS:—The principal mining operations of Amador county at this time seem to be almost entirely confined to the great quartz ledge, which stretches across the county in a diagonal course from the Mokelumne to the Cosumnes river.

On this ledge are located some dozen or fifteen mills, varying in capacity from 5 to 80 stamps each. Only about one-half of these are in operation at this date, but several of the old mills, besides a number of new ones, will start up very soon.

Most of the ore in this district is of rather low grade and is somewhat difficult to work. Free gold is in very limited quantities, and most of the mines are provided with chlorination works for the final reduction of their ores.

Among the most noted of the mines in this county are the Kennedy, Zeile and Amador, near Jackson, the latter company having just completed a 60-stamp mill with all the latest improved machinery, and as they have already a large lot of ore ready for milling, this mine will soon be in running order.

Just above Big Bar bridge on the Mokelumne there is a 10-stamp mill finely located for economical working. It stands directly on the river-bank, with no expense for water, and the ore is run from a tunnel direct to the mill without any expense for hoisting. I did not learn the owner's name, but judging from appearances he has a "sure thing."

The Reed mine, a few miles east of Jackson, is also running right along. They have cheap power also, as their mill is on the main Amador canal, and has a large wheel in the flume, so as to use the whole force of the big ditch without wasting any of the water.

At Sutter Creek several mines and mills are running, but only working a small force at present. The one formerly known as the Wildman mine has a very complete outfit, and, as far as I could learn, is doing a fair amount of business with satisfactory results to the company.

The sulphuret or chlorination works here, under the management of E. Voorhees, is doing custom work for the surrounding mines that have no furnaces of their own, and as the sulphurets yield from $100 to $200 per ton, it will be seen that this part of the mining business is of considerable importance. Before the discovery or application of this chlorination process all the fine gold contained in these sulphurets was washed down the creeks and was a total loss.

The Keystone mine, in Amador City, is in full blast, and, judging from the amount of material on hand and other indications of prosperity, the mine is on a solid paying basis.

In the vicinity of Drytown the Bunker Hill and Gover mills were pounding away at a lively rate, and near Plymouth the old Empire and Pacific, or as these mines are now called, the Plymouth Consolidated, are doing a rushing business, while the New London Company, near by, has commenced making preparations to erect a fine mill in the immediate future.

At Volcano a French company has secured control of an old cement gravel claim on the hill north of town. This mine is reputed to be very rich in free gold, and when the company puts up the proper machinery for grinding this cement, this claim will, no doubt, turn out to be the best paying mining property in the county.

One of your old subscribers, N. W. Peck, has strong faith in the richness of his claim at this place, and if he only had water he would soon make his pile. The placer mines of Amador are pretty well worked out, but, taken as a whole, the mines of this county are still a great source of wealth for her people. W. W

Plymouth, Amador Co.

THE general business outlook on the Puget Sound, from a commercial standpoint, is improving, in the local, coastwise, and foreign lumber trade, and is fast assuming the larger proportions that were generally anticipated at the commencement of the year. The large list of tonnage under engagement to load on the Sound is an excellent indication that the lumber-mills will be more active than usual this summer and autumn. Capitalists are eagerly purchasing all the available timber lands in Washington Territory, and the near approach of Statehood has brought an influx of immigration from the Eastern States, which is making investments in all available enterprises. A Wisconsin syndicate has purchased a mill-site near Seattle with a large acreage of timber, and within 12 months will have in operation one of the largest lumber-mills on the Sound.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

STRIKE IN THE MORLEY.—*Ledger*, May 11: At the Morley or Wetzlar mine, in Hunt's gulch, some exceedingly rich ore was struck Thursday of last week. It is of the same character of gold-bearing black metal met with in the Mammoth and Valparaiso claims. It was met with in the winze, and also in the two drifts. A number of sacks were taken out and stored in the office. The strike has considerably raised the spirits of those interested.

MISCELLANEOUS.—The Rudd pulverizer, which promised great things in the way of reviving gravel and cement mining in Amador and other counties, has not met expectations. It was tried in Volcano some two weeks ago, with the intention, should the trial prove satisfactory, of adopting it in the reduction of the hard, auriferous cement met with in the French company's claim. The company, however, have decided to have a cannon-ball quartz-mill instead. Some big prospecting is being done at the old Keystone mine, at Amador City. It is said the force employed by the company at present is about as large as before the shutting down of half the milling capacity. At the Plymouth Con. they are still running 40 stamps. Some work is being done on the Empire shaft, which conveys the idea that this mine is not to be permanently abandoned, as was generally supposed. John Tregloan was in San Francisco recently purchasing cable for the Wildman, also arranging for the introduction of an air-compressor in this prosperous mine.

PLYMOUTH.—Cor. Amador *Ledger*, May 11: The mines are all running as usual, with an abundance of water for power to run with. Work will commence right off on the New London mill foundation. Duff Reeves has got his mill all ready to run, and will start it up about the first of the week. H. P. Gordon and George Lamb have got their Huntington mill running, and as their rock is reported to be very rich, we expect to hear of a rich cleanup before long. The Leventon gravel claim is yielding some very rich pay dirt, going as high as $50 to the pan.

DRYTOWN.—Work on the Drytown Con. mine started in earnest yesterday morning. There are three shafts with several drifts and stopes to drain, but they expect to reach the bottom inside of five weeks, if the main shaft is in good condition. During the first 24 hours the water lowered 18 feet. Donnelly & Howard's contract has been finished and accepted by the directors as a first-class job in every respect. The machinery and framework is substantial, and capable of running to a depth of 1000 feet. The entire length of pipe, about 3000 feet, was laid under the direction of Mr. Moyle, and the leakage will not exceed one inch of water. All the stockholders who have visited the mine are well satisfied with their property. The owners of the Minnie Moore mine are making preparations to sink their shaft about 100 feet deeper.

SUTTER CREEK.—Cor. Amador *Ledger*, May 11: The miners are jubilant, and are all taking advantage of the abundance of water. The rainfall here now foots up for the season 20.10 inches. Sinking at the North Star is proceeding favorably. The contractors find that they can make about two feet per day, which at the contract price, $10.50 per foot, enables them to earn good wages. It is calculated that it will take four months to complete the job.

Butte.

FROM INSKIP.—Cor. Chico *Enterprise*, May 11: A storm of this duration and at this time of the year has rarely been known by the residents of this ridge, and especially 20 inches of snow. It is unprecedented. No doubt much damage has been done in the valley, by so much rain falling at this season of the year. We are, however, above high-water mark, not inclosed by a levee, but unfortunately not above the snow belt. Mining and milling are the principal interests in our section. Although the early part of the winter was not favorable for the miners, owing to the dryness and light fall of snow, only 2½ feet in December being the deepest. However, welcome March came in with a very heavy 15-day rain, in fact the heaviest rain that was ever known here that supplied their wants, and the frequent showers in April kept it replenished, and now the snow will make a very good run for them. According to reports some have done remarkably well, namely, W. Rooker and W. Boyer, taking out eight ounces in about three weeks run in Little Secret. W. J. Gordilla occasionally picks up half-ounce pieces. Messrs. Morgan & Henderson of the famous Golden Bnzzard mine are engaged in driving a new tunnel to tap the vein deeper, and expect to reap a golden harvest.

Calaveras.

UNION COPPER.—Cor. Angels *Record*, May 14: The Union copper mine at Copperopolis has been at work actively since June, 1887, and has up to this time taken out and shipped to New York about 5000 tons of 16 per cent ore. Have on an average worked about 50 men. Are now prepared with new machinery, and will from this time increase the force of men in all the departments, and will also, as a matter of course, increase the output of ore. Heretofore the ores have been shipped East for reduction, but considerable copper will hereafter be produced or extracted by a process known as lixiviation or leaching. This process, though in use by others, and recommended by Mr. J. A. Ferson, the superintendent, has only recently been adopted at this mine, and is now becoming a decided success. They have recently put in a new six-inch Cornish plunger pump, which is now in successful operation, raising water 500 feet at one lift; also have recently put up a new engine-house and introduced a link machine, 12 inches, V. Goering latest patent, but use the old 16-inch engine for the pump. Thus after many delays with the old machinery the company have made ready to do a successful business.

Colusa.

AROUND SULPHUR CREEK.—Cor. Willows *Farmer*, May 8: Our first visit was to the Manzanita mine and mill, where we found everything working up to about a full capacity. The 10 stamps are kept regularly running night and day, mostly upon the ore from what was the Cherry mine, but were unable to learn the result of its milling. The two Victor concentrators at the mill are working quite satisfactorily, and Supt. Northey seems pleased with them. For simplicity and perfect work we have yet to find anything superior to them of the kind. Leaving the Manzanita, we proceed in the direction of the Clyde and Keeley mines. But before reaching the steep ascent of the hills we called at Alex. Hunger's, where we saw some fine specimens of bituminous coal he has been prospecting for a short distance below his house. At present he has not found it in any large quantity. After a tedious pull up the hill, we arrived at the Clyde and Keeley mines and found that H. M. Cooper had discontinued work upon the tunnel, but were informed that he expected to resume at an early day. At the Keeley mine, J. W. Brim informed us that he had completed placing his machinery in position and that after starting up found all to work to a nicety. In connection with his Huntington mill he has also a Victor concentrator, with which he seems to be quite satisfied, being able to save about all the gold he can work through the mill. He informed us he was about fairly started, and thought his reservoir at the confluence of the two branches of the gulf would afford water sufficient to run one shift all summer, and perhaps two. He seems to be quite satisfied with his claim and hopeful of future results. At the quicksilver mine of J. P. Rathbun we found considerable work had been done, but nothing doing at present.

El Dorado.

LEASED.—Georgetown *Gazette*, May 10: Armstrong and Christy have leased from Sam Forni a quartz mine on his land some two miles below town. It is a new prospect, having been little worked by some prospectors about two years since, with encouraging results, but abandoned because of Forni's ownership to the land. They have started to run about 200 feet of tunnel to cut the ledge at some 80 feet in depth. It is about a foot wide and is said to be well worth mining and milling.

Napa.

MINING IN CALISTOGA DISTRICT.—*Calistogian*, May 11: Interest in prospecting has revived somewhat here lately, mainly on account of a number of locations made well up on the side of Mount St. Helena, where rich croppings have been found at a point which attracted attention when the excitement about the old Calistoga gold and silver mine prevailed. Ten or twelve locations have been made, and a portion of the ground is to be prospected as soon as the weather will permit. Preparations for doing work are being made. Not a great way from this point locations were made a few weeks ago by probably a dozen persons from Napa and vicinity, and they have been doing considerable work. Prospects on the mountain are pretty bright, judging from the croppings we have seen and the reports bronght to us. The assays from claims located by Calistogians are surely very encouraging. In the King canyon group of locations, work is being continued in the long tunnel of the Calistoga Con. Co. Though still 35 feet from the ledge, there are indications which strongly incline interested parties to believe that the much-wished-for ore is ahead of them. The prospects are surely encouraging. The finding of good ore and the opening of another mine there would create increased interest in mining business here. In the matter of prospecting in the Calistoga mining district, we feel greatly encouraged at present, as the work is being done in a more thorough manner than common, this being true from the fact that more money than usual is being used. The day for digging gopher-holes seems to have almost passed, and in our opinion the good results will soon be made apparent. In the Palisade mine, work continues as usual, and the reduction works are kept running the same as during several months past. Stoping ore in the Easly vein from the first level toward the surface has occupied time there many weeks past, but, as is usual in such cases, the value of the ore grew less as they ascended on the vein toward the top. Preparations are being made to take ore from points lower down, and also from the Palisade vein. There is a great deal of water on the lower, or third level, and this is to be removed. An engine and boiler to be used for this purpose was purchased in San Francisco last week, and will be located at the shaft in King canyon. The boiler will be received first and taken to the canyon as soon as the ground is hard enough to move it. The mining prospects in the district we believe are better now than at any time in a number of years, and we see no good reason why they will not continue to improve. One more mine and mill in full operation is needed to help place the district in a more favorable light before the public, or, more particularly, mining men; and we believe the second mine is going to be opened soon.

Nevada.

ACTIVE OPERATIONS.—*Tidings*, May 10: The Crown Point shows a three-foot ledge of ore that should yield well, if appearances are an indication. The ledge improves in appearance as it is uncovered. Active operations are soon to be undertaken at the Peek-a-Boo (Downing) mine. This property is advantageously situated between the Old Eureka and Coe. It is understood that a hoisting and pumping plant to be operated by water-power will be put up. At the Evening Star two stations have been cut out and some timbering done. A six-inch pump is to be put in. The water in the Coe is now lowering rapidly. And this reminds us that yesterday a man employed in the shaft found some pieces of quartz in one of the levels, and the quartz is as "pretty-looking milling ore as a man would want to see."

TO BE PROSPECTED.—Nevada *Transcript*, May 10: W. H. Veale is to take charge of the work of prospecting Myron Foote's quartz claim which adjoins the famous Banner situated a short distance east of this city. Mr. Foote owns 3000 feet on the ledge, and his property is generally believed to be a valuable one. Some very rich quartz has been found there heretofore, and Mr. Veale will proceed to more thoroughly explore the ground with a view to definitely determining the extent and character of the deposit.

ANOTHER MINE STARTED.—*Transcript*, May 15: The Muller & Walling mine, on Woods ravine, just north of the Nevada City, is to be developed this summer. The water has been pumped out of the 65-foot incline shaft and sinking will be commenced Wednesday. When the shaft is down the required depth, drifts will be run. Two shifts of three men each are to be employed for the present, and the force will be increased as soon as room is made.

Placer.

IOWA HILL.—Placer *Herald*, May 11: The Horhman mine road is, I hear, completed, with the exception of planking two short bridges. The mill pit is also completed, and the grading for a boarding-house and sleeping-house is under way. The sleeping-house will be some little distance from the boarding-house, to avoid the noise, which is a good idea for those who work nights, and the mill is situated quite a distance down the canyon, so that the chances for a good sleep in the daytime will be number one. I hear that there will be two large boilers to furnish motive-power, and a possibility of water being used next winter to run the machinery. It is now understood that the crushing will be done with a large Bryan roller-mill, although it is reported that the firm has been considering whether stamps would not be preferable. The cement is quite hard and will require to be crushed rather finely in a rock-breaker, for quite a large amount of gold seems to be fastened on the rocks, which will necessitate their crushing also. The Morning Star still continues to show a fine appearance. I hear the average per load for the past nine months is over $7.50 per carload. Reports from Red Point are very satisfactory.

CONCENTRATOR TEST.—Placer *Republican*, May 10: The owners of the Hathaway mine are making some severe comparative tests of three concentrators, the Frue, the Woodbury, and the Victor. The competition has been conducted at the mill below Ophir by experts, each interested in the success of his own machine.

TO BE STARTED UP.—The old Bellevue mine above Ophir is to be started up again after being idle for several years. A gentleman named Curtis from Boston has charge, and is occupying the house built by A. Shurtleff. Water with 75 or 80 feet head will be brought from the ditch for power.

POCKET.—A. Shurtleff struck a small pocket in St. Patrick the other day, which produced about $100, and he thinks he is on the eve of something good.

Shasta.

SQUAW CREEK MINES.—Redding *Free Press*, May 11: The various mines on and adjacent to Squaw creek were never in a more promising condition, respecting both development and prospects. We gathered a few items of interest from Ben Conroy. Ben had several specimens from the Balaklala in his pocket, one of which would mill 3000 ounces silver to the ton and another 8000 ounces. The 3000-ounce specimen had been heated and the silver stuck out all over it like great beads of sweat. The other specimen was in its native state, resembling somewhat in color a dirty, gray-streaked indigo, and was almost as heavy as lead. The Balaklala, from which these specimens were taken, is owned by a company of about 18 people. Over 2000 feet of tunnels have been driven in this mine, and the work still goes on. It is possible that the company may soon commence shipping ore below. A rich strike was made in the Black Bear mine last week. A contract for a new tunnel was let some time ago by Edward Reilly, the owner, and this rich strike is the result. The face of the tunnel is figuratively bespangled with gold-bearing quartz. The Sierra Buttes Co. is working 50 men. The company is getting out timber for the mine, and lumber with which to erect dwellings for occupation by miners with families. The construction of dwellings by the various mining companies for the use of employes will soon enable Squaw creek to put on village airs. The construction of the wagon-road from Kennet to the mines is progressing slowly.

NO PATENT.—Shasta *Courier*, May 1: A sale of another mine was prevented this week for the simple reason that no Government patent had been obtained. Men like Wm. T. Coleman and others who control capital want to know just what they are buying when offers for investment are made. A Government patent shows what is secure. Men purchasing mines all over the coast don't want to buy into a lawsuit, or bring their blankets up in the mountains of Shasta and sleep on claims in order to hold them, and they will not do so. Wm. T. Coleman, who has spent a couple of weeks inspecting his mining and milling properties in Trinity and Shasta counties, was in town Tuesday, en route for home, and accompanied by Supt. Jas. Sutherland of the Niagara, French Gulch. Mr. Coleman was in good spirits and feeling well over the result of his investigations.

LAID OFF.—A number of men were laid off at the Lost Confidence mine Monday, the rainstorms having interfered with the mill works.

Sierra.

THE KENTUCK MINE.—*Mountain Messenger*, May 11: The Kentuck is a quartz mine, and is situated about half a mile below Pearson's Ranch, at St. Charles Hill. The property is bonded to Mr. Belshaw, who is putting up a quartz crusher there, to be run by a steam engine. The boiler is on the ground, and the engine and all the other machinery has got as far as Goodyear Bar. Work was suspended a few days this week on account of the storm. Mr. Belshaw has been up from below for the past ten days. Mr. Rouse is in charge of the work.

Siskiyou.

SALMON RIVER GOLD.—Yreka *Journal*, May 15: It is reported that at least $200,000 will reach Etna within the next two months from the various mines on Salmon river, and the Know Nothing creek, Methodist creek and Quartz Valley mines. A very large quantity will also be received at Fort Jones from McAdams creek, Scott river, Oro Fino and other sections. In Yreka the income from the various quartz mines of Humbug, Greenhorn, Hawkinsville, Klamath river, Shasta river, Little Humbug, and other places, is also large, but when the Klamath river miners reach bedrock, the amount will be immense.

San Bernardino.

THE BAGDAD MINES.—*Times-Index*, May 11: Each report that comes to this city from the Bagdad mining camp is an improvement on the preceding report. The Craig boys have just shipped to this city 1000 pounds rich silver ore which have been re-shipped to the Selby Smelting Works in San Francisco, and in a few days the report from this shipment will be made public. Mr. Craig, Sr., the veteran assayer, says it is very rich but does not give the figures. A large number of claims are being opened up and all look well. In the vicinity of these mines is to be found large quantities of smooth boulder stones which upon examination prove to be almost pure lead, carrying silver to the extent of about $20 to the ton. One of these rocks was brought in to Mr. Craig and he sawed it in two. These specimens vary in size from that of a bullet to rocks larger than a man can lift, but the ledge from which they came has not as yet been found. They are all round and smooth as though they had been washed in a stream for ages or cut by the drifting sands of the desert.

San Luis Obispo.

A PROMISING LOCATION.—*Tribune*, May 11: A fine discovery has been reported to us which has been made within 10 miles of this city. A ledge crops out about four feet in width showing about 30 inches of ore carrying lead, silver and copper. The ledge is in a canyon with plenty of wood and water, and can readily be made accessible. The ledge can be easily developed; a tunnel run in 150 feet would tap the ledge at a depth of about 300 feet. Five locations have been made and samples of ore have been sent to San Francisco for analysis. If the reports of the test are satisfactory, work will be commenced at once.

Trinity.

QUARTZ.—Trinity *Journal*, May 11: We understand that the quartz interests on Eastman gulch are looking well. The prospects of the Venetia mine are more favorable than for some time past. Jack Chichobie, on the Deer Horn, near the Venetia, is doing good work, taking out ore and developing his mine. He has a very good looking ledge.

Tuolumne.

GRIZZLY.—*Union-Democrat*, May 11: This mine, located near the Consuelo on the Tuolumne river, is now being inspected by a mining expert, with a view to purchase. It is the property of Mr. Leechman.

KELTZ.—There is now being developed by a tunnel a fine body of ore of good grade in this mine. The chute of ore is over 150 feet in length. The tunnel originally driven had a wrong course to reach this chute. This has been remedied under charge of Mr. Sharwood, and the tunnel has now struck and proved the existence and good character of the body of ore. The mill of 10 stamps will start into operation at an early day.

MARY ELLEN.—This mine, also situated on the Tuolumne river, is showing exceedingly well in free gold, and the sulphurets go unusually high, a late assay giving $19.25 per ton. A 10-stamp steam mill is now being erected on the mine, and Blanding concentrators will be used to save the sulphurets. In time, water will be substituted for steam.

CONSUELO.—Situated on the Tuolumne river, has been sold to McCann and others, and work is now being done on it. This mine was operated extensively in early days and had a large mill upon it.

NEVADA.

Washoe District.

ALTA.—Virginia *Enterprise*, May 11: The ore extracted from the winze being sunk from the 825 level to connect with the ore stopes above the 925 level is more than sufficient to keep the mill running in connection with the ore extracted in raising. The connection is now nearing completion.

BELCHER.—No. 2 east crosscut and No. 2 west crosscut on the 200 level are out 95 and 65 feet respectively. The 1100 west crosscut is out 186 feet, and has reached what is believed to be the footwall. Twenty-five feet back from the face a streak of ore about one foot in width was encountered, assaying from $80 to $160 per ton, and from that point to the face the ground is composed of porphyry and quartz, showing bunches of ore. Have started a west crosscut on the 1300 level, 70 feet north of the 1100 crosscut, and are preparing to start a south drift from the 1000 incline station to ascertain the value of the ledge at these points.

SAVAGE.—On the 400 level the joint west crosscut has been advanced 24 feet. The face is still in vein porphyry. The winze from the north drift is now down 27 feet and continues in ore of good quality. From No. 1 and No. 2 west crosscuts are stoping ore of fair grade, and are also extracting ore from the old stopes in the north and south drifts. During the week hoisted 508 tons of ore and shipped to the Rock Point mill 489½ tons and have milled 490 tons. Average battery assays $20.83 per ton. Total bullion shipments for last month, $24,426 58.

HALE & NORCROSS.—On the 400 level the stopes in the north drift from No. 1 crosscut continue in good ore. On the 600 level are extracting the usual quantity and quality of ore from the several stopes. On the 700 level the grade of the ore is improving in the stope from the west drift above the eleventh floor. During the week hoisted 1178 tons of ore, shipped to the Nevada mill 1072½ tons and milled 1149 tons. Milled last month 4579 tons of ore, which produced $90,525 in bullion.

CONFIDENCE.—The joint Challenge-Confidence north drift on the 300 level is out 135 feet, having been advanced 23 feet during the week. The joint Challenge-Confidence raise from the 300 level is up 50 feet, 10 feet having been added during the week. The face shows low-grade quartz. The joint Challenge-Confidence east drift on the 1250 level is in 4 feet, having been commenced during the week.

CHOLLAR.—The north lateral drift on the 750 level is out 160 feet; face in clay and quartz. North lateral drift, 850 level, is out 230 feet; face in hard porphyry. The east crosscut in north lateral drift, 50 feet south of north line, is out 35 feet; face in quartz giving assays of from $15 to $25 a ton.

EXCHEQUER.—On the 382 level, the east crosscut on the north line is out 125 feet; face in soft porphyry. The west crosscut on the north line is out 130 feet; face in hard porphyry. The north lateral drift on the 500 level is out 475 feet north of the Alpha shaft; face in clay and quartz.

CROWN POINT.—Have opened the seventh floor in the 400 south stopes, and find the ledge narrowed to 4½ feet. The quality of the ore is good. Have

shipped to the Mexican mill during the week 810 tons of ore, the average battery sample of which is $18.52 per ton.

POTOSI.—South lateral drift, 750 level, is out 345 feet; face in quartz and porphyry. South lateral drift, 850 level, is out 260 feet, face in hard porphyry. South lateral drift, 930 level, is repaired 350 feet south of the Chollar shaft.

OVERMAN.—Extracted 280 tons of ore and shipped 320 tons to the Vivian mill. On the fifth floor of the stopes have extended the upraise from the northeast drift 13 feet, total 25 feet, through quartz giving low assay.

SEG. BELCHER.—The west crosscut, 1100 level, is out 304 feet, having advanced 37 feet during the week. The ground is composed of soft porphyry with no indications, so far, of approaching the footwall.

ALPHA.—On the 500 level, the east crosscut on the north line is cut 70 feet, and the face is in clay and quartz. The east crosscut, 50 feet south of the shaft, is out 50 feet; face in clay and quartz.

CHALLENGE CON.—The work continues, to be jointly with Confidence, and is described in the letter from the latter mine. Ore extraction has been indefinitely suspended.

JUSTICE.—Resumed sinking. The new double-hoist engine works smoothly. The mill is running steadily and regular shipments of ore are made.

BALTIMORE.—Are crosscutting on the 225 and raising from the 338 level, in both of which places ore is extracted and saved for milling.

THE OTHER MINES.—The work reported from the Scorpion, New York and Silver Hill is merely with reference to progress.

BULLION.—Are running a north lateral drift in the ledge on the 750 level.

Pahranagat Lake District.

PROSPECTING.—Pioche *Record*, May 8. Messrs. McDonald and Christian, who, for a year past, have been prospecting in Pahranagat lake district, came in Wednesday bringing a small quantity of high-grade ore. They have done the work necessary to hold their several locations and will strike out now for a new grub stake.

Pioche District.

REDUCTION WORKS. — Pioche *Record*, May 8: The greater part of the material comprising the two Bruckner roasters to be placed in the new reduction works has arrived; 84,000 pounds arrived during the week. About 36,000 pounds more are now on the road. The roasters were taken down at Secret canyon, eight miles from Eureka, under the supervision of Billy Culverwell, and shipped on by Mormon teams at two cents a pound. Eureka teamsters wanted none of it at three cents. Seventy-four horses and 32 wagons were employed in transporting the material. When in operation the two roasters can handle 42 tons of ore in 24 hours. At the Geddes & Bertrand mine, from which these roasters have been removed, a third roaster is in operation. The ore, which is of a rebellious character, is chloridized and then leached to 85 per cent of its value, the bullion being 995 fine.

Tuscarora District.

BELLE ISLE.—*Times-Review*, May 10: Have resumed work on the west lateral, 150-foot level. South drift from west crosscut, 250-foot level, extended 14 feet.

COMMONWEALTH.—The stopes are all looking well. Hoisted and sent to the mill 250 tons; average assay $130 per ton. Mill has been shut down to change the draft of the furnaces; it carried too much pulp back into the dust chambers. One furnace and 10 stamps now running; doing good work. The other will be running by Monday.

NEVADA QUEEN.—Crosscut, 350-foot level, has been advanced nine feet, showing low-grade ore; assays return $15.08 per ton. The concentrator running well and doing good work; 280 tons of concentrating ore hauled during the week; assay $21 per ton. Have $15,000 in crude bullion on hand.

NORTH COMMONWEALTH.—Joint east crosscut, 225-foot level, extended 14 feet; entering favorable formation. West crosscut from the end of the south drift, 100-foot level, is in 20 feet and is still in vein matter showing some rich ore.

NAVAJO.—South drift, 250-foot level, extended 15 feet, showing low-grade ore. Work has been discontinued in No. 7 upraise, 350-foot level. The usual quantity of ore has been sent to the mill.

NORTH BELLE ISLE.—North drift, 500-foot level, has been extended six feet. Rock continues very hard. Good progress has been made with the work at all other points.

DEL MONTE. — East crosscut from the end of north drift, 100-foot level, is in 22 feet, and is still in vein showing some high-grade ore.

Wild Rose District.

PARADISE NO. 3.—*Silver State*, May 14: It is reported that Martin McCurdy struck a very rich and big ledge of ore in the Paradise mine No. 3, Sunday afternoon. The mine is located in Spring City and it is to be hoped that it is a big bonanza.

ARIZONA.

NOTES.—Prescott *Journal-Miner*, May 8: The quartz-mill in Big Bug district was destroyed by fire last Sunday night. C. W. Culver's big teams arrived yesterday from the Congress mine with a cargo of ore for shipment to Denver. John Whitman has conveyed for $500 to the W. G. W. R. Co. the Smuggler and Swindler mines and mill-site. J. S. Chambers brought in a five-ton lot of ore yesterday from the Black Canyon country, to the sampling works. Four carloads of Congress ore have been shipped within the past four days. The Howard mine continues to look well, and still holds its own as development progresses. The two-stamp mill is kept busy crushing ore. A lot of machinery, consisting of a Cornish roller, crusher, and concentrator, arrived from Denver, for the Dixie mine. A number of teams were engaged in loading them. F. E. Murray continues to make regular shipments of ore from his Copper Wonder mine at Yucca to the Copper Basin smelter. From two to four carloads arrive each week. A report prevailed this morning that the Senator had suspended operations permanently; but the fact that men have been engaged to work for it during the last two days contradicts the rumor. They will commence to ship ore soon from this mine. The United Verde Copper mines are not being run to their full capacity, only one smelter being in operation. The price of copper is at this time so reduced that it has become necessary to limit the production of bullion. Mr. Isaac L. Stoddard, president and general manager of the Oro Bella Mining Co., is in the city purchasing supplies for his mines and camp at Bayard. He reports that the company's mill will be completed and start up about the 15th inst. Regular shipments of concentrates are expected to be made, via Prescott, after that date.

MAMMOTH. — Tombstone *Epitaph*, May 10: From Mayor Thomas, who has been down to the Mammoth mine, in Pinal county, we learn that the mine has not been sold and that negotiations are at a standstill. The company has an immense ledge of gold-bearing rock and ample machinery of the latest and most improved kind. There have been several attempted sales of this property, but some unforeseen difficulty has always arisen and interfered. Mr. Thomas brought back with him some very fine specimens from some mines owned by him and others in that district.

COLORADO.

LEADVILLE'S APRIL OUTPUT.—Denver *Republican*, May 11: Approximately the output of Lake county mines for the month of April was about 30,000 tons. This shows a decrease of over 7000 tons less than the product of March. To the persistent low price of lead, together with a loss of faith in the prospect of Mexican lead ores being soon practically prohibited from entering our markets, may be mainly attributed the material decrease in the production of Lake county mines last month. The only mines which have noticeably reduced production through necessity in the month of April are the Matchless and Silver Cord. They have fallen off respectively from 80 to 35 tons, and from 100 to 50 tons a day. It is held, however, that this marked decrease in both mines is temporary. The outlook for a largely increased production of Lake county mines this month is prominently apparent. The Agassiz mine and new mill will be running in full blast in a few days; the President mine and new mill will soon renew operations; the Continental Chief, in Iowa gulch, and the Bartlett, on Sugar Loaf, will each double their usual daily output in a short time; the Helena, in Iowa gulch, and the Harvard, on Fryer hill, will add more generously than ever to the production of the district; while the La Plata and other properties of lesser note will also fall into line and help swell the output of Lake county during the month of May.

DAKOTA.

GOLD EXCITEMENT.—An Associated Press dispatch from Deadwood, dated May 11, says great excitement prevails, it being caused by the discovery of a new and rich placer diggings about 40 miles from here. Prospecting these diggings last year on a small scale showed gold in quantities, which was kept quiet; but on renewing the work this spring the secret got out, and now the men are rushing to the new gold-fields from all directions on foot, horseback and with teams, taking tents, provisions and complete mining outfits. All are on the rush. Parties from the diggings returning for provisions and supplies show plenty of gold dust, and they state the diggings are extensive and worth 60 and 70 cents to the pan.

IDAHO.

CŒUR D'ALENE. — Wardner *News*, May 4: The suspension of operations in the Bunker Hill & Sullivan mines has been a general topic during the week and drawn much comment from all interested in the welfare of Cœur d'Alene. The closing has not been brought about by hasty conclusion, but from mature deliberation on the part of the company, who considered it the most advisable course to be pursued at present. The freight rates demanded by the Northern Pacific railroad company were greatly in excess of what the owners of the mines could afford to pay. Had the market price of lead kept up to a moderate figure, work would undoubtedly have been continued, but no concession being made by the railroad company in view of the falling off in the value of lead, the B. H. & S. company were forced to the course they have adopted. As matters now stand with these two great ore-producers, the public while reflecting on the past can look hopefully toward the future. A force of men is still retained on the main development work of the mines and will continue operations uninterruptedly. The *News* is informed by Superintendent Clement that no more work will be done in the present concentrator, but the erection of a mammoth mill will be commenced as soon as desirable rates can be obtained from the railroad companies. The Bunker Hill & Sullivan company have two plans in view for connecting the mines with the mill-site on which the new concentrator will be erected. One is the erection of a Bleichert wire tramway which would be two miles long with a fall of 910 feet. The other proposition is the building of a railroad with a track of four miles, a survey of which has been already made.

ROCKY BAR CONCENTRATES. — Wood River *Times*, May 8: About three tons of concentrates belonging to the Bear Creek Gold Mining Co. are on the way to Hailey from Rocky Bar. This is the first lot of concentrates that has been shipped this way from Rocky Bar, and it is probably only the forerunner of many more that will come regularly from this time on. This result is undoubtedly due to E. C. Coffin, manager of the Alturas Fast Freight line, as the advantage of having freight both in and out is apparent. This will, in time, prove no inconsiderable source of revenue to Hailey.

LOWER CALIFORNIA.

MINING PURCHASE.—Cor. San Diego *Union*, May 11: I arrived at Ensenada from El Alamo today. The most important matter that has occurred during the past week was the sale of the Lopez mines to the International Company, the consideration being $30,000. The purchase includes the Princess, Ulysses, Telemaco, Grandata and Cocinero. General Manager Scott, accompanied by engineer Sutherland, visited the camp last Saturday, and after a thorough and satisfactory investigation of the different ledges by Mr. Sutherland, the sale was consummated. This group of mines had previously been bonded by Wm. Denton for $60,000, but he failed to produce the amount within the stipulated time. It is the intention of the International Co. to proceed immediately with the development of the claims, the work to be in charge of Mr. Sutherland, and several stamp-mills will be erected for the reduction of the ores. The people at El Alamo are jubilant over the sale and it has already awakened a new impetus to mining developments. The second sale of importance was the Keynota ledge, owned by the Messrs. Castillo, to Mr. Hice of San Bernardino, the consideration being $15,000. The discovery and announcement of new finds occur daily, no fewer than 12 having been made during the past week. A. H. Butler is entitled to the credit of having nerve enough to introduce the first quartz mill. It is now on the ground and he is busily at work with a corps of assistants putting it in working trim. Every kind of business at the mines is booming.

MONTANA.

THE ORO FINO DISTRICT. — *Inter-Mountain*, May 8: Mr. C. E. Gable, superintendent of the Mountain Lion mine, came in to the city to-day. He reports sinking in that property to have progressed to a depth of 175 feet. It will continue to the 200, when a crosscut will be made to the south for a distance of about 50 feet. At that point it is expected that a lead, parallel to the one on which sinking has progressed, will be found. The shaft has already run through about 15 feet of quartz in one of the leads, and it is thought at the 200 station the shaft will be about in the footwall of this lead. Mr. Gable is confident that the Mountain Lion will prove a great mining property. Work progresses on the Franklin, adjoining the Mountain Lion. A tunnel has been driven 700 feet to the west on this property, and work is still progressing.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, May 9: The output for the week ending May 9th was 59 bars of bullion containing 88,905.52 ounces silver and 120.55 ounces gold.

THE HOPE. — The report that spread rapidly throughout the district Monday morning to the effect that the Hope mill had shut down and suspended operations indefinitely was received among the people of this camp with much regret. The Hope, it is well known, has been the life of this camp, and kept the place in existence when it had no other resources. On investigating the facts regarding the report, we find that a liberal amount of exaggeration and imagination had been added to the truth. The mill, however, has been shut down for an indefinite length of time, the ore reserves being insufficient to keep the mill running on a paying basis. Also a general cleaning up and the making of repairs that have long been needed will be attended to, and when done the mill will be in better shape to continue operations. The force at the mine has consequently been reduced from 40 to 20 men. It is known to the older residents that it is no unusual occurrence for the Hope to shut down temporarily, as several times in its history operations have been suspended, owing to an insufficient output from the mine to pay working expenses; and this is the principal reason for the discontinuance at the present time. Owing to the peculiarity of the pay ore in this mine laying in pockets, it is only reasonable to suppose that there are many yet to be encountered equally as rich as those that have kept the company in existence for the past quarter of a century.

BIMETALLIC.—At the Bimetallic tramway they will start buckets running, conveying the ores of the mine to the mill, to-day, and it is thought there will be no difficulty whatever to contend with. The cable has been running since Tuesday and works with entire satisfaction. The distance from the mine to the mill is about two miles, via the tramway.

TWO PER CENT.—The Two Per Cent property, or better known as the Poormau, is to be operated again, and a shift of men will be put to work on it the first of next week. This property is among the oldest prospects in the camp and was the first to make a shipment of ore from this county.

NEW MEXICO.

CARLISLE.—Silver City *Enterprise*, May 10: H. J. Longmaid has been made general manager of the Carlisle works. A change all round has been made in the officers and directors of the company. H. J. Walton from Telegraph reports the Gila still booming. A good pay streak of $60 ore has been encountered in the 600-foot level of the Tecumseh. John Bragaw, who has a lease on the McNulty at Georgetown, is cleaning out the old workings and putting the mine in good shape. He is opening out some new ground and is taking out ore. The bullion shipments since the 1st, through Wells, Fargo & Co., are as follows: Mogollon Mining Co., two bars weighing 73½ and 77 pounds, valued at $1250 each; Silver City National Bank, $2400; Thos. B. Pheby, seven bars, $10,972.80; First National Bank, $700, gold; Key Co., $2500, gold; Aztec Co., $1500, gold. A mining deal is on the tapis for a group of mines near Cook's peak in the Granville district near Clifton, consisting of the Lucky Jim, Belle Isle and Rainstorm, in which Capt. Cooney, James McCarthy, J. H. Hovey, Geo. Mowland, Dan Wadhams and others are interested. The prominent deal of the week was the transfer of the Night Bird mine at Pinos Altos, to Albert Freudenthal of New York City. Harry Fowler recently shipped four cars of zinc ores from Hanover. One car went to James S. Matthews & Co., Denver; one to Joplin, Mo.; and the others to the St. Louis sampling and testing works. These shipments have been made merely as samples and to ascertain where the best results can be had. This ore will average from $12 to $16 in silver. The St. Louis people promise to give returns for all there is in the ore. Two carloads of zinc ore will be shipped from the Thunderbolt, of Hanover, this week. The ore goes to Joplin, Mo., one of the best zinc markets in the country. H. N. Castle, who has been in charge of the lixiviating process at Chloride, in the Black Range, claims that the lixiviating process has been a complete success on ores of that section, but states that it requires some experience with ore to know how to handle it. When the plant was started up only 57 per cent of the metal was saved, but now the average is 90 per cent, and has been run up as high as 97. Mr. Castle thinks that the metal in the ores of the Black Range can be saved to a much higher per cent through the lixiviating process than any other method of treatment.

PINOS ALTOS.—A new discovery is reported by Messrs. Lee, Spaulding and Walker, near the head of Rich gulch, in close proximity to the Mountain Key location. The vein carries 10 inches of pay material, which, it is thought, will mill at the rate of $40 per ton. In addition to this find, another of importance has been disclosed in the nature of a fairly rich placer within the boundaries of the claim. As predicted in the last issue of the *Enterprise*, the new shaft on the Mountain View mine, recently purchased by New Orleans capitalists, is opening out in a good vein of pay ore in about the same ratio as the work of development is progressing under the energetic management of D. J. Lewis, superintendent. The Gold and Silver Ribbon south drift is in a fine grade of ore, and this exploration clearly proves the theory that to the southward of the discovery shaft there is an ore chute equal in extent and value with those which have produced so handsomely on the northern side.

UTAH.

MARYSVALE CAMP.—Cor. Salt Lake *Tribune*, May 3: We thought that the quiet little mining camp of Marysvale had sunk into oblivion until we had occasion to visit it a few days ago, and witnessed a thrift that convinced us to the contrary. Marysvale is destined to have a boom in the near future, and the boys even fancy that they can hear it now rumbling in the distance. In the Last Resort mine, formerly known as the Antelope, they have struck it rich. The mine was leased and bonded last October by Johnny Flynn, Jack Jacobs and Doc. Bailey, who have been prospecting it ever since with a view to finding the vein that had been lost by the old company. These gentlemen commenced sinking a shaft about 75 feet west of the old workings, and struck the vein at a depth of about 70 feet. The vein at this point is about five feet wide, containing three feet of free milling ore that averages $50 a ton, of which character of ore they have about 150 tons on the dump. In prospecting along the course of the vein about 200 feet west of this shaft the vein was struck again within a few inches from the surface. The vein at this place and the character of the ore is very much the same as that in the shaft, with the exception that here the ore averages about $90 in silver and $10 in gold. The Bully Boy and Webster mines, owned by R. C. Chambers, are leased and bonded to Secretary Hall and others, who have been working the mines for the past three months. They have a vein containing from one to three feet of high-grade ore, and have a force of men working on the mine taking out 10 tons daily, most of which is worked at the Bullion mill and averages $73 per ton—the higher grade ore being shipped to Sandy for reduction. The Glen Erie mine, owned by H. D. Lisbonee, is situated about 600 feet west of the Bully Boy and Webster, and supposed by some to be on the same vein as those mines. There has recently been shipped from this mine some very high-grade ore—assaying as high as $1700 per ton. This character of ore is found in pockets along the vein. The Deer Trail, with its mountain of ore assaying from 20 to 40 ounces silver, is now lying idle waiting for cheap transportation, or a reduction works near by. The Alma, joining the Deer Trail on the south, is under the control and management of Mr. David Giles, an experienced miner. He has sunk a 40-foot shaft on the vein, which exposed ore all the way down assaying from $10 to $80 per ton. He is now actively at work with a force of men pushing a tunnel in to tap the vein 500 feet from the surface. Besides these mines there are many good prospects being worked around and in the vicinity of the camp. There was, perhaps, never a time in the history of Marysvale when the mines looked so well as at the present time.

APEX OPERATIONS.—Park *Record*, May 11: Operations for the present in the Apex workings consist chiefly in drifting on the big rich vein, and as soon as the roads are in condition for shipping ore a large amount of stoping ground will be opened up.

CAMP CROSSCUTS.—The Ontario tunnel is in about 1200 feet and the progress through the running ground is necessarily slow. No ore was brought down over the Crescent tramway the fore part of the week owing to the bad weather and also to the fact of repairs being made to the engine. There are now several parties in camp looking for profitable investments in mine leasing. Many more such men may be expected here in the near future, and mine-owners who have not the means or inclination to develop their properties themselves should advertise the fact and thereby bring their properties well under the observation of mining men.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 230,400 pounds of concentrates. The Ontario bullion for the week was 30 bars, containing 16,167.91 fine ounces of silver. For the week just ended the Mackintosh sampler received 423,500 pounds of Woodside leasers' ore; 342,800 of Ontario, and 175,620 of Daly; total, 950,920 pounds.

GREEN RIVER GOLD-FIELDS.—Salt Lake *Tribune*, May 14: Judge Powers returned on Sunday from a trip to Green river, and while there he learned some interesting particulars concerning the discovery of new gold-fields in Southern Utah. The fields are located below Dandy Crossing, 120 miles south of Green river, and are close to the Arizona line. To a *Tribune* reporter, who asked him what he thought the discoveries amounted to, Judge Powers replied: If the reports which are coming in from them are true, the fields are very rich, running from 25 cents to $3 per yard. While the gold is fine, it is not "flour dust," and is easily separated. Three camps have already been established there and about 50 men and 2 women are on the ground. The climate is very mild, and the past winter has been like spring, so that the miners have been able to work all winter. Mr. Beardsley of the Green River house has gone down to the fields to look the ground over, and on the day I left Green River five boats and a complete mining outfit arrived by train, and I believe this party proposes to make the trip down through those canyons, which Lieut. Powell says are almost impassable. As to the gold-fields, without expressing any opinions as to whether all that has been said is true, those who have visited the place say the diggings are the richest discovered since the flush times of California.

MECHANICAL PROGRESS.

Do We Need a New Motor?

The announcement that a new motor has been discovered will attract the attention of the average business man or mechanic more quickly than almost any other announcement. Now I do not wish nor expect to enroll my name high on the temple of fame by the side of Keely and others, but I wish to open up a discussion on a much-needed subject: Do we need any new motors in addition to what we now have?

I take the ground that we do not, provided we can accomplish two other things which are more likely to be accomplished; the first is a cheap, convenient and effective way of storing up power; second, a cheap and effective method of transmitting it. The latter seems to be practically accomplished in the electric motor and wire. Now, if electricity will accomplish the first, then a new motor will have but a small demand. To illustrate, I run a factory where I need 25-horse power for 10 hours a day for three or four days every week. Now I can, by a wind-wheel running when the wind blows night and day, secure that much power every week at a small part of the expense necessary to run a steam engine. If I could store about two days' power ahead to use at pleasure, without too great expense for storage plant, the question of a cheap motor would be solved. Over our western prairies there is a great surplus of power, which can be cheaply used by the common windmill, and it is very doubtful if they are near perfection yet.

Then, again, see the great power going to waste in our waterfalls and flow of tide, which could be utilized if a cheap and effective storage system could be devised. The irregular power of the tides, the fitful power of the wind and the small but steady power of small streams and springs, could thus be used in any quantity and at any time desired.

The method of storing by pumping water into reservoirs is too expensive, as we can get but little, if any, over one-half of the power used for effective purposes; besides, the expense of the plant is too great.

Let Edison and the "Inventive Yankee" set their wits to work to give us a good system of storing power, and "future generations will arise and call them blessed."—*Practical Mechanic.*

HOW TIN FOIL IS MADE.—It is melted and run into blocks weighing from 200 to 400 pounds each, and in this form the metal is kept for ordinary use. The old method for reducing it to the necessary thinness for foil was by hammering it by hand as the gold-beaters do gold leaf, and this process is still in vogue to limited extent. This, however, is a very laborious process, as the sheet must be constantly beaten without intermission, to keep up the heat generated by the continuous strokes of the hammer, and the great drawback to it was that only one surface or face could be produced. This brought about the invention in this country of rolling-mills for this kind of work, and it is notable that prior to their invention nearly all the foil used in this country was imported, and that the introduction of the rolling machines has completely revolutionized the trade, so that in place of importing we now export. In these mills the metal is run between two heavy rollers, which give it a beautiful polish on both sides; it is then cut into widths of from 12 to 15 inches, rolled on reels, and cut to order by cutting machines. The great advantage of the machine-rolled foil over the hand-beaten foil is that while the latter is full of minute holes, so small as not to be visible to the naked eye, the former is, as a rule, perfectly intact, and thus being air-tight, forms a wrapper for tobacco that cannot be equaled by any other substance.

A NEW IDEA.—The Cumberland Valley Railroad Company has just completed at its shops at Chambersburg, Pa., a movable electric light station of wonderful illuminating power and a novelty in railroading. It is intended to furnish light for wrecking purposes. The main car is 33 feet long by 9 feet wide, and 13½ feet high. The floor is of iron. In one end is a 40-horse power vertical boiler and a 35-horse power vertical automatic engine. The engine and boiler rest upon a cast-iron floor plate 9x11 feet. In the other end of the car are two dynamos, one of 25 lights, the other of 15 lights, both of 2000 candle power. The dynamos are connected by belting with the engine. In the car are also folding-beds, closets and all the conveniences for operating the plant. Under the car the lamps are carried, and also the tools for erecting the line. Attached to the car is a tender to supply water and coal for the engine. Upon the tender are racks for carrying the poles, hoods for lamps, and a reel for holding the wire. The poles are made of hollow iron piping of a handy and convenient pattern. The car will form a novel auxiliary to the equipment of the road, and it has attracted much attention from railroad men.

HOW TO TURN A BRASS BALL TRUE is answered in the query column of the *American Machinist* as follows: For turning a complete sphere you would need, in addition to a tubular hand tool, a cupped chuck on the live spindle. This may be simply a piece of cast iron 1½ or 2 inches in diameter, held in an ordinary jaw chuck, and the outer end bored out to a depth of about an inch, leaving a thickness of metal around the hole of about one-fourth inch. The inside corner being rounded a little and made true, it will act as a driver for the ball previously made as true as possible upon centers. A piece of iron or brass about half an inch thick and one inch diameter, having a center in one side of it to run on the dead center of the lathe, the other side being cupped out to bear on the ball near its edge, completes the equipment. By turning the ball in all possible positions, and applying the tubular hand tool, you may secure a very accurate sphere.

THE AGE OF INVENTION.—Those of us not yet 50 years of age have probably lived in a most important and intellectually progressive period of human history. Within this half century the following inventions and discoveries have been among the number: Ocean steamships, street railways, elevated railways, telegraph lines, ocean cables, telephones, phonograph, photography, and a score of new methods of picture-making, aniline colors, kerosene oil, electric lights, steam fire-engines, chemical fire-extinguishers, anæsthetics and painless surgery; gun-cotton, nitro-glycerine, dynamite, giant powder; aluminum, magnesium, and other new metals; electro-plating, spectrum analysis and spectroscope; audiphone, pneumatic tubes, electric motor, electric railways, electric bells, typewriter, cheap postal system, steam heating, steam and hydraulic elevators, vestibule cars, cantilever bridges. These are only a part. All positive knowledge of the physical constitution of planetary and stellar worlds has been attained within this period.

WHAT KILLED THE COPPER SYNDICATE.—The error of the syndicate was in making the price of copper too high. Had the general selling price of lake copper been put at 12 cents, the syndicate basis 10 or 11 cents, and other brands in proportion, the syndicate, though in that event unnecessary, would still be in existence, and the violent and injurious fluctuations we are now having or are likely to have in the price of the metal would have been avoided. The outcome of this wild attempt at cornering the copper of the world has been the utter bankruptcy of the Societe des Metaux, the most important copper-manufacturing concern on the continent; and of the Comptoir d'Escompte, the second largest banking institution in France, and the more or less serious embarrassment of several lesser institutions and individuals.—*Engineering Journal.*

STEEL SHOES ON STEEL TIRES.—That the use of steel brake-shoes upon steel tires does not produce good results has been demonstrated by the experience of many who have given them trial. We recently saw an irregular lump of steel formed by the cuttings occasioned by the use of steel shoes. The cuttings from the tire had lodged in the recess of the shoe, which was of the Ross type, and had become a solid mass that was removed with difficulty. The other shoes upon the truck were in the same condition. An inspection of these shoes and tires might cause those who are using steel shoes upon steel tires to reflect deeply upon the wisdom of their course.—*Railway Review.*

THE PROCESS OF GALVANIZING TIN PLATES is, comparatively speaking, a simple one. All that is necessary is to use pure zinc in the galvanizing-pot and cover it with a coating of sal ammoniac, which acts as a flux, while the tin on the plate itself also serves as a partial flux. According to our information on the subject there is little difficulty in doing the work, provided care is exercised in all the steps of the progress. We would, however, state that it is not economical to run a galvanizing bath unless the work is done instantly.—*Metal Worker.*

TO MAKE SOLID PLASTER OF PARIS CASTS.—Take a sufficient quantity of water to mix into a stiff paste—this can be determined by a few trials—and pass the plaster through a sieve into the water very slowly, stirring all the time, and be very careful not to take the article used for mixing out until finished. Stir with a circular motion, and from bottom upward; of course care must be taken in pouring into mold; if possible, incline it at an angle and pour slowly.

METALLIC SURFACES.—The surface of metal is said to have a moire appearance when it bears a resemblance to watered silk. Moire metallique is tin plate acted upon by an acid, so as to display, by reflected light, the crystalline texture of the tin. A superior moire appearance is given to brass by boiling in a solution of sulphate of copper. Sometimes friction with a resinous or waxy varnish will bring out the wavy appearance characteristic of moire.

IMMENSE SHEARS.—Messrs. Bolckow, Vaughn & Co. of Eston, England, are putting down for their own use immense shears for the purpose of cutting nine-foot steel plates. The plant necessary for the shears will weigh nearly 350 tons. The demand which is growing for very large plates in the shipbuilding trade has necessitated this.

HOW THE RECORD IS KEPT.—At the intelligence bureau of the U. S. navy department a large map shows by colored tags the present location of the world's war vessels, which include about 150 belonging to Great Britain, 100 to France, 40 to Germany, and 40 to the United States.

SCIENTIFIC PROGRESS.

Earthquakes and Their Influence on Mine Gases.

Herr Falb, an Austrian scientist, has been advancing some peculiar views on the above subject. He recently spoke before a large audience, made up largely of mining engineers, at Bocham, the center of the Rhenish-Westphalian coal-mining district. A correspondent of the *Colliery Guardian* refers to this lecture as follows:

The very fact of so large a number of practical men coming together, many of them from long distances, to listen to an exposition of the grounds of his belief, shows that his doctrines are no longer regarded as the outcome of mere dreams, unworthy the attention of men engaged in the matter-of-fact business of life. Practical men are beginning to think that after all there may be something in Falb's theory. This was made evident by the earnest attention with which the lecturer's discourse was listened to. Judging from the impression which seemed to have been produced, the result of Falb's visit to the Rhenish-Westphalian coal miners has been to win over to his view a great number of disciples.

As long ago as the year 1868, Falb called attention to the possibility of the moon exerting upon the great ocean of molten matters beneath the earth's crust the same influence which at surface occasions the tide in the ocean of water; and he argued that if such is the case, as, indeed, it seems likely enough, the solid crust is at certain times severely strained, and more or less warped and broken. A few years of observation raised this possibility into a probability, and 20 years of experience has sufficed, according to the lecturer's statement, to transform the probability into a certainty. There is, perhaps, some exaggeration in this statement; but as Falb says, it is more easy to ridicule than to argue, a lighter task to reject than to disprove.

Anyhow, there is much to instruct in the lecturer's discourse, and many will read with interest and profit his remarks concerning the origin, character and results of earthquakes. These disturbances are, in a degree inappreciable by the senses, very frequent. But though unfelt, they may be sufficient to liberate gas in mines. Herr Falb assures us they do; and he brings forward an imposing array of facts in support of his assertion. These disturbances, he says, are of three kinds. There is first the vertical shock, in which the force acts from the center of disturbance to the surface; next we have what he calls the horizontal wave shock; and third, there sometimes occurs the whirl shock, a description which is self-explanatory. I will only add to what I have already written that in the course of the week following the delivery of the lecture, one of the local journals published a list of all the serious colliery explosions that had occurred in the last five years, and showed that by far the greater number happened at those periods which Falb describes as "critical."

THE PENDULUM PROVES THE EARTH'S ROTATION.—The longest pendulum on this continent, says the Philadelphia *Times*, swings in the technological school at Atlanta. It is a heavy pear-shaped piece of iron attached to a brass wire 42 feet long. The upper end of the wire is pivoted in a steel point which rests on the center of a steel plate so as to cause the least possible friction. The swinging of the pendulum gradually describes a circle on the floor in a direction following the sun, showing in this way that "the earth do move." Directly under the pendulum is a large circle divided into 24 parts, of 15 degrees each, to correspond with the hours of the day. The North Pole is placed directly under the pendulum, and the meridians of longitude meet there. The parallels of latitude make smaller circles inside the first. Dr. J. S. Hopkins, president of the school, who made and put up the pendulum, performs the experiment as follows: The iron is brought to the edge of the circle in the meridian of Atlanta and let swing across. Apparently it goes straight across, but gradually it traverses the circles in the direction taken by the sun, and opposite to the revolution of the earth. The pendulum not being directly over the axis of the earth, does not move in exactly the same time as the sun, but falls behind some hours a day. It is said that if it were at the North Pole, where it would be immediately over the axis, it would traverse the circle in exactly 24 hours, and at the equator it would not traverse it at all, for gravity would operate to prevent.

THE LAUGHING PLANT.—Palgrave, in his work on Central and Eastern Arabia, mentions a plant whose seeds produce effects analogous to those of laughing gas. The plant is a native of Arabia. A dwarf variety is found at Kasum, and another variety at Oman, which attains a hight of from three to four feet, with woody stems, wide-spreading branches and light-green foliage. The flowers are produced in clusters and are yellow in color. The seed pods contain two or three black seeds of the size and shape of a French bean. Their flavor is a little like that of opium, the taste is sweet and the odor from them produces a sickening sensation and is slightly offensive. These seeds, when pulverized and taken in small doses, operate upon a person in a very peculiar manner. He begins to laugh loudly and boisterously, and then sings, dances and cuts up all kinds of fantastic capers. The effect continues about an hour and the patient is extremely comical. When the excitement ceases the exhausted individual falls into a deep sleep, which continues for an hour or more, and when he awakens he is utterly unconscious that any such demonstrations have been made by him.

LIQUID CARBONIC ACID.—The manufacture of liquid carbonic acid has already become an industry of considerable importance in Germany, in one establishment in Berlin as much as hal a ton of this commodity being produced daily. The acid is sent out in steel bottles, each containing from 17 to 18 pounds, and the price being somewhat less than 25 cents per pound; the quantity contained in a bottle, when expanded into gas, occupies over 10,000 cubic feet, and is principally used in the manufacture of mineral waters and for beer engines. In this connection, the fact is of special interest that, a few years ago, an important use of carbonic acid was suggested by Dr. Raydt of Hanover for raising of wrecks, and who demonstrated the possibility of this application by an experiment at Kiel. The apparatus consisted of a steel bottle containing the liquid acid, and collapsed canvas bag placed over the neck of the bottle; on the whole being submerged and attached to the object to be raised, a cock was opened and the liquid in the bottle allowed to expand in the bag, inflating the latter and thus causing it to rise.

INTERESTING EXPERIMENT.—Herr J. Puling of Vienna has devised an ingenious method of rendering visible the form of a stretched string set in vibration, by having one of its extremities attached to one prong of a tuning-fork, which was kept in motion electrically, and gave a definite note, the pitch of which was carefully determined. The vibrating string was lighted up by a vacuum tube connected with a Rumkorff coil, the rate of discharge through the tube being alterable at will, and when this is made equal to or some aliquot multiple of the number of vibrations made by the string, the latter was only illumined when occupying some one definite position, and, owing to the persistence of its image on the retina, appeared as if at rest. In this way the shape of the string, and the positions of the modes and vertical segments, were rendered clearly visible.

SUDDEN FORCE OF DYNAMITE.—Dynamite is so instantaneous in its action that a green leaf can be compressed into the hardest steel before it has time to flatten. One of the experiments at the United States torpedo works was to place some leaves between two heavy flat pieces of iron, set them on a firm foundation and see what gun-cotton would do in forcing the iron pieces together. A charge was placed upon them by compressing the gun-cotton into a cylindrical form about one inch thick and three or four inches in diameter, through the center of which a hole was made for a cap of fulminate of mercury, by which the gun-cotton is exploded. The reaction was so great, from merely being exploded in open air, that one of the iron pieces was driven down upon the other quick enough to catch an impression of the leaves before they could escape.

A NEW METHOD OF PREPARING SILICON.—H. W. Warren suspends small bars of ferro-silicon immersed in dilute sulphuric acid from the positive pole of a battery, and resting upon a platinum plate that forms the negative pole. After solution of the iron, the residue consists of graphite, silica and amorphous silicon; this residue is heated to redness in carbon dioxide, and then to bright redness in a closed iron tube with zinc. The silicon is dissolved by the zinc, and is obtained in crystals when the zinc is treated with hydrochloride acid. If aluminum be used instead of zinc, and the temperature raised to whiteness, graphitoidal silicon is obtained.

SCIENCE AND CREATION.—"The researches of science," says Dr. W. H. Dallinger, F. R. S., "are physical. The observable finite contents of space and time are the subjects of its analysis. Existence, not the cause of existence; succession, not the reason of succession; method, not the origin of method, are the subjects of physical research. A primordial cause cannot be the subject of experiment nor the object of demonstration. It must forever transcend the most delicate physical reaction, the profoundest analysis, and the last link in the keenest logic. Absolute knowledge concerning it can only be the prerogative of itself."

A DISTANT POSSIBILITY.—A curious speculation has been made concerning what would happen were the earth's rotation to cease. The equatorial diameter being 26 miles more than the polar diameter, the earth would present an equatorial zone of solid ground miles high above sea level, the water all being drawn to the poles. This land zone would then be like our Arctic regions, and would be banded by a ring of permanent ice and snow.

HOW THE EARTH MIGHT BE SUBMERGED.—The mean hight of the land above sea level, according to John Murray, is 2250 feet, and the mean depth of the ocean is 12,480 feet. Only two per cent of the sea is included inside a depth of 500 fathoms, while 77 per cent lies between 500 and 3000 fathoms. If the land were filled into the hollows, the sea would roll over the earth's crust to a uniform depth of two miles.

Plans of the California River Commission.

William Hammond Hall, State Engineer and one of the examining commissioners of rivers and harbors in California, was appointed a committee at a recent meeting of the board to draft a memorandum for the general guidance of the board in its consideration of the subject of its labors. In his report, which is quite long, he reviews the obligations of the Government of the United States to its citizens, and its jurisdiction over the navigable rivers of the country. But the policy of the Government in ordinary improvement matters being based solely on the idea of promoting the interests of commerce, only holds in view the betterment of navigation facilities and gives no attention to the great arterial drainage problems which confront our people. The Government has never done anything toward the betterment or preservation of the flood-carrying channels in this State, but on the contrary, it has encouraged practices which have damaged its rivers in this respect.

The report, after showing the duty of the Government in the premises, says:

It is absolutely impossible to compass the control of floods in the great central valley of California except through the agency of works and regulations carried out and administered by some general power having authority over the whole. The State may co-operate and property-owners may contribute and assist, but it would seem that the National Government alone has the scope of power sufficiently great to take the initiative and maintain the requisite general authority.

The report then shows that the general laws of the United States are inadequate to give California the relief she needs, cites the course of Arkansas, Mississippi and Louisiana in procuring the creation of "The Mississippi Commission" and the inauguration of a new national river policy, which has wrought wonders in the Mississippi river, and proceeds to show that there is a necessity for such national action for California. But this matter is not understood at Washington, and it is the object of this commission to make it understood. Mr. Hall says:

The merits of causes such as that which California has to urge respecting her main rivers are not adequately presented at Washington. Our Congressmen are at as much disadvantage in this special cause as are the military engineers in the cause of river improvement generally.

There is wanted in Washington an authoritative professional representation of the technical and equitable phases of our local river problems and State claims to National action in solving them. Such work need in no way conflict with the work or reports of the Government engineers, nor with the efforts of the State's representatives, but should supplement each. This commission should attempt such representation, and for this purpose it should prepare itself:

First—To forcibly present and make clearly apparent the equitable claims which California has to special consideration at the hands of the National Congress in this regard.

Second—To show the extent and nature of the land, municipal and commercial interests involved and the probable extent of benefits derivable from a successful treatment of our rivers.

Third—It should outline in general terms the engineering possibilities of the several river navigation and arterial drainage problems, and present general estimates of cost of the greater works and of each improvement as a whole.

Fourth—It should illustrate the entire subject with maps designed and drawn especially for exhibition and as the basis of argument at Washington.

Fifth—It should prepare synopses of existing data and arguments, and generally brief the cases for the use of our representatives at Washington.

Sixth—And finally, its members should serve as professional advocates in explaining and presenting the cases to our members and Senators and others.

The report sets forth that no extended and expensive surveys and field examinations are necessary, the past work of the State Engineering Department being directly applicable to the uses of the commission. Mr. Hall says that the points to be made by the commission are:

First—That the rivers shall be taken in hand rationally for their betterment in each drainage basin to perform every legitimate function required of a river.

Second—That a special exception in national legislation be made in their favor in matters of administration and treatment, because of the peculiar circumstances recited.

Third—And that enough money be appropriated annually by Congress to keep the work going at a due and proper rate.

The report then shows that the Board of United States Army Engineers working under the "Biggs debris" law can accomplish only temporary good, and declares that what is wanted is a permanent Federal commission of engineers to manage and improve the California rivers.

As to the immediate work of the State Commission, Mr. Hall says:

Our consideration of plans should be for the presentation of engineering possibilities only and the formation of general estimates of probable cost, which can be readily done without going into details of methods or espousing and advocating special lines of river or arterial drainage treatment. With this idea, in my judgment, it will be well to confine our surveys for the most part to local re-examination of the main rivers to see what changes have taken place since the State surveys of them were made eight or ten years ago. * * * We shall be compelled to consider the extent of damage to the main rivers already affected, however, to illustrate the necessity for actively dealing with the river conditions as they now exist. As to other rivers than the Sacramento and San Joaquin and their tributaries, and as to the harbors, the law makes it obligatory upon us to examine them if called upon so to do by the Governor, but not otherwise.—*Chronicle.*

USEFUL INFORMATION.

Facts About Feet.

The ideal foot of modern ladies is about a No. 3.

The common unit of lineal measure, a foot, was derived from the length of the human foot.

In a man 5 feet 11 inches tall, the foot measured 10½ inches, and the middle toe 2½ inches.

In Chinese subjects, the ordinary hight being five feet, the length of the foot was nine inches and five lines.

The longest foot of measure is that of old Turin, which is equal to 20 inches of English measure.

There was a time when not only each country but each town had a foot-measure of its own, indicating different averages of the different feet in various localities.

Among a tribe of low-stature Indians whose hight varied from 5 feet 1 inch to 5 feet 3 inches, the length of the feet was found to be from 9 inches 4 lines to 9 inches 6 lines.

In order to get an idea of the length of shoe sizes in inches, it may be stated that a foot measuring 10 inches, with the weight of the body resting upon it, may comfortably wear a 6 shoe.

A youth in the South Sea islands, 6 feet 7 inches in hight, had a foot 12½ inches long. His lower extremities measured 38 inches in length, circumference of calf of leg 17½ inches, and his ankle 10 inches.

CARE OF CARPETS.—It is quite desirable to have something with which to sweep carpets, to prevent raising a dust and to brighten the colors. Probably the safest and best way is to take half a package of soft paper and cut or tear it into bits not over an inch square. Wet it and press out the water, then scatter over the carpet. It should not fall in large lumps, but be picked apart so that it will cover almost an entire room. When the broom is used it will roll into little balls, and, as it is swept over the carpet, will take up the dust quite thoroughly. Some housekeepers go over the carpet the second time with clean paper. Very coarse salt used dry is good. If the house has damp corners it should be used sparingly, as it has a tendency to attract moisture. Wet leaves are used by some country families. One old lady has a quantity of cuttings of calico and white goods. These she moistens and throws over the carpet. When she is done, the scraps go into a tub of water, are whirled about, and then thrown upon an old wire screen, where they dry, and are clean for the next time. Brooms should always be hung up by a ring in the top of the handle. If they are set upon the floor, especially while damp, they get out of shape, and the ends of the brush are curved out, rendering them almost useless. Do not stand them up with the brush uppermost. If they are damp, the water will soak into the body of the broom, and not only rust the wire and rot the cord with which the broom is made, but will make the broom straws smell musty and disagreeable, and finally rot them altogether. Mops and window-brushes also should be hung up by the handles.

HOW TO CARE FOR A TOOTHBRUSH.—"If," said a young lady in an Albany drug store this morning, says the *Journal* of that city, "you can sell me a toothbrush the bristles of which will not come out after I have used it two or three times, I will buy one." Said the druggist as he placed before her a box of toothbrushes: "I will tell you a secret about that matter. These brushes have been in the case for a long time. Now, when you buy one, take it home and put it in water for an hour or two before you use it. The bristles are dry and are apt to come out when they are used. Always remember that when you buy a toothbrush."

SPONTANEOUS COMBUSTION.—Reports made by insurance companies on the substances especially liable to spontaneous combustion show that cotton-seed oil will take fire even when mixed with 25 per cent of petroleum oil, but 10 per cent of mineral oil mixed with animal or vegetable oil will go far to prevent combustion. Cotton cloth in rolls, which had been dyed black with logwood, potash, sulphate of copper, and sulphate of iron, and which had by oversight been dyed without washing, was destroyed by spontaneous combustion, even the wooden rollers on which the rolls were wound being heated almost to the point of ignition. Olive oil is combustible, and, mixed with rags, hay, or sawdust, will produce spontaneous combustion. Coal dust, flour dust, starch, flour, especially rye flour, are all explosive when mingled with certain portions of the air. New starch is found to be highly explosive in its comminuted state, when confined in a close chute and water directed on it. Lampblack, when slightly oily and damp, with linseed oil especially, is dangerous; so, also, commercial zinc dust or gray zinc oxide, in fact, many finely divided metals, such as lead, zinc and iron, take fire when exposed to the air. Chloride of lime and turpentine, in contact, are dangerous.

DON'T TURN KEROSENE LAMPS LOW.—For the benefit of those over-economic people who have a way of turning down low the light of the kerosene lamp when leaving a room for a little while, it may be said that experiment demonstrates that the saving in oil by this means is hardly appreciable. With the low flame a considerable quantity of the products of incomplete combustion are making their escape into the air, and these are not only offensive to the sense of smell, but are injurious to the health.

CONDENSED COFFEE.—An Iowa grocer has discovered a process of condensing Java coffee with cream, in such a manner that by moistening the product a delicious cup of coffee can be obtained in a few minutes. He discards the tannin in the coffee, but retains all the valuable properties of the bean. The preparation will be put on the market in a short time.

AMERICAN KEROSENE FOR INDIA.—The British ship Palgrave, now on the way to New York from Calcutta, will, it is reported, carry back to India 1,300,000 gallons of kerosene oil. The Palgrave is a strong iron vessel of 3078 tons, and on Nov. 6, 1886, left with the largest cargo of grain ever taken from a Pacific Coast port.

THE POSTAGE STAMP CRAZE.—The highest price on record for a postage stamp was realized recently, when an unused four-cent British Guiana stamp of 1856 was knocked down at auction to Mr. Buhl, the dealer, for $250. The same gentleman also bought a similar stamp, which had, however, been through the post, for $190.

AMERICAN MINERS IN CHINA.—A New York mining expert, says a journal of that city, took four skilled men to China and has 200 natives at work developing silver mines for the Government 300 miles northwest of Tein-Tsin. Fifty thousand dollars' worth of machinery has been brought from the United States.

GOOD HEALTH.

Poisoning the Baby Unwittingly.

It is probable that many parents kill their infant children, without meaning to do so, from ignorance of the dangerous nature of popular sedatives and soothing syrups; while many more, without knowing what they are about, form the dreadful opium habit in their babies before the latter are weaned.

In connection with this subject, Taylor's Medical Jurisprudence, 1880, says: "It is important for a medical jurist to bear in mind that infants and young persons are liable to be killed by very small doses of opium. They appear to be peculiarly susceptible to the effects of this poison. The syrup of poppies, paregoric, elixir, Godfrey's cordial, Dalby's carminative and a variety of soothing syrups owe their narcotic effects to the presence of opium. One-sixtieth part of a grain of opium has thus destroyed life in an infant. Two children, twins of six weeks, died recently from the effects of a teaspoonful of Godfrey's cordial, given to each. This dose of cordial equals three-tenths of a grain of opium. Mrs. Winslow's soothing syrup, called also 'Quietness,' a compound resembling syrup of poppies—two doses of this caused the death of a child 15 months old, with the usual symptoms of narcotic poison. An analysis of this syrup showed that an ounce of it contained one grain of morphia with other opium alkaloids. It is not surprising that it should prove fatal to infants in small doses. It has been remarked that most of the poisoning by opium proves fatal in from about 6 to 12 hours. This drug in all its forms is especially fatal to infants. They die rapidly from very small doses. I have no doubt many a parent who has noticed the prolonged stupor following a dose will realize how close to the border line he has been. Extreme caution in the use of this drug is essential, not only in the young but the aged, and with those who indulge to excess in alcoholic beverages."

H. C. Wood, in his work on materia medica, published in 1886, cites a case where a few drops of paregoric proved fatal in a child aged nine months. He particularly admonishes against the use of Dover's powder for the reason that owing to the improper admixture of the opium with other drugs entering into its composition, no reliability can be placed on a dose for uniform strength.

ELEVATED RAILROAD PARALYSIS.—Residents along the lines of the elevated railroads and persons whose business has brought them on or near these lines have developed a singular periodicity in intervals of speech as the result of enforced habit during a considerable portion of their waking existence. Involuntarily they cease speaking, even in the middle of a sentence, at the end of each measured term of four minutes. Should not their attention be called to the habit, by the remark of others, they will remain silent for a few seconds—the length of time an elevated train ordinarily takes in passing—and then go on with their speech, unaware that there has been any break in it. During those few seconds there seems to have been entire cessation of mental action. The interruption is like a wink in a steady visual contemplation, only that it is a little more protracted. The cause of the habit is the compulsory stoppage of speech, or increased effort, during the regularly recurrent deafening roar of passing trains. Only a portion of those subjected to this influence are affected by it to the extent described, but those who are have been noted in sufficient numbers to call attention to this new malady of the nerves of action. Instances of its manifestation among women are infrequent—the deduction from which fact is obvious.—*New York Metropolis.*

PHYSICAL EFFECTS OF ALCOHOL.—But if the physical results of alcohol are varied, much more diverse are its effects upon the mental and moral nature of man. Indeed, they are as multiform as man himself. One general classification only is possible. Certain individuals (fortunately the small minority) are always pleasurably affected by stimulants. Each successive dose arouses in them increased exhilaration, and when intoxication supervenes, their sensations are delightful. Their every sense is exalted; they fancy themselves endowed with every gift—with all power and possession. As is often remarked, these are generally men of the most brilliant intellect and of the most charming moral qualities. Once led captive by alcohol, these unfortunates seldom have sufficient power of will to refrain from renewed indulgence. No moral considerations avail to restrain them, and with few exceptions, they yield wholly, finally and fatally to the tempter. For such men total abstinence is the only refuge. * * * Upon the large majority of men the effects of alcohol taken to intoxication are clearly and essentially different; although at first exhilarated, repeated indulgence brings drowsiness, dullness of apprehension, anæsthesia, vertigo, nausea, and vomiting—in short, bodily and mental symptoms which are excessively disagreeable. Of this class very few become drunkards, and those are men to whom anæsthesia becomes desirable as a temporary refuge from bodily pain and mental distress. Herein lies the sole explanation of the fact that the proportion of drunkards to moderate and habitual drinkers remains so small.—*Dr. W. S. Searle in North American Review.*

CURATIVE POWER OF MAGNETIC IRON ORE.—Mr. W. H. Lake of San Bernardino recently discovered what promises to be a veritable mountain of magnetic iron ore. Soon after his discovery he, in company with two assistants, went up to the mountain to develop the ore. Mr. Lake, who is 62 years of age, was so crippled with rheumatism that his joints were distorted. After being there four days, he made a singular discovery. The iron seemed to be permeating his system and acting like a tonic of the tincture of iron. His improvement continued, and now Mr. Lake is entirely recovered and equal to any exertion. He has recently experimented with the ore and others who have rheumatic troubles, or pains in the back or head, and it seems to be a cure as well for heart disease. The miners at Daggett now use the ore for a remedy. They tie it in a cloth and bind it on the affected part. The curative powers of magnetism have long been a subject of study and practice in certain diseases—rheumatism, in particular, has been benefited by its use in one form or another. It is possible that its use, as above, direct from nature, may be more successful than its indirect use. At all events, the miners who have been at work at this particular mine are quite sanguine in regard to the curative power of this particular deposit, and it is said that the establishment of a sanitarium on this mountain is among the early probabilities.

CARBOLIC ACID IN INDIGESTION.—In a recent number of the *Practitioner and News*, a correspondent says: "I have just passed through a severe attack of indigestion accompanied by colic, pyrosis, food eructations, epigastric weight, uneasiness, etc. Alkalies, muriatic acid, pepsin and pancreatic extract failed to give relief. Seeing your note in the *American Practitioner*, on the use of carbolic acid in acid eructations, etc., I took, with almost instant relief, two or three drops of the acid as soon after food as regurgitation, distention or acidity occurred. One dose was usually sufficient. On two occasions only was a second dose required. This I took half an hour after the first. I dropped the acid on a bit of fresh bread and rolled the mass into a pill. Since my own case I have given it in a similar case, with like good result. Here I added a scruple of carbolic acid to one ounce of glycerine. Dose, a teaspoonful."

THE EYESIGHT.—It is well known that practice in looking at distant objects improves the eyesight. In the test for color blindness among the engineers of the New Jersey Central road, it was found that the oldest man in the service had the best sight for long-distance purposes and was better able to distinguish the various shades and colors.

TABLE OF CONTENTS.

EDITORIALS.—Tuolumne County, 353; Passing Events: The Lead Tariff; The Copper Situation; The Trial of the Charleston; A "Water-power" Cable Road; The MINING AND SCIENTIFIC PRESS, 360; Fracks for Inclined Planes, 361.
ILLUSTRATIONS.—Sonora, County Seat of Tuolumne County, 353; Arrangement of Tracks and Safety Devices for Incline Railways in Mines, 361.
CORRESPONDENCE.—The Mines of Tuolumne County, 354. The Divol Bonanza; Mining at Plymouth, Amador County, 355; Lower California Mines, 362; The Golden Treasure Mine, 365.
MECHANICAL PROGRESS.—Do We Need a New Motor; How Tin Foil is Made; A New Idea; How the Record is Rept; The Age of Invention; What Killed the Copper Syndicate; Steel Shoes on Steel Tires; To Make Solid Plaster of Paris Casts; Metallic Surfaces; Immense Shears, 358.
SCIENTIFIC PROGRESS.—Earthquakes and Their Influence on Mine Gases; The Pendulum Proves the Earth's Rotation; The Laughing Plant; Liquid Carbonic Acid; Interesting Experiment; Suction Force of Dynamite; A New Method of Preparing Silicon; Science and Creation; A Distant Possibility; How the Earth Might be Submerged, 358
MISCELLANEOUS.—Plans of the California River Commission, 359.
USEFUL INFORMATION.—Facts About Feet; Care of Carpets; How to Care for a Toothbrush; Spontaneous Combustion: Don't Turn Kerosene Lamps Low; Condensed Coffee; American Kerosene for India; The Postage Stamp Craze; American Miners in China, 359.
GOOD HEALTH.—Poisoning the Boby Unwittingly; Elevated Railroad Paralysis; Physical Effects of Alcohol; Curative Power of Magnetic Iron Ore; Carbolic Acid in Indigestion; The Eyesight, 359.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 356-7.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 368.

Passing Events.

The late heavy storm, accompanied by considerable snow on the high mountains, is destined to make an average season after all for the miners, especially those in the northern counties of California. Up on the Comstock in Nevada the storm is as much good as the discovery of a rich strike. The *Enterprise* says that "it will insure employment to 1000 men at least two months longer than if the dry weather had continued, and enable the Hale and Norcross and Con. Cal. and Va. to pay dividends."

The result of the conference in Paris on the subject of the copper syndicate shows pretty clearly that the American mine-owners have the whip hand, and will bring the Bank of France, the Rothschilds, and others to their terms. Mr. Haggin's speech at the conference is printed in this number of the PRESS and states the situation very tersely.

The Anaconda Co. is to rebuild the big smelter at Carroll. The new one will be larger than that recently burned. The immense building is to be of iron throughout.

The latest gold excitement is near Deadwood, Dakota. Good prospects are reported, though little is yet known of the diggings.

The building of stamp-mills at El Alamo, the new Lower California quartz-field, will very soon prove the value of the ledges.

The Assistant Secretary of the Interior is this week listening to mine-owners on the question of how much the present tariff law really applies to the admission of foreign smelting ores that carry more or less silver. The result of the hearing is of great importance to lead miners.

The Lead Tariff.

Delegations of lead miners and smelters appeared before Assistant Secretary Tichenor in Washington on Wednesday for a hearing on the subject of the importation of foreign lead ores. Under a ruling of the Treasury, all ores in which the value of precious metals exceeds the value of base metal are allowed free of entry as precious ores. Lead and lead dross are dutiable at 1½ cents per pound, but by this ruling lead ores are practically duty free. It is also claimed that great frauds are committed by bringing in trainloads of lead ore with high-grade silver on top of the carloads and dutiable lead ore beneath in great quantities. It is contended that the ruling of the department is erroneous, and that it was the intention of Congress to make lead ores dutiable where there was a greater quantity of lead than of silver in the importation, notwithstanding that the value of silver might be greater than that of lead. The importation of silver with lead is made in many cases for no other purpose than to evade the payment of duty on lead.

Imports of lead ores at El Paso, Texas, during the year 1888, were 68,212 tons, on which $30 a ton is the duty, but not a cent was paid by the smelters. They imported these Mexican lead ores, under guise of silver ores, free of duty, and defrauded the Government of a revenue of $2,046,360. Besides, they extracted from these ores in 1888 41,647,290 pounds of lead, which, in place of paying two cents per pound duty, undersold the miners of this country and almost ruined an industry in which millions of dollars are invested.

By way of Eagle Pass, Texas, 12,125 tons of lead ores were admitted free of duty, being invoiced as silver ores, and the 10,000,300 pounds of lead extracted therefrom were sold all over much below the cost of production in this country.

By way of Laredo, Texas, 8432 tons of lead ores were smuggled from Mexico, and 5,629,789 pounds of lead thrown upon the market, on which the duty of two cents per pound was not paid either. Is it a wonder, with an importation of 57,277,379 pounds of lead free of duty, the present prices of lead range from 3½ to 3¾ cents per pound, instead of 5 to 5½ cents?

It is not only the miners in the Southwest who are being injured by this, but Utah, Idaho, Montana and Dakota are very largely interested. The Bunker Hill and Sullivan mines, Idaho, recently closed down by reason of this ruling. Lead ores are coming in from British Columbia, as well as from Mexico. This free admission of lead has seriously affected the lead-mining interests of this country, but some of the large smelting companies are interested in having the present condition of affairs continue, and they have great influence. The hearing in Washington will bring out all the facts, for the delegates who have gone there are fully posted in all details. Mr. Tichenor will report the hearing to Secretary Windom, who will then make a decision.

"WEST AMERICAN OAKS."—A review of the monograph with this title was published in the PRESS of last week. It may be well to say, in addition to what was remarked then, that the work is not only a memorial to Dr. Albert Kellogg, but a valuable contribution to scientific knowledge and a large factor in the forestry question of this coast. Dr. Kellogg was the fittest man on this coast to illustrate such a work; his love of the subject and his minute accuracy of drawing and knowledge of plant structure, controlled him and turned all labor into a work of love. This work—and we hope others to follow—will stamp his character and lift it above what his modesty would have shrunk from.

A FOUR and a half ounce gold nugget has been found about 20 miles from the famous Broken Hill mine, Australia. So it is probable a new district will soon be opened.

The Copper Situation.

Later news confirms the statement made in the PRESS of last week concerning the situation in the copper mining industry. The conference at Paris was not very satisfactory, and the French syndicates were unable to "bluff" the representatives of American mines. They wanted production restricted; and export from this country restricted to 20 per cent of the product. The Americans came away without any definite conclusion being reached. Mr. J. B. Haggin of San Francisco, one of the representatives for this country, said in New York when he returned, Monday: "There's nothing to say except that every tub must stand on its own bottom, and we've come back to throw our copper on the market for what it will bring."

It is said that at first the Frenchmen did not show much inclination to attend the meetings. The Rothschilds and the Bank of France people in particular, seemed to consider it *infra dig* to comply with the request of the American committee for a conference. At last a number of meetings were held, and finally Mr. Haggin rather astonished and startled the Parisians by the following plain and characteristic speech. He said:

"Gentlemen, I have listened to this discussion several days. If I have been edified I have not been instructed. You do not seem to appreciate the situation. It is this: I mine copper to sell, not to keep it to look at. It costs me nothing to mine my copper. The silver extracted from my ore yields such a profit that my copper is practically a by-product. But suppose I say copper costs me three cents per pound, ready for delivery in bars, you will see I can sell it at a profit whether you agree on a price or not. The Calumet and Hecla copper is better than my own, but it does not cost its owner over two cents a pound more. The Calumet and Hecla mine and my mine, the Anaconda, produce at the present time 60,000 tons of copper annually, but neither of them works full capacity. The Calumet and Hecla has 13 shafts and works only three. If that concern and the Anaconda work full capacity they can supply the world with nearly three-fourths its annual consumption of copper. We who compose this American committee have crossed the Atlantic to confer with you and assist in relieving your difficulties—for the difficulties are yours, not ours—but we are prepared to make concessions, and to expect you to do likewise. As I mine copper to sell, I shall return to America within a few days and sell it; meanwhile, if we can make an arrangement, well and good; if not, I shall put my copper on the open market and sell it for what it will bring, and you must be prepared for the consequences."

The Mining and Scientific Press.

We hope that our readers will notice the especially interesting number of the MINING AND SCIENTIFIC PRESS which is published this week. Our correspondents have contributed several articles of value and interest which should be read carefully by all interested in mining matters.

Owing to the broadening of the mining field, the increase in correspondence and advertising patronage, and a desire to improve the paper, we have found it necessary of late to add four pages to the regular size of the paper, making 20 instead of 16. This has enabled us to present a greater variety of reading-matter each week, and has also given more space for illustrations. It will have been noticed that more engravings have been used of late than was formerly the case, and this feature we intend to still further broaden.

The PRESS, now the oldest mining journal in the United States, is to be found in all the mining camps on this coast. If our old subscribers will call the attention of new-comers to its merits and usefulness, they will confer a favor on them and on the publishers. No one connected with the mining industry can afford to be without a paper which is devoted to that interest.

MINING ENGINEERS COMING.—A special train with a party of mining engineers, numbering about 75, will start from New York for a tour of this coast soon. The trip will be for pleasure, but the route will be such as to afford the engineers an opportunity for visiting some of the larger mines of Colorado, Nevada, California and Arizona. The party will arrive in San Francisco about the 1st of June.

R. W. CHASE, formerly superintendent of the Savage mine, Virginia City, died suddenly of pneumonia last Sunday.

EXCITEMENT prevails at Hope, Idaho, over recent mineral discoveries.

The Trial of the Charleston.

The new steel cruiser Charleston, built by the Union Iron Works, returned on Monday from her preliminary trial trip in the Santa Barbara channel. Altogether the trial was satisfactory, but some changes will be necessary before the speed trial is finally made. The vessel was found to be a good sea boat. The steering apparatus, boilers, etc., all worked well, but there was some difficulty with the air-pumps and the cross-head slides of the starboard engine. With 40 revolutions the speed was about 6½ knots; with 72 revolutions, the speed was 12 knots; with 98, 17 3 10 knots; and with 109 revolutions, 18¼ knots, which speed was maintained for 15 minutes. The indicated horse-power was, with the auxiliaries, 5900, this being within 100-horse power of what the engines must develop to be accepted.

Hard spots on the hammered-steel engine slides caused heating with the starboard engine, so that the 4-hour speed trial could not be made. New shoes for the crosshead will be put on or new phosphor-bronze slides substituted for the steel. A vacuum of 27 was maintained at ordinary speed; but it is probable that larger air-pumps will be substituted for those now in the vessel in order that this part of the machinery will be more satisfactory.

The naval officers detailed to inspect the Charleston declare that with a developed horse-power of 5500 she is one of the fastest fighting ships in the world, and, with the modifications to be made at the works, she will not only be able to excel with 7000-horse power the record of the Naniwa-Kan, her sister ship, but threatens to rival the one or two exceptionally fast cruisers which have covered 19 knots. All of those on board during the first trial were pleased with the results, though further trials must be made before the ship will be accepted by the Government.

Some changes were made in the air-pumps from the original designs employed in the Naniwa-Kan, but these do not appear to have remedied the defects sufficiently to make a complete success, so that larger ones will be made.

The fact that the ship made such good speed on her preliminary trial proves that she will be a very fast ship when everything is in good working order. It usually takes several trials before everything is satisfactory to the Government officials. It might be as well to make future trips only as far as the Farralone islands and back until everything is found to work well, since in that case the ship will only be a few hours from the shops, where repairs or changes can be quickly made. When everything works smoothly she can then go to Santa Barbara channel for her speed trial in smooth water.

A "Water-Power" Cable Road.

An enterprise that gives promise of very flattering results is that of the Spokane Cable Road now being built at Spokane Falls, W. T., by the Western Cable & Street Railway Company.

The largest item of expense in running a cable road is necessarily that of power. The road referred to will be operated by water-power originated by the Spokane falls, and located in the heart of the city. It is calculated that at least 30,000 horse-power can readily be obtained from the river at this point, for manufacturing and other purposes, of which perhaps some 150 horse-power will be used to operate this road, and at a merely nominal cost.

The road is 3½ miles long, single track with turnouts, and passes over two bridges, one of which is 1600 feet long and a first-class example of bridge construction, costing some $45,000.

The machinery for the road is being built at the Vulcan Iron Works of San Francisco, from designs of H. C. Holmes, Esq., the engineer of the road.

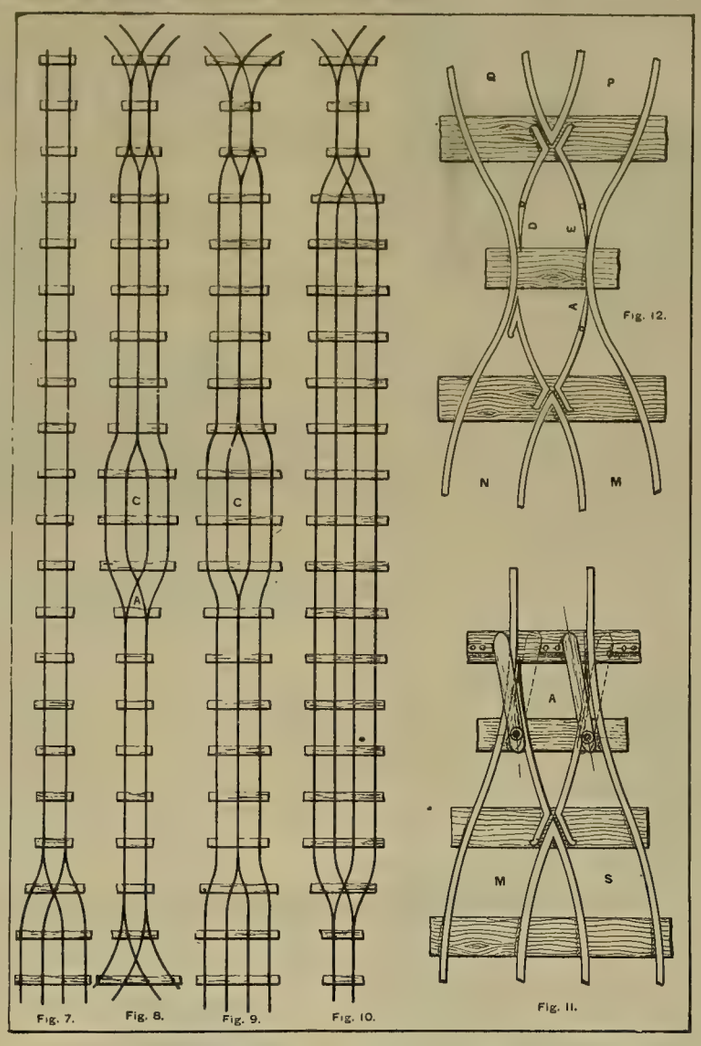
MECHANICS' FAIR.—Secretary Culver of the Mechanics' Institute says it is intended to make the machinery department the most prominent feature of the Institute exhibition this year. The city has been thoroughly canvassed, and all of the leading foundries and machine shops have promised to make exhibits.

JAMES M. MCKEOWN, once a millionaire Nevada miner, was murdered on his ranch near Aztec, Arizona, this week.

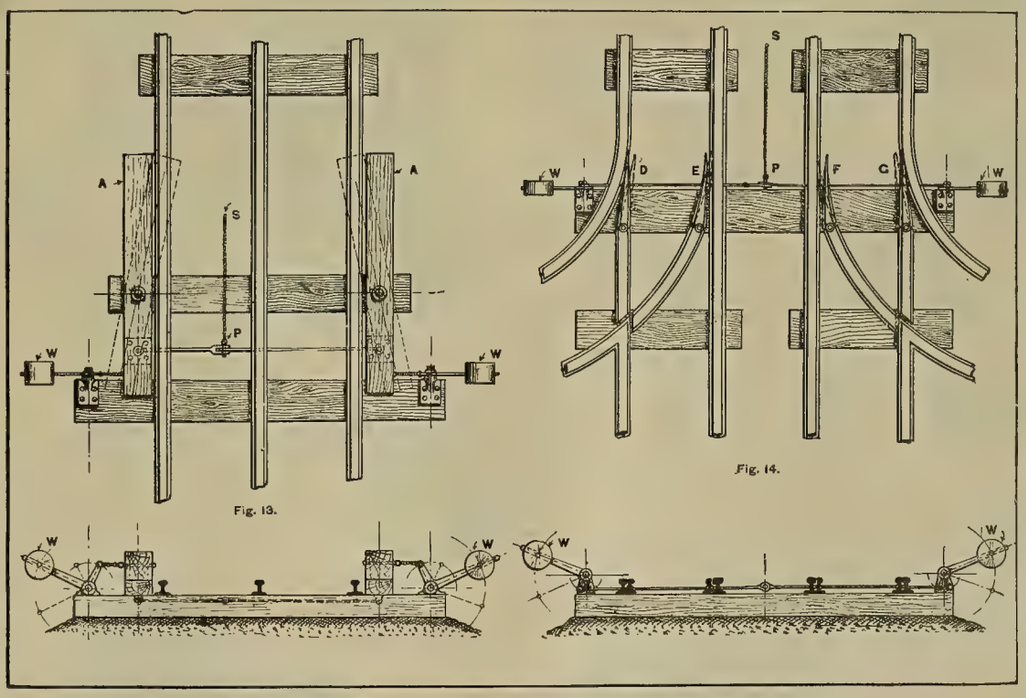
Tracks for Inclined Planes.

Inclined planes for shaft inclines or for bringing coal or ore down a mountain-side to cars or reduction works, are common in many places. In either type of inclined plane the line of descent may be curved or have variable grades, the only requisite being that the fall shall be in one direction and that the grade shall be sufficient to enable the loaded or empty car to descend by gravity. In a paper read before the American Institute of Mining Engineers by Frank C. Roberts of Philadelphia, he discusses quite elaborately wire-rope haulage and its application to mining, and gives considerable space to the inclined-plane systems. Fig. 7 of the cuts given herewith shows the method of running from double to single track and vice versa. Fig. 8 represents the most economical arrangement of tracks, while it has the merit of a capacity equal to that of any other. The section *C* is termed the *parting*, its purpose being to enable the descending and ascending cars to pass each other. For this reason it is placed in the center of the inclined plane. The distinguishing feature of this road-bed is that above the parting we have three lines of rails, while below we have but two. This plan necessitates the use of an automatic switch at the lower point (*A*) of the parting (see Fig. 11, which is, however, reversed in position as compared with Fig. 8). This simple arrangement consists in two iron-bound timbers pivoted at one end and moving over the rails. In the illustration the switch is arranged so that the loaded car going up will take the track *S*, while the wheels of the descending car on *M*, in passing *A*, will shift the switch to the position shown in dotted lines. When the next loaded car ascends, it passes into the parting on the track *M*. This arrangement of road-bed has been used with great success, and the general verdict of the mining community is that it answers, to all intents and purposes, the ends sought by more expensive devices. To avoid the necessity of the automatic switch at the lower end of the parting, the system illustrated in Fig. 9 has been devised. Its operation will be readily understood from the figure. The double-track incline, Fig. 10, is frequently employed, but the extra expense of broader road-bed renders it less common among mines of ordinary capacity. Where the output is very large, however, its advantages are evident.

An important detail in connection with all inclined planes is the arrangement of switches placed at the mine end of the plane. Fig. 12 shows a simple and efficient device. The switch consists of three pivoted tongues, which govern, according to their position, the disposition of the cars. In the gravity system the loaded cars descend alternately by the tracks *P* and *Q*, and the empty cars always pass to *N*. In the engine incline the loaded cars *ascend* alternately by the same tracks, the *loaded* cars here passing to *N*. As the switches are placed the empty cars in the gravity plane will pass to *N* and the loaded car advancing by *M* will pass to *Q*, while the empty car returning by *P* will open *E* and close *D*. *A* being closed, the empty car passes again to *N*, while the next loaded car advancing by *M* descends the plane by *P*. Except that the tongue *A* has to be kept closed by a tender, the switch is automatic. The same is true of the operation of the switch at the head of an engine plane, except that the loaded instead of the empty cars pass to *N*. In all inclined planes it is necessary to employ some form of safety device to provide against accidents arising from the breakage of the hoisting rope. The chief objection to these devices is that they are all controlled by a man stationed at the head of the plane.



Figs. 7 to 12—ARRANGEMENTS OF TRACKS FOR MINE INCLINES.



Figs. 13 and 14—SAFETY DEVICES FOR STOPPING RUNAWAY CARS.

Fig. 13 represents a simple device for stopping runaway cars. Two heavy iron-bound timbers *A* are pivoted near their centers at the side of the outer rails, as shown. The arrangement of counterweights is such that when it becomes necessary to bring the timbers into action the pin *P*, forming the connection between the two timbers, is withdrawn by pulling the wire *S*, connecting with the head of the plane. As a result, the release of the counterweights *W W* throws the timbers over the rails, as indicated by the dotted lines. A number of these devices are placed along the incline, all being connected to the single wire leading to the head of the plane. This method is somewhat inferior to the one illustrated in Fig. 14, owing to the uncertainty of stopping the cars when descending at a great velocity, their tendency being to jump the timbers and continue in their course. The device shown in Fig. 14 consists in side-switching the car. This is performed by the tongues *D*, *E*, *F* and *G*, actuated by a system of bell-cranks and weights, as shown. The switch is held open by the pin *P*, and when this is withdrawn by means of the wire *S*, the switches are closed by the action of the counterweights *W*. This device, although resulting in the partial destruction of the car, renders the danger to life and valuable property considerably less than the preceding arrangement. What is known as the *dead fall* is employed in some mines. A heavy timber, guided in an upright frame, is placed over the track, and when released falls over the rails.

Mexican Mining Districts.

Copalquin.

Continuing his interesting descriptions of Mexican mines, Mr. A. H. Dubois says:

Copalquin district is located in a deep gulch between ridges breaking abruptly from the mesas or high tablelands of the Sierra Madre mountains. The country rock here consists mainly of porphyries and highly metamorphic rocks and some shreds of granite. Farther up toward the mesas the rocks are metamorphosed in a lesser degree, still showing stratification.

The mineral deposits seem to be unproductive in the granite, whereas in the porphyry and metamorphic rocks there exist a large number of lodes and of smaller veins on which are to be seen numerous prospect holes, mostly very imperfectly developed. However, several of them have produced considerable quantities of gold and siver bullion.

The Refugio property between the years 1850 and 1860 yielded to a reckless mining laborer, "El Zacatecano," a considerable bonanza of extremely rich gold ores at surface. Some $2,000,000 worth of gold bullion was sold in Culiacan; nevertheless the owner died in abject poverty.

The vein or veins—for there seem to have been several at least on surface, the main pay streak being a narrow streak of decomposed carrying one ounce or more of gold per pound—seems to strike nearly due east and west with a northerly dip. These bodies seem to have laid nearly horizontal, the dip not having been over 15°. Farther into the mountains the dip seems to become steeper.

As might be expected, these outcrops were gouged out and the workings caved in; nevertheless the property was sold, on its record, for a considerable sum of money.

Subsequently the old workings were reopened and some little investigation instituted, but nothing of any consequence was met with.

A tunnel some 300 feet in length has been driven in the hope of crosscutting the ledge at a depth of about 120 feet, but owing to the small dip, it is probable that it is yet very far off. So far this tunnel has intersected mere stringers of quartz carrying but scant silver and gold ores.

Worked-Out Claims.

So much for mere records and for sanguine speculators who seem to labor under the delusion that a mine with a record—in fact, the shell of a worked-out bonanza—constitutes a property; and once such a property is obtained, the happy possessor is on the highway of acquiring at an expenditure of little labor and less judgment—an independent fortune.

Nothing is further from the truth. Bunches and chimneys of ore in mineral veins constitute the exceptions; large stretches of barren vein stuff or of low-grade ores seem to be the rule, these usually only being enriched when exceptionally favorable circumstances concur.

Copalquin consists of a straggling street of adobe houses in a narrow gulch 3000 feet above the sea level. On the precipitous declivity of a spur 900 feet above the town is the "San Manuel property," containing a large ore body, the "Santa Apolonia lode," which is in breadth over 20 feet and trending north and south (parallel to said spur) and with an easterly dip of 45 degrees, the mountain-side falling abruptly westward. This deposit is intersected by two small veins trending also north and south, but dipping to the west the same as the San Manuel lode proper, which is too far out on the mountain-side to intersect the Santa Apolonia, at least according to the present profile of the mountain.

San Manuel Property.

The developments on this property consist of a crosscut (from the open workings on the outcrop of the San Manuel, now leveled off as a platform) by which the Santa Apolonia has been reached. There is a chimney of ore (some 20 feet east of the crosscut) extending about 40 feet on the vein, which yields very good free-milling ore assaying in bulk some 50 ounces silver and one ounce gold per ton, besides a good deal of exporting

grades of ore. On sinking on this deposit, following down on the footwall, the dip was soon found to grow steeper and soon reached the perpendicular. It shortly changed to a westerly dip, the deposit narrowing down considerably. The vein stuff and ores also totally changed in character, besides becoming considerably poorer and baser.

It would seem that one of the veins (intersected in the main tunnel at about 200 feet in) which should intersect and naturally displace Santa Apolonia, was unconsciously reached and followed down; and eventually communication was effected on the same vein with the main tunnel.

The main San Manuel tunnel, now in 390 feet, was started by the former Mexican owners of the property, and by them driven over 300 feet, at a level 160 feet below the crosscut, in the hope of intersecting the Santa Apolonia at a little over 400 feet, as might be expected in case this deposit was not the displaced outcrop of the "Cucaracha."

In fact, on climbing up the steep hillside above the crosscut at a vertical hight of about 100 feet, we find an outcrop, the Cucaracha, on which some superficial prospecting points to a large deposit of low-grade quartz. The vein stuff and ores are all similar to the Santa Apolonia, and probably will prove to be the deposit of which Santa Apolonia would be merely the displaced (slipped down) outcrop.

The crosscut by which the Santa Apolonia was reached would have to be extended some 200 feet to reach the Cucaracha deposit.

Very recently I had a conversation with a gentleman connected with the Nashville, Tenn., enterprise. The Refugio Gold & Silver Mining Company are the owners of the Refugio and San Manuel properties. I understand that rational developments on the same will soon be energetically undertaken with view of exposing the Santa Apolonia deposit and of fully investigating the Refugio property. They will also develop some of the other properties owned by same company, these last alluded to consisting of half a dozen undeveloped prospects, some of them opened on promising deposits in the same camp.

This company has a 10-stamp silver mill with Washoe pans moved by steam-power, in which the ores derived mainly from the San Manuel property have been carefully and successfully worked with moderate losses of quicksilver producing a considerable amount of bullion, probably over $300,000 in value, one-third of which product was referable to the gold contained in the ore.

The character of the ores worked seems to be similar to those now derived from the Comstock.

Another Valuable Property in the Same Camp

Is the Soledad mine, owned by the same parties as the San Ignacio, previously described. The Soledad is some 200 feet in depth, worked on a large vein (5 to 10 feet in breadth), producing much free gold with silver ores proper and a considerable amount of rich pyrites. The best ores are exported and the bulk of the output, carrying from one to six ounces gold and frequently much more, besides 40 to 80 ounces silver per ton, are being piled up for treatment by Patio process, better returns being derived by same than by the Washoe process proper, using cupric sulphate and salt. This latter system has only yielded 60 per cent of the gold and silver called for by the battery samples.

Parallel to the Soledad vein and some 60 feet distant is another considerable deposit, the *Veta-tierra*, seemingly 10 to 15 feet in breadth. It has so far been investigated only by an open cut, showing it to carry red ocheraceous ores, both gold and silver bearing, evidently decomposed pyrite.

A tunnel now in about 250 feet will soon open out the lower level of this mine, at which depth a breast of ore some 10 feet in breadth, bearing ore probably worth $100 per ton and seemingly part of a chimney some 40 or 50 feet in length along the course of the vein, is now in sight.

Besides these, numerous strong veins exist, all showing silver and gold ores, on some of which prospects are scantily developed. Capital, energy, judicious development and efficient reduction works are alone requisite to make the Copalquin district a very flourishing one indeed.

Copalquin is at present the quietest, best-behaved and securest camp I have met in all Mexico. The sale of liquor—the maddening mescal—is carefully prohibited. Strict lynch law is carried out on all robbers and burglars in the large extent of these mountainous districts owned and controlled by the numerous energetic and influential Rocha family.

Following down the Copalquin creek a couple of miles, we come to

The Village of Limon,

Some 1500 feet above the sea level on the Limon river, with plenty of water all year round and presenting remarkable facilities for utilizing quite considerable water-power in convenient locations for milling purposes. Undoubtedly this is the location for the mills when the Copalquin district is developed as it deserves to be.

Some five miles further down the Limon river, on the trail leading to Culiacan, is the Chihuahuilla mine, a very valuable property owned by Mr. R. Rocha. The lode is several feet in width and produces rich gold and silver ores, of which a considerable proportion are exporting grades. The rest is ground in four arastras moved by water-power and reduced by Patio process.

These ores consist of a matrix of hard flinty quartz stained with hematite, and carry coarse gold, argentite, horn silver—often massive—besides polybasite and other silver minerals proper. Specimens of argentite with very coarse horn silver are found.

Lower California Mines.

Geology of the Alamo Camp.

[Written for the PRESS.]

Much has been said and written for and against the new gold discoveries on the peninsula of Lower California, particularly since the Alamo camp was founded; but so far, I think, no one has described the geology of that section so as to give intelligent mining men a chance to form opinions and draw conclusions without a visit to the district.

With many men the geological formation of a new mining camp decides the question at once, whether they will give the matter any further consideration or not; and these recent discoveries have been so decried by the press and so misrepresented by would-be reporters, that a truthful statement is due the country.

The country rock for many miles around the Alamo camp is a syenite, in most places much decomposed, so that the stream beds are filled with a sand or gravel of feldspar and quartz. On the bedrock in many places are accumulations of hornblende, which at first is mistaken for the ordinary "black sand" of the placers found elsewhere, and with this hornblende and epidote is found the placer gold in greater or less quantities.

But it is unnatural to look for placer gold in this district in any large amount. The alluvial deposits are everywhere light. There is no evidence of any glacial action in the mountains to have worn away the hard vein matter. There is very little frost at the present day to help the disintegration, and no great amount of rain to wash the gold into the gulches. Therefore, the soil on the level mesas and on the hillside pays nearly as well as the bedrock of the stream beds. Acres of this mesa soil have already been scraped up and taken to water, where it is put through the rocker, averaging at least day wages to all that work hard for it.

In the basin of the Alamo I found with the placer gold considerable native amalgam; also some platinum, iridisinine, etc., but not in quantities that would change the output very materially.

Now in regard to the quartz veins; here is where the great value of these discoveries must be looked for.

Through the syenite rock with a northwest and southeast course run great dikes of trap of the diabase order, but in some places changing to a porphyry. There are probably from 12 to 15 of these great dikes, cutting mile after mile through the country, crossing valley, mountain, and mesa alike, and between them all run the quartz veins, parallel to and conforming with the diabase rocks. Some of these veins are "blind," and are only found by moving several feet of soft syenite. Others again crop out plainly for a long distance. Generally, however, the quartz carrying the most gold is softer, being associated with iron oxide, and often the iron has re-formed as a hard hematite. Some of the veins are inclosed in walls of syenite; others again show one wall of chloretic slate, and nearly all stand vertical.

One thing is noticeable—where the quartz is mineralized with gold it is very uniform in its richness. Of course very little deep ore has been seen yet, but there are some pyrites observable, and it is arsenical and very rich in gold. There is no doubt but that this will be the character of most of the ores below decomposition, which will make concentration necessary.

Some of the veins show a little galena and lead carbonate on the surface, but so emphatically auriferous are these ores that the lead does not give a trace of silver, and the gold assays about $19 per ounce. Now, with the associate rocks and the well-defined condition of most of the veins, I see no reason to doubt the continuity of the ore bodies, but I do see strong reasons for thinking them continuous.

The camp is at an altitude of about 3200 feet. There is considerable timber within a few miles, mostly live oak. To the east in the main range are immense forests of pine. Water is plenty enough to run several stamp-mills and concentrators.

The writer of this has spent over two years on the peninsula, investigating its minerals, and during that time has traveled on mule-back 6000 miles, and is fully of the opinion that there are other points of equal interest in the mineral belt of the peninsula. All it needs is the right kind of men to explore and develop there. In regard to the mines at Santa Clara and Alamo, it all depends on who gets hold of the leading veins. With the right men at the helm, a splendid output of gold will be the result, and for this reason it is to be hoped that California mining men will lay aside their prejudice and the idea that "no good can come out of Nazareth," and investigate the country while fine prospects can be had at low figures. A custom-mill of say 20 stamps would be a grand investment, and would serve as an incentive to the prospectors to open up their claims. Sufficient ore for a mill of that size can be had without doubt. C. E. ANTHONY.

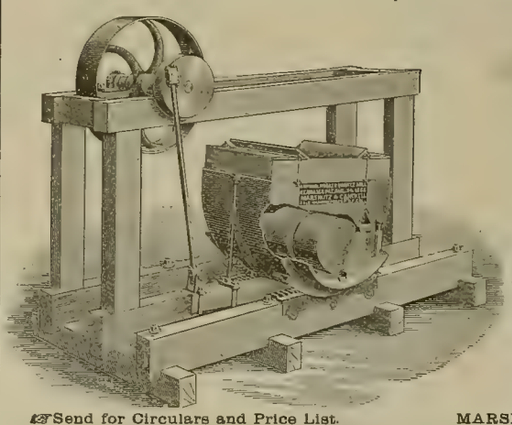
KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

"RED

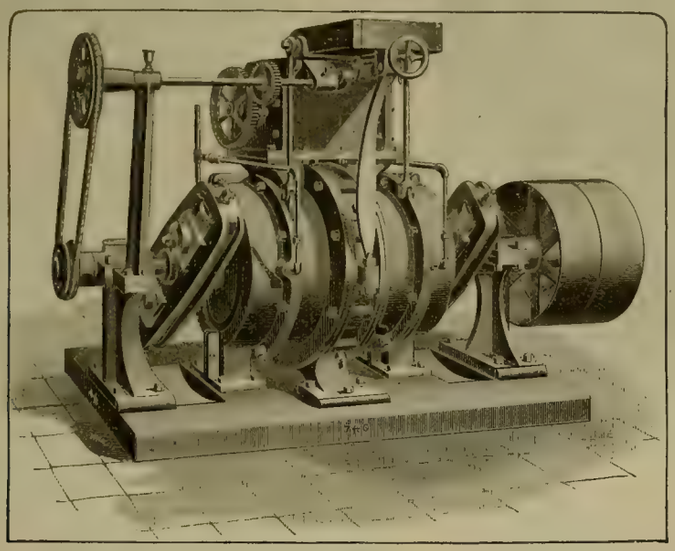
CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. ☞ Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all hardware dealers. Price, 60 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

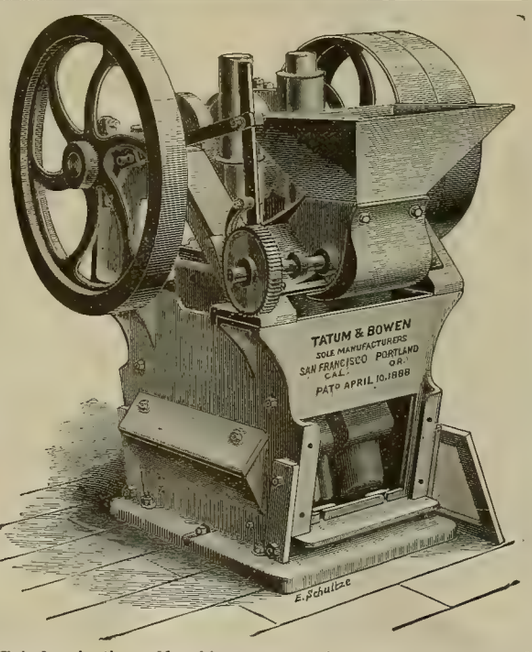
"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE
"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

—THE—
PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective
Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.
We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

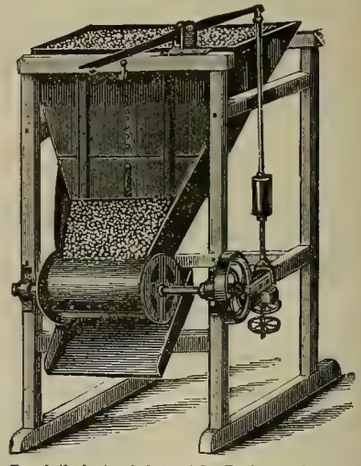
THE ROLLER ORE FEEDER
[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

402,932.—OILER—W. F. and C. E. Traves, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FASTENER FOR THE MEETING RAILS OF SASHES.—Chas. H. Foster, Alameda. No. 402,816. Dated May 7, 1889. This sash-lock for windows consists of a cam pivoted horizontally upon the top of the lower sash and having a V-shaped or beveled periphery, correspondingly shaped catches upon the vertical sash with which it may be engaged, a guard projecting over the opening or space between the two sashes to protect the cam from being moved from the outside, and a stop by which the movement of the handle in the direction of the window is limited. This device is specially useful for the purpose of locking and holding the upper sash when it has been dropped and partially open, and it enables one to lock one or both sashes at any point when partially open.

STRAP-FASTENER AND TIGHTENER FOR TRUNKS.—Charles Sparks, Sacramento. No. 402,776. Dated May 7, 1889. The invention relates to the class of fasteners especially adapted for securing and tightening up the ends of straps for boxes, trunks, etc. The invention consists essentially in a bar to which the opposing ends of the strap or band are secured, said bar being adapted to be rotated axially, whereby it rolls up the ends of the strap or band. The invention consists farther in connection with this bar, of a key for holding it in the position to which it is adjusted, and also in cases where found desirable of a bracket forming a bearing for the axially rotating bar. The object of the invention is to provide a simple and effective fastening and tightener for bands and straps of all kinds. It is especially applicable for securing and tightening the straps of trunks or boxes, especially of metal bands and straps, though it is applicable to tightening and holding clamping bands, which secure the metal couplings in the adjacent ends of hose.

INSULATOR AND HOLDER FOR ELECTRIC RAILWAYS.—Byron Jennings, San Jose. No. 402,836. Dated May 7, 1889. This invention relates to an insulator for the rails of conduit electric railways, the hood and the insulator by which the rail is suspended and insulated from contact with other conductors. The invention is specially designed to provide an insulator within which the electric conducting rails of a conduit electric railway are retained, and by which they are insulated from contact with their supports or other conductors. It has also for its object to retain the insulators within the hood in which they are held and prevent them from being drawn out of place by the expansion and contraction of the rail. In these roads there is an electric conducting rail in contact with which the wheels of a trolley (which conveys the electric current to the motor of the car) are caused to travel. As these rails serve to conduct the current of electricity throughout the length of the conduit, it is important that they should be properly insulated from the surrounding metal, and this is done by securing them in glass insulators which are fixed in hoods or supporting chairs attached at intervals to the yokes within the conduit. At present the rail is secured within the glass insulator by means of wire, which passes around the insulator and the rail, but the expansion and contraction of the rail is apt to draw the insulator out of its supporting hood or yoke, and the constant movement and vibration of the glass within the iron, caused by the passage of the trolley wheels over the rail, soon breaks off the projecting shoulders of the glass and causes it to fall out of its supporting hood, rendering it useless. These defects this invention is designed to remedy.

The Golden Treasure Mine.

[Written for the PRESS.]

This mine is situated on a ranch of 320 acres in Tuolumne county, all patented. Gold was discovered subsequent to the issuing of the patent, and by late decision of the Secretary of the Interior, goes with the patent, which makes the title perfect. The formation is granite, overlaying slate, with diorite dyke, accompanying the main lode, which is a direct continuation of the Buchanan and Eureka vein, etc., which I always designate as the main-master fissure, or mother lode of the upper belt, a contradistinction of the well-known mother lode of lower belt. The developments made on this property, which I will briefly describe, are principally found on the spur vein, which strikes from the main vein north 60° east. The course of the parent vein is north 45° west. The main incline shaft is sunk on the spur vein 350 feet deep, opened by levels; lowest 212 and 210 feet from near bottom of shaft, each side east and west. There are other levels from same shaft higher up of 70 and 180 feet long. The shaft is also connected by tunnel from almost water level of Sullivan's creek, a distance of 280 feet, through which the pumps discharge the water. It is in this tunnel the main vein was intersected, and proved to be a lode of 7 to 10 feet wide, which has been drifted 200 feet west, to intersection of spur vein, where very rich rock was found showing free gold. The poorest rock on this vein yields $7 to $9 a ton and sometimes as high as $20.

Parallel with this main vein runs a diorite dyke, near footwall, with soft granite between it and vein. The spur-vein rock has a milling value of from $8 to $40 per ton, and even higher in free gold. The deeper the lateral developments have been extended the richer the quartz is found to be. The chutes on the surface are not long but "fan out" as depth is attained, making, so far as explored, one continuous gold-bearing and payable deposit. The angle of pitch of the spur vein is 33 degrees; a flat vein dip about north. At the junction of the two veins at lower level in the shaft a body of quartz was crosscut, showing a vein of 25 feet wide and "pay" all through, milling an average of $8 per ton. No stoping has been done, but several thousand tons of rock have been extracted, and over 1000 tons crushed, with exceedingly good results. This ore was taken indiscriminately from the dump. About 125 feet from the main incline shaft another has been sunk 80 feet, disclosing rock of the value of $25 and upward per ton. Besides there are a number of small prospecting shafts ranging from 10 to 30 feet deep, all and each showing a large vein with good pay quartz, none of it worth less than $7 per ton where taken from a "chute." The spur vein contains rich arsenical pyrites from 1½ to 3 per cent of assay value, averaging $300 per ton concentrates. Further I find a rich molybdenite containing a heavy percentage of gold, which I have personally tested. I find also chalcopyrite and galena. All these bases contain considerable gold mechanically combined and of great value. I have seen some very pretty specimens of "mariposite," which, from its apple-green color, is readily distinguished. I have made a vast number of scorifications and fire assays, and have milled, or had milled under my direction, hundreds of tons, with in all cases payable results, often exceeding my most sanguine expectations.

The best feature of this mine is, that as the workings descend, the value of the rock steadily improves, and being nearly all below water-level, viz., 250 feet from adit, speaks alone for its general permanency. I consider this property has merit and prospective value second to none in the State. I have watched its developments for the past 11 years, and predict a great future. Some English company will secure this property without a doubt, while Americans living at its portals will let it slip through their hands.

A number of smaller veins cut into the hanging-wall at intervals north and south, which have not been individually opened on, but they act as feeders to the veins and thus serving their true purpose. I know them to be rich. The two veins extend through the patented land some 4000 feet and for the entire distance along the line. I have prospected and had prospected; no place has been found without payable quartz apart from the regular workings and from the surface outcroppings. Furthermore, 500 feet from the base line of the spur vein is found another large, solid, compact lode of 12 feet in thickness running through the entire property, but only very partially explored. The rock I have tested, and it has been tried by other competent experts and its surface value proved to be $7 to $8 per ton.

The fact that a parallel vein of such great magnitude and value does exist is worthy of more than a passing notice. Besides, there are many other veins that I know of that show surface merit and value, yet to be developed in the near future. This property is a veritable bonanza, as time will prove, and Tuolumne county, now to a certain extent discarded or forgotten (probably for want of railroad communication), will surely shine forth as the brightest star or jewel in California's diadem.

There are suitable forests of yellow pine, for mining purposes for all time, surrounding the property and on it. The water supply is simply unlimited, having an altitude above the works of 1000 feet. This can be made available for hoisting, milling-power, etc., but must be paid for at the rate of six to eight cents per inch, or by special contract from the Tuolumne Water Co. There is the free water of Sullivan creek, which may be made available for overshot or turbine wheel, giving moderate power only. There is a ram that now throws the feed-water to the boilers from the creek. There are miners' cabins, boarding-house, office, blacksmith shop, etc., all well equipped, in good preservation, besides two 12 horse power steam engines, boilers, etc. One of these is for hoisting and pumping, with Cornish pumps; the other serves to run or drive a Huntington roller quartz-mill, rock-breaker, Hendy Challenge ore-feeder and Victor concentrators. There is a good, substantial, hard-finished two-story dwelling-house, with stables, barns, etc.

The hospitable and lucky owner, Moses Hyde, is always ready and pleased to entertain any one who wishes or desires to visit and inspect his property. A good bed and mountain fare in abundance is always at the visitor's disposal.

This magnificent estate is laid out in valuable orchards, grain-lands, etc. I almost forgot to mention a placer deposit of 1½ miles long, the major portion being unworked, but a goodly number of thousands of dollars have been washed out from this source alone, and many thousands left in bank in Mother Earth.

Picturesquely, it is one of the most beautiful places in the mountains. It is, so to speak, a sunken plateau surrounded by pine-clad mountains, traversed in the center by a sparkling trout stream (full of fish). On the banks may be seen in the season trees laden with ruby and golden fruit (apple, peach and pear), and green clover-fields spread their fragrant carpet over this beautiful oasis. ARGUS.

Safety Guards for Cable Roads.

Owing to several accidents which have occurred of late on our local cable roads, there is an imperative demand by the public for more efficient safety guards on the dummies. Some of the roads have no devices of any kind. Those on the more hilly portions of the city contend that devices which serve the purpose on level roads will not answer on theirs, owing to frequent and sudden change of grade.

The Board of Supervisors have taken the matter up and this week passed a resolution requiring all cable roads to adopt some safety device within 60 days. At a committee meeting a number of inventors submitted their safety appliances to the supervisors and representatives of the cable roads. Some very impracticable plans were submitted as well as others of merit. Among the inventors who showed models or drawings were: R. M. Elwards, Frank Loftus, C. P. Ware of San Rafael, J. K. Smedley, W. J. Watkins, J. Peterson, H. Montag, N. Beauregard, H. J. Baddeley of Napa, P. F. Dundon, W. P. Howland, Thos. Carter, D. L. Smith, F. McPherson, W. G. Hoffman, H. E. Pohlman, B. D. McEachern, Police Officer McLaughlin, Charles H. Ohm, William Hughes, William F. Eneign, William A. Holland, and Horace Ewing.

There is no doubt that the demand for a safety device will be met by one or more appliances which will be suited to the various conditions. Aside from the number already invented since the agitation commenced, numerous inventors have applied for patents through the MINING AND SCIENTIFIC PRESS Patent Agency, and many of these patents are still pending.

Chinamen Cannot Return.

The Supreme Court of the United States has affirmed the validity of the Scott Act by confirming the judgment of the Circuit Court in the case of Chae Chang Ping. This Chinaman went to China, taking with him a certificate of prior residence, similar in form to the certificates under which Chinamen had been returning for several years. Before he came back the Scott Act was passed, depriving such certificates of validity and absolutely closing the door against all Chinamen, whether they had been prior residents or not. The Chinaman rai ed the point that his certificate was a contract by which the United States were bound. The Supreme Court holds that it is not and that the United States have the power to exclude Chinamen at their will, notwithstanding the reservation in their favor contained in the Acts of 1882 and 1884.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

CORPORATIONS AND CITIZENS.—The U. S. Supreme Court has just made an important decision regarding the locating of mining claims. A point was made in a Colorado suit that the laws of the United States did not permit the entry of mining property by any but citizens of the United States; that a corporation was not a citizen. Judge Field, in his decision, holds that a corporation is a citizen within the meaning of the laws, and can enter mining property.

Mining Share Market.

Trading the past week in both Comstock and outside stocks was light, with a steady shading in values. The constant wear on the patience of outside holders of stocks has naturally caused many to let go, which has allowed the "pool" to concentrate to a better advantage the stocks desired for leaders in an upward move. When the move will be commenced is an open question which the outside public is at work to answer. The large majority do not look for much previous to fall, say about October, and in the meantime low prices will obtain so as to get the last share that is possible to be had from outsiders. In this, it is said, the pool will be assisted by assessments, and the work now going on in the leading mines not calculated to run into any important body of ore, or at least, the public will not know it if it should happen to be done. The brokers report very few stocks held on a margin by outside operators; this, in a measure, is confirmed by the banks reporting the brokers having balances to their credit. The news from the Comstock mines is of a meager, unsatisfactory nature, entirely different from what it was five months ago, when the pool was peddling stocks. Those who claim to be well informed on the situation in the mines, assert that the work now going on in Ophir, Mexican, Union, Potosi, Alpha, Challenge and Confidence is of a very important character. In Belcher and Crown Point as work on the lower level progresses, it is thought that they should deserve more careful watching, particularly when work is inaugurated on the Sutro tunnel level. Some of the Tuscarora stocks after being cut more than half in two by dividend talk, are now advancing on assessment points. The Quijotoas and Bodies remain idle and unattractive.

The stock market opened to-day (Thursday) weak under strong bear reports, but among the well informed it is claimed that an upward move is near at hand. Official advices received yesterday from the Gold Hill mines are of a bearish character. Advices from the middle mines are of a non-committal character. Yellow Jacket's ore assays $30 a ton. The bears think this is a mistake on the part of the pool; it should, they say, be lower.

Advices received to-day (Thursday) from Virginia City report that a drift has been started in Con. Virginia to run into Ophir so as to intersect the ore body run into in the latter mine some years ago by Patten. An improvement is reported in Alpha. The trench to drain the crescent in Union is finished, and work is to be resumed in the crescent.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

PACIFIC COAST SYRUP CO., May 11. Capital stock, $100 000. Directors—P. L. Wooster, R. S. Palastri, Fred Weeker, B. J. Hopacher and A. G. Hawes.

RIO BRAVO VINEYARD & RAISIN CO., May 11: Capital stock, $80,000. Directors R. E. Houghton, Chas. H. Bunn, J. W. Litchfield, Geo. C. Sweet and H. A. Blodgett.

GUARANTEE LOAN & TRUST CO., May 13. Capital stock, $500,000. Directors D. H. Jones, E. W. Wheeler, C. R. Slawson, S. P. Platt and J. C. Pinto.

NEVADA AND CALIFORNIA M. & TRADING CO., May 13. Capital stock, $200,000 Directors—P. J. White, N. C. Fassett, James W. Burlong, W. F. Lyon and Edmund Marks.

HARTERY CON. M. CO., May 14. Location, Grass Valley. Capital stock, $1 000 000. Directors—A. W. Stoddart, Chas. E. Uren, John M. Thomas, Geo. W. Whiteside and A. D. West, all residents of Grass Valley.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Nevada Queen, May 14, $15,000; Navajo, 15, $6000; Con. California and Virginia, 11, $72,207; Hale and Norcross (for April), $90,535; Mt. Diablo, 16, $10,650; Queen of the Hills, 9, $1300; Hanauer, 9, $3300; Savage (for April), $24 426; Hanauer, 10, $1850; Queen of the Hills, 12, $1400; Hanauer, 12, $1400; Alice, 11, $33,440; Moulton, 11, $12,432; Blue Bird, 11, $18,992; Lexington, 11, $21,632.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A. F. JEWETT—Tulare Co.
F. B. LOGAN—Southern California.
H. G. PARSONS—Southern California.
GEO WILSON—Sacramento Co.
J. C. HOAG—San Francisco.
CHAS. F. BLACKBURN—Idaho.
FRANK S. CHAPIN—Colusa Co.
MRS. E. J STEPHENS—Sierra Co.
R. G. HUSTON—Montana.
E. H. SCHAEFFLE—Calaveras and Tuolumne Cos.
WM. WILKINSON—Amador and San Joaquin Cos.
CHAS DUGAN—Stanislaus Co.
R. G. BAILEY—San Francisco.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

54-INCH BY 16 FEET STEEL BOILERS IN 2 SHEETS.

STEAM USERS, ATTENTION!

The engraving represents our standard 54 in. x 16 ft. Boiler. These boilers are made of homogeneous STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are supplied with a small hand hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, he result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 54 inches diameter by 16 feet, with 46 3½-inch tubes; Shell, 5-16; Heads, 7-16.
1 Steam Drum, 36 inches diameter by 72 inches long.
1 Breeching.
1 Smokestack, 30 inches by 60 feet, Nos. 12 and 14 Iron.
300 feet galvanized strand for Guys.
1 C. I. Front, complete.
1 Foundation Plate for front.
1 Set Grate Bars for coal or wood.
1 Back Bar Bearer.
1 Ash Cleaning Door and Frame.
1 Back Arch Plate.
1 Set Binder Braces and Bolts for Brickwork.
1 Stand for back end of Boiler.
1 Steam Gauge and Syphon.
1 Glass Water Gauge, complete, with column and 3 Gauge Cocks.
1 Safety Valve.
1 Stop Valve.
1 Feed Valve.
1 Blow-off Valve.
1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds. Total weight of Boiler and fixtures, 17,000 pounds.

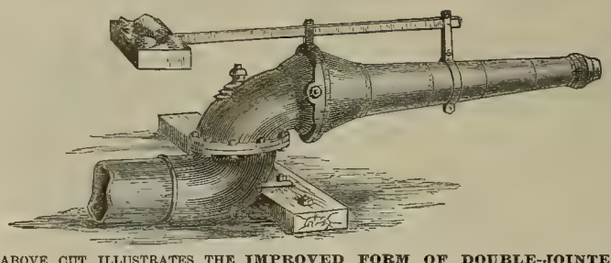
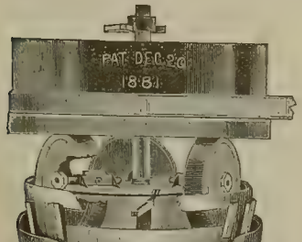
IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish **Single-Jointed Giants** when required. Prices, discounts and Catalogues of our specialties of **Hydraulic Mining Machinery** sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

GUTENBERGER'S ROLLER ORE CRUSHER.



Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gearings, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working. The first ore crusher used in Durango, Mexico, was built at my shop in Sacramento, and under my patent.

☞ Any Infringement on this Patent will be prosecuted to the full extent of the law.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, May 16, 1889.

General trade continues fair, but not large. The feeling which appears to control is of a conservative character, and therefore speaks well for the future. Our advices from the mining and also from the agricultural sections warrant the assertion that an unusually large trade will be enjoyed this fall; larger than ever before, and, what is more, buyers will be in better condition to pay their bills promptly, provided no unfavorable event takes place in the meantime. There is an abundance of water for mining, while the rains and cool weather in this month go far in assuring the largest crops, particularly of wheat, ever harvested either in this State, Oregon or Washington Territory. Replies received by the writer to confidential circulars sent out to all distributive points in California justify the assertion that the crop prospects are of such a character that farmers who are largely behind in their accounts will be able to pay in full soon after marketing their grain. This assertion is based on the price being in this city as low as $1.20 to $1.30 per ctl. for No. 1 white shipping. The yield will be so much more to the acre, that a low price will more than equal a fairly high price with a light yield. Among iron-workers there is a growing, hopeful feeling, based on large crop prospects, large water supply for the mines, and an abundance of capital. Much new work is being talked about.

The money market is very easy. There is no trouble in placing paper, even if not gilt-edged, at any of the commercial banks, while outside capital is offering in vain. On United States bonds a large loan was negotiated at 3½ per cent per annum, which is the lowest rate of interest accepted on this coast. Leading importing houses in want of funds to meet bills at the East, have no difficulty in borrowing where the debts are due, and at a low rate of interest, too. This is against the money market here. So far there is no speculative movement on this coast in anything calculated to invite operators. Wheat and barley futures can only be dealt in to a limited extent at prices which attract buyers, while local securities are rather too high, and besides, they do not fluctuate enough. Mining stocks are also too lifeless, not but prices are low enough, but there are no active, attractive moves up and down. Outside speculators like rapid fluctuations, and it is only these that attracts them to operate freely. The public appear to be dying of the dry-rot and sigh for some kind of speculation at which they can take a hand. It is generally conceded that an active stock deal will revive general business.

On April 29th there was in the United States subtreasury in this city in gold coin, $36,908 530; in standard silver dollars, $18,335,134; and in fractional silver, $6,805,171.

For the week ending May 11th, the bank clearings in this city were $13,904,128, against $15,452,645 for the previous week. This shows the inactivity of speculative feeling here.

The steamer Gaelic sailed for Hong Kong on last Saturday, taking out the following treasure: For Hiogo, silver bullion, $160,500; for Hong Kong, silver bullion, $130,000; Mexican dollars, 175,000; gold coin, $7872; gold dust, $25.

The foreign imports at this port in last month aggregated in value, $18,985,463.

Imports of coin by water the past week aggregated $13,826.

The amounts and descriptions of specie shipped from San Francisco in the first four months of the year compare as follows:

	1888.	1889.
Silver bars	$2,517,550	$2,857,200
Mexican dollars	1,077,965	2,359,820
South American dollars	2,208	41,131
Gold coin	1,586,642	3,220,277
Silver coin	14,800	65,700
Gold dust	345	800
Currency	269,980	531,301
Totals	$5,469,490	$9 076,229

Some time ago the MINING AND SCIENTIFIC PRESS stated that the Southern Pacific Railroad Co. had succeeded in purchasing a number of the small roads in this State, and therefore they would not push railroad building so fast after July next. The first confirmatory news of this statement is the official anouncement of the purchase of the California Northern railroad.

SILVER—The market has held to strong prices throughout the week. Sales are reported at 92⅜c, although 92½c is given as a basis for quotations. There is only one buyer in the market, but light offerings and also a strong market abroad cause the higher prices.

MEXICAN DOLLARS—The market is strong at 92⅜@92½c for old, and 92¾ to 92⅞c for new. The offerings are said to be light, necessitating buyers to bid up so as to have their wants met.

QUICKSILVER—The market is higher and strong at the advance. The demand is good. Receipts the past week were as follows: Thirty flasks to Bradford Q. M. Co.; 50 to Parrott & Co.; 41, Haas Bros. The shipments by water were 63 flasks to Mexico.

BORAX—The market is quiet, but steady. Receipts the past week aggregated 594 ctls. The exports were 66,997 lbs. to Chicago via C. P. R. R.

LIME—There is a good continued home demand at unchanged prices. Receipts aggregated the past week 4519 barrels.

TIN—Imports the past week were 2341 ingots of pig and 22,829 boxes plate. The exports by water aggregated 54,000 lbs. to Victoria, B. C. The market for pig is lower and weak, but for plate it is strong and higher. The plate received the past week were sold to arrive. Fruit-canners, since the reduction in overland freights, are more disposed to prepare for active canning.

LEAD—The market has a steady, firm tone pending the decision on duty upon imported ore. The consumption is fully up to this time last year.

COPPER—The market is still unsettled. The prevailing opinion is that lower prices will obtain, therefore the buying is confined to immediate wants.

LUMBER—A movement is on foot to curtail production so as to keep the market up. It is thought that this is the first step to higher prices.

COKE—The market is firm at unchanged quotations. Imports the past week aggregated 206 tons.

IRON—The market for pig is still reported to be quiet, but the tone is firmer, and continued advices abroad of a strong, active market. The East reports another decline, owing to the active competition of the Southern companies. Imports the past week aggregate 402 tons.

COAL—Imports the past week were as follows: Tacoma, 9450 tons; Coos bay, 800; Departure bay, 3485; Nanaimo, 2200; Australia, 4498; Glasgow, 1174; and Swansea, 1307. Total, 23,014 tons. Australian advices report a steady increase in tonnage on the way to and loading for this port. The local market is reported steady, with a free consumption of steam coal. Holders think prices will advance, while buyers hold to a contrary view on coast and Australian coals.

Eastern Metal Markets.

By Telegraph.

NEW YORK, May 16, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42¼	99⅞	$14 00	$3 90	$20 50
Friday	42 3-16	99¼	13 25	3 92½	20 50
Saturday	42 3-16	99¼	13 00	3 90	20 55
Monday	42 3-16	99¼	12 35	3 90	20 65
Tuesday	42 3-16	99¼	13 00	3 87½	20 70
Wednesday	42¼	99⅜	13 00	3 87½	20 75

NEW YORK, May 15.—Borax quotations unchanged. Trade steady. Quicksilver is quoted at 62c, following Rothschild's London advance to £8. The copper market remains in its undecided position. There has been no business of wholesale importance, and whatever tone is expressed is for low future rates. Pig lead obtains some support for late advance. Outside spot, $3.90@3.95 on 'Change; $3.90@3 94 for June; $3.92½@3.94 July; $4 August; $3.95 September, with sales.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

ABOUT 90,000 coal miners of Germany are out on a strike. They demand better pay.

Every Miner His Own Assayer.

A chemical for testing and ascertaining the value of all kinds of ore, by which every miner and prospector can make his own assays, anywhere in the mountains, at a cost of a little over 5 cents and in a few minutes' time. No apparatus or dangerous acid needed; a dry powder, which may be carried in the pocket. This, mixed with the ore and a little water in a teacup, produces an electric current, which separates the silver from the ore instantly, no matter how refractory. Try it; you will be delighted Will save you many dollars for assaying. Package sufficient for 30 tests, with full directions, by mail to any address on receipt of $2; 6 packages for $10. Address, Prof. J. Herman, P. O. Box 1845, San Francisco, Cal.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 15th day of May, 1889, an assessment, No 13, of Five Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 327 Pine St., Room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 16th day of July, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.

OFFICE—327 Pine St., Room 9, San Francisco, California.

Kodak A Camera with which any one, without previous knowledge of photography, can make excellent pictures. Photography reduced to three motions—point the camera, press the button, turn the key—and the rest will be done for you at the San Francisco or Portland Agency, unless you prefer to do it yourself. Weight of Camera, loaded for 100 pictures, 26 ounces. Enclosed in sole leather carrying case with shoulder strap and is no larger than a field glass. Price, complete, $25. Reloading for 100 pictures only $2. The Kodak will photograph anything, still or moving, indoors or out, and can be brought into use without a moment's notice, as no tripod is required and it is not necessary to focus. Call and see the instrument or send 2 cents in stamps with request for Kodak "Primer" with sample photograph.

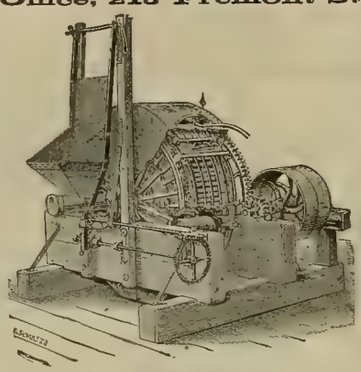
FOR SALE BY ALL DRUGGISTS.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
—ALSO—
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.
ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

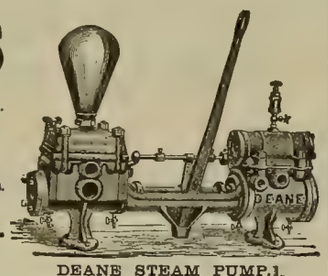
FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 213 Fremont St., San Francisco.
—MANUFACTURERS OF—



TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.
Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or barred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

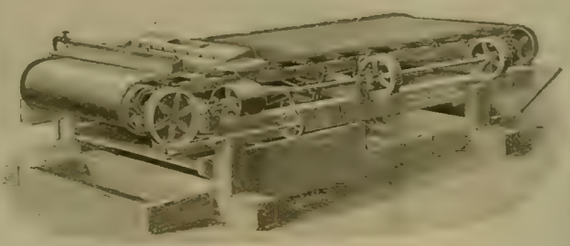
IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

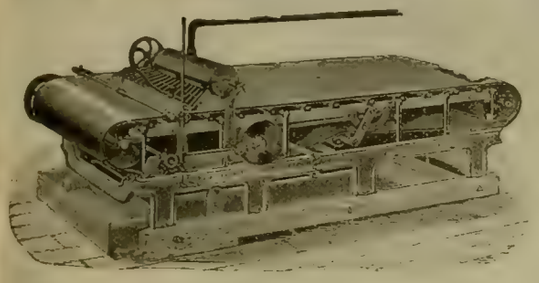
THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00).



THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 Fremont St., San Francisco, Cal.

PACIFIC IRON WORKS

1850. 1888.

—BUILDERS OF—

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of **LATEST DESIGN** and **MOST IMPROVED** construction. We offer our customers the **BEST RESULTS OF 38 YEARS' EXPERIENCE** in this **SPECIAL LINE** of work, and are **PREPARED** to furnish the **MOST APPROVED** character of **MINING AND REDUCTION MACHINERY**, adapted to all grades of ores and **SUPERIOR** to that of any other make, at the **LOWEST POSSIBLE PRICES.**

We are also prepared to **CONSTRUCT** and **DELIVER** in **COMPLETE RUNNING ORDER**, in any locality, **MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC.**, of any **DESIRED CAPACITY.**

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

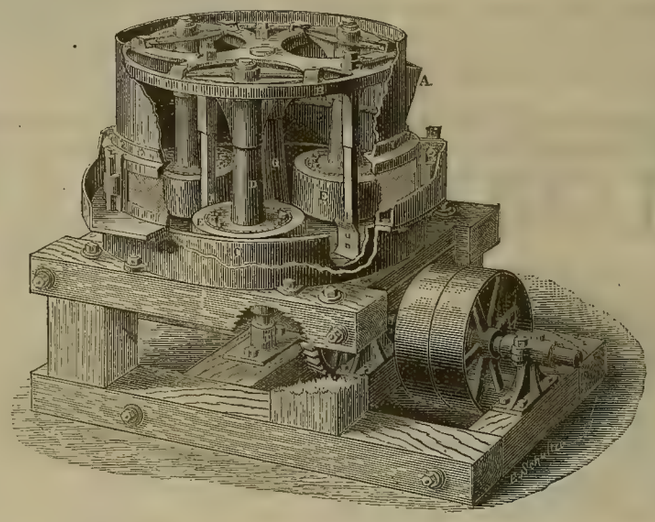
Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

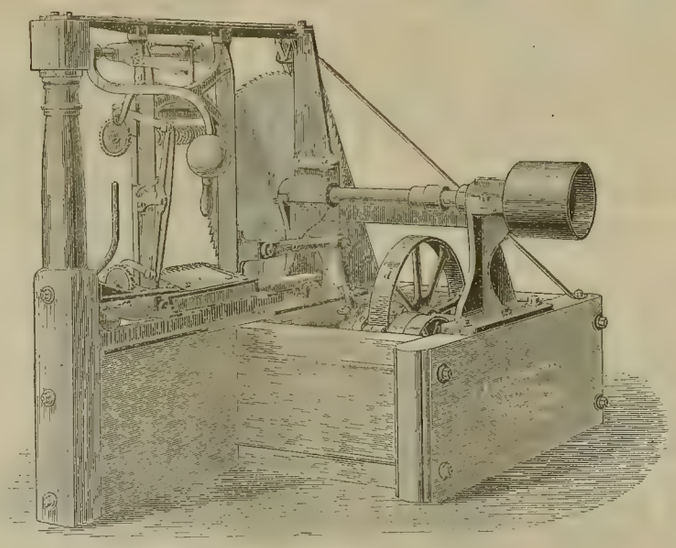
The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S
PATENT SHINGLE MACHINE.

This Machine is so well and favorably known by all the principal Lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. This feed-works is positive and uniform in its action and obviates all the jar or tremor formerly given to the machine by the weight used in the old style feed.



For simplicity, durability and rapidity of action, these machines have no equal, cutting from 50,000 to 75,500 shingles per day.

Price, complete with Jointer and one 38-inch Saw, $475.00.

The new feed-works can be applied to any of the old machines.

Price $100.

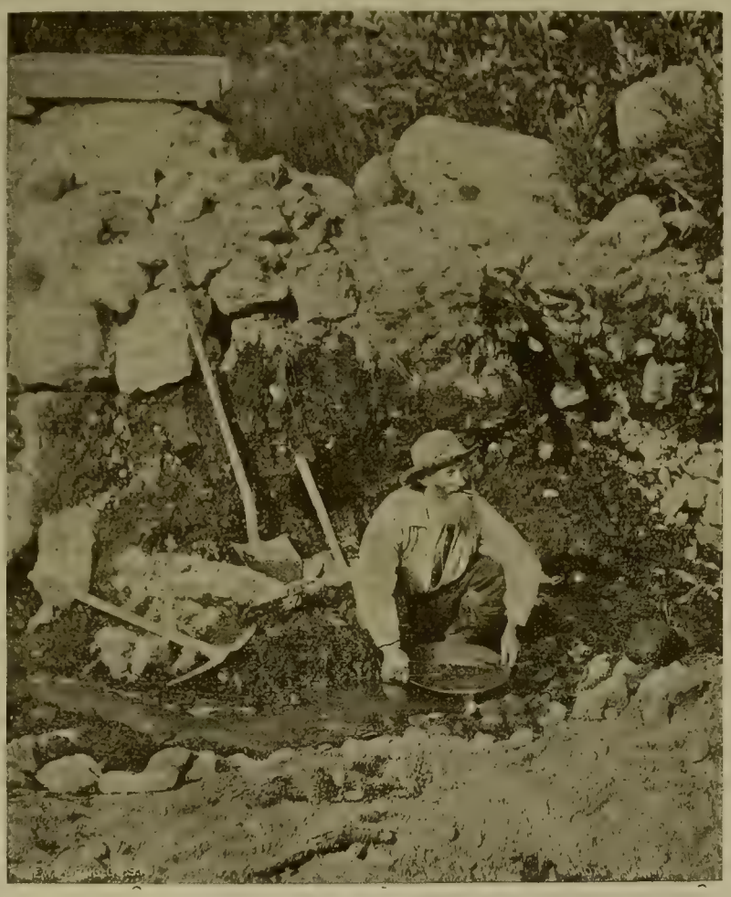
Hydrogen Amalgamators.

A recent invention to prevent sluggishness of mercury in amalgamation of gold is the hydrogen-amalgam process invented by B. C. Molloy of London. The principle involved in this process is the well-known one, that when gold is brought into absolute and maintained contact with clean or "quick" mercury the gold is retained in the mercury from which it is afterward retorted. In cases where refractory ores have to be dealt with, they cause the mercury to "sicken;" that is, to become coated with an oxide which lies like a sheet of paper on the surface of the body of the mercury, preventing contact between the particles of gold and the clean portion of the mercury. This sick mercury also "flours," so that the floured fluid metal is carried away and lost. The result is, therefore, that not only is the gold not captured, but mercury is lost or carried away in the refuse or tailings. The object of the hydrogen-amalgam process is to save this enormous loss of gold and mercury. The method pursued is, first, to maintain the "quickness" of the mercury, and second, to insure a continual contact between the particles of ore and the mercury.

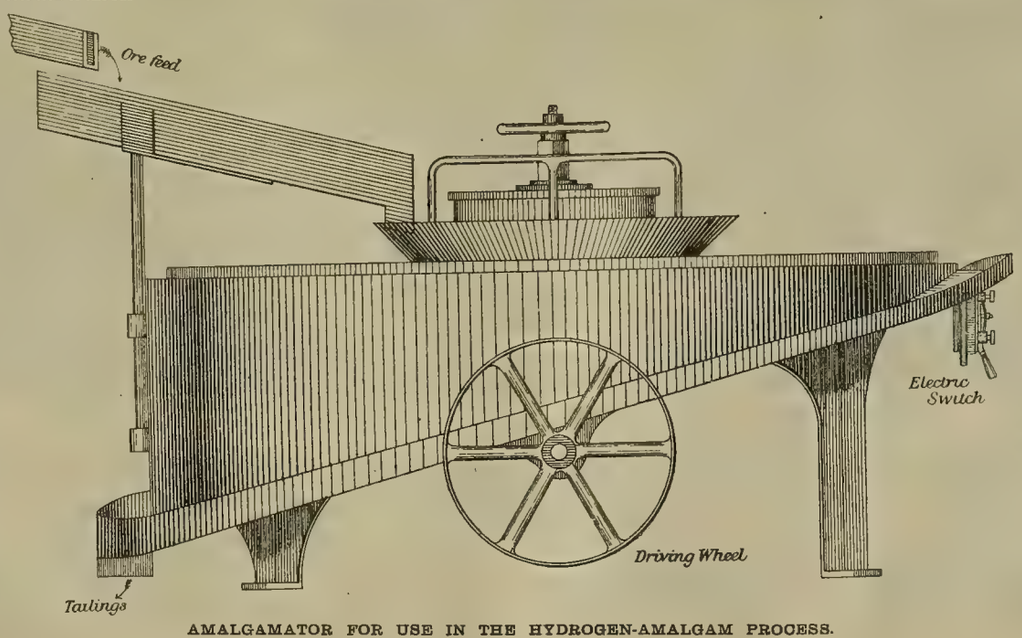
The apparatus for accomplishing this is shown on this page. It consists of a shallow pan about one inch in depth and 41½ inches in diameter, which contains mercury about half an inch in depth. In the center of this pan is a porous jar, so placed and fixed that the mercury cannot enter or move it. Within this jar is a cylinder of lead and a solution of sulphate of soda. This lead cylinder, which constitutes the anode, is connected with the positive pole of a small dynamo machine, while the mercury is connected with the negative pole of the same dynamo. When the current passes, oxygen is evolved from the surface of the lead anode, while hydrogen is evolved from the surface of the mercury. This action, which is apparent to the eye, is of course due to the decomposition of the electrolyte formed by the solution of the sulphate of soda. The mercury combines with a portion of the hydrogen and so forms a hydrogen-amalgam, while the excess of hydrogen so formed passes away. Now, while the mercury is thus charged with hydrogen it cannot oxidize, because of the presence of an excess of hydrogen. Thus, no matter what the character of the ore, the mercury under these conditions is always quick and greedily attacks and absorbs the gold.

So far, the ingenious but simple method of maintaining the mercury in a quick condition. We now have to describe the equally and simple means whereby the pulverized gold-ore is brought into absolute, and maintained, contact with the quick mercury. Floating upon the surface of the mercury is a disc 40 inches in diameter, which dimension leaves a narrow outside channel all round the edge of the pan where the mercury is uncovered. The center of the disc has a circular hole in it so as to clear the porous jar by about 2 inches. This central opening in the disc has a rim about 2 inches high, which forms a hopper. The disc, as it floats on the mercury, is slowly revolved by simple mechanism. The pulverized ore, as it leaves the stamps or other crusher, flows into the hopper, accompanied by a stream of water, and is then, by centrifugal action, carried under the revolving disc and rolled round in the mercury in ever-increasing circles until it reaches the periphery of the disc, and consequently the outward channel between the edge of the disc and that of the pan. Here, freed from the pressure of the disc, the pulverized ore floats up and over the edge of the pan and passes away, leaving behind it in the mercury the amalgamable gold it previously contained. This perfect extraction is due to the rolling action which separates each particle of the ore and rolls it for some ten seconds in the bright, quick mercury, which wrests every atom of amalgamable gold from it. The whole machine weighs only about five cwt., and its working capacity is ten tons per day.

Prof. Ricketts of the Columbia School of Mines, N. Y., has made a series of trials with this process, and in each case showed an increased quantity of gold extracted with these amalgamators over that extracted from the same ore by ordinary amalgamation. Each amalgamator will treat from six to ten tons in 24 hours, according to character of ore. No plates, blankets, or auxiliary apparatus are required. J. W. Higginbottom, M. E., Omaha, Neb., is agent in this country for the machines. He informed us, when in this city, some time since, that a 60-inch amalgamator, with dynamos, tools, etc., capacity 12 to 24 tons per day, will cost about $2000. A number of the machines are in use in Australia and Africa.



THE OLD PROSPECTOR.—See page 380.



AMALGAMATOR FOR USE IN THE HYDROGEN-AMALGAM PROCESS.

THE REFORMA MINE.—This mine in Mulege district, Lower California, is about eight hours' travel from Guaymas by line to steamers to Santa Rosalia. Attention was first called to it over 20 years ago by Dr. F. Von Lohr of the School of Mines of Freiberg, and by Mr. W. M. Gabb, of the State Geological Survey, in their report of the mineral wealth of Lower California. The property has not been worked for some time, owing to the indifference of its owners, but we are informed that men skilled in mining, backed by capital, are about to take the management, the mine having changed hands. This ought to be welcome news to the few who have retained their stock through all these years. The work already done on the mine has exposed a large ledge of ore which is said to assay $200 in silver and $85 in gold per ton.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

At Silver King.

EDITORS PRESS:—I want to say that a prospector in this part of Arizona gets but few favors, and is generally ridiculed by the people for entertaining the idea that there are other mines here besides the Silver King. I have had my share of this sort of thing like others, especially for advocating the theory that the King was an ore chute from an ore channel, running northeasterly and southwesterly from the Silver King; and that the Silver King would continue so far westerly from the surface, and would then turn and dip eastward. Also that the "Bilk" shaft, which is on the west, would not touch the King ore body. This was proved, however, by the Bilk shaft being sunk 1000 feet without ore.

My reasons for this argument are as follows: That there are three granite formations here, plain and distinct, which traverse the country for many miles; that each stratum is different in character, and in mineral and quartz; and each formation is the same in general character throughout its entire width and length; that each formation contains a separate deposit of ore which represents a geological epoch. As the two younger formations (on the top) have an eastward dip, and as the Silver King is in the central formation and near its western edge, that it was impossible for the King ore body to continue its westward trend and leave its own formation that it was deposited in; that the ore body must turn and dip eastward with the formation; and from the best information I can get, that is just what the ore body is doing now. The Bilk shaft is just outside of the King formation.

The Silver King Company are working about 30 miners now, and in time "old Comstockers" will have quietly experted the lower portion of that huge and peculiar silver vault, placing it in condition to become again a dividend-paying mine.

The Mineral King Company has made a good strike in the Crispin mine at a depth of 245 feet. The ore resembles the Silver King and some of it is very rich. The Crispin shaft is about 1000 feet southwesterly from the Silver King. There are several mining claims pooled and under bond, and are pending a sale to Boston, Mass., and Philadelphia, Penn., capitalists. This "pool" of claims is situated southeast of and are near the Silver King mine.

Major W. H. Lumker, Colonel P. C. Cumeford and Robert Wright, Esq., all of Silver King, are the owners of the mine referred to.

There are a number of good prospects in Pioneer district, within a radius of one mile of the Silver King, which merit the attention of capital, and some of them may prove as good as the Silver King. MINER.

Silver King, Arizona.

A Point in Leaching Ores.

EDITORS PRESS:—Referring to the communication of Mr. Dubois, in the PRESS of 4th instant, I wish to say that his observations accord with my own. Some years ago I noticed that the indicated solubility of the silver in a sample of roasted ore was considerably less when the ore was soaked all night in the hypo than when it was leached rapidly on a filter, and I abandoned the soaking process in consequence.

A few months ago I ascertained by experiment that copper and silver are quickly precipitated from their hypo solution by precipitated zinc sulphide. Silver is also precipitated by the same reagent from its solution in aqueous potassium cyanide; but if the latter be strong the silver sulphide soon redissolves. It seems quite likely, as suggested by Mr. Dubois, that Russell's solution acts practically in some cases by decomposing the sulphurets of zinc, etc., in raw or imperfectly roasted ores, forestalling and preventing the decomposing action of these substances on the silver thiosulphate, as well as redissolving any silver which they may at first precipitate as sulphide, though in the main, the copper of the extra solution would, of course, be precipitated first. The theory of silver leaching is not yet complete.

C. H. AARON.

A "Black Sand" Lode.

An Interesting Occurrence of Gold.

EDITORS PRESS:—There has recently been discovered on Rattlesnake creek, Tulare county, a vein carrying gold in a new and interesting combination. A letter from a gentleman owning a claim on this lead, says: "We have found the lead the gold came from found in the Sawyer Diggings. It differs from anything I have known. It seems to be composed almost entirely of black sand. It is readily picked and slacks in water after being brought to the surface."

This gold is perhaps as fine as any mined in the State. It is in the form of water-worn grains, and the most of the country rock in the vicinity of the lead is slate—probably of the Jurassic age—or corresponding with that found in the old placers further north. There is one variety of this slate, however, in perfect conformity with the others, which contains rounded pebbles. In some cases these pebbles are partially incorporated into the rock in which they are imbedded, by metamorphism, and have lost their shape. In other cases the water-worn polish of the surface still appears and is impressed upon the matrix, from which it can readily be separated. As I have said, this matrix has a slaty cleavage, and like the other slates stands nearly vertical. The disintegration of this slaty conglomerate reveals a very heavy percentage of black sand and a trace of gold, and I had been led to suppose that all the gold of the adjacent placers came from the wasting away of these rocks.

As to the exact relation of this so-called black sand lode to this pudding-stone slate (if I may be allowed the use of the term), I have been unable to ascertain. I shall visit the locality in a short time, and may be able to throw more light on the subject.

In the metamorphism which has taken place in this formation, there is a faint suspicion that all the rounded pebbles have been more or less flattened, and it is noticeable that they all stand on their edge. STEPHEN BARTON.

Kernville, Cal.

Northern Counties of California.

Topographical and Geological Features.

EDITORS PRESS:—The seven northern counties of the State of California are comprised and included in that area situated between the parallels of 40° and 42° north latitude and 120° and 124° 30′ west longitude. Del Norte, Siskiyou and Modoc, the northern tier, form the northern boundary of the State, while Humboldt, Trinity, Shasta and Lassen adjoin on the south. For facts concerning the topographical features of this broken and mountainous region, the writer is indebted to J. W. Powell, Director of the United States Geological Survey for the California Shasta Sheet of his official map made by members of his staff in 1883 and 1885.

In no other portion of California can be so well seen the stupendous effects and powerful influences of the pent-up force of dynamic agencies that have been generated in Nature's laboratory as in this region.

This whole section has been tossed, torn and dislocated by irresistible and invisible forces. The strike or trend of the stratified rocks, as well as their central core, has been changed from west of north to north 20 east as if swung on a pivot. The main axis of the mountain range with its central granitic core has not only been metamorphosed by chemical action, but as stated, changed its position and been thrown into confusion with no order or system.

From Mt. Shasta, which evidently was the focus of the disturbance, subordinate ranges and spurs of ranges radiate in every direction, with isolated peaks and buttes of greater or lesser proportions indiscriminately thrown up like bubbles of gas in a seething caldron. Old river channels were obliterated and new rivers formed. The eccentric course of the river now known as the Klamath, in its efforts to find an outlet to the sea, was due to this cause. Its tortuous and snake-like windings is a fair illustration of this chaotic confusion, this cataclysm of events.

The long-pent-up powerful gases that produced these effects finally found an outlet in Mt. Shasta and her subordinate volcanic vents which belched forth torrents of molten rocks, lava, scoria, etc., not only building for themselves isolated mountains of no mean proportions formed of eruptive matter, but covering the surrounding country to great depths, filling beds of extensive lakes and basin-shaped depressions forming plateaus or table-lands of immense extent. The overflowing molten current passing onward in a southerly direction followed the course of and filled the channels and troughs of the then existing system of Pliocene rivers and hermetically sealed their auriferous contents for the use of unborn nations, overflowing their banks and surrounding ridges, covering verdant plains teeming with the vegetation of the tropical clime, and destroying all animal life in the morasses, lagunas and rivers that had not been dried up or evaporated by the advancing flood of the fiery molten stream. Abundant evidence that this was the case is seen in the numerous remains of the mammoth, mastodon, the horse and other species which are found in the gravelly beds of these Pliocene channels and the surrounding bogs and morasses of this region. It is also possible that Pliocene man may have existed during this Tertiary or early Quaternary period and laved in these ancient streams.

This period was followed by oscillations of the earth's crust. Alternate elevations and depressions occurred, producing great changes in the physical geography of our continent—as well as climatic changes—from a tropical clime to the temperate, followed by the glacial period, when an icy sheet covered the whole Western Continent, of which there is abundant evidence in glacial marks that have scored and furrowed the surface of the rocky formation. Previous to this period, however, the Sierra Nevada range of mountains had assumed shape, form and proportions with its granite core, flanked by the metamorphic slates that form our present metalliferous omain.

At a still later period the coast range of mountains raised its head above the ocean (anterior, however, to the volcanic changes) with its sandstones, shales and slates of the cretacious and tertiary formation forming the easterly bank and shore line of an arm of an inland sea that extended at least as far north between the two ranges as Shasta Basin, and possibly into Oregon, the recipient of the waters of a river equal if not superior in size to the Columbia, possibly the Columbia itself. That this theory is tenable is evidenced by both the flora and fauna of this region, and by the remains of a system of ancient rivers that flowed from the north southerly through Washington Territory, Oregon and California. This system spanned a width of nearly 40 miles, situated on the high peaks and table-lands of these northern regions at elevations of from 4000 to 6000 feet. In places it is lava-capped; at others their trough or channel with inclosed gravel are exposed where cut by bisecting modern streams that course at right angles with the Pliocene system.

J. H. CROSSMAN.

Remarkable Railway Building.

The *Railway Age* of April 12 published a table of railways in this country under construction and projected in the first three months of the present year that is a source of surprise, and, at the same time, congratulation, so far as outlining a prospective prosperous future. It is a source of surprise from the fact that the table gives the names of nearly 700 railway undertakings scattered through 46 of the States and Territories, aggregating a total mileage of about 55,000 miles. That these roads indicate a prosperous future is witnessed in the fact that so many small lines (out of the nearly 700 only about 130 have each a mileage of from 100 miles and upward) are among the undertakings. These small roads are the pointers that go to prove that it is the necessities of localities that are calling them into being, and not speculation. They are the feeders for main lines made imperative by the growing demand of each section through which they pass. Another reassuring sign is that the smaller roads are not confined to new States and Territories, for the table gives the names of large numbers that are either being built or to be built at an early day in the older-settled States. Among the names of the roads given having a mileage of over 100 miles each, four are in California, two in Oregon and three in Washington Territory. A careful analysis of the new roads makes it certain that, notwithstanding they will have a mileage of about 55,000 miles, yet their building will not run counter to others to such an extent as to destroy their individual usefulness, so far as their incomes are concerned, by creating such an unjust competition that many will be short-lived. This examination cannot fail to impress one with the vastness of the country which affords room for so many separate lines without interfering with each other, and as the *Railway Age* suggests, "the almost unlimited possibilities of future railway construction, of which the enterprises made public during the last three months give only a glimpse."

FOUNDRY AT SAN BERNARDINO.—One of the worthy institutions of San Bernardino is Henderson's foundry and machine-shop. From 15 to 30 workmen are employed. All descriptions of machinery are manufactured, from special agricultural implements to stamp-mills for the mines. A plant of the latter description is now being constructed. All species of castings are made, lathe work is done, etc. Such an establishment is a great convenience to miners, builders, and others in the large territory tributary to San Bernardino.

THE Virginia *Chronicle* says: The widow of W. Drysdale, a miner killed about a year ago, while ascending the Consolidated Virginia shaft on a cage freighted with timbers, has received a check for $1000 from the Con. Cal. and Virginia Mining Company. The check was given the widow at the suggestion of J. W. Mackay.

CON. CALIFORNIA AND VIRGINIA produced last month 12,830 tons of ore, yielding bullion of the gross assay value of $295 832 55, of which $131,053.03 was gold and $164,779.52 was silver. The average yield in bullion per ton was $23.05, and the average assay value of the battery samples was $26.99 per ton.

FOR some months a Chinese miner worked at Kanaka Bar, in Sierra county, with a rocker. He had poor luck until last week, when he struck a $1500 nugget and three ounces of gold in one pocket. He was content with his luck and left for China.

CURIOSITIES.—Mr. E. A. Hornbeck of National City has a curiosity in the shape of an amethyst crystal with a drop of water in the center of it. He also has some shells taken from the oil well at a depth of 1050 feet from the surface.

MINING throughout New Mexico is booming, and news from all the camps is to the effect that the influx of miners from Colorado, Arizona and California is increasing.

A CABLE ROAD is being constructed at Spokane Falls, all the machinery for which is being built in this city by the Vulcan Iron Works.

THE last dividend—No. 235—of the Idaho gold mine of Grass Valley brings the total dividends nearly up to $5,500,000.

Growing Cities in the Great Valley.

The great interior valley of this State, owing to the building of railroads and the influence of irrigation systems, is being rapidly settled. At various points cities and towns are growing in size and importance The development of the country has made these communities prosperous. On this page are views of two of the more important cities in the valley.

Fresno.

Probably there is no city in California today which is having so great a proportional growth as Fresno. Its boom began almost as early as the greater boom in Los Angeles and Southern California. It was not characterized by the wild excitement of other real-estate crazes, but has seemed to show staying qualities not enjoyed by any other boom in the State. The appreciation of Fresno's advantages was slower in coming than appreciation in some places, but once it came it has remained a fixed factor.

The present population of the city is already 10,000. With the present moderate impetus continued for a few years, who can predict its population, say at the taking of the census in 1900?

Like other towns in Central California plotted by the railroad company, there is a reservation on either side of the track, and on one side of this reservation, for a distance of three blocks, the front is well lined with business houses, stores, factories, etc. The principal street of the city extends from the depot to the Court-house square—three blocks. This street is lined with stores the entire distance, some of them being very fine structures. The new First National Bank building—an elegant brick block—and the Grand Central hotel, are on this street. Parallel with this, on the south, is another street, which is beginning to rival the thoroughfare first noticed. On this street are the Hughes hotel, the Hughes block—both solid, fine structures—the Masonic block and two equally fine brick blocks now nearly completed. On the north, another parallel street is rapidly improving—thus making the better business port on of the city, between the depot and the court-house, nine blocks in extent. Within this radius nearly all the best buildings are located, and nine finer blocks, representing greater wealth, it would be hard to find in a half-dozen other cities in California.

Without doubt Fresno owes its late growth to the fact made known to the world that it is located in the midst of one of the most favored fruit regions in the United States. The fruit raised most successfully here is the grape, and from Fresno grapes the finest raisins in the world are made, and some of the best wine. But it is as a raisin-producer that Fresno county is chiefly celebrated.

It is needless to enumerate with particularity the various institutions of Fresno. She has all the characteristics of wide-awake sisters in other parts of the State, except that in many instances these features are intensified by her present activity. Water works, gas, electric light, street railway, fine hotels, concentration of capital in banks, growing wholesale houses, immense retail establishments, fine public schools, modest manufactories, etc., etc, are all here. A good court-house stands prominently in the center of a large reservation or park, which gives a pretty view to the eastern part of the city. At least 15 to 20 fine brick buildings are in course of construction at the present time. A few of these are outside of the limits mentioned in the former part of this letter, and indicate the speedy expansion of the business quarter of the city. The style of architecture adopted in many of the leading buildings is attractive in the extreme. Brick walls are relieved by trimmings of yellow sandstone or white granite, and pointed towers finish the upper stories of corner buildings. There is a commendable pride among the builders to erect handsome structures, and those now about completed are models of their kind.

Tulare City.

This pretty "City of the Plains," as its citizens like to term it, is in the almost exact center of what is locally known as Tulare valley, and very centrally located between San Francisco and Los Angeles, being 251 miles southerly from the former, and 231 miles northerly from the latter city. It is ten miles east of south from Goshen, the junction of the Visalia railroad and the Huron branch of the Southern Pacific railroad, with the great Southern Pacific Overland road.

Tulare City grew slowly during 1878 and 1879; 1881–82–83 were quite prosperous, its population June, 1883, numbering 1020. On the 25th of July, 1883, the first great conflagration reduced the town to ashes. The losses footed up $180,000. During the next six months, to January, 1884, there were 77 buildings erected at a cost of $131,274.

The building continued on into 1884, and in May of that year the population was 1293 During this year 60 buildings were erected, costing $100,000. It was at this time that the citizens voted a tax to build a $20,000 schoolhouse, which was immediately erected, and is one of the finest in the interior.

The year 1886 began very prosperously for Tulare City, and the census taken in May gave a population of 2257. Some very substantial improvements were made, and everything looked prosperous, when on the night of August 16th occurred the greatest conflagration ever known in Southern California. The fire broke out shortly after 11 o'clock P. M., and as a strong wind was blowing from the north, it was but a few moments before the fire was beyond control, and sweeping everything before it. The water-works were among the first things to burn, leaving the people powerless to fight the flames. Sixty-three business houses were burned, with nearly all their contents. Only two general merchandise stores and three small groceries were left. Every hotel and restaurant was consumed. The loss inflicted was not far from $350,000; insured for less than $200,000. Notwithstanding this great conflagration, the year 1886 was a remarkable year in the history of this prosperous town. Its present growth is a marvel. It has been rebuilt at a rapid rate, and the new buildings are generally of brick, and of a superior character. The present population of the city is doubtless 3500 to 4000.

Tulare City lies on both sides of the railroad, being about equally divided. The business portion, with some residences, lies on the east side, while the churches, schools and the main residence portion lie on the west side.

The city of Tulare lies in the midst of a great wheat-growing locality. The proceeds from the sales of this cereal shipped from Tulare are said to be fully $500,000 per year, and for a portion of the season the railroad company has a lucrative business in hauling the immense product to the mills at Stockton and Vallejo, or to tidewater at Port Costa. Besides this, $75,000 to $80,000 worth of wool are annually shipped from Tulare, showing that the sheep husbandry of this locality is extensive. Cordwood cut in the foothills to the east is also an important product of Tulare, and considerable is exported besides that consumed by the railroad company.

Tulare being the end of a division on the Southern Pacific railroad, the round-house and machine shops of the company are located here. This is an important element in the prosperity of the city, for the monthly payroll amounts to $12,000 or more. The shops are quite extensive, but are inadequate to the growing needs of the company at this point.

Connected with the management of railroad matters in Tulare is a fine free reading-room, which, besides containing excellent works of fiction and science, is kept supplied with the best current literature of the day. The building containing this library is in a central location, and is well patronized by the employes of the road and the citizens of the town.

The people of Tulare City are justly proud of their educational facilities, and especially of their public-school system. Their new public schoolhouse, an eight-class-room building, is a large, beautiful structure, built of brick, with a high tower, in which is set a clock. Six teachers are employed. The aggregate daily attendance is 375. The school is taught 8 to 10 months in the year. Besides the public school there is an institution known as Tulare Seminary, which is a preparatory branch of the University of Southern California.

Prominent among the industrial enterprises of the town are the Tulare Flouring-mills, with a capacity of 100 barrels of flour per day. They have the full roller process, and make all kinds of feed also. The water-works of the city are important. The supply is obtained from two artesian wells, over 400 feet deep, and is inexhaustible.

There are many solid and extensive mercantile institutions in Tulare, and without many exceptions they are housed in attractive and commodious brick stores. There is a thrifty and clean look to the city, which is not excelled by any interior town in the State. Its fine appearance was a pleasant surprise to our correspondent, and we think many others who visit the city have been or will be agreeably surprised in the same manner.

A BIRD'S-EYE VIEW OF FRESNO AND ADJACENT COUNTRY.

A GENERAL VIEW OF TULARE CITY, WITH SIERRA NEVADA MOUNTAINS IN THE DISTANCE.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

COAL.—Livermore *Herald*, May 22: Sixteen men are still employed in the Livermore Coal Mining Company's incline, and a cutting-out station is now being established at a depth of 350 feet. From this point a tunnel will then be run back to the vein. Lateral drifts will then be run both ways, and the company will be ready to take out coal. This will be hauled by team for the present. Secretary Higgins estimates that the company will begin taking out coal in from six weeks to two months.

Amador.

AMADOR.—*Ledger*, May 18: The superintendent of the Amador gold mine, John I. Minear, showed us on Wednesday two small buttons of retorted gold, the product of the rock crushed in the one-stamp test-mill now in operation on that property. One was worth about $40 and the other $15 to $20. We cannot give any approximate estimate of the number of tons crushed in realizing this yield, but the result is chiefly significant as tending to show that the ore contains free gold in more liberal quantities than is generally supposed. This gold was obtained from the plates and batteries, independent of the sulphurets. A yield of $2 per ton in free gold, if the sulphurets run anything like those of the Zeile, would leave a fair margin of profit, operating with a 60-stamp mill, and with large ore bodies to draw from. New hoisting works are making satisfactory headway. The pump is to be put under ground next week, and by that time the blacksmiths will have finished the new skips.

NEW LONDON.—Preliminary steps are being taken toward the erection of a 40-stamp mill on this property. The site has been selected just north of the hoisting works. Men have been put to work clearing the site. The contract for the complete mill, we are informed, has been let to San Francisco parties.

MISCELLANEOUS.—Nearly all the men working at the Morley and Wetzlar mine in Hunt's gulch were discharged last Monday. About 20 were turned loose; six or seven are retained to do prospect work. The bunch of ore met with, as reported last week, does not amount to much as a mining proposition. It was merely a pocket, and a small pocket at that. Nothing of a very cheering character has been developed in the prospecting operations so far. Prospecting, however, will be prosecuted for some time to come. The Zeile Reduction Works are closed temporarily, owing to lack of sulphurets, and to enable the ovens to be thoroughly overhauled and repaired. By the time this work is completed, the shaft will likely be repaired, when the full 40 stamps of the mill will be started, which will keep the sulphurets works running full blast. The engine and boiler for the McKenzie mine has arrived, and will be placed in position as soon as possible. The Bunker Hill is short of timbers. A number of the men are laid off awaiting their arrival. A contract has been let at the North California to run a drift 300 feet.

REED & ASKEY.—*Dispatch*, May 18: A tunnel 600 feet in length has been run on the ledge in this mine. The average width of the ore body is four feet, and the yield is $8 per ton, besides rich deposits which are occasionally met with. The mill is kept running steadily, and nine men are employed.

KEYSTONE.—Twenty stamps are kept busy on picked rock; they have a vast body of ore in the mine which will mill about two dollars per ton, but as the cost of mining and milling is a trifle over this amount, this rock is left untouched, while the prospecting for a new vein goes on. The Co. are considering the advisability of running the entire works with electricity.

ACME.—Timothy Hanley Jr., the owner of this claim, which is situated in Hunt's Gulch, while doing his assessment work last week, encountered a fine body of ore, which gives promise of making this property a paying mine.

ALPI.—At the sale of delinquent stock of the Alpi Mining Co. last Monday 29,287 shares were sold. There were no bidders, and the entire lot was bought in by the company for the amount of assessment and costs.

Calaveras.

AT MURPHYS.—Cor. Angels *Record*, May 21: The abundant water supply has set in motion the great wheels of industry, and particularly in mining greater activity is noticeable than ever before everywhere within a radius of ten miles from this point. In this vicinity it is pleasing to note the sturdy stride in improvement. In the Norfolk an important strike has been made that bids fair to rival in extent and richness any that has been around here for years. Supt. Morse is in high glee with the good appearance of the mine. The Total Wreck, recently bonded by Mr. Campbell of San Francisco, have a shaft down on the lode 90 feet deep in excellent quartz; 20 tons of this quartz crushed recently in the Oro Plata pulverizers paid over $12 per ton. The Beatrice, in close proximity, has a large vein nearly covering the face of the tunnel which taps the vein at a depth of 200 feet. The lode where the miners are now at work is bold and well defined of good sulphurets variety and improving as progress is made.

KING SOLOMON MINE.—Calaveras *Chronicle*, May 18: A new Huntington mill has recently been constructed upon the King Solomon mine, located about midway between Valley Spring and Campo Seco, or about 1½ miles from either place. The mill was started last Saturday and we understand has been running steadily since starting up. The gold-bearing material put through the mill is a singular formation of a chalky nature, eight or nine feet in thickness, changing from whitish to yellowish and then a reddish color, with threads of quartz throughout. It rests beneath what is commonly called a lava formation and upon slate bedrock. It is known among miners as a "blanket mine." Strange to say, the quartz which threads the mass bears no gold, the precious metal being confined to the chalky substance. It is said to prospect well, and is very easily milled, and if the gold can be saved good results may be expected. The formation, we are informed, is quite extensive. A prospect tunnel has been run of about 200 feet in length and three crosscuts run. The location was discovered 20 years ago, and some prospecting done upon it, but nothing noteworthy came of it, and it lay untouched for many years until recently.

BONDED.—The placer ground formerly patented to the Hughes Bros. in the Chili Gulch Mining District, this county, and now owned by Chas. A. Werle, has been bonded to an Eastern company for a good sum. Work on the property will soon commence.

Contra Costa.

COAL MINES.—*Gazette*, May 22: After many delays and disappointments the machinery at the Independence shaft, Somersville, has been put in working order, and we are informed that last week work was commenced in hoisting out the immense body of water at present in the mine. Everything about the machinery worked smoothly and satisfactorily. A slight accident happened last week by one of the buckets becoming caught, which will delay the work several days in repairing the damage done, after which time pumping will be kept up steadily until the mine is drained. Mr. Jas. Rankin is giving most of his attention to the opening up of the Independent, and by his careful management, is bound to make a success of it. It is hoped with no further mishap and under fair conditions to get the mine pumped dry in a short time, when coal-cutting will be immediately commenced, and to this end the inhabitants of Somersville are anxiously looking forward. Employment will be given to a greater number of men, and should the opening up of the old shaft prove successful and come up to expectations, a new era will dawn upon Somersville as well as the county.

El Dorado.

GRAVEL.—Placerville *Observer*, May 21: At the Chili Ravine mine, which has been idle for a long time, gravel estimated to pay $40 per carload has recently been discovered, and there seems to be a large body of it, all hard, blue cement gravel. The Gignac mine, after being abandoned and considered worthless for many years, is now being successfully worked by a Bryan roller-mill, the cement being very hard. The old Granite mine at Smiths Flat, abandoned for many years, and even sold for taxes, is now yielding gravel that contains from $8 to $10 per ton in gold, the gravel bed being over 4 feet thick. Tunnels are being run further east, on a range with Damascus and Sunny South, which is a range east of Iowa Hill, the Mayflower, Forest Hill and Dardaoells, and promising prospects are being obtained. We have in this county miles in extent of these gravel beds yet undeveloped. Many places have been worked and fortunes made, but recent developments establish the fact that the bulk of gold is yet in the ground. The Bryan roller-mill at the Gignac mine has worked 56 carloads of cement, equal to 41 tons in eight hours. This is a small mill. The Bobby Burns quartz mine, seven miles east of town, was worked to some extent 27 years ago, and abandoned till within the last few months. The owners have sunk a shaft 70 feet deep, and run a level 40 feet, making development, 70 by 40 feet, of a ledge four feet wide of ore that will average $40 to the ton. This ledge shows bold croppings at intervals for several miles. We hear flattering reports from the Big Sandy and Kelsey. Parties who have visited the mine since the new 10-stamp mill was started, say that the mine is showing well, and the plates are anything but discouraging. Eight men are employed at this mine. The ledge is from 10 to 20 feet wide, and is of good grade.

Fresno.

WEST SIDE COAL MINES. — Fresno *Republican*, May 17: The operations of the San Joaquin Valley Coal Mining Co., in this county, are quite extensive. A. B. Symington is the mining engineer and J. E. Rawlins general manager. Indications above ground were in their favor, and in order to determine the regularity of the vein of coal below ground, three tunnels, aggregating 3080 feet in length, have been run one above the other into the side of the hill which contains the coal. Satisfactory results crowned their efforts; the vein was reached in three different places equidistant 125 feet one above the other. This was sufficient to satisfy the most skeptical that with the present openings coal was available to meet all possible demands for many years to come. To avoid accidents by gas explosions, a most perfect system of ventilation has been adopted. Each tunnel has an independent air shaft of some 200 feet in length. Another interesting feature in the plan of operations was the laying of tracks from the tunnels. Twenty-seven tons of rails have been used for the purpose. They are laid on grades cut on the side of the hill, all of them converging at a point a short distance from the bunker, where a single track again leads to the dumping-off place. The coal now passes over a screen, the screenings and coarse coal falling into separate compartments of an immense bunker. The merits of Fresno coal are known to some extent in Fresno, and there is nothing to hinder its rapid introduction. From what we have seen we are satisfied that no delays need be apprehended in filling all orders promptly.

THE MINARET MINES.—Fresno *Expositor*, May 15: We have upon several occasions within the past few months made reference to the rich mineral section lying in the northeastern corner of this county, in the rugged region surrounding Mt. Lyell and the Minaret Peaks. C. J. Beck, well known in this city, has spent most of the time for the past eight years quietly prospecting that region and developing the various discoveries that he has made. By private letter from Mr. Beck, bearing date of May 13, from San Francisco, we learn that a syndicate, composed in part of English operators, has been formed with a capital stock of $5,000,000 to open these mines. The first step necessary will be the construction of a road to reach the property, that mining supplies and milling machinery may be easily and cheaply transported to the place of operation. This will probably consume much of the present season, but besides men and material will be sent in to commence the work of development by packtrain.

RICH GOLD FINDS.—We alluded yesterday in the *Expositor* to some fine specimens of gold quartz left at the Board of Trade rooms as samples, but then could not give the names of the parties or the locality of the mine. The secretary informs us to-day that the owners of the property are H. Sherwood and A. B. Chambers, and it is known as the Bonanza mine. It is located in Auberry valley, at Temperance Flats, about 30 miles from Fresno. At present there is but a small force of men working the mine, taking out about 20 tons daily of good quartz from a well-defined lead, the ore averaging about $2000 to the ton. The shaft is now down about 100 feet. Mr. Sherwood is very confident that there is a wide gold-field in the vicinity, and invites prospectors to come out and prospect. He says he has enough in the mine they are working, and now desires others to come in and aid in developing the country.

Placer.

THE MAYFLOWER.—*Republican*, May 16: The Mayflower at Forest Hill has developed into a mine which promises to become as permanent and steady in its output as any of the famous quartz mines of Grass Valley. It will be remembered by miners that the new main tunnel which leads under the channel is 5585 feet long. From the end of this tunnel two gangways are run, one north and the other south under the old river channel in which the gold-bearing gravel is deposited. These gangways run through the bedrock and are a little smaller than the tunnel, being 6½ feet high and 5½ feet wide. The north gangway has now been run a distance of 440 feet, and the south gangway 525 feet. In the channel over the latter the breast of gravel now being worked is 75 feet wide and six feet thick. In the north gangway, the breast is 110 feet wide and six feet thick. At the north breast, which leads toward the shaft of the old works now filled with water, they have within a few days encountered a large stream of water which Supt. Chappellet thinks drains the old works and the whole mine. This breast is 920 feet from the old works, and the water is supposed to run down that distance through the gravel. When the mine is drained there will be little trouble in working northerly. Some prospecting has been done northeasterly from the junction of the tunnel and gangways, with the discovery of another channel as a result. It is probably the Orono which they found in the Breece and Wheeler. The Mayflower now employs 135 men, of whom 60 are miners. The others are engaged on outside improvements. The company is putting up a new boiler at the mill, and will also put in ten more stamps immediately. They are now averaging 150 tons of gravel a day, and also take 60 tons of bedrock from the gangways. The mill and compressor are being run by water-power, but steam must be used during the summer months, and the new boiler is for that purpose. Since the mine has been in operation through the new tunnel, the company has taken out $122,000. The first cleanup was made January 2d, and the last on the 2d inst. The average yield to the carload of 2250 pounds has been $10.50, and the cost of mining and milling is $2.50 a ton. The gold is 891 fine.

Shasta.

BULLYCHOOP ORE SHIPMENTS.—Anderson *Enterprise*, May 17: Three carloads of ore were shipped from here last week to the Hill smelter in Denver from the Foster mines at Bullychoop. The last shipment of ore from these mines to the smelter at Vallejo made an average of $168.98 per ton. Some high-grade samples of sulphurets which were shown us will assay more than $1000 per ton. This group of mines is destined to be one of the best paying in the State. There is now in sight 250,000 tons of ore that will average $150 to the ton. While there is not a great quantity of ore on the dump, sufficient force of men is kept working to keep a six-horse team hauling here steadily for shipment. The recent snowstorm made bad roads and hauling is now a little tedious, but sufficient time can be made to make shipments of four or five carloads a month.

IRON MOUNTAIN.—Shasta *Courier*, May 18: Go to L. Garrecht's saloon and see the specimens of Iron Mountain ore as put through the different processes until the bar of bullion on exhibition is produced. The specimens he has were taken from a ton of ore that produced $28 in gold, 525 ounces silver, and 27 per cent copper. This result was obtained by reduction on the ground, in small test works erected there. Heretofore the same character of ore shipped to reduction works a long distance away gave no gold return, at least none was reported back. It takes Frank Satterlee and Jim Sallee to get the mineral out of Shasta county quartz.

MIDDLE CREEK.—The roaster at the Calumet is now in operation, and the mill will start in a few days. John Kempton is now sinking a shaft for Deakin & Taylor on one of their mines in the Lower Springs district.

Siskiyou.

RIVER AND QUARTZ MINES.—Yreka *Journal*, May 22: The quartz from Abbott's ledge on Greenhorn, now being crushed at Warren's mill, on Yreka flats, promises to yield $30 to $50 a ton average, some of the quartz showing gold very plainly to the naked eye. The Schroeder & Werner quartz ledges on head of Deadwood still continue to yield handsomely, and the mill is kept running steadily, there being a great amount of quartz on the dump with a large force of men taking out more. The quartz in the ledge of the Gold Ball Mining Co., at Salmon river continues to improve in extent and richness, and bids fair to become one of the most permanent and best paying ledges on the coast. From Klamath river we learn that Pullen is getting on well with his work and hopes to be ready to pump out his claim in a short time. A Chinaman was killed at Pullen's claim Saturday evening by a bank of earth caving down on him. Jillson & Co. are hydraulicking every day, the recent rains, no doubt, having furnished a much better supply of water. Wm. Jillson has his dam completed, wheel built, and is almost ready to start the pump. Work at the Keweenaw mine progresses steadily; 200 feet of wing dam eight feet high are completed, and the whole 240 feet will be done this week. The head dam will be closed next week and the claim ready to pump out about June 10th. The company has a large force of men at work and will be taking out the yellow dust in about four weeks or less. Mr. Wm. Davis, who located a quartz ledge in Cottonwood mining district two weeks ago, christening it the Nest Egg, says his find is not for sale; that he knows when he has a good thing and might as well keep it as to sell and allow some other party to reap the benefit. He says it will take a year to open up his mine and get in shape to mill his rock. With the mines on Hungry creek, the quartz and placer claim around Cottonwood and the mines along the river near by, the northwestern part of the county is coming to the front as a mining section. There will no doubt be a large output of the precious metals from this quarter during the summer and fall. On Humbug creek there seems to be considerable activity, especially up the gulch, where the old Eliza mine is located. John Boyle has a force of 18 or 20 men at work in his new discovery near the summit of the mountain, and is extending the wagon-road above the Eliza quartz-mill site. The Thornton Thomas ledge, about which there was a dispute of ownership some time ago to stop operations, is now being worked with indications of striking big pay. The McCook mill is now running steadily in crushing quartz from Lawson's gulch, and the Hegler boys and Bruce Aldrich are also running their mill, with an abundance of rich quartz on hand, besides constantly getting out more.

San Diego.

AT JULIAN.—*Sentinel*, May 18: The Helvetia mine, about a mile east of town, has been purchased by Dr. Murray and E. C. Smith, who will at once put in machinery and develop the mine. They intend running a tunnel from the foot of the hill, to tap the main ledge at about 350 feet. Timbers for the tunnel are now being cut.

SOME exceedingly rich ore is being taken out of the San Diego mine.

THE mill at the Owens mine was started up yesterday.

NEVADA.

Washoe District.

ALTA.—Virginia *Enterprise*, May 18: The mill is running steadily and the ore reserves are looking as promising as ever—better, in fact, as the winze from the 950 has run through ore continuously.

HALE & NORCROSS.—On the 400 level the stopes in north drift from the west crosscut continue in good ore. The north drift was advanced 18 feet and shows the same character of ore as the stopes. The winze from the south drift from joint west crosscut is down 60 feet and connected on Thursday last with the north upraise from 500 level. The north and south upraise on this level continue in ore of good quality. On 600 level are extracting usual quantity and quality of ore from the several stopes. During the week have hoisted 1277 cars of ore, have shipped to Nevada mill 1020 tons, and have milled 1040 tons; average battery assay, $26.60. Have bullion on hand and previously shipped for this month amounting to $30,104.98.

OVERMAN.—Extracted 313 tons of ore, and shipped to the Vivian mill 244 tons. At a point 54 feet above west crosscut No. 3, have drifted 24 feet through quartz. At a point 60 feet south of west crosscut No. 3, and 63 feet above the track level, have made an incline upraise to the east 76 feet and to the south 33 feet. Formation, quartz and porphyry. On the 6th instant shipped a bar of bullion; value, $10,272 43.

SAVAGE.—On the 400 level the joint west crosscut has been advanced 25 feet. Face is in porphyry and clay. From Nos. 1 and 2 west crosscuts we are stoping ore of fair grade; are also extracting ore from the old stopes in the north and south drifts. During the week have hoisted 515 tons of ore. Have shipped to the Rock Point mill 468½ tons, and have milled 490 tons. Average battery assays, $21.

BELCHER.—Have been engaged most of the week in timbering loose ground in the 1105 west crosscut and in preparing to raise on the streak of ore uncovered in it. The raise was started on the 12th instant and is up 6 feet. Have completed repairs to the 1000 level incline station and chutes, and have started a south lateral drift from it. Are also engaged on the 1200 station with a similar object in view.

CROWN POINT.—Have opened the eighth floor in the south stope on the 400 level, and so far it shows a little improvement over the seventh floor for width. Are extracting some ore from the 160 west stope, and will soon start a west drift on the 250 level to strike the same body if it extends down that far. Have shipped to the mill 890 tons of ore during the week.

YELLOW JACKET.—Are extracting ore from the 1100 upward. The battery samples at the Brunswick mill average $30 a ton. Have started to crosscut west on the 500 level, to strike a ledge of gold-bearing quartz, calculated to be about 2000 feet distant. It will strike the ledge at a depth of 1500 feet.

SEG. BELCHER.—The west crosscut on the 1100 level is now out 387 feet. What is believed to be the footwall was encountered May 14th. Should this prove to be the case, will stop the drift and start a raise in the vein and on the ore streaks found in the crosscut, and follow them.

ALPHA.—The 500 level east crosscut, 50 feet south of Alpha shaft, is out 66 feet; face in porphyry. The east crosscut on the south line is out 110 feet; face in porphyry.

CONFIDENCE.—The joint Challenge-Confidence north drift on the 300 level is in 155 feet, 20 feet having been added during the week. The face shows porphyry.

POTOSI.—North lateral drift, 750 level, is out 216 feet; the face is in clay and porphyry. The north lateral drift, 285 level, is out 271 feet; face in hard porphyry.

JUSTICE.—Have been sinking from the 650 level since the new double-hoist engine has been put in place and running the mill steadily.

HAYWARD.—Are now working ore from below the tunnel level, near the hanging-wall, and keeping the Taylor mill stamping.

NEW YORK.—West crosscut, 240 feet north of shaft, 800 level, is out 174 feet; the last 5 feet is in quartz giving low assays.

EXCHEQUER.—On the 382 level the west crosscut on the north line is out 135 feet; face in porphyry.

CHOLLAR.—The south lateral drift, 750 level, is out 463 feet; face in quartz giving low assays.

BALTIMORE.—Still drifting on the 338 level and saving ore for reduction.

WEST CON. CAL. & VA.—No work is being done in this property at present.

ANDES.—Drifting west on the 350 and continuing repairs on the same level.

BULLION.—Drifting north on the ledge on the 760 level.

Eureka District.

FAULT OF OWNERS, NOT MINES.—Cor. Eureka

Sentinel, May 18: Eureka district has produced in round numbers, as near as can be ascertained from official sources, about $80,000,000 of gold, silver and lead bullion. Ore has been taken out of 235 mines of the district and sold to our furnaces. Two of our companies operating in the district have each declared dividends amounting practically to $4,000,000 and aggregating $8,000,000. Neither of these two companies has worked to a greater depth than 1200 feet, and no other company in the district has worked to a greater depth than 850 feet. Most of the work done on the 235 mines has been done by poor men—prospectors—who were financially unable to do expensive deadwork to open their mines properly, and may fairly be termed "surface scratching." Three principal tunnels have been driven into Prospect Mountain—the Eureka, Prospect Mountain, and the Ruby Hill. The Prospect Mountain tunnel is over 2000 feet in length, and its eastern end is under several very prominent mines. The depth from the tunnel level to the surface is about 1000 feet; the other two tunnels are about 1500 or 2000 feet in length, and each passes under mining claims that have yielded good ore. Good ore has been taken out of mines through the Eureka and Prospect Mountain tunnels, and good ore is now being taken out of each, as well as out of the mines of several companies and those of a large number of individuals. And yet there is an evident lack of energy, of vim, in nearly all mining enterprises in the district. With the above showing, why is this? Why are the 200 ore-producing mines of the district, owned by poor men, permitted to lie comparatively idle? Is it because the mines are not sufficiently promising to justify the necessary outlay to develop them? I will venture to say there are 50 mines in the district today that show better prospects at the surface than the Richmond (with about $4,000,000 dividends to its credit) did when it was located. It is fair to assume that the fault is that of the owners and not of the mines.

Pioche District.

RAYMOND AND ELY.—Cor. Salt Lake *Tribune*, May 18: A letter just received from Pioche states that the water level in the Raymond & Ely mine was reached last Friday evening and that the main shaft and the pump shaft are both repaired down to the 1200-foot level where the cage now descends. The Cornish pump column is now repaired to the 900-foot level, and in about a month or six weeks this big pump will be ready to start up. In addition to repairing the shaft, the Pioche Consolidated Co. has been prospecting the virgin ground of the R. & E. Some time ago a vein of ore was encountered in the 10th level that averages four feet thick of very fair smelting ore. A winze in it is now being sunk and as work progresses it improves greatly in quality; but the real bonanza is the famous black ledge. The machine shops are in full blast turning out the machinery for the concentrator and reduction works, now rapidly nearing completion. On the opposite side of the building adjoining the Bruckners to the southeast is the site selected for the smelting works. A 40-ton water-jacket smelting furnace has already been ordered, and work will commence putting it in place as soon as the machinery arrives. A prominent feature in the mines of Pioche is that the ore in all of them changes from free-milling to smelting ores as depth is attained, the Yuba mine being a fine example of this. The ore in the upper levels was chiefly free-milling, and as the lower levels were reached it changed to the very finest smelting ore, but base, as the old-timers would call it.

Siegel District.

GALENA ORE DISCOVERY.—Virginia *Chronicle*, May 21: A vein of galena ore three feet in width was exposed by a recent cloudburst or washout in Siegel district, about 20 miles northeast of the Comstock. There were no surface croppings to indicate the presence of the vein, the portion exposed by the washout being located in the bottom of a ravine. The ore is almost solid galena and assays $280 silver and $9 in gold per ton and carries about 38 per cent in lead. The discovery has led to the location of several claims in the district along the course of the vein, which has a southwest trend.

ARIZONA.

REDUCTION WORKS AT PRESCOTT.—*Courier*, May 13: The hope of miners and others is that works will soon be put up that will treat all valuable classes of ores, right at home. Our own people are scarcely able to carry the scheme to the point of success, but they propose to make a sturdy beginning. To this end, the *Courier* calls upon the people of the town and country to unite their ideas, might and means. The ores are here, sure, to keep a large plant going, but the plant must be of the right pattern, run honestly and intelligently, in order to accomplish purposes for which it is wanted. Taking out a few tons of very rich ore, each day, or hour, for that matter, having "it" sampled here, then shipped to Colorado or elsewhere, to have the metals taken from it, will never increase population here. Plain milling has been tried to the utter disgust of miners and others, and it gives us the blues to hear of people throwing away their money in mills and milling. Ores of this section are base, and cannot be profitably worked by common mill process. Concentration, chlorination, smelting, etc., will have to be resorted to before we shall be successful. This, people who are now laboring to erect and run general reduction works here, know for a fact, and we ask every person in this town and section to do everything they can to help along the enterprise.

HILLSIDE.—Arizona *Journal-Miner*, May 16: Robert Brown has some very rich specimens of ore from the Hillside mine. Wm. Dunlap has sold to Thomas Brown the Treadwell mine, Hassayampa district, for $500. Alex. Carlisle yesterday conveyed to Jos. Chambers one-half of Forest Queen mine, at Big Bug district, for $1000.

OCCIDENT.—W. A. Rowe is in town to-day, having just returned from a trip to the Peck mine. He says that a very rich strike was recently made in the Occident mine, the ore being similar to that taken out of the Peck. Samples assayed from it gave a value of $2000 per ton. Major C. P. Eagan, owner of the property, is expected here in a few days. The discovery has created considerable excitement in the old camp.

LYNX CREEK.—A gentleman just in from Lynx creek says the Dixie mill is a substantial and commodious looking structure. Copper Basin smelter continues to run, and regular shipments of bullion are made to Prescott every day. Alex. Harris returned last evening from Squaw Peak district, and says that work on the Wire Gold mill is progressing satisfactorily.

TURKEY CREEK.—W. J. Mulvenon yesterday purchased a whim, and has shipped it to Turkey creek, to be used in raising the water from the Mulvenon and Roach mine. The framework for the Congress mill is being erected. There are 100 names now on the company's pay roll, and they are prepared to ship 150 tons of ore per month.

BRITISH COLUMBIA.

DIFFERENT DISTRICTS.—Donald *Truth*, May 11: The mining business is beginning to take a little spurt upward in this section of Kootenay district. Work has been commenced in earnest on a smelter at Revelstoke; that it will be continued to completion is not altogether a conundrum, as it is said the syndicate has $57,000 to its credit at the Commercial Bank at Winnipeg. While the syndicate may not have enough ore of their own to continuously run the smelter should it be blown in, outside prospects and mines will undoubtedly help out. There is no hope of getting even a small fraction of the ore of the Toad mountain and Kootenay lake districts up the Columbia to Revelstoke this year, so the ore will all go south to the Northern Pacific. Development work is going on on both sides of Jubilee mountain. John McCrea has struck a good body of ore in the Maggie McCrea; Cham McKay has men on his claims, and Jones & Wells have tapped the Spilimichene ledge with a 50-foot tunnel. They will at once begin another tunnel so as to strike the ledge at a greater depth. A new trail has been cut into McMurdo, and the owners of claims in that promising district will at once begin operations. The wagon-road to the Corbin & Kennedy mines on the north fork of Illecillewaet will be completed by the middle of June, which will enable that firm to put in the machinery required to work their ground. A dozen or so men are prospecting the placers of Canyon creek near Golden. Little actual work will be done out on Porcupine creek before June 1st, Rosamond, Kirkpatrick & Co. have a trail cut in to their claims on Toby creek, and they hope to make a big showing before the summer is over. They have some very promising ground. Work is said to be progressing on Dr. Orton's claims on Arrow lake, and from the amount of supplies going up to the Big Bend country, that section's output of dust this year will figure up in the thousands.

COLORADO.

MINING ACTIVITY.—Denver *Republican*, May 16: It may not be generally known, but it is nevertheless a fact, that mining in Colorado is experiencing something that much resembles an excitement. Go where you will, and the discovery will be made that people everywhere are investing in what they are pleased to term "holes in the ground" in Colorado. If these people are using the same judgment that they would exercise in their various vocations or business in which they engage in life, they will, or can, in nine times out of ten, get their money back many times over. The hills and mountains of Colorado are filled with the precious metals. Where to look for a mine the geology of the country plainly teaches, and the wonderful discoveries that have lately been made at Ouray, about Aspen and Red Cliff and other places, fully bear out this statement. The prospecting fever is on. Scores of men have left Denver in the last few weeks for the hills, the majority of whom have been outfitted by the quiet, staid business men of the city. Hardly three of the number have the same objective point, but every one of them is after a mine and many will make a location which, if properly developed, will in years to come produce for them a competency—such a thing as they could never have by toiling in the city at so much per diem. Judicious mining pays a better profit than any other business in which people generally engage.

ORE SHIPMENTS.—The Aspen ore shipments for the week ending with Friday last amounted to 2785 tons. This was a decided gain over the weekly shipments shortly after the railroads reached Aspen. Of the ore shipped, Denver obtained 1303 tons, nearly one-half. Leadville ranked next, Pueblo third and Kansas City fourth. The comparison of the Pueblo and Denver receipts is interesting in view of the prediction that, after Mr. Holden blew in his smelter in Pueblo, that town would become as great an ore market as Denver. It has certainly not become so, in so far as Aspen ores are concerned. The truth about the smelting business in Colorado appears to be that Denver, having better railroad connections and more wealth than any other place in the State, is likely to hold the lead always in the reduction of ore as well as in nearly every other industry.

DAKOTA.

NEW PLACER DIGGINGS CAMP.—Cor. Deadwood *Pioneer*, May 16: Arriving here yesterday, I found the main gulch, Gold Run, to be an undulating bottom, bare of timber and underbrush, and bisected by a rapid watercourse, wonderfully clear and carrying about 300 miner's inches, and walled in by a series of low hills, timbered with heavy pine, and rimmed with croppings of limestone. The main divide, or cement body, lies on the left bank of this stream and prospects all along the ridge, which is about seven miles in length. The prospecting work at present has been limited to a few of the hundreds of little feeders which come from the cement body. They are all dry diggings and so far the outlook is very cheering. A couple of the boys, Ole Lee and Ole Larson, commenced yesterday sluicing their dirt, which they had to haul about a quarter of a mile and are making about $6 or $7 a day. A nugget which they took out last week is valued at $13. No work on bedrock on Gold Run or Blacktail, which empties into it about two miles from its mouth, has yet been done, as it will have to be drained, but the probability is that they will prove very rich, as all the feeders from the cement body empty into them. The present headquarters of the district is at Garvey's ranch, at which place a meeting of the miners was held last night, some 25 being present, at which the district was legally organized. The district is to be called the Limestone Placer Mining District, beginning at George Williamson's discovery location on Cement hill, and extending therefrom four miles north, east, south and west, thus forming a parallelogram. No miner is to be allowed more than one claim in each gulch, such claim to be 600 feet up and down the gulch from rimrock to rimrock.

IDAHO.

MINES AROUND WARDNER.—Wardner *News*, May 11: The only mines closed at or about Wardner were the Bunker Hill and Sullivan, and development work still progresses on them and will so continue until the completion of the company's new Mammoth mill. The group of mines surrounding Wardner have no equal in the Northwest, and when they are all worked thousands of men will be employed, and the biggest and most prosperous mining camp in America will be the result. Besides the Bunker Hill and Sullivan mines, which have a world-wide reputation, the following named have all been surveyed for patents: The Fairview, Rolling Stone, Forest Belle, Reed Fraction, Mammoth, Lackawanna, Phil Sheridan, Stemwinder, Emma, Skookum, Last Chance, Tyler, Viola, Oakland, Sierra Nevada and Ontario, all within one-half hour's walk of Wardner, besides an innumerable amount of locations reaching to Government gulch, a distance of four miles, on which claims are situated that give every indication of great wealth, and which only wait the momentous hour when development will prove them to be mines worthy of comparison with their peerless neighbors.

ALMA AND NELLIE WOOD CON. G. M. AND M. CO.—Since the 1st of April operations on the Alma and Nellie Wood Consolidated Co.'s mines on Elk creek have been entirely confined to development work. The mill being shut down on the 3d of last month, the number of men employed in the mine was reduced to 20.

SIERRA NEVADA.—The Sierra Nevada mine is gaining a widespread reputation as one of the veritable bonanzas of the Northwest, while the frequent rich discoveries made in its various workings excite the wonder and delight of all connected with it.

THE ALTURAS-SENATE MINING CO.—Ketchum *Keystone*, May 18: The Alturas-Senate Con. M. Co., whose property is situated at Galena, have commenced work, and the old camp shows signs of life and activity once more after its long period of inaction. The company owns 14 claims, but only three will be worked to any extent this season. These three are the Senate, Gladiator and Little Chief. Frederic F. Chisolm, M. E. of Denver, is manager and consulting engineer, but will only spend a portion of his time at Galena. The work will be prosecuted under the direct supervision of assistant superintendent George Philbrick of Ketchum. Between 30 and 40 men will be employed, the largest force being put on the Senate mine.

LOWER CALIFORNIA.

ALAMO QUARTZ.—Cor. *Lower Californian*, May 21: Some very rich specimens of gold-bearing rock have been found about seven miles from Alamo. In two instances the ledges have been found, which shows that the Alamo mineral belt is much larger than was at first supposed. A party of prospectors left Alamo Saturday to look at some new finds about 40 miles southeast on the mineral belt toward Valledares. Some good work is being done by prospectors on the borders of the Alamo mineral belt. The International Co. is crowding the work on the Telemaco, Penelope, Cleopatra, Ulises, Lopez, Cocinero, Princesa, Grande, Grandota, Grandisima, Red Cloud, Jupiter, Chispa and Jesse G. On five of the company's mines the men are working day and night. The company had 56 men at work on Monday at Alamo. Other mines will be opened as soon as supplies of tools, steel, powder, etc., reach the mines. As a whole these mines look exceedingly well. Capt. Ramsdell & Co. will have finished the work on the possession shaft of the Telemaco mine by the last of the week. They will also sink the new shaft on the Princesa, which will be put down west of the work already done. The vein has been uncovered for a distance of 600 feet west of the old shaft. The vein is looking splendidly and the ore holds up its reputation for exceeding richness. Miller & Co. are putting down the new shaft on the Ulises. The vein is looking well and shows free gold. Rosa & Co. are doing the work on the Cocinero and Lopez mines. The vein has been opened in four different places west of the old shaft. Gibbons & Co. struck good ore at the depth of 18 feet in the Jupiter. The ore on top at the point where the shaft was sunk was not very rich, but improved as the vein went down. On Saturday last very rich ore was struck at the depth of 11 feet in the Grande mine. The vein was badly broken on the surface and seemed to narrow down to almost nothing, but at 11 feet Col. Chase struck a large rich vein of ore. Free gold shows in the face of the drift on the Telemaco at the depth of 20 feet. The vein is fully five feet in width and rich in gold. The Telemaco is believed by many practical miners in camp to be the great mother vein. The Quinota mine was the first mine at Alamo to apply for possession, and the Messrs. Castillo have done well. They struck a very rich body of ore last week in the possession shaft.

MONTANA.

A PROMISING STRIKE.—*Montana Mining Review*, May 15: A barber named Bradley, at Wickes, is said to have struck the banner claim, about eight miles west of that place, and some excitement in that vicinity has been created thereby. The ledge is a big strong one, showing considerable quantities of very high-grade ore at the grass-roots, some of which shows native silver. Assays made from this new discovery run as high as 300 ounces in silver and 10 per cent copper, though some of the ore will undoubtedly run much higher than this. From developments being made in the locality of this find and other sections tributary to Wickes, it would seem as if the extent of the wonderful mineral resources of that section has, until a recent date, been only partially realized, but it is now attracting the attention of mining men from all over the county.

BONDING MARYSVILLE MINES.—The mining properties around Marysville are attracting the attention of outside capital, and from present indications it looks as though New York capital will be extensively represented. For some time past a party claiming to represent New York capitalists has been looking over the field and has succeeded in securing bonds on several of the properties adjoining the famous Drumlummon mine, among them being the Empire, Little Giant and Last Hope. It looks now as though Marysville will have a boom in mining this summer, and we shall watch diligently the developments made by this syndicate.

SOUTHERN CROSS.—Phillipsburg *Mail*, May 18: Reports from the Southern Cross mine from parties who have visited it from here are remarkably good. The shaft is now down 260 feet and the ore is of unusual richness for so a large a body. They are unable to continue sinking any further with the present facilities and will at once put an engine to work, when the sinking will be resumed.

GRANITE MOUNTAIN.—The output for the week ending May 16th was 58 bars of bullion, containing 90,500.40 ounces silver and 148.95 ounces gold.

NEW MEXICO.

ORE SHIPMENTS.—Rio Grande *Republican*, May 18: A car-load of ore from the Comstock was shipped to Pueblo this week. Lead went bounding up to four cents last week, but has gone down to 3.90. A deed has been placed in escrow for the property at Morenci, A. T., in which Dessauer & Smith of this city recently became interested. The deed calls for $35,000, and an interest in a mill which is to be built. The delay in the construction of the new Deming smelter is caused by the decision of Mr. Waring to put in extensive machinery for an improved and successful method of handling refractory ore. The new machinery is now being made and will be put in as soon as possible. Zinc ores are being shipped from Grant county to Joplin, Mo. The silver that is in the ore averages $12 and pays the freight. One property at Hanover is now in shape to ship two car-loads per day. These zinc mines have been thought to be of little value, but like the low-grade properties of New Mexico, it is gradually being demonstrated that they can be worked at a profit. H. N. Castle, who has been in charge of the lixiviation process at Chloride, in the Black Range, spent several days of last week in Silver City. According to the *Enterprise*, he claims that the lixiviation process has been a complete success on ores of that section, but states that it requires some experience with ore to know how to handle it. It has been determined by the owners of the Lady Franklin, Bullion, Superior, and other mines at Kingston, to adopt the lease system, and according to the *Shaft*, 30 men are now at work. This method of development has been carried on at Lake Valley for two years, resulting in a profit for the company, and also for the miners, quite a number making small fortunes from their leases.

OREGON.

CRACKER CREEK MINES.—Bedrock *Democrat*, May 13: Yesterday morning's west-bound train, arriving at 10:45, brought to our city by special car a party of prominent St. Louis and Memphis capitalists en route for the Cracker Creek district to examine the Columbia mine, which property they are negotiating a purchase of, based upon the report of their mining expert preceding them, Mr. John B. Farish of Denver. If Mr. Farish's report is favorable the purchase of the property will undoubtedly be consummated. The persons composing the party are Col. R. F. Looney, W. P. Dunavant, Abe C. Looney, Martin Kelly and Sam Tate, Jr. of Memphis, Tennessee, E. P. Cowin of St. Louis and Wm. Buchanan of Texarkana, Texas. All are wealthy and prominently identified with the railroad and mining interests of the United States. The mining property which is expected to fall into their hands is a most valuable one and is an extension of the celebrated Eureka and Excelsior mines owned by the Oregon G. & S. M. Co., composed of St. Louis capitalists. The property has been under rigid development for a year past and from all accounts it is showing up in a manner excelled by no other mine in the country.

STARTED UP.—Jacksonville *Times*, May 16: Stanley & Howell of the Homestake mine in Woodville precinct have started up their arastra, with good prospects. The Waldo hydraulic company has invested in a drifting machine, which arrived recently. It is said to work well. The rains of the past month have afforded enough water to enable the placer miners to do some work. Those who have good water privileges will be able to make a short run.

UTAH.

BINGHAM MINING SALE.—Salt Lake *Tribune*, May 18: The Stalwart and Talisman group of mines, owned by W. S. Martin, has been sold to some California and Seattle men, and the money paid over through McCornick's bank. The amount, while being kept private, is known to have been a handsome sum, as the consideration for these excellent mines. This sale means extensive operations on this valuable property, which Mr. Martin has been working for so many years.

MINERALS ON THE RESERVATION.—The Indian reservation in Uintah county appears to be the richest country in minerals in all the West. It is a great field for gilsonite, which alone can be mined because of a special Act of Congress in the interest of the company. Coal, iron, copper, lead, silver, gold and a number of other minerals are known to exist there, but cannot be mined, while ozocerite, petroleum, and other hydrocarbons are abundant. It is estimated that about 200 prospectors are scenting around on the reservation, dodging the military, since they have no rights there as prospectors. It is understood that an order will soon be issued warning all trespassers off the reservation, and that the order will be enforced by the military. It is a pity that this reservation cannot be thrown open to civilization.

MINES IN THE SOUTH.—Parties over from Marysvale say that the Antelope mine there is opening up bigger and bigger. They have gotten down on their vein now where the ore assays from $100 to $400 per ton. A miner who has been working at Silver Reef, says Woolley, Lund & Judd, in one of the Christy Co. mines, has struck it richer than it ever was. The camp has had a pretty black outlook for the last year, but the miners think it will soon be equal to what it ever was at its best.

MECHANICAL PROGRESS.

The Strong Locomotive.

Quite a delegation of New York newspaper men, occupying a special car, came to this city on train 1 on the Erie. The reason of the visit was the trial of the new Strong locomotive, which is being tested on the Erie. This engine involves an entirely new principle of construction, and if it continues to give the results it has already done it will revolutionize locomotive building in the construction of the boiler and valve gear. The boiler of the Strong locomotive is bifurcated at the fire-box end, forming two fire chambers, and contains two grates, the fire-boxes being joined to a single combustion chamber, which forms the next division of the boiler. These parts are made of corrugated steel plates, with welded longitudinal seams. The combustion chamber abuts against the tube sheet, and forward of this comes the main body of the boilers, which is traversed by 236 tubes. The boiler shell, itself bifurcated, incloses the two fire-boxes and the combustion chamber. A man can have access to every part of the interior around the fire-boxes. The two fires cooperate in burning the fuel. On one grate a very hot, thin fire is kept, while a new fire is kept burning on the other, thus burning the imperfectly oxidized gases. The absence of stays and crown bars adapts the boiler to withstand strains and jarring.

By the peculiar valve, however, the engine is expected to do away with the compounding of the cylinders. There is no steam-chest, but each cylinder is fitted with four valves, two exhaust and two steam valves. The steam valve has ten parallel openings, each 4⅜ inches long. The whole valve motion is worked by one eccentric, so that the usual link motion is not used. The general action is slow at the beginning of the movement until the cushioning of the exhaust end of the cylinder relieves the pressure, when the valve quickly completes its travel. When the engine is working at 250 revolutions a minute, it is claimed that the initial pressure cylinder is within two pounds of the boiler pressure.

The engine is capable of running at the rate of 70 miles an hour, and has made a mile in 47 seconds.—*Buffalo News.*

Opposed to Steam Machinery.

It is a somewhat singular fact that the Bureau of Engraving and Printing at Washington objects to the use of steam as a motive-power in a large portion of the work in that department. As to the full extent and character of the work which is directed to be done by hand, we are not informed, beyond the fact that all the paper money issued by the Government is so done. The *American Machinist*, in commenting upon this rule, speaks very properly as follows:

The opposition to the use of steam presses in the Bureau of Engraving and Printing at Washington seems to be based not so much upon a question of the comparative quality of the work done as upon the supposed injury to working people resulting from the introduction of steam presses. We think that opposition to improved machinery and methods for such a reason is very short-sighted, and that those who think machinery is responsible for our present industrial evils do not look very deeply into such matters.

History informs us that working people have been very successfully oppressed—for a time—in most, if not all, of the older civilizations, even those which existed before machinery was thought of. In ancient Rome the working people were very sorely oppressed without any assistance from machinery whatever, and those who are inclined to think machinery of itself oppressive would do well to look up the condition of the working people during the latter part of the existence of the Roman Empire, and notice what it was that made their oppression possible and sapped the manhood of the people to such an extent that the destruction of the Empire was made easy. Machinery did not do it. And look at the nations in existence today. Are those in which labor is most oppressed the ones in which the use of machinery is most common? Is it because machinery is so much more generally used in Ireland than in this country that Irish labor is so much worse off than American labor? We think not.

The opposition to machinery is without a reasonable basis, and the time and energy spent in that opposition is worse than wasted.

Industrial Progress in Asia.

The ancient and populous continent of Asia is being invaded on all sides by the modern spirit of progress. England has long held possession of its great southern peninsula, into which she is now rapidly introducing railroads, steam engines and manufacturing machinery of various kinds. Burmah has recently come into her possession, which will soon open the door to that most secluded of all nationalities, the Kingdom of Thibet. England is already projecting a great continental railroad to connect her Indian Empire with the frontier of Eastern China. With progressive Englishmen on the east, south and west, and the Russian on the north, that immense Empire must soon open wide its doors to European progress. Russia has spread herself all along the northern border of Asia from the Urals to the Pacific ocean, and even the Chinese wall cannot prevent her from an early inroad into the northern portion of that Empire.

Persia has already opened her doors to the European, and the steam whistle is already heard along her vast and fertile plains. And now comes the report through the *Times of India* that Mr. T. S. Pine, C. E., who is the engineer to the Ameer of Afghanistan, is taking to Cabul this spring a lot of machinery for extensive iron works which he is constructing close to that city. Mr. Pine has already imported large steam boilers, engines, driving gear, an immense steam hammer, and machinery to be put up as soon as the buildings and workshops he has designed for them are finished. The site of these new iron works is on the north side of the Cabul river opposite the city, and not far from the village of Deh Afghan. When work begins, the presence of these new works, with their tall chimney, the noise from the steam engine and steam hammer to be heard throughout the city, will probably astonish the people in that part of the world, while the sight of the machinery in motion doing the work of hundreds of men is calculated to surprise them still more.

If manufactures be an indication of peace and civilization, then a new order of things has begun in the capital of the Afghans. Unfortunately, however, manufactures, especially in the iron trade, are being more and more utilized for the construction of destructive weapons, and it is anticipated that guns and rifles and bayonets will claim the first attention of the Ameer's workmen.

Iron has long been worked, to a limited extent, after native methods in all the provinces and in many districts in India. Modern works are now going up, or are already in operation in several localities. At the Barrakur Iron Works, which have, within a radius of five miles, excellent coal, iron and lime, the stock of pig iron produced the past year rose from 677 to 3683 tons. English iron, however, is still in common use, and generally undersells the local product. But all this will soon be changed, and both iron and cotton goods will, in a short time, be produced in sufficient quantities for local consumption, if not for export.

We may also mention in this connection that, according to the *Indian Engineer*, the manufacture of the Denham-and-Oliphert cast-iron sleepers is being briskly carried on in the East Indian railway workshops at Jamalpur, the daily output being from 400 to 500 complete sleepers. This gives employment to a large number of natives, and is the means of utilizing a large quantity of Burrakur iron monthly, the use of imported iron being entirely suspended meantime.

AN ADJUSTABLE COUNTERSHAFT.—Every machinist knows that it is best to keep driving belts just as loose as the nature of the work will admit, for by so doing the friction and wear upon the journals is much reduced, the life of the belt is very greatly increased, and it is much more easily handled and shifted from step to step of the cone pulleys when changing speed. Where only one thing is done upon a machine, it is, of course, possible to keep the belt about as loose as the work it has to do will permit; but in the case of a lathe, milling machine, or, in fact, most machine tools upon which a variety of work is done, there are times when it is necessary to have the belt as tight as possible, and yet, perhaps, most of the time it could be quite loose. Mr. Frank R. Hynes of Rochester, N. Y., has devised and patented an improved countershaft to enable a belt to be instantly adjusted to the degree of tension desirable for the work in hand. It is claimed that in the use of such a countershaft no greater tension need be upon the belt at any time than is absolutely necessary to make it pull the out, and thereby, as every machinist will know, a great deal of destructive wear and tear upon belts, machine, and countershaft journals may be avoided, besides effecting a saving of power, time (otherwise spent in lacing and unlacing belts) and of patience.

AMERICAN AND EUROPEAN IRON WORKERS.—We see, from a report just published on the production of steel in Great Britain and the United States, that 1048 hands in the latter country produced 4500 tons of Bessemer rails in a week, which would average 4.3 tons per man. In Great Britain, on the other hand, 600 workmen produced 1500 tons in the same time, or only 2½ tons per man. The average wages in America were, however, fully 35 per cent higher than in Great Britain, which nearly equalized the cost of labor per ton in both cases. The difference in the actual cost of production in the two countries must, then, principally be attributed to the great distances from which the American works have to obtain their supplies of raw material for the manufacture of Bessemer steel.—*London Practical Engineer.*

STEEL CHEAPER THAN IRON IN SHIPBUILDING.—It is generally estimated among English builders that if an iron vessel costs $48.60 per ton, a steel vessel would cost $46 56 a ton of her dead weight of carrying capacity. There is not at present any very great difference in the price of steel and iron ships; but the superior quality of steel ship plates gives them decided advantages over those built of the old metal.

SPEED IN WORK.—Cultivate a quick motion in all your work, tempered with sufficient care to avoid slighting, for true speed is that which needs no after-mending.

SCIENTIFIC PROGRESS.

Magnitude of Star Movements.

The elder Struve made the movement of the sun through space to be about five miles a second; but on the supposition of the brightest stars being between two and three times nearer to us than they seem really to be. We can now see that the actual speed of the solar system can scarcely fall short of 12 or exceed 20 miles a second. By a moderate estimate, then, our position in space is changing to the extent of 500,000,000 miles annually, and a collision between our sun and the nearest fixed star would be inevitable (were our course directed in a straight line toward it) after the lapse of fifty thousand years!

The old problem of "how the heavens move," successfully attacked in the solar system, has retreated to a stronghold among the stars, from which it will be difficult to dislodge it. In the stupendous mechanism of the sidereal universe, the acting forces can only betray themselves to us by the varying time configurations of its parts. But as yet our knowledge of stellar movements is miserably scanty. They are apparently so minute as to become perceptible, in general, only through observations of great precision extending over a number of years. Even the quickest moving star would spend 257 years in crossing an arc of the heavens equal to the disk of the full moon. Yet all the time (owing to the inconceivable distances of the objects in motion) these almost evanescent displacements represent velocities in many cases so enormous as to baffle any attempt to account for them.

"Runaway stars" are no longer of extreme rarity. One in the Great Bear, known as "Groombridge 1830," invisible to the naked eye, but sweeping over at least 200 miles each second, long led the van of stellar speed. Prof. Pritchard's photographic determination of the parallax of Cassiopeia shows, however, that inconspicuous object not only to be a sun about 40 times as luminous as our own, but to be traveling at the prodigious rate of 300 miles—while Dr. Elkin's result for Arcturus gives it a velocity of less than 400 miles—a second! The "express" star of the southern hemisphere, so far, is one of the fourth magnitude situated in Toucan. Its speed of about 200 miles a second may, however, soon turn out to be surpassed by some of the rapidly moving stars picked out for measurement at the Cape. Among them are some pairs "drifting" together, and presumed, therefore, to be connected by a special bond and to lie at nearly the same distance from ourselves. This presumption will now be brought to the test.—*Contemporary Review.*

Origin of the Great Lakes.

Mr. A. T. Drummond, a Canadian geologist, has recently published an interesting paper on the origin of the great lakes of North America. It has been the opinion of most geologists that these lakes were formed by glacial action, a view which seemed to find corroboration in the fact that a very large amount of debris apparently worn from the basins occupied by these sheets of water lies on the country to the south of their borders in positions where it could only have been brought by ice action. Mr. Drummond holds that glaciers had not much effect in eroding the lake basins proper, or in shaping their present outline. He furthermore holds to the conclusions that Lake Superior is the most ancient basin of this chain, and that it was formed in the Cambrian and Huronian times, *i. e.*, in the earliest stages of the earth's history. He regards it in part due to a downfolding of the rocks, as in the trough of a mountain valley, but that much of the detail of its shape was due to long-continued volcanic action, which has clearly occurred about its borders.

Michigan, Huron and Ontario he considers to have been low areas on the path of an ancient river, which existed before the glacial period, the basin-like character of the country having been given by the relatively recent warpings in the surface of the country. Erie and St. Clair he regards as the last formed of the lakes, these basins also being due to warpings in the rocks about them, which created barriers across the original outlets of the valleys.

There is no question that Mr. Drummond's explanation of the lakes shows that the circumstances of their formation were more complicated than is commonly supposed by geologists. It does not appear, however, that he has given quite sufficient weight to glacial action or to the processes of solution by which the waters of such great lakes extend their shore lines. A large part of the rocks about these basins other than Lake Superior are of a limy nature, and in parts more or less charged with saline materials, all of which readily pass into solution and go away to the sea. This dissolving process is of more importance in fresh-water basins than in the seas. The sea-water is already so far charged with mineral matter held in solution that it cannot readily dissolve the rocks with which it comes in contact. Where, however, fresh-water basins have their shores in contact with rocks containing a considerable quantity of lime, they readily and rapidly extend their margins by this process of decay.

SOMETHING NEW IN TELEPHONY.—M. Leon Esquille, a Mexican, it is stated, has perfected a marvelous invention in electricity and photography. By speaking in a photophone transmitter, which consists of a highly polished diaphragm, reflecting a ray of light, this ray of light is set into vibrations, and a photograph is made of it on a traveling band of sensitized paper. Now comes the wonderful part. If the image of this photographic tracing is projected by means of an electric arc or oxyhydrogen light upon a solenium receiver, the original speech is then heard. It is evident that there is no limit to the development of this peculiar combination of methods.

The Unconquerable Ocean.

We have bridled the elements and made the earth our storehouse. We have electricity, magnetism, steam and gravity for our servants, but the sea eludes us. We cannot master it nor foretell it. We trust ourselves blindly to it when we must, and escape from it thankfully when we may.

It is the last realm of romance left in the world. We put up our little futile safeguards about its edge—lights that reach out a mile or two, and life-boats that reach across the breakers, but these are nothing. A storm comes and all we can do is to wait and count the dead that are cast on the shore when the waves are through with them. The sea is a standing rebuke to our Aryan egotism, and until we conquer it our work will not be done.

Expert physical geographers have claimed that there is a close connection between the relative extent of coast line and civilization. They have found that commerce and good harbors go together, and that laws, learning and literature follow in their train. There are many facts which may be marshaled to support this theory, and yet there is nowhere that civilization and progress have proved themselves such arrant failures as on the seaboard. The history of the last few weeks vindicates the statement.

Fifty vessels are known to have been wrecked in a recent storm, and the loss of life was almost beyond belief. All along the Atlantic Coast, from Hatteras to Fundy, the wreckage of ships and men is to-day coming ashore to bear mute testimony to our failure. The ocean has foiled our art. It is as dangerous to-day as it was when Paul was wrecked on Malta. It defies us, and in its solemn ebb and flow, it is beyond us and above us.

COMPRESSED GAS AS A CAUTERY.—Dr. Benj. W. Richardson, ever foremost in practical scientific medicine, has made a suggestion in the last number of his English quarterly periodical, the *Asclepiad*, which is as interesting as it is novel. It is to use a jet of highly compressed gas as a cautery. It is known that accidents occur to workmen sometimes in factories where compressed gases are prepared or employed from such a jet impinging on any part of the body, and causing an injury of the same nature as a burn. Dr. Richardson turns this property to account, and suggests its employment for the removal of warts or small pendulous growths. It does not appear that he has carried out the idea in practice, but there is little doubt that we shall shortly hear of his doing so. He points out its advantages over the cautery, heated wire, or knife, in that it is less alarming and for the moment painless, as cold as an anæsthetic. He enumerates the gases which might be used, and specifies chlorine as no doubt most effective. He, however, gives the palm to carbonic anhydride (CO_2) as most manageable, cheap, almost inodorous, not unwholesome, and not inflammable, so that it can be used with artificial light. It is now a little over 20 years since Dr. Richardson introduced ether spray as a means of producing local anæsthesia. It remains to be seen whether the present suggestion may not lead to an equally important weapon in the armory of the surgeon.

EFFECT OF ELECTRICITY ON STEAM.—The condensing effect of electricity upon steam has just been demonstrated by Prof. Sorket, the electrician, at Genoa. In a darkened room he heated some water in a platina basin which was connected with an electric machine. Just above the surface of the water was fixed the other pole of the electric stream which passed through the platina and the water. An arc lamp made the steam visible as it rose from the heated water. As soon as the machine was set to work, the steam was observed to fall down upon the edge of the platina basin and there condense itself, instead of rising as usual. When the point was brought quite close to the surface of the water, the generation of steam was completely stopped, although the water continued to boil.

WILL ELECTRICITY SUPPLANT THE MARINER'S COMPASS?—The London *Electrician* reports a rumor from Berlin to the effect that a means has been discovered of using electricity for ascertaining the true north, instead of the magnetic needle; that, in short, the new means will be superior to the compass and is likely to supersede it. This will be welcome news to the sailing-masters of iron and steel ships, where the variation of the needle is often erratic. This discovery, if it is what it is represented to be, will also obviate the danger to which vessels are now subjected by the changed condition of their magnetism by induction during a lengthy voyage, to which may be attributed the loss of more vessels than is usually thought to be the case among maritime men.

GOOD HEALTH.

Health Condition of the State.

The report of the State Board of Health for the month of April contains reports from 75 different localities, with an estimated population of 701,950, which gives a mortality of 835, which is a percentage of 1.18 per 1000 in the month, or an annual mortality of 14.16, the lowest annual percentage at which we have yet arrived, indicating a remarkably good condition of the public health throughout the State.

Consumption, as usual, heads the list of decedents with 138, which, however, is a decrease from the number reported last month.

Pneumonia shows how rapidly its frequency is abating by recording only 45 deaths in April as against 76 in March. This rapid decrease in fatality is in a great measure due to the favorable weather during the month, which was warm and pleasant, without any extremes of temperature.

Bronchitis caused 21 deaths, the majority occurring in the very young or the very old. Congestion of the lungs is reported as having caused seven deaths.

Diarrhea and dysentery, although increasing very much in frequency, are not increasing in fatality in the same ratio. Cholera infantum again claims attention by its death-rate, 15 deaths being ascribed to it during the month.

Diphtheria was fatal in 19 instances, which is a decrease from last report.

Typhoid fever was fatal in 23 instances, a slight increase over last month's fatality from this cause.

Remittent and intermittent fevers are reported to have occasioned four deaths.

Cerebro-spinal fever—Nine deaths were reported from this disease—one in Chico, one in Ione, one in Sacramento, one in San Diego, two in San Francisco and three in San Bernardino.

Cancer has caused 32 deaths, a slight excess over the usual mortality.

No Prevailing Diseases.

Reports of sickness received from 80 different localities indicate a minimum amount of disease in the various towns heard from, many of them reporting no sickness whatever. These reports of an absence of any prevailing disease at this season of the year are gratifying to the sanitarian as an indication of the progress that sanitary science is making in the State. We believe that it is rapidly becoming a settled conviction in the public mind that without cleanly homes and surroundings, good health cannot be maintained. With the advent of the new law compelling the organization of a Board of Health or the appointment of a health officer in every town of 500 or more inhabitants, we expect a sanitary movement throughout the State that will not permit any town to abide in filth and take its chances of Providence averting an epidemic that its own sanitary condition has invited. Through these officers we hope to find many diseases entirely prevented from passing beyond their original place of development, and no disease allowed to attain to any epidemic proportions if sanitation can prevent it.

Malarial Fevers.

Malarial fevers are noticed in our reports with increasing frequency as the warm weather approaches. To the present time they offer no evidence of malignancy, the mortality being exceedingly limited. Many of these cases of fever can be prevented by a little attention to the surroundings of our dwellings; in seeing that no garbage or decomposing vegetable matter be allowed to decay in the cellar or outhouses; that the sewers are kept clear; to allow the surface water to be freely drained from our doors; by having cellars and outhouses thoroughly cleaned and whitewashed, and by being a little particular as to the source of water supply.

Bolted Flour Bad for the Teeth.

EDITORS PRESS:—I saw in a late number of the PRESS an article, under "Good Health," on the causes of bad teeth, ascribing them to bacteria. There is no doubt that bacteria will have an effect on teeth when in the right condition, but I think we must go beyond them for the prime cause. Probably there have been some bad teeth always, but the first place where they became common was in the manufacturing villages of New England from 1835 to 1845.

Here bad teeth were unknown before the mines were found. Now if we look for a cause we must find something that is common to all. Alcohol is not a cause, for teetotalers have bad teeth as well as drinkers; that climate is not the cause we know, for the natives and Spaniards here before the mines were found were not troubled with them.

In looking for the principal cause of bad teeth, I would name our bolted-flour bread. The first people to use white bread as a common food were the residents of factory villages in the Eastern States, and bad teeth followed the use of fine-flour bread to the West, finally jumping over the mountains to this State, where we have the worst teeth of all. After the mines were found, we, for a long time, had nothing to eat but bolted-flour (starch) bread, sugar and lard. Chemists say none of these will make bone, and as the teeth are mainly bone, of course, that being the case, our teeth were in a good condition for the bacteria to act on them. We got our first flour from Chili and afterward from New York.

The things (food) I have named all act in concert, not by hurting the teeth directly, but by failing to build them up, and the principal of these is bolted-flour bread. If this had been right, the others would have done but little harm; if this had been wrong and the others right, we would have been some better off, but the combination has been too much. Not only are our teeth nearly gone, but every other organ in the body has been injured by the same cause. We have more sickness and insanity among our people than any other, and all caused by too much bolted-flour bread (starch), sugar and lard. JOHN MARSHALL.

Sebastopol, May 7, 1889.

THE CHILDREN'S FEET.—Wise mothers see that the children have dry feet. Shoes should be loose enough to be comfortable always—half an inch longer than the foot, but not loose enough to slip round. Never let a child wear a shoe that is run over on the side or heel, and constantly discourage the habit of standing on the outer edge of the shoe, turning in the toes, or rubbing one foot over the other. Have the child taught from the earliest hours of understanding that the moment his feet are wet he must change shoes and stockings. Some children's feet perspire so as to keep the feet damp and cold; let such wear woolen hose. If mothers will make it a rule that the child's hose must be hung up when taken off, and the feet warmed before going to bed, they will save themselves much trouble. Too many mothers tie up the child's throat, a most pernicious habit, and allow the child to wear thin shoes or sit with rubbers on for hours.

DIED IN HIS COFFIN.—A man in Rothchild, Neb., dressed himself in a shroud and laid himself carefully into a coffin which he had purchased. In this position he went to sleep. When his friends discovered him a few hours later, he was dead. Any person who will lie down in an air-tight box, even with the cover off, will soon become asphyxiated from breathing over and over again the air in the box. Such air soon becomes overloaded with carbonic acid gas, which is heavier than common air and will not rise up and run over the sides of a close box, but will cause death in a very short time. The custom of using box cradles for infants is for this reason a very dangerous practice. Even when it does not kill, it often works permanent injury to the infant. Wickerwork or cradles open at the sides and bottom are the only ones which should be used. No doubt many deaths of infants have been caused by the use of close-jointed box cradles.

USEFUL INFORMATION.

Rattlesnakes.

One of the younger scholars of the Russ school, in San Diego, named Sadie Marigold, recently distinguished herself by killing a rattlesnake, which she very nearly stepped on, in the school-yard. The reptile was already coiled and ready to strike when the child discovered it. Her presence of mind in putting an end to its poisonous existence in all probability saved some of the numerous children at play in the yard at the time from being bitten. One of the boys of the same school killed one of the same species only a few days previously.

Another "rattler" was killed about the same time by a laborer on the Cajon Valley ranch. He had opened a gopher-hole which happened to be occupied by the snake. Unknown to himself he cut the reptile in two with the point of his shovel. Finding a rock in his way, the man reached his hand into the excavation and was bitten just below the knuckles by the forward half of the reptile. Immediate doses of whisky were taken, and though the hand and arm swelled to twice their natural size, the remedy was efficacious.

Apropos to the above, it is stated that a fine pointer on Hennagin's ranch, near Woodland, stirred up a large rattlesnake about two weeks since. He attacked and killed it after a savage fight. As soon as the snake was dead, the dog ran to a shallow mud-hole, buried himself for several hours and came out all right. Perhaps the instinct of the dog may be a good "pointer" to man. It is possible that a mud bath may be better than whisky in such cases, but then the latter is more convenient and tasteful—to some.

THE CUBAN FIRE FLY.—A most interesting experiment has recently been made in taking a photograph by the light of the Cuban fire-fly. The species of this insect belonging to the United States are well known, but its light-producing powers are very feeble compared with those of its relatives, the lantern-flies or cucuyos of Cuba, Brazil and Mexico. It is said that persons traveling by night in the tropical forest are accustomed to place these fire beetles on their boats to light the way, and that Cuban ladies mount the cucuyos as gems for their hair and clothing. A living specimen of these tropical insects was recently presented to the Bridgeport Scientific Society. It is about an inch and a half long and bears upon each side of its body oval spots resembling eyes. In the dark these spots emit a greenish light resembling that of tiny electric lamps in full glow. If the cucuyo is placed on a watch dial its light will enable one to tell the time of night, and it also clearly illuminates a small printed page. Its radiance seems to be in a measure under the control of the will, for, when a gas jet is rapidly turned on and off, the insect, whether from rivalry or some other motive, is sure to do his best. After various trials of the insect's power, the experiment of photographing by its light was successfully carried out. A copy of a family portrait was made, the insect being held within an inch of the original and in such a way that the rays fell perpendicularly on the negative. The time of exposure to bug light was about 30 seconds.—*Scientific American.*

WOOL COTTON.—A vegetable product that can scarcely be distinguished from wool, it is said, has been found in Arkansas. A gentleman named B. F. O'Kelly, who arrived in this city from Jefferson county, Ark., has recently presented to the Board of Trade of Fresno a sample of what he terms "wool-cotton," grown in the State and county named above. He knows little of its origin, except that the seed was obtained from the Patent Office at Washington, and during the past two years planters have been experimenting very successfully with it. It has the appearance of wool, and the fiber would be taken for wool by those not acquainted with its origin. When woven, the texture bears every resemblance of wool cloth and wears a gloss that even exceeds woolen goods. Mr. O'Kelly is largely interested as a planter in Arkansas, and although his wool-cotton is an experiment at present, he is firmly of the opinion that the fabric made from it will be a great favorite upon the market, and the demand constantly increase. The specimen of the crude wool-cotton can be seen at the Board of Trade rooms by applying to Secretary Smith. Some of the experimental cotton-growers of Fresno county examined it yesterday, and pronounced it a phenomenon in cotton growth.—*Fresno Expositor.*

FOOD FOR SHIPWRECKED SEAMEN.—At the French Academy of Sciences the Prince of Monaco read an interesting paper, showing that shipwrecked seamen who have to take to the boats without provisions on the high seas can obtain food from the ocean itself by trailing a dragnet made of any light stuff along the surface during the night. The net will in the morning be found to contain small shellfish available for food. In the sea to the west of the Azores the vegetable matter on the surface teems with animal life and fish which are capable of affording substantial nutriment.

CODFISH ON THE COAST OF SAN DIEGO.—It is said that D. Schuyler of San Diego City has about organized a party to explore the codfishing banks reported off that coast by the Fish Commission steamer Albatross. Twelve well-known San Diegans have been recruited for the voyage, which will take place in a steam-schooner. Several Gloucester fishermen will accompany the party, which will be further equipped with one of the Albatross charts. Black and blue cod are reported on the banks in vast quantities.

COLONIAL DAYS.—In the pioneer days of New Hampshire, articles of ornamentation were almost unknown, and most articles of use were rare. In 1768 there were in the town of Sanbornton, N. H., but three horses, three great-coats, and two men each owned a pair of boots. It is said that the first person who had shoes upon his horse gave great offense to a neighbor, who was about to go on a journey, by refusing to lend his horseshoes to be used on the occasion.

THE GOAT.—Col. Daniel of Talbotton, Ga., says that goats are spunky animals. He says that his father had a flock of goats, and that the goats while grazing came to a pond of clear water. They went to the pond to drink, and when they lowered their heads they saw their shadows in the water. They began to butt at the goats in the water, and failing to drive them away they continued to butt until the entire flock was drowned.

A NEW DEPARTURE IN LEGISLATION.—A recently enacted law in the State of Maine provides that "whoever by intimidation or force, alone or in combination with others, prevents a person, journeyman, or apprentice from continuing or entering into the employment of a person, firm, or corporation, shall be punished by imprisonment not more than two years, or by a fine not to exceed $500."

OBJECTS TO ELECTRICITY.—William Kemmler, who has been sentenced to die by electricity, for killing a woman, is in mortal fear of "death by battery," as he calls it. He says he would rather be hanged 40,000 times than suffer the electric death. The execution will take place at the Auburn State Prison soon after June 10th.

AMERICA publishes more papers than all the rest of the world combined. Last year its 17,107 periodicals printed the enormous number of 2,959,566,500 copies—enough to supply every soul on earth with two newspapers.

NATURAL COLOGNE WATER.—A spring of natural cologne, whose liquid has been analyzed but has the odor of patchouly, is a new wonder said to have been discovered in Algiers.

ELECTRICITY.

Progress of Electricity.

The progress of electricity in the United States is most remarkable, and bids fair, before many years roll by, with continued improvements in its use, to rank both gas and steam. Its growth is well illustrated by a large array of tabulated figures presented at the last meeting of the National Electric-Light Association, held at Chicago, by the president of the association, S. A. Duncan. In his carefully prepared table he gave the number of central stations and isolated plants in use in the United States at 4000 in the month of February, 1888, which one year later had increased to 5747, showing a gain of nearly 45 per cent. In the same month in 1888 there were 157,000 arc lamps in use in this country, which had increased within the following 12 months to 219,924. In February, 1888, there were in daily use 1,760,000 incandescent lamps, which had increased one year from that time to 2,504,490.

The capitalization of the electric-light companies in the United States shows an equally remarkable gain, for the returns as given in February, 1889, showed an increase for the year of $69,397,744. In August, 1888, there were 53 electric street railways in operation, with 44 being built. In February, 1889, there were 42 electric street railways incorporated but not contracted for. In the same month there were 378 electric cars in operation, with 329 under contract for roads not yet finished. The single-track electric roads in operation in February, 1889, extended 294 miles, with 273 miles under contract but not finished.

Economic Progress.

Great progress has not only been made in the general introduction of electricity, but the economy and efficiency of its use has also been largely improved during the last few years. A. R. Foote of Cincinnati has prepared some interesting figures in this connection. His showing, which covers a period of five years, is as follows: Dynamos, increased efficiency, 25 per cent; decreased cost, 40 per cent; incandescent lamps, increased efficiency, 100 per cent; increased life, 100 per cent; decreased cost, 66 per cent; carbons, decreased cost, 75 per cent; wire, decreased cost, 20 per cent; line construction, decreased cost, 20 per cent.

FELLING TREES BY ELECTRICITY.—Hitherto machines for felling trees have been driven by steam-power, but this is sometimes inconvenient, especially in thick woods, and electric power has recently been adopted in the Galician forests. Usually in such machines the trunk is *sawn*, but in this case it is *drilled*. When the wood is of a soft nature, the drill has a sweeping motion, and cuts into the trunk by means of cutting edges on its sides. The drill is actuated by an electric motor mounted on a carriage, which is brought up close to the tree and shackled to it. The motor is capable of turning around its vertical axis, and the drill is geared to it in such a manner that it can turn through an arc of a circle and make a sweeping cut into the trunk. The first cut made, the drill is advanced a few inches, and another section of wood removed in the same way until the trunk is half severed. It is then clamped to keep the cut from closing, and the operation continued until it would be unsafe to go on. The remainder is finished by a hand-saw or an ax. The current is conveyed to the motor by insulated leads brought through the forest from a generator placed in some convenient site.—*London Times.*

AN ELECTRICAL FIRE ENGINE.—Prof. S. S. Wheeler is the inventor of an electrical fire engine, which gives promise of good results. Some of the advantages claimed for this new apparatus are: It can be instantaneously started up at full speed; it is much lighter than a steam fire engine of equal power; it costs one-third less; it is safer and easier of control; it is noiseless in its operations, and it is economical.—*World's Progress.*

THE DYNAMO AS A SURGEON.—A peculiar and successful application of electricity to a new use was recently made. Charles Nier ran a needle into his foot, and after the surgeons had searched for it for a week, he was taken to the dynamo-room of the Suburban Electric Railway Co., and his foot held near one of the dynamos. In 15 minutes the needle was drawn out.

A NEW USE FOR THE ELECTRIC LIGHT.—The body of a boy drowned at Winchenden, Mass., recently, was found through the use of the electric light, a bulb being fastened to a pole and submerged, illuminating the water for a considerable distance in the neighborhood. The electric light promises to become an important aid in all manner of submarine operations.

ELECTRICITY AS A RAILROAD BRAKE.—The method of stopping the electric cars on the English road where the series system is used is not done by the ordinary brake, but by momentarily short-circuiting the motor and immediately reversing the current through the field magnets.

THE ELECTRIC LIGHT IN JAPAN.—The rapid adoption of electric light in Japan has caused a proposal to increase the capital of the Tokio Electric Light Company from $250,000 to $500,000.

TABLE OF CONTENTS.

EDITORIALS.—Hydrogen Amalgamators; The Reforma Mine, 373. Passing Events; The Recent Earthquake; The Prospector; Protection or Indemnity Needed, 380. The Tail-Rope System, 381.
ILLUSTRATIONS.—The Old Prospector; Amalgamator for Use in the Hydrogen-Amalgam Process, 373. Applications of the Tail-Rope System of Mine Haulage, 381.
CORRESPONDENCE.—At Silver King; A Point in Leaching Ores; A "Black Sand" Lode; Northern Counties of California, 374.
MISCELLANEOUS.—Remarkable Railway Building; Foundry at San Bernardino; Growing Cities in the Great Valley, 374.
MECHANICAL PROGRESS.—The Strong Locomotive; Opposed to Steam Machinery; Industrial Progress in Asia; An Adjustable Countershaft; American and European Iron Workers; Steel Cheaper than Iron in Shipbuilding; Speed in Work, 378.
SCIENTIFIC PROGRESS. — Magnitude of Star Movements; Origin of the Great Lakes; Something New in Telephony; The Unconquerable Ocean; Compressed Gas as a Cautery; Effect of Electricity on Steam; Will Electricity Supplant the Mariner's Compass, 378.
GOOD HEALTH.—Health Condition of the State; Bolted Flour Bad for the Teeth; The Children's Feet; Diet in His Coffin, 379.
USEFUL INFORMATION.—Rattlesnakes; The Cuban Fire-fly; Wool Cotton; Food for Shipwrecked Seamen; Codfish on the Coast of San Diego; Colonial Days; The Goat; A New Departure in Legislation; Objects to Electricity, 379.
ELECTRICITY.—Progress of Electricity; Felling Trees by Electricity; An Electrical Fire Engine; The Dynamo as a Surgeon; A New Use for the Electric Light; Electricity as a Railroad Brake, 379.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 376-7.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 388.

Passing Events.

The Keystone Mining Co. of Amador county proposes shortly to run its entire works by electricity. Where the conditions are favorable this system can be adopted with great convenience and economy. Before many years it is probable that many mining works will be run by electricity in this State, where water is available as the original source of power.

The Chinese Six Companies are reported to have purchased large interests in Lower California mines, and will ship 1000 laborers to work them.

The subject of the free importation of lead ore is being thoroughly investigated in Washington. It is probable that the existing condition of affairs will be changed, as it is injurious to the lead-mining interests of this country.

English capitalists are getting possession of leading quartz mines in Alaska, having purchased from American locators. What mines have been successful there are mainly low-grade propositions, but the ore bodies are very large and have paid well.

In this number of the PRESS we illustrate and describe the largest steel boilers ever made on this coast. Marine work is largely increasing with our local foundries.

The Recent Earthquake.

Shortly after 3 o'clock on Sunday morning an earthquake of unusually great duration occurred in this State which was felt from Santa Cruz on the south to Calistoga, and eastward to Nevada City. The shock was not a sharp one, the movement being slow, but the vibrations were prolonged. Prof. Holden of the Lick Observatory, Mt. Hamilton, says: "Our earthquake machine shows the up-and-down movement lasted 84 seconds. The period of each wave was about 1.7 seconds, which is very gentle and slow, and the double amplitude of the vertical waves was never more than .08 of an inch. The east and west movement consisted of strong tremors for nearly four seconds, when the waves began and lasted as strong decided movements for 29 seconds, after which the tremors continued until their trace was lost. Ninety seconds after the beginning, the periods of these waves is .8 of a second (very slow) and the double amplitude is about .03 of an inch. The most remarkable motions were in the north and south direction. The tremor was felt for 3 seconds, 10 large waves for 45 seconds succeeded by tremors until 132 seconds from the beginning. Their period was .6 of a second. The double amplitude is .05 of an inch. The duplex machine shows results agreeing with the above and indicates the very complex nature of the motion of the ground."

Through the politeness of Mr. Blinn, of Highland Park, East Oakland, and Mr. Burkhalter, of the Chabot Observatory, Oakland, we are enabled to reproduce the registers made by their respective seismographs. It will be seen by reference to these that the movements were a series of ellipses. In the diagram made by Mr. Burkhalter's instrument, the first of these were north and south, and the last from southeast to northwest, while the final mark was a swerve to the northwest before the pen came to rest.

Blinn Observatory. Chabot Observatory.

SEISMOGRAPH RECORDS OF SUNDAY'S EARTHQUAKE.

The marks made by Mr. Blinn's seismograph are northeast and southeast, and the register is double the size of that of the Chabot Observatory. In fact, this is ten times longer than any other record ever made since the instruments have been in position. The diagram represents the motions of the earth, but amplified four times. The motion was thus just one quarter of that indicated. We had a very sharp shock on the 18th of last November, but there was ten times more motion in this case.

The time as given at the Chabot Observatory was 3 h. 10 m. 44 sec., when the mean time clock was stopped. At the Davidson observatory in this city there was a difference of only two seconds, Prof. Davidson timing it as 3 h. 10 m. 42 sec. Clocks were stopped in many places in this city and Oakland. The peculiar feature was the length of the vibrations. It was the most severe in that respect felt here for many years, but its slowness was such that no damage was done anywhere within the area affected.

MINING COMPANIES' STATEMENTS. — Nine separate suits, commenced by Emanuel Eyre against the directors of as many mining companies, to recover $1000 in each case, for failure to post monthly statements of receipts and disbursements in the offices of the respective companies, as required by the law of March, 1880, are on trial before Judge Hunt. It is admitted that statements were posted by the officers of the companies in the form as advised by the attorneys of the corporations; but Eyre claims that they were not complete enough to conform with the requirements of law. Since the above was written, judgment has been entered for defendants.

THE work of photographing the stars of the Northern Hemisphere has been commenced at Mount Wilson with the Harvard 13-inch photographic telescope.

The Prospector.

The photo-facsimile on page 373 of an old prospector is a photograph from life made not long since in one of the mountain counties. The "Judge" who is handling the pan is a veritable "'49er," who still sticks to prospecting as an occupation. The scene is a characteristic one in the California mining counties. The old man was digging away on the edge of the bank of the river with perfect contentment, while the photographer who was immortalizing him was nearly melted by the fierce rays of the sun which were beating down with 106-degree power at the time. He seemed surprised that any one wanted to photograph him, but was pleased as well when one of the "pictures was promised him.

This particular prospector, it is remembered by the writer, had not been "in the city" for 20 years. He had been digging away in the creeks, canyons, rivers and on the mountains and hills for so long that he cared for no other life. But his is by no means an isolated case. There are hundreds of others as well contented to remain away from the centers of civilization, and who are wedded to the nomadic but free life they have led so many years. They are perfectly contented, being constantly buoyed up by the hope of striking it rich some day.

SUCCESS WITH LOW-GRADE ORES.—F. S. Chapin writes us as follows: "At the Manzanita mines, Sulphur Creek, Cal., your correspondent was greatly interested by the account of Superintendent Geo. V. Northey touching his experience with low-grade ores. After several years of poor success with many appliances and changes of machinery, he has discovered a plan of working that enables him to surprise the company with a dividend. His report of last run shows cost of mining and milling the ore of $1.29 per ton, and yield a little over $3 50. By increasing the plant and adding some better machinery, he hopes to still further reduce cost of working not less than 25 per cent. I am sorry not to be enough of a mining man to give a definite report of Mr. Northey's experience, and hope that he may be induced to place such items as he is willing to make public before your readers."

THE COAL MINERS' STRIKE at Gallup, N. M., was declared off on Monday, after lasting two months and causing untold misery to families in hard circumstances. The strike first originated from the talk of professional agitators, and when they saw that the companies did not intend to back down and were importing negro miners from Kansas, a meeting was held and the strike came to an end. The superintendents of the various mines consulted together and agreed to re-employ the good miners and drive the agitators from camp, which was done. The strike closed up for the time three big mines, making coal for railroad purposes scarce, and throwing out of employment over 3000 miners.

AN explosion of a small casting-box, into which molten metal was being run, occurred in the molding-shop of the Union Iron Works at the Potrero last week. Eleven men were injured, but only one seriously, and he was removed to St. Mary's hospital for treatment. The others were able to go to their homes, where they will be treated by the surgeon in the employ of the works.

POCKET MINES. — The little cut in Mr. Schaeffle's correspondence, in last week's PRESS, page 354, referred specially to the mines on Bald Mountain, though it appears in the paragraph concerning the "Bonanza claim." By reading the description of the "Bald Mountain Pocket Mines," it will be seen that the cut refers to them.

Protection or Indemnity Needed.

The following letter received by the publishers of the PRESS this week is one which shows the condition of one class of miners in this State who are unable to prosecute work on their claims under the present conditions of law:

I send you my note and will pay at maturity, or before if possible. We will have the debris commissioners here this month to see us miners; but I tell you we have a hard show to make a living out of the mines, for we are harassed from all sides, and even accused on some points. It is hard, I tell you, but when a man has a large family and no chance to run, he has got to stand and take it and do the best he can. Hoping that you will do the best you can for us, I remain Yours, — ——.

This is only a sample of the condition of many an honest miner who is in no wise to blame for his present predicament. The situation appeals to the sympathy of fellow-citizens everywhere. The Government and State should do the best that can be done to compromise the conflicting interest between the miners and farmers, in order that the innocent men in each calling should be protected, or indemnified for their losses as far as possible.

The debris controversy has been carried on very acrimoniously for some years, certain partisans on each side being unwilling or unable to see any rights of the other. Of late this feeling has been to some extent abated, but there is still more than there should be. The Government Commission now engaged in the practical study of the question will doubtless endeavor, as far as possible, to eliminate from the statements of both parties to the controversy prejudice and personal animosity, and bring to the solution of the problem unbiased judgment based on personal observation and a thorough professional knowledge from an engineering point of view.

If it be possible in their judgment to again permit the hydraulic mines of the State, under proper restrictions, and in certain localities, to be worked without detriment to other interests, the plans proposed should be submitted to the test of practice. And if they shall decide that only special mines may be worked, and others prevented from so doing, those who consider themselves aggrieved should obey the mandate.

It should be remembered that the miners do not consider that the so-called debris dams have been given a fair trial; and that they think the judgment that condemned them was given by an expert in law rather than an expert in engineering. The other side do not agree with this reasoning, and insist that the debris dams do not remedy matters.

But now skilled and experienced engineers of the Government, specially appointed, are investigating the subject, and, having no personal interests at stake, should be better fitted to decide than either of the parties to the controversy. Before many more months their report will be made, and it is greatly to be hoped that it will be of such a character as to put an end to the controversy and offer an acceptable solution. It is not alone the parties locally interested who suffer from the long delay of settlement, but the business and progress of the whole State is retarded.

MINES NEAR MAYBERT.—A correspondent at Maybert, Nevada county, informs us that all the mines in that section are working in full blast and paying well. "The Diamond Co. are making a new road so as to get their supplies from Emigrant Gap instead of by way of Nevada City, which will be a great saving. The Yuba mine is grading for a new air compressor so as to run more machine drills. The mine is paying better than it ever did before under the able and efficient management of George A. Hare, and his foreman, James Gribble. The Blue Jay Co. are packing rock to the mill for a test run."

MINERALS AND THE STATE FAIR.—The State Agricultural Society have not offered any very liberal premiums for mineral collections at the State Fair. An examination of the premium list which has been issued by the society, discloses the fact the best that is offered in this department is a premium of $35 or a silver medal. Offering a silver medal for an exhibit of gold ores seems rather sarcastic. The State Fair management does not seem to care much for the mineral resources of the State.

LYMAN BRIDGES of this city has been appointed by the President one of the engineers of the Irrigation Survey.

The Tail-Rope System.

In the tail-rope system of wire-rope haulage in mining, the hauling engine is located at a convenient point, generally the adit, and the *main* and *tail* ropes are attached to two rope-drums seated on the engine shaft. The end of the main rope leading from the drum is attached to the forward end of a train of cars, while the tail-rope, running along the side of the entry to the end of the line of tracks, passes around a sheave or wheel, so located that the rope is brought midway between the rails. The rope continuing between the rails is fastened to the rear of the train. In connection with each drum there is a friction clutch, by means of which one drum may be driven by the engine, while the other runs freely on the shaft. Thus, when a number of cars are drawn to the adit, the *main* rope is wound on its drum while the *tail* rope is paid out. To take the empties back into the mine, the ropes are attached to each end of the train as above, the engine is reversed, and the tail-rope, now acting as the hauling rope, draws the cars back into the workings.

In application, this system naturally divides into two sub-systems: 1st, that in which the main entry only is operated by wire rope, the mining product being transported from the side workings or entries to the haulage track by mules or gravity; and, 2d, that in which the side entries also are operated by wire rope, the haulage system in this case extending to all parts of the mine. One of the best systems of the former class is illustrated in Fig. 27, and is in use in one of the coal mines on the Monongahela river. This, with the other, we take from the paper of F. C. Roberts, read before the American Institute of Mining Engineers. The circumstances of location are such that it is necessary to place the engine and drums at a point intermediate between the two terminals, and not, as is usual, at one or the other end. This makes it necessary to employ two tail-sheaves, one at the parting *A*, and another at the parting *B*. The main rope is fastened to the drum *M*, and passing off is led around the tail-sheave at *B*, and attached to the forward end of the train at *C*. The tail-rope, on the other hand, is fastened to the drum *T*, and is led thence around the tail-sheave *A* and attached to the rear of the train. The main rope is supported between the rails by six-inch rollers, about 18 feet apart, and the tail-rope is supported overhead along the side-walls by rollers supported from the hanging-wall or roof of the pit. The rope is guided around curves by 12-inch wooden sheaves, arranged as in Fig. 28.

At the sharp bends, guide-sheaves, four feet in diameter, are placed, and guard-rails are introduced at the sides of the track to prevent the derailing of the cars, due to the angular pull of the rope at this point. The engine is double-acting, with 10-inch by 12-inch cylinders, and four-feet diameter drums, geared one to five and a half. The road is, approximately, 3300 feet long, and its daily capacity is about 750 to 900 tons. In this instance, the coal is hauled by mules from the side-entries and branches to the general parting. When a sufficient number of cars have accumulated, the main-rope is attached to the forward end of the train and the tail-rope to the rear end, and the train is hauled to the tipple. This is the simplest form of the tail-rope system.

When it is necessary to haul a set of cars into any particular one of the side entries, the connections of the rope in the main entry opposite the side workings to be operated are detached, and the engine end of the main rope is attached to the extremities of the side-rope which, as before mentioned, extends into the side work-

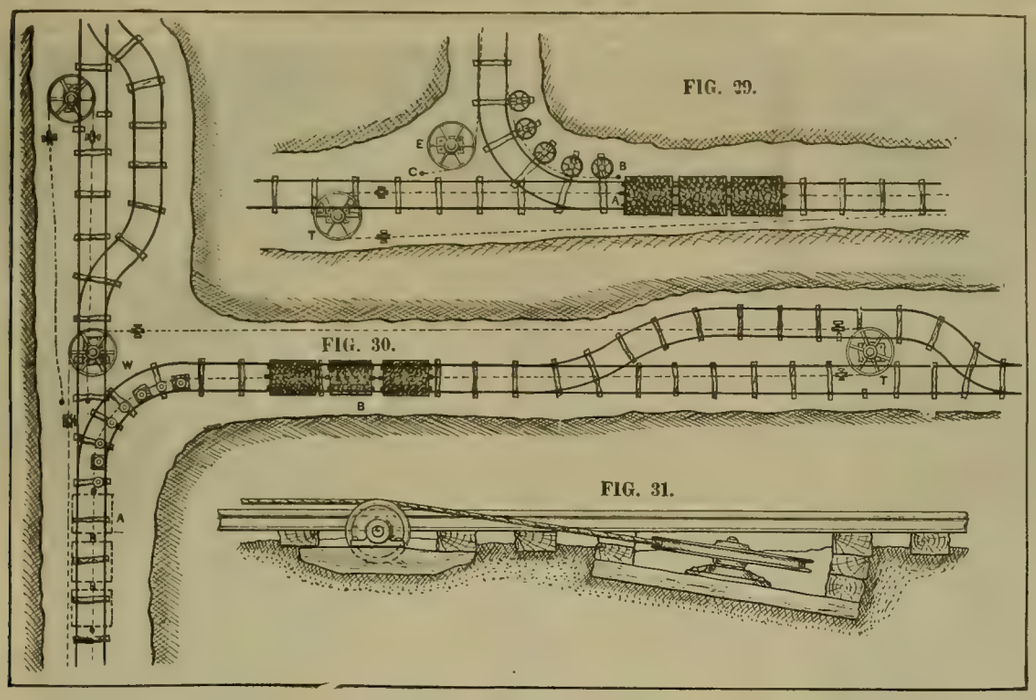

FIG. 29.

FIG. 30.

FIG. 31.

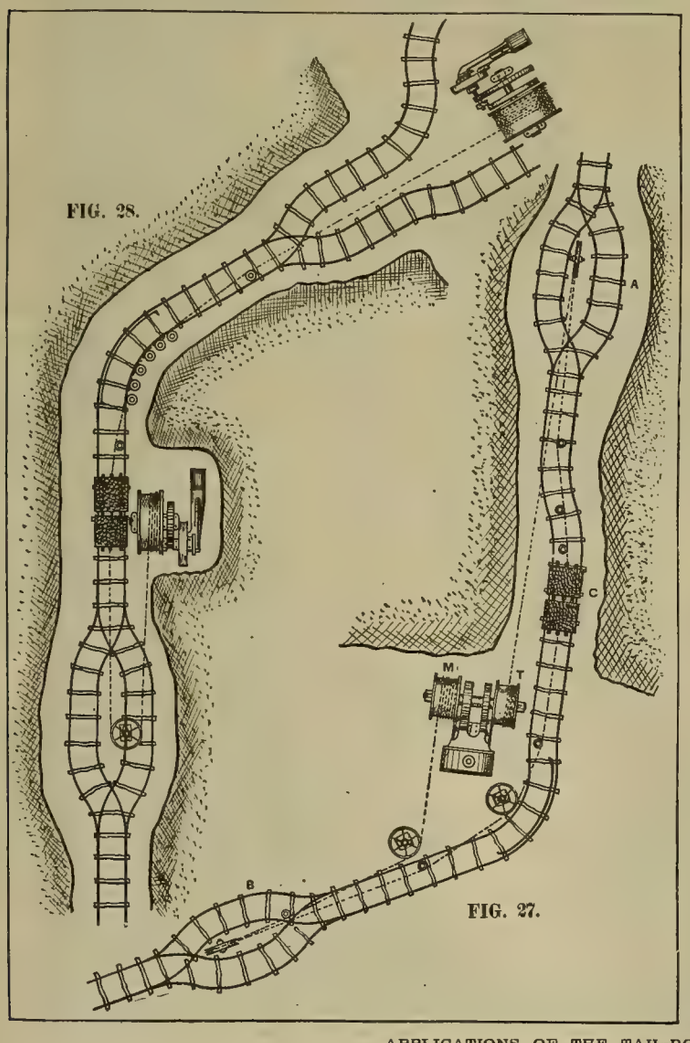

FIG. 28.

FIG. 27.

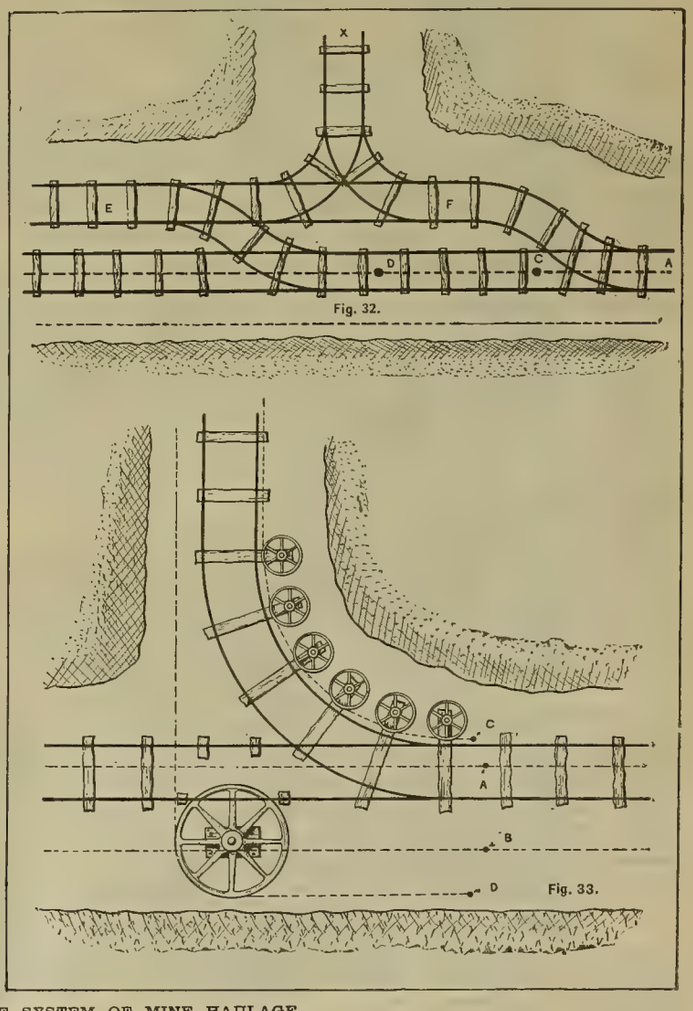

Fig. 32.

Fig. 33.

APPLICATIONS OF THE TAIL-ROPE SYSTEM OF MINE HAULAGE.

ing. When the connections have thus been made, we have what corresponds to the original continuous rope, but, in this case, the tail sheave for the rope is located on the side entry. Figs. 29, 30, and 33 illustrate the usual methods of arranging the side-entry ropes. Fig. 33 shows the arrangements permitting the changing of the ropes when the cars are at the adit. In this case, when it is desired to hau

set of cars into the side entry the main rope is detached at *A* and *B*, while the entry rope ends *C* and *D* are connected to *A* and *B*, thus forming a continuous rope passing into the entry.

Figs. 29 and 30 illustrate other arrangements, both of which are based upon changing the rope connection when the cars are near the side entry, and not, as in the former case, at the terminus of the system. In Fig. 30 the guide-wheel *W* is placed *under* the main track to permit the free passage of the rope, and the connections being severed, as before, one end of the entry-rope is attached to the train and the other to the main rope; and in this manner the side entry is operated as shown. The dotted lines at *A* show the position of the cars while the disconnection is made, *B* showing the train after passing into the entry. Fig. 29 shows an arrangement whereby but one disconnection is made in the main entry-rope, namely, at *A*, the head of train. The end *B* of the entry-rope is here attached to the car, and the end *A* of the main rope, being free, is drawn a little farther by the engine and attached to the end *C* of the entry-rope. In both of these latter arrangements, where the road is not level, the disconnection is of necessity made while the rope is under a severe stress, thus rendering disconnection a difficult matter. This is not true of the method illustrated in Fig. 33, as the ropes are here disconnected while the cars are at the end of the system, and the rope is consequently free from stress. The usual method of locating the tail-sheave is illustrated in Fig. 31.

When it is found necessary to locate intermediate loading points in the main or side entry between two terminals, the arrangement illustrated in Fig. 32 will be found convenient. Suppose a branch to a side entry at *X* and it is found necessary to have a switch station for loaded and empty cars at *X*. The empty cars coming from the direction *A*, the rope ends *C* and *D* are knocked off at these points, and the empties run on siding *E*. The rope extremities are now about opposite the front and rear cars of the loaded train at *F*, and can be attached at the forward and rear ends and hauled to the adit. Other dispositions of tracks and switches are sometimes employed, but none that have proved themselves so efficient.

Mexican Silver Mines.

The following additional information concerning Mexican mines we obtain from Mr. A. H. Dubois:

Los Cuates.

Returning to Copalquin, we strike westward across the spurs and gulches carved by erosion and atmospheric agencies out of the border of the mesas of the Sierra Madre range, and two days' travel through Alpine scenery and mineral ground bring us to Cuates.

Here is a mine called San Jose de Ledesma, discovered only three years ago, although rumors of old tradition point to the Indians having obtained silver from it, doubtless washed out of the weathered outcrops.

This mine has produced several

Bunches of Massive Native Silver.

The vein which carries these rich deposits is often very irregular, and runs into a precipitous bluff, oftener pinched up into a mere seam, then opening out into a narrow vein of barren quartz.

In the proximity of a bunch of native silver or sometimes of argentite, or of ruby silver, the vein usually widens out somewhat, showing some evidences of either of these minerals sparsely distributed in the quartz, and all of a sudden the miner, who often has toiled in vain for weeks or months, is rewarded by a bonanza.

Two years ago I saw one such bonanza, consisting of a mass of native silver, intermingled with but little veinstuff, about nine inches in thickness, and six or eight feet long by about four feet in breadth, and was detached from the wall by a couple of blasts, a gouge having been previously cut.

The whole neighborhood flocked to view the sight, and also with the hope of smuggling away, unnoticed, some stray pieces of the precious metal.

This mass was with considerable labor broken and cut up into manageable pieces, and subsequently melted down in native rude refining furnaces termed vasos, and produced to the owners proximately 40,000 ounces of silver; moreover, a considerable quantity, claimed to amount to one-fifth or one-sixth of the mass, was given away or mostly pilfered.

I am informed that several considerable bunches have been struck since, aggregating as much or more than the one referred to.

Half-way up on the ridge on the opposite side of the gulch is a large lode,

The San Antonio,

Carrying copper and iron pyrites. Old caved-in workings are visible, but when I saw it an open cut and a drift some 20 feet in length had been opened on the lode at some distance from the old workings, and thereby exposed a vein seemingly six feet in breadth. I found an assay value of 42 ounces in silver, besides considerable gold in the worst grades of the ores broken, consisting of dark quartz, much intermingled with porphyry, and carrying some 15 per cent of iron pyrites, and as high as 200 ounces silver in the massive copper pyrites.

Los Cuates is deficient in water supply; in fact, water for drinking purposes is barely available in the dry season, and probably it would be necessary to carry the San Antonio ores over the ridge, a distance of three or four miles, to the Refugio river, which would furnish water-power, with abundant fuel available. About one day's journey, northeast of Cuates, are the two camps of Galeana and Cuervo, held by American parties, who claim that their mines carry considerable bodies of silver ores with much gold.

Northwest from Cuates, about half a day's journey, on a hillside about 600 feet above the Refugio river, we come to large, open cuts or rather quarries. These are the remains of

The Once Famous Refugio Mine,

Discovered about the beginning of this century. At the surface it was a large deposit of rich, free milling, oxidized ores, carrying horn silver, argentite, and native silver. These were gouged out and quarried. Now a strong vein, carrying much very base and poor sulphurets, is in sight, and some development has been done on it, but only occasional spots of better ores are met with. These, when reached, show considerable ruby silver, intermingled with low-grade sulphurets.

Some 15 or 20 years ago about $70,000 was squandered here by an agent of Mr. Vidaureta's, the former owner of La Bajada mines. Buildings were erected, and but little money was spent on actual mining. Nothing was achieved and the enterprise abandoned. Some few chloriders here, styled gambusinos, are eking out a scant existence by gophering.

On visiting this mine a couple of years ago I was struck on finding the country rock, consisting of light-colored, friable shale, to be uniformly impregnated with oxidized silver compounds showing occasional flakes of native silver, and here and there small seams and spots of rich stuff permeate the deposit.

The dump of the mine, extending all the way down to the banks of the river and a couple of hundred yards in breadth, is claimed to amount to half a million of tons. A great amount of this (at least on the surface of the halvan) consists of the yellowish shale above referred to and the rest hard quartz showing a sparse sprinkling of sulphurets. As a matter of course, the lower part of the dump is claimed to be quite rich. There may be some truth in this; nevertheless none of the rich stuff is in sight.

On sampling the entire surface of this immense harvan, I found it to show by assay 10 troy ounces of silver per ton and no gold, and tests showed me that practically 90 per cent of this amount could be saved by leaching the unroasted ore by hypo after a previous treatment with salt and bluestone. Here crushing by rollers and raw leaching on a large scale at the very foot of the dump might prove a success. A considerable expenditure would be incurred to render water-power available from the Refugio river.

Some 15 miles up a branch of the Refugio river is the little town of Dolores, one day's journey west of which lies the important

Yedras

(Poison oak, not ivy) property, on which large leaching works are being successfully operated. Great trouble was formerly experienced in treating these highly arsenical ores bearing much calkspar as gangue. Said ores balled in the Bruckner furnaces and yielded a waterproof cement mass in the leaching tubs. Favorable results seem to be actually obtained mainly by the roasting in the Stetefeldt furnace, and some extra amount of silver is being saved by the use of the Russell process. North of Dolores, one day's climb over rugged ground brings us up into the southwest corner of the State of Chihuahua and we reach

Guadalupe y Calvo,

A small well-built mining town with some 5000 or 6000 inhabitants. It is in a gulch of the Sierra Madre mountains 8500 feet above the sea level in quite a cold climate.

The deposit seems to consist of a large body of quartz. Native mining men, who seem to be well posted, claim that two or more bodies of ore exist in close proximity to one another—carrying silver sulphurets (with some intermixture of base ores) and free gold.

It was discovered about 1840, and people flocked from all parts of the country, leading to the abandonment of many mining camps, among others of Refugio above alluded to. The ore was very rich in gold and shortly the desolate mountain gulch was studded with huts and arastras.

An English company soon obtained a lease of the property and took out in a few years a very considerable amount of bullion, mainly gold, by working the ores by Patio process with fair results. The grinding of the ores and amalgamation of the gold was accomplished in arastras in a deep canyon below the town, water from the considerable creek, being carried by a wooden flume to the head of the string of arastras (moved by water-power) placed stepwise one above another on the slope of the mountain. This company produced until 1848 the considerable sum of $31,000,000, which was coined in the Mint erected in this same town.

Subsequently the mine was again leased to a New York company, who put up a 20-stamp steam mill with pans and hoisting works, but seem to have attained very indifferent results.

On visiting this camp a couple of years ago I found that the mining operations were suspended and the mine "drowned" at a depth of 600 feet. I was informed by native miners, who are evidently well posted, that this last company had been working on a body of indifferent ores, but that the good body of rich quartz had not been touched by them in all the lower workings, and that it was intact.

The mill was working on the dump claimed to assay or yield $15 to $25 per ton, but the extraction was not close. They were also roasting tailings which were said to assay $20 to $30 per ton, but obtained very bad results, turning out very base bullion much charged with lead, and a low percentage of fine was extracted from these tailings.

On the whole, it would seem that this last enterprise made a complete failure, and from very late information received from this camp, it would seem that a company, consisting of the merchants of Guadalupe (among others the owners of the mines), have registered the mines as abandoned for non-fulfillment of the mining laws. I have but little doubt that henceforth they will be energetically and economically worked and the ores fairly beneficiated, and that Guadalupe y Calvo will shortly again be a prosperous mining camp.

Heavy Steam Boilers.

The Largest Ever Built on the Pacific Coast.

The screw steamship Australia, of which Messrs. J. D. Spreckels Bros. are the managing owners, has for the past two months been laid up for the purpose of converting her old machinery, which was on the compound principle, and using steam of 75 pounds pressure, into the modern system of triple expansion, using steam at 160 pounds above atmospheric pressure. The contract for the conversion was intrusted to the Risdon Iron and Locomotive Works, and is now rapidly approaching completion. Although it cannot be said that Messrs. J. D. Spreckels are the pioneers of triple expansion on the Pacific Coast, it is gratifying to note the spirit which animates the firm in desiring to place themselves in the front rank as steamship owners by keeping pace with the times as regards modern improvements, especially in such a locality where the cost of fuel is one of great importance to steamship owners. It has been proved beyond doubt that a well designed and constructed triple engine and boiler, using steam of 140 to 160 pounds pressure, produces a clear saving in fuel to the owner of at least 25 per cent over the ordinary compound system.

It will at once be acknowledged that this in itself is of vital importance to the shipowner, especially when keen competition and low freights have to be contended with, for in many cases it means on a long voyage the difference between a dividend and no dividend, and when it is borne in mind that the cost of maintenance in the triple machine is no more than that of the ordinary compound, due to the fact that in the engine we have practically a balanced engine with strains of more uniform nature, while the first cost amounts to but a slight percentage more, we do not hesitate to say that for deep-sea purposes the compound engine will soon become a thing of the past. The triple engine and boiler is a far more delicate machine, especially in the boilers, than its predecessor, and requires more careful attention on the part of the attendants, but as this is only a matter of educating the men to the higher pressure, all difficulty soon vanishes. It will be self-evident that more attention must be paid to the matter of cleanliness, for in dealing with the high pressure, any carelessness on the part of engineers in allowing accumulation of salts or grease over the more vital heating surfaces will be productive of failure, but seeing that every facility is given for thorough examination of the boilers, no excuse is permissible where such disasters arise.

We have much pleasure in presenting herewith illustrations of the boilers of the Australia. They are two in number, 14 feet 4 inches mean diameter, 16 feet 4½ inches long. Each boiler is fitted with six of Fox's corrugated furnaces three feet four inches mean diameter, 17-32 thick, having one fire-box common to each pair of through furnaces. It will be observed that the furnace fronts are flanged outward, thereby affording the means (which is highly essential) of hydraulic riveting. The back end of the furnace is flanged upward to take the tube sheet (the latter is 29-32 thick), so that in the event of a furnace crown collapsing, no difficulty arises in replacing the furnace, seeing that the furnace mouth is larger in diameter than the outside corrugation, and cutting at the back ends affords attachment for new furnace.

With the exception of tubes and braces, the boilers are constructed entirely of steel manufactured under the Siemens-Martin process. The shell plating, which is 1¼ inches thick, having tensile strength of 62,720 pounds, is built up of three courses, having two plates in each course. The longitudinal seams are fitted with butt straps inside and out, and are treble riveted, with the exception of end courses, which are double riveted; the circular seams are also treble riveted.

With the exception of the forward end circumferential seam, the whole of the riveting on shell and ends is hydraulic riveting. The machine used for this purpose was built in San Francisco, and exerts a pressure upon the rivet of 150 tons to the *square inch*. Where practicable, the riveting of the fire-boxes is also hydraulic.

The fire-box plating is composed of one-half-inch plates, excepting bottom, which is 11-16, and is single riveted to tube sheets. The plates forming the tops and sides of each fire-box are in one piece, so that only two plates form the outside of the box. The roof is efficiently supported by crossbars having braces screwed through the plate with nuts and washers inside. The sides are supported with braces screwed through the shell and also to each other. Each brace is protected with iron ferrules, in conformity with the U. S. Government requirements.

The flat part of the ends in the steam space are supported with wrought-iron braces 2¾ inches in diameter, having plate-washers 10 inches in diameter outside, with nuts inside and outside. The tubes are 3½ external diameter, No. 8 thick; the number in each boiler, 616. Every alternate tube, vertically and fourth horizontally, is fitted as a stay screwed through the front and back tube plates and beaded over at both ends, this plan having proved more efficient than that of fitting nuts which are liable to burn away. These tubes are three-eighths thick, and together with the plain tubes were expended by roller mandril. The whole of the plating is calked inside and out on the most approved principle.

The boilers have been constructed to conform to United States, Lloyd's Registry and British Board of Trade requirements for a working pressure of 160 lbs. above the atmosphere. With this pressure it is estimated, with the ample grate and heating surfaces provided, that the Australia, in ordinary work, and with coal of average quality, will develop 2300 indicated horse-power—and this upon a coal consumption of 39½ tons per diem. The previous horse-power of the ship was 1800, with a consumption of 50 tons per diem. With the new machinery, the ship is estimated to attain 13½ knots per hour.

The heating surfaces are as follows:

Tubes	6814 2
Furnaces	482 5
Fire-boxes	316 4
Tube plates	283 1
Total in two boilers	7896.2
Total fire-grate area in two boilers	234 sq. ft.
Ratio of heating surface to grate area	33.7:1

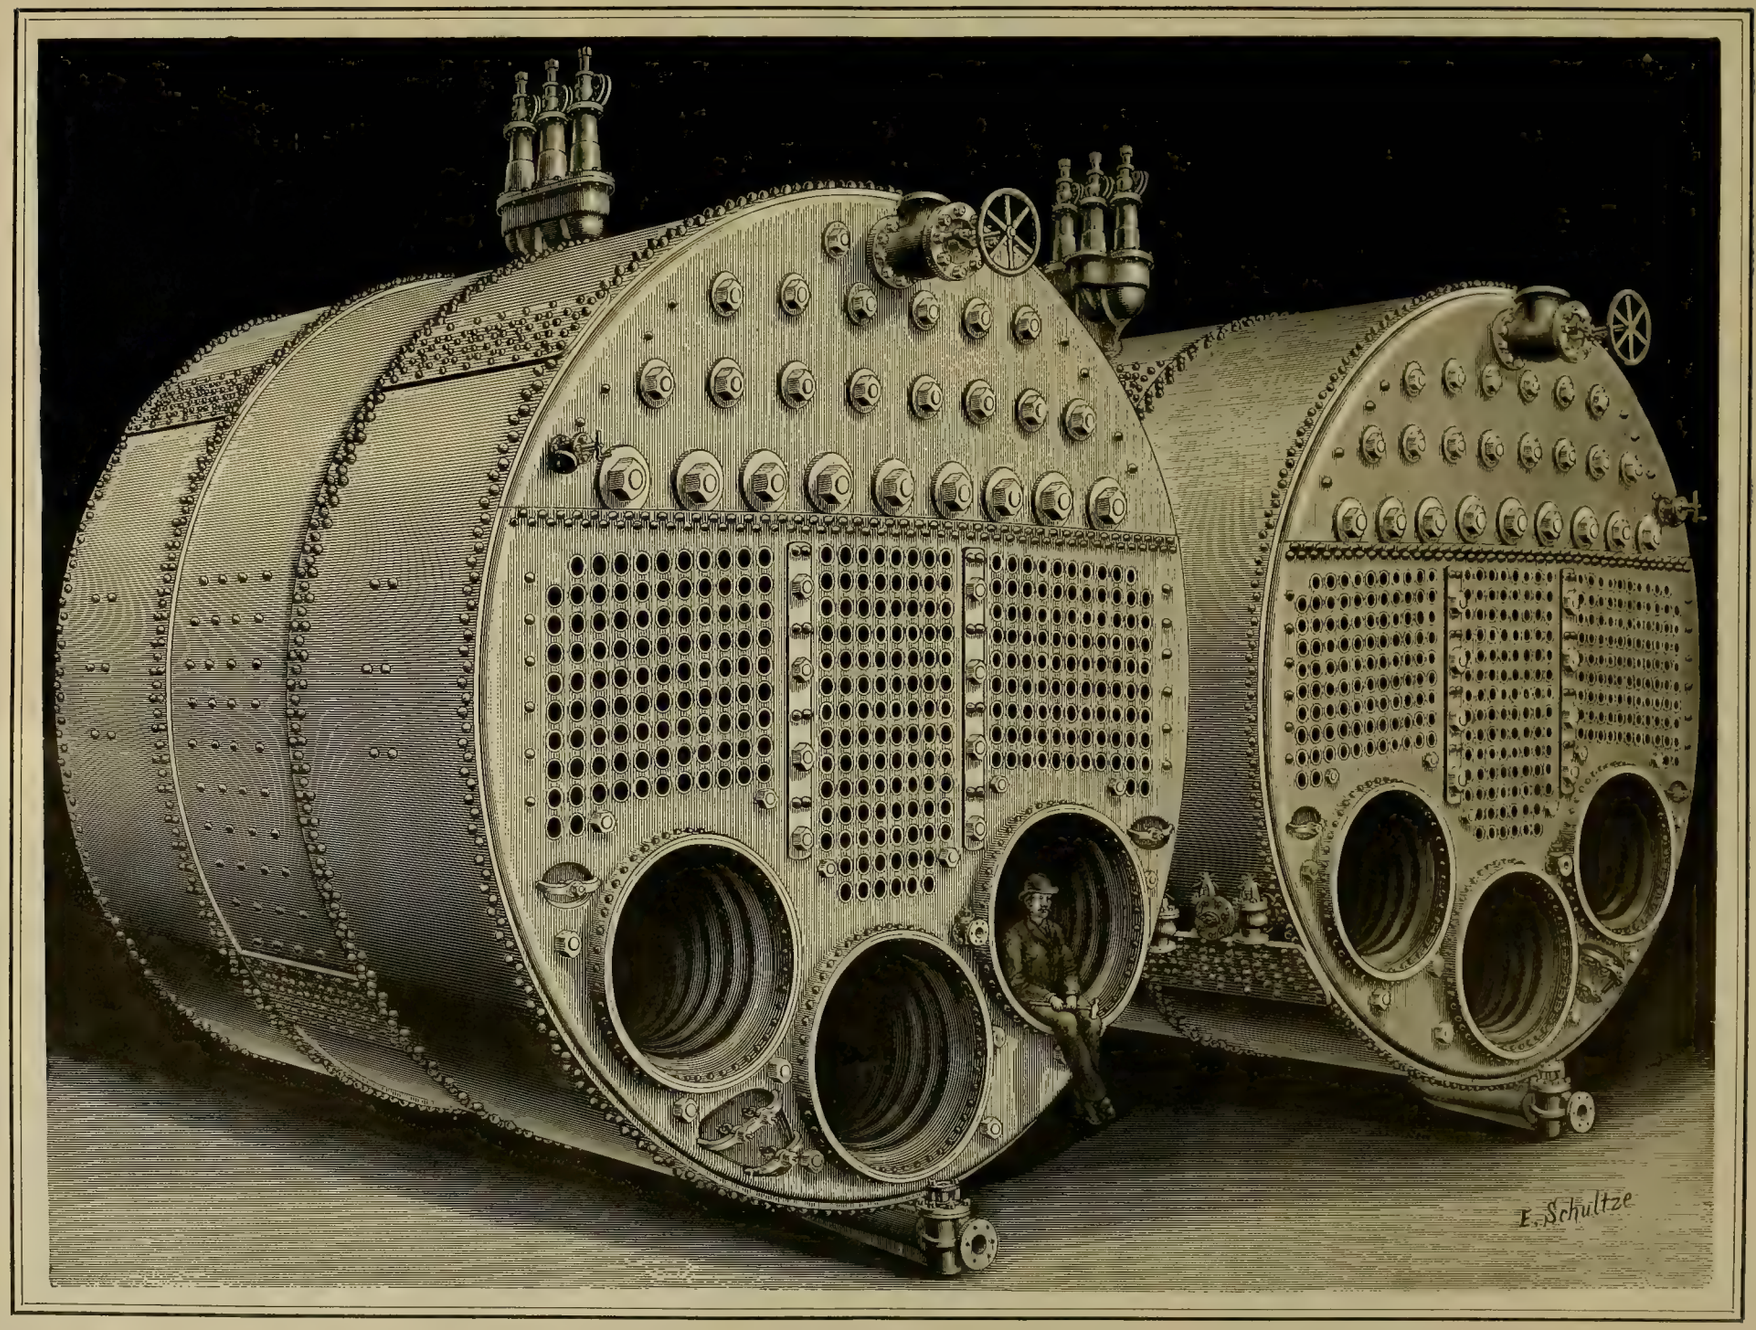
Each boiler is fitted with Cockburn's spring-loaded safety-valves—three to a set—and are 4 5 16 diameter. The advantage this type of valve possesses in a heavy sea-way over the common dead-weight or lever safety-valve, is well known to all practical engineers. All the valves can be eased from stokehold platform, and can be turned round while under steam.

Main stop-valves, with brass internal steam pipes, are provided on both boilers 7 inches diameter shutting off steam from engines and from each other. Surface, bottom, blow-off and drain cocks are also fitted together with a double set of water gauges and test cocks, having cocks at extremities of pipes on boilers. The main and donkey feeds enter at the after end of the boilers and are so fitted that either valve can be overhauled while under steam. Internal pipes carrying the feed away from the furnaces over the tubes are also fitted. There is connection with non-return valves on both boilers providing steam of reduced pressure into winch range.

As too much care cannot be exercised in raising steam in these high-pressure boilers, in order to reduce the possibility of leakage at bottoms to a minimum, Clarke's patent circulators, with steam connection from winch boilers, are supplied. Steam jets for blowing tubes at sea or in port are fitted. The fire-doors are constructed on Martin's principle and to the firemen are a great boon. They are perfectly balanced and open upward, so that a touch with the firing shovel is all that is required to open or close them, while in cleaning or slicing a fire they can be opened to the required hight and so prevent the intense heat from attacking the fireman, as is the case with the common swing-back door, which is a decided nuisance in a heavy sea. Ash-pit dampers and pricker-bars are fitted as usual. The fire-bars are of the ordinary type, in two lengths, supported on the ordinary dead-plate in front and on Tucker's patent bridge walls at back end.

The smokestack is also fitted with a damper worked from stoke-hold platform. All the steam and feed pipes are of hammered copper, having spigoted flanges on the locomotive principle, and the flanges of steam pipes are brazed and further secured with rivets. The boilers with their mountings in place have been subjected by hydrostatic test to a pressure of 320 pounds to the square inch (twice the working pressure) before leaving the works, and no evidence of weakness was discernible. The whole work proved to be perfectly stanch and watertight. Within two months from date it is expected the Australia will be ready for sea and will resume her place on the Honolulu route.

LA TRINIDAD.—One of our subscribers, who has just returned from La Trinidad mines, Mexico, where a number of Comstock miners went some months ago, informs us that everything is in a most deplorable condition at these mines. There is no money to pay the men, and some 12 or 15 miners, who came here recently, had difficulty in getting bullion to get away with. There are no less than four caves in the mines, the good ore being covered up. There is not a spot where metal can be found, and it will take some weeks to clear off the rubbish from the caves. The mine is said to be good, but the management poor. It costs about $2 to get out $1 in silver. The Comstock miners who went there have mostly come back, and those who have been paid got their wages in Mexican money. It is no place for miners from here to go to.



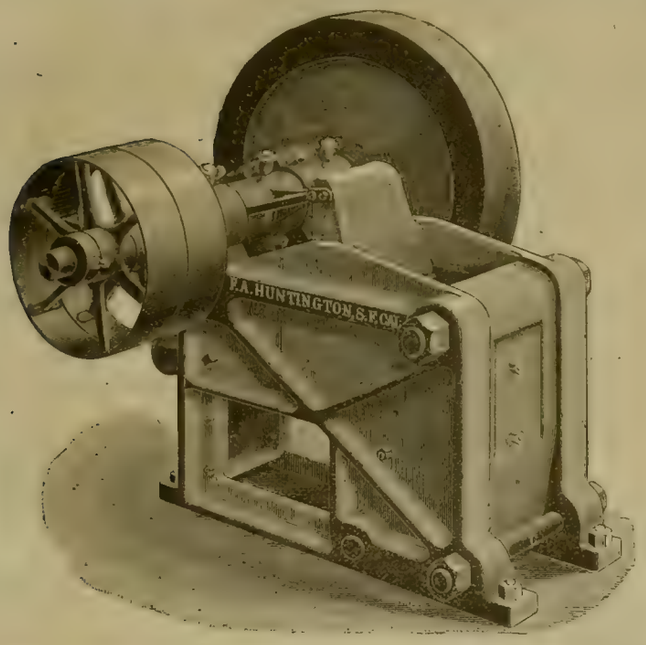
BOILERS OF OCEANIC STEAMSHIP CO'S STEAMER "AUSTRALIA," BUILT BY THE RISDON IRON AND LOCOMOTIVE WORKS.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

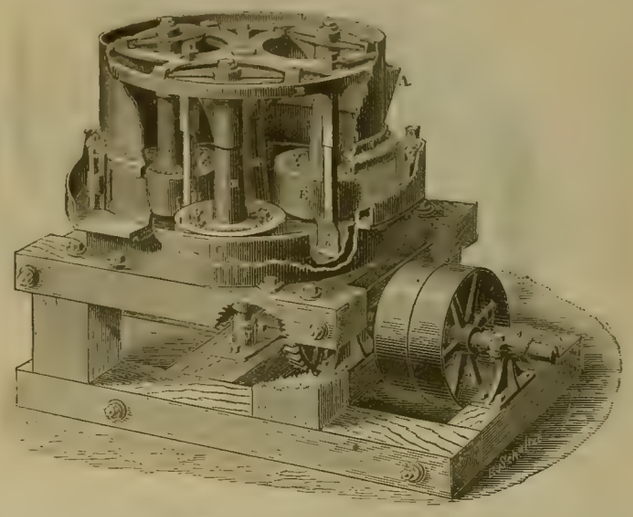
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

Woolen Manufacture.

[Written for the Press by J. R. F.]

The history of the development of woolen manufacture in the United States is of great interest to all, but for a newspaper article only a brief outline can be given.

Virtually the manufacture of woolen goods in this country began with the erection of fulling-mills in Massachusetts in 1648 by a society of Yorkshire people, who brought from England their looms and implements of trade. This claim of being the first to manufacture woolen goods can rightly be maintained, for the history of that period states that the "woolen webs of the hand looms of the private families were carried to the fulling-mills to undergo a process which gave them greater body and thickness, adapted them to a better finish, and besides increased their durability." This naturally led to each community throughout the colonies having a fulling-mill, while every family had its loom and every woman was a weaver. Aside from this, there were weavers who traveled with their looms from family to family to ply their trade at a stipulated price. The fulling-mills of the present day are, by connection, a part of the woolen manufactories, with probably the remote and isolated localities of the South and Central States excepted.

The first record of the building of a woolen factory in this country was in 1788, when Jeremiah Wadsworth and others erected one at Hartford, Conn. In this mill there was only one loom. The capacity of the factory was 5000 yards of cassimeres or broadcloth per annum. So important was this move looked upon by Americans that special mention was made of a visit to the factory by General Washington, who afterward wore a suit of clothes made from the broadcloth manufactured there when he made his inaugural address to Congress. Special mention was also made of the factory and its important bearing on the industries of this country, in an address to Congress by Alexander Hamilton in 1791. In this address he urged the importance of improving the breed of sheep. In 1789 another woolen-mill of about the same capacity was erected at Stockbridge, which was followed in 1790 by the erection at Watertown of another factory, having the same capacity. This gave in the latter year three woolen-mills in operation in this country, having a combined capacity of 15,000 yards of broadcloth a year.

The first incorporated woolen company organized in the United States was formed at Byfield, Mass., in the year 1794. The company built a factory and used the latest improved machinery that could be imported from Europe. They also employed skilled laborers brought over from England under charge of Arthur Schofield. In this factory, it is recorded, was made in 1804 the first fine broadcloth manufactured from merino wool. The success met with by the Byfield company led to the forming of another company in 1809 at Pittsfield, Mass., for the purpose of manufacturing fine cloth. So far as any record can be found, there were only five woolen-mills in the United States in the year 1810 that manufactured fine cloth, but there were nine others running upon coarser cloth averaging about 10,000 yards a year each. Aside from the above there were ten small factories. The statistics of that period report that the product of cloth in 1810 by the factories aggregated 200,000 yards, having a market value of from $1 to $10 a yard. It is also stated that in the same year there was manufactured in the private families woolen cloth to the extent of 9,500,000 yards, so that the factories cut a small figure in the total number of yards turned out. The value of the 9,700 000 yards was placed at the time at $25,608,788. Each State had its woolen factory, the principal or largest being located as follows: Byfield, Mass.; New Ipswich, N. H.; Warwick and Portsmouth, R. I.; Derby and Hartford, Conn.; Watertown and Poughkeepsie, N. Y.; Philadelphia, Pa.; Wilmington, Del., and Baltimore, Elkton and Frederick, Md.

In 1812 steam as a motor was first introduced into the woolens. The first application was at Providence and Middletown. The first power loom was used in 1825, when it was used by the Pontoosac Manufacturing Co. for making broadcloth, also superior all wool, cotton-warp, drab and fancy cloths. It is stated that the first large factory in the United States was erected by L. Pomeroy, who used hand-looms only. Great impetus was given to the industry by the war of 1812, owing to the large demand for military and naval cloths, blankets and negro cloths. This increased call for woolen goods was met by the erection of many more factories, whose growth was of a mushroom nature, for after peace in 1815 the superior goods, of English manufacture, were imported, for at that early day our manufacturers had neither the skill, labor, machinery nor fine wools to successfully compete against England. Heavy importation of foreign woolen goods sent prices to such low figures as to compel many of the home factories to suspend operations. The foreign imports in one year aggregated a value of nearly $155,000,000. The depression in the industry in this country is better illustrated by the following comparison of values of woolen goods manufactured in the United States: In 1810, $25,608,788; in 1820, $4.413.060; in 1830, $14,528,166; and in 1840, $20,696,699. Urgent appeals were made to Congress for greater protection, which resulted in several changes in the tariff. In 1816 an ad valorem duty of 25 per cent was levied on all imported goods, which was to run for a period of three years, after which time it should be reduced to 20 per cent. In 1824 Congress again raised the duty on woolen goods, making the tariff 25 per cent ad valorem on all imported goods costing 33½ cents or less a yard, and 33½ per cent ad valorem on all going above 33½ cents a yard; but unfortunately for manufacturers, Congress at the same time levied a duty on raw wool of 30 per cent ad valorem on wools costing 10 cents and over a pound and 15 per cent ad valorem on all wools costing less than 10 cents a pound. England, in order to offset the changed duty, in 1825 reduced her import duty on foreign wools so as to enable her manufacturers to turn out woolen goods cheaper, by which they would be able to furnish woolen goods to America notwithstanding the higher tariff laws, which they did most successfully. In 1828 Congress increased the duties on woolen goods to 45 per cent ad valorem on all goods costing $4 and under a yard and 50 per cent ad valorem on all costing over $4 a yard; but at the same time the duty on raw wool was increased to fully 100 per cent ad valorem on all wools costing 8 cents or over a pound. This law, owing to the high duty on the raw material, gave only temporary relief. In 1832, Congress, to meet the demand of manufacturers for cheaper coarse wools so as to compete against foreign woolen goods, allowed all wools costing 8 cents or under a pound to be imported free of duty, but kept the duty on all going above 8 cents a pound at 4 cents a pound and 40 per cent ad valorem—the same as it was made in 1828. In 1846 the tariff was again changed, by which all raw wool costing 20 cents or less a pound should be admitted free of duty, and only 30 per cent ad valorem should be imposed on all wools costing over 20 cents a pound. The tariff on woolen goods was also reduced to 30 per cent ad valorem. This law gave more general satisfaction and caused quite an expansion in the manufacture of woolen goods. This rate of duty was kept in force until 1861, when the exigencies of the civil war caused a higher duty to be levied.

Before extending this article further for this issue it may be appropriate to refer to the improvements in the manufacture of woolen goods, and this cannot be better done than by giving the following from the business experience of the late Thomas R. Hazard, one of the earliest woolen manufacturers of the country: In 1816 and later I used to employ scores of women to spin at their homes at 4 cents a skein, by which they earned 12 cents a day at most. Inferior cotton shirting *sold then at 50 cents a yard*, thus requiring four days' work of the woman to pay for one yard of cloth, she boarding herself. The wool was carded into rolls at Peacedale and transported to and from on the backs of horses. Some time ago I stood in the manufactory in the same village and took note of a stripling who tended two highly-improved jennies, from which he was turning off daily as much yarn as *six or seven hundred* formerly spun on wheels in the same time. In the meantime the introduction of labor-saving machinery and perfected skill had so reduced the cost of goods that a superior article of cotton cloth was then sold in the village stores for 15 cents a yard, for what formerly cost 50 cents a yard. So that had this boy spinner been paid the same price per skein that was formerly paid to a woman for an equal amount of work, he would have received as much as could formerly have been earned by about *two thousand hand-spinners* in the same time.

Land-Distribution Humbugs.

A correspondent and old subscriber asks us to give the public information regarding a certain "Land-Distribution" concern advertised by circulars, with some sort of a lottery attachment.

We have no knowledge as to the particular "enterprise" which he refers to, but we do know that there have been a number of swindles in the way of "colony" and otherwise entitled schemes—some of which have been exposed in the columns of the Pacific Rural Press within the past year—lately worked in this State to the fleecing of the unwary, and we can advise him and all other honest people who have no money to throw away on sharpers to let all such projects severely alone.

A Query.

EDITORS PRESS:—Will any of the readers of your valuable journal kindly inform the subscriber through your columns where, within a reasonable distance of San Francisco, a "Victor" concentrator can be seen in successful operation? VERITAS.

THE Kingsland M. & M. Co. own property in the Silver Mountain district, San Bernardino county, and intend developing it by the erection of both smelters and mills. It is a Los Angeles company, with P. H. Lemmert, president; A. A. Kingsland, of New York City, vice-president; Richard Garvey, treasurer, and William H. Burns secretary.

AT the regular meeting of the Academy of Sciences on Monday, Dr. Behr read a paper on "The Duration of Life in Insects," which gave much interesting information regarding the great vitality which some insects possess.

A CAVE occurred in the copper mine at Copperopolis last week, doing some damage.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPRING GUN.—E. Y. Knapp, Blue Lake, Humboldt Co., Cal. No. 403,432. Dated May 14, 1889. This toy gun consists of a barrel, a magazine, a vertically moving carrier by which the bolts or darts are transferred from the magazine to the barrel, and a mechanism whereby the carrier is lifted in the act of cocking the gun, and is retracted when the trigger is pulled, leaving the bolt to be struck by the hammer and ejected from the gun-barrel.

GRAIN-DRIER.—Lewis Borland, S. F. No. 403,412. Dated May 14, 1889. This invention relates to that class of grain-driers in which the body of grain passes down between the perforated walls of a vertical column or passage through which, from side to side, the heated air is passed. The object of the invention is to provide for subjecting the grain at the beginning and end of the operation to a high degree of heat, and at the middle of the operation to a lower degree of heat.

HYDROSTATIC WEIGHING MACHINE.—Frank Batter, Slide, Humboldt Co., Cal., assignor of one-half to W. S. Vanderburg, Marshfield, Oregon. No. 403,452. Dated May 14, 1889. This improved weighing scale consists of a chamber with a rising and falling float fitted therein, said float having a pan for the support of the article to be weighed, and in connection with the chamber of a scale consisting of a series of diagonally arranged pipes connected with the chamber and having graduations marked from end to end.

GRAIN-DRIER.—Lewis Borland, S. F. No. 403,411. Dated May 14, 1889. This is one of that class of grain-driers in which the grain is advanced throughout its course in a series of perforated casings by rotating augers therein, being subjected to an uprising body of heated air which passes through the perforated casings and the grain contained therein. The invention consists in certain constructions and combinations. The heat is under perfect control and the grain can be subjected to the proper drying at different stages of the operation.

FEATHERING PADDLE-WHEEL.—H. F. W. Sohst, S. F. No. 403,392. Dated May 14, 1889. This is one of those feathering wheels in which the wings or blades are adapted to be turned so as to alternately present their faces and their edges to the water, whereby they apply their powers and then clear themselves. The invention consists in axially pivoted blades or wings mounted in radial planes of the wheel and the novel cam mechanism whereby said blades or wings are turned at right angles to the plane of the wheel's rotation and back again into line therewith. It further consists in the novel arrangement of the cam mechanism and the devices for operating it.

SAFETY DEVICE FOR ELEVATORS.—Philip B. Sullivan, Tuscarora, Nev. No. 402,780. Dated May 7, 1889. This safety-hook is for elevators or cages for mines or buildings, and is designed to prevent the cage from running up into the cable-sheave, by releasing it before it reaches that point. The safety clutches act to hold the cage and prevent it from falling. The invention consists of a hinged plate by which the clevis to which the rope is attached is connected with the suspending bar at the top of the cage, and in connection with this of an eccentric which locks the hinged plate, and has an arm or lever projecting from it, so that it may engage a projection upon the framework or guides and release the holding-plate, so as to let the clevis and the cable go free, while the clutches on the cage will set and stop it.

STEAM AND WATER MOTOR.—Chas. R. Hunt, Redding, Shasta Co., assignor of one-half to C. K. McElwee, Auburn, Placer Co. No. 403,430. Dated May 14, 1889. This steam and water motor consists of a chamber submerged in a tank of water, above which is journaled a wheel having buckets upon its periphery, a jet-pipe or tube extending from said chamber upwardly, so as to discharge into the buckets on the wheel, a suction tube or pipe in line with the first and opening rearwardly through the side of the chamber into the water in the tank, and a steam pipe opening into the chamber so as to discharge from the first-named nozzle in such a manner as to draw water through the suction pipe and discharge it with the steam into the buckets on the wheel. The reactionary force of the water assists to impel the wheel and it also returns the water instantly to the tank as soon as its work is done, so that it may be used over and over.

Government Irrigation Work

Interest is rife in the proposed irrigation work by the General Government. The leading topics under which present information arranges itself are two: The plans of the special Senate committee and the effort of California to adequately impress them with the results attained here by irrigation enterprises and the desirability of giving California a generous share of the work under charge of the U. S. Geological Survey. It is telegraphed from Washington that the Senate Committee expect to spend three weeks in the field, and will visit Northern Dakota, Montana, Idaho as far as the Snake-river basin, Utah, Nevada, California and Arizona, Southwestern Texas along the valley of the Rio Grande from El Paso to San Antonio, and thence by the Fort Worth, Santa Fe & Colorado railway across the Staked Plains, the Pan Handle region and part of Southeastern New Mexico, and through that Territory to Southwest Kansas, Colorado and Wyoming.

This seems rather a large extent of territory to cover in three weeks, but perhaps the committee will overrun their estimate and take a more thorough look into affairs than three weeks would allow. It would seem that it would require about that much time to cover the distance at ordinary rate of railway speed, and that a car-seat review would be all that could be made. We trust that the telegram is in error and that the committee will give three months to the work.

As to participation by the U. S. Geological Survey, the telegram says that the committee will be accompanied by the director of the Geological Survey, and by Richard J. Hinton, who prepared for the Department of Agriculture a report on irrigation in the United States, published by the United States Senate in 1887. He accompanies the special committee as an expert, having been appointed Irrigation Engineer in the U. S. Geological Survey, which will have six engineering parties in the field some time before the committee starts. The public domain west of the tenth meridian will be divided finally into about 15 hydrological districts, as the topography of the region best indicates proper storage basins.

The California State Board of Trade is undertaking to arrange facts and routes for the use of the visiting committeemen and experts. Senator Stewart of Nevada, who has pushed this project from the start, is now engaged with local preparations for the committee's visit. A determined and we trust successful effort will be made to convince the visitors, and through them the Eastern people, of the vastness of the possibilities of the arid regions west of the Rocky mountains if adequate irrigation work is done, and we hope it will succeed.

BULL-DOGS AS FIRE PREVENTIVES.—It is reported that the Standard Oil Co. has placed an order in Philadelphia for 200 bull-dogs, which will be used to guard the company's tanks in the Ohio field against tramps. Numerous fires have been caused by sparks from the pipes of tramps, and it is thought that the bull-dogs will keep them away.

LA VELERA MINE, within two miles of La Trinidad mines, Mexico, owned by an English company, is now in high-grade ore, carrying from 100 to 400 ounces in silver per ton. A water-jacket furnace and a mill have been purchased in this city and will be running by July.

D. O. MILLS says that he has not sold his one-third interest in the Treadwell mine, Alaska. The stock of the mine amounts to 100,000 shares, and Mills says the owners of two-thirds of these have sold out at $16 a share to British capitalists.

THE people in Prescott, Arizona, are very anxious to have good reduction works, and stop shipping ore away.

PARKE & LACY COMPANY

IMPORTERS AND MANUFACTURERS OF

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,
AIR COMPRESSORS, ROCK DRILLS,
WALL'S CRUSHING ROLLS,
CONCENTRATORS, PULVERIZERS,
TURBINE WATER WHEELS,
ROCK BREAKERS, DRY JIGS

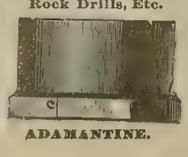
Chrome Cast Steel for Rock Drills, Etc.



ADAMANTINE.

H. D. MORRIS,
220 Fremont St., San Francisco,
MANUFACTURERS' and PURCHASING AGENT.

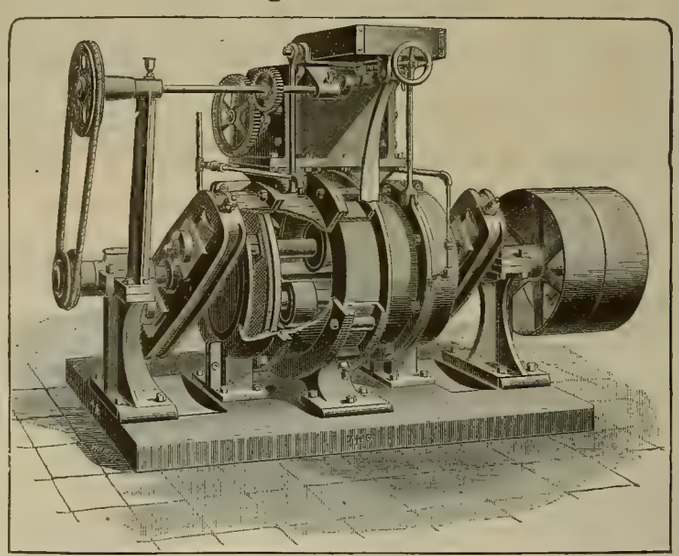
Special attention given to purchase of

MINE and MILL SUPPLIES.

ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.
H. D. MORRIS.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, May 23, 1889.

General trade the past week was good, with an increase in the volume of goods going out on orders. The outlook for a large trade was never so favorable as at present. The crops of all kinds promise to be exceptionally good, particularly in cereals, which will, without an unfavorable change in the climate, be the largest on record. To secure the various crops, a large force of men will be required, probably fully one-third more than were given employment last harvest. From the mines our advices are to the effect that more gold-producing quartz mines are being developed than ever before in the coast's history. This gives employment to a largely increased number of men. All advices are confirmatory that a mining boom will soon "be on," and which will not be confined to any one State or Territory on this coast.

The money market continues easy, but there is a growing belief that an active demand will set in soon from the country to aid in moving the crops. So far, interior banks and capitalists have met the wants of their particular section, but as harvesting becomes general and farmers begin to make deliveries, this city will be called on for funds. The low prices at which new crop wheat and barley will rule for at least one or two months, will, without doubt, cause more to be stored and money borrowed on it. If this proves true, large sums of money will be tied up in grain. For wool, there is a fair call for money. Manufacturers are not urgent in their wants. Considerable money is going into circulation, owing to more buildings going up and other improvements being made.

Treasure imports by sea the past week were as follows: Mexican dollars, 37,587; coin, $10,148. silver bullion $68,280.

The steamer City of New York, hence May 18th, for China, took out the following treasure: To Hongkong, Mexican dollars, 447,635; silver bullion, $189,000; gold coin, $5419. To Bombay, silver bullion, $95,000.

SILVER—Under freer competitive buying, the market has held strong, with 92¾c readily paid. The receipts are not large, which is contrary to what the ruling opinion was the forepart of the year. It was then thought that the Comstock mines and other silver-producing mines would turn out more bullion than they have done so far. With the revival of business that is now going on in Europe, it is generally conceded that more silver coin will go into circulation, which will naturally improve the market for silver bullion.

MEXICAN DOLLARS—The last steamer for China took out more Mexican dollars than has any one steamer this year. Supplies being well held, cause any improved call to be met by better prices. The market has been creeping up until 74c is paid for new, and 73¼c for old.

QUICKSILVER—Receipts the past week were as follows: One hundred and forty-five flasks, Haas Bros.; 50, Parrott & Co.; 32. C. S. Neal; 66, A. Abbey; 19, R. F. Knox; 7, D. Myer. Total, 319 flasks. The market is very strong at another advance, under a freer demand and light obtainable supplies.

LEAD—The market is without essential change. The general tone appears to be weak in sympathy with the East.

TIN—Both pig and plate on spot are weak at a lower range. Buyers appear to have their temporary wants met. The East and Europe come through easier.

COPPER—The situation is virtually unchanged. It now looks as if some kind of truce or compromise will be patched up between European holders of copper and mine-owners.

IRON—The imports the past week were 360 tons of pig from Irondale. The market for all kinds continues very dull and heavy. It is claimed by buyers that they can get spot parcels for less money than we quote.

BORAX—Receipts the past week were only 364 ctls. The works in Alameda county will start up soon. Stocks are said to be so far reduced as to justify this move. The market is firm.

LIME—Receipts the past week aggregated 3284 barrels. The market is barely steady, notwithstanding there is a good demand.

COAL—Imports the past week were as follows: Seattle, 7120 tons; Nanaimo, 750; Australia, 20,820; and Departure bay, 7968. Total, 37,658 tons. The market appears to have a steadier tone since the recent contracts for Australian to the gas company to arrive. These contracts are as follows: Twenty-five thousand tons at $7; 15,000 at $6.75; and 10,000 at $6.87½. Buyers outside of the above continue to confine their purchases as much as possible to nearby wants.

Eastern Metal Markets.

By Telegraph.

NEW YORK, May 23, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42¼	92¾	$12 00	$3 80	$20 80
Friday	42¼	92¼	12 00	3 80	20 70
Saturday	42¼	92⅜	12 00	3 80	20 70
Monday	42¼	92⅜	12 25	3 70	20 60
Tuesday	42¼	92⅜	12 25	3 70	20 40
Wednesday	42¼	92⅜	12 25	3 70	20 40

NEW YORK, May 23.—A recent settlement of 12c for Lake Ingot copper allows consumers 4¼c rebate upon April and May deliveries. Buyers, however, do not take kindly to the deal, as an impression prevails that the price must eventually move more favorably, so no important sales are noted. A sale was made on 'Change at 11¼c for 25,000 for September. Pig lead dropped to $3.80; small, prompt deliveries; $3.75 bid for important lots. Refined petroleum in barrel, $6.85; plain casks, $8.85. The latter is active, on a free shipment to Spain. There is the usual consumers' demand for borax at the old prices. Quicksilver is firm at 62c.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

MEXICAN BONANZA M. CO., May 17. Location, Sonora, Mexico. Capital stock, $2,000,000. Directors—S. R. Norton, T. L. Flanagan, Menzo Spring, Charles Henderson and Orson Wentworth.

COFFIN COMBINATION PUNCH & TICKET CO., May 18. Object, the manufacture and sale of punches and tickets. Capital stock, $10,000,000. Directors—D. E. Hayes, C. S. Neal, R. Derby, W. W. Coffin, S. R. Chappel.

GANDEE JOURNAL BEARING CO., May 20. Object, to acquire the exclusive right to manufacture the Gandee system of machinery bearings. Directors—F. P. Veisard, Geo. W. Arnold, J. B. Pitchford, E. L. Campbell and Oswald Lubbick, Capital stock, $100,000.

DYKES IMPROVED AUTOMATIC GAS MACHINE CO., May 21. Object, to manufacture gas machines under the Dykes patents. Capital stock, $100,000. Directors—H. J. Dykes, W. A. Ristenpart, W. A. Knapp, W. H. Moore, and V. A. Lewis.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Justice, May 21, $3166; Hale & Norcross, 21, $4224; Hanauer, 15, $2100; Mt. Diablo, 21, $10,650; Con. California and Virginia, 18, $62,093; Hale & Norcross, 18, $30,104; Hanauer, 16, $2675; Alice, 16, $19,442; Hanauer, 16, $1800.

NEARLY 8000 miners have resumed work at Pittston, Pa., after an idleness of over seven months. All the collieries owned by the Pennsylvania Company and nearly all those owned by individual operators are now working.

ON the 19th of September last Albert Van Der Naillen was injured by the fall of an elevator in the History building. He now sues to recover from the Bancroft Company the sum of $25,000 damages and cost of suit.

THE cruiser Charleston has been insured in English companies by the builders, and the agents of the American insurance companies in this city decidedly object.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Mining Share Market.

In mining stocks the market, so far as the Comstocks are concerned, has been disappointing to the bulls in the almost continuous sagging in prices. At times there were slight revivals, but which were unfortunately followed by a still further sinking in values. This condition obtained up to yesterday (Wednesday), when a steadier tone set in, as if the pool was about ready to force some of the smaller bears to cover, and at the same time get out the stock taken in at the low prices on the outside public at a good profit. Although the general public are bearish, yet there are many who believe in better times within the near future, but what they base this belief on is not at present apparent, for it is quite certain that stocks are too widely distributed to allow of the making of much of a move. Manipulators, unless when prepared to make a market, never buy back much of the stock at the prices at which they sold. There is nothing as yet to warrant a belief that the pool is ready for a market, although they may be for a small deal so as to collect assessments to continue active prospecting work in the more promising mines. From all the writer can learn, the situation is as follows: That while the work going on in the mines is very important, yet it takes time to get everything in order for taking out bullion, even after it is found. While running drifts and crosscuts, making upraises and sinking winzes, strikes of ore of varying width and value are liable to be run into at almost any time, which are, if the market is in position, taken advantage of to make an upward movement, but how much will depend on the amount of stock the pool has taken in and wish to sell out at profit. These moves keep life in the stock business and also make the bulls hold their stock and pay assessments.

Private reliable news from the Comstocks is to the effect that the drift mentioned in last week's issue, which is being run from Con. Virginia into Ophir, is on the 1665-foot level and is double track. In Union they expect soon to be in ore, not much, but enough to make a slight stir of from one dollar upward, if it is so desired. When they get under the winze sunk in ore from the 1300-foot level of Union, an upraise will probably be started so as to get ventilation. In the Mexican crosscut an upraise, it is claimed, will be commenced soon, so as to run into the ore on a higher level, and also get air connection with the 1300-foot level. With good ventilation in Union and Mexican, more active prospecting can be inaugurated in the two mines. It is claimed that further work west will give good results. In Utah and Sierra Nevada important work is now going on. On the 500-foot Alpha level a crosscut has been started west on the Con. Imperial line. Some time ago this paper mentioned that active work would soon be commenced in the Ward shaft so as to prospect to the west the mines running from Chollar to Exchequer. It is claimed that the work is liable to result in running into ore of some value lying toward the west. In Yellow Jacket very important work to the west is now under way. The upraise from the 1100-foot level in Belcher is said to be proving of more value than the inside is willing to admit. In Hale and Norcross, as the work goes westward, more interest centers. In Best and Belcher active work toward the west will soon be inaugurated. All the work in the mines is toward the west, which goes far in proving that the West Con. Virginia's work has awakened renewed interest in the west side, and which may result in considerable excitement as the work progresses, but there is a probability it will take more time and money than is claimed at present.

In the outside stocks the Tuscaroras held up well during the break in the Comstocks. The Quijotoas were weak with a slight shading in values. The reports from the above two districts continue flattering, but apparently there is too much ore to make a successful deal. The Bodies followed the Comstocks on the down grade. It now looks as if they will soon be ready for another line of assessments. It takes money to work the Bodies on the lower levels.

THE STORY METHOD of counting ballots was followed at the Stockton city election last Tuesday and worked admirably. About 2300 votes were cast. The returns of 11 of the 12 precincts of the city were all footed up within 2½ hours, and the result in the whole city was known at 8:30—3½ hours after the polls closed.

BEEF TRUST.—At a meeting of the representatives of the American Meat Co. and the American Cattle trust held in New York on the 18th, a contract for a term of years was signed by the controlling powers of the two organizations by which the meat company will handle the entire product of the cattle trust. Senator Dorsey said that the two organizations had not been consolidated, adding: "We have effected a traffic agreement, which practically makes the American Meat Co. the agent of the American Cattle trust."

PROMPT AND RELIABLE. — From the manner Knupp & Anderson, searchers of records at Visalia, Tulare county, recently executed an order from this office, we can give them credit as above. They are also well-known real estate, loan, and insurance agents at the Government seat of their large and improving county, the firm business having been established in 1877.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A. F. JEWETT—Tulare Co.
F. B. LOGAN—Southern California.
H. G. PARSONS—Southern California.

CHAS. DUGAN—Stanislaus Co.
R. G. BAILEY San Francisco.

Every Miner His Own Assayer.

A chemical for testing and ascertaining the value of all kinds of ore, by which every miner and prospector can make his own assays, anywhere in the mountains, at a cost of a little over 5 cents and in a few minutes' time. No apparatus or dangerous acid needed; a dry powder, which may be carried in the pocket. This, mixed with the ore and a little water in a teacup, produces an electric current, which separates the silver from the ore instantly, no matter how refractory. Try it; you will be delighted. Will save you many dollars for assaying. Package sufficient for 30 tests, with full directions, by mail to any address on receipt of $2; 6 packages for $10. Address, Prof. J. Herman, P. O. Box 1845, San Francisco, Cal.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

WANTED FIVE OR SIX THOUSAND DOLLARS are required by the owners of a developed and very valuable Gold Mine to complete its mill and means of output of ore, etc. For this advance of capital a valuable interest will be given at a very low price. The mine is remarkably well located, with abundance of wood and water and every facility for mining, and can soon become one of the notable gold properties of the State. The owners are responsible men and practical miners. G. M., Box 2517, San Francisco, Cal.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

reface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth: 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

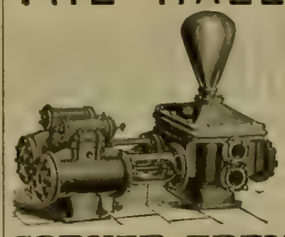
There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

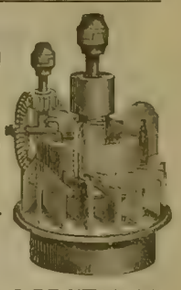
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

THE HALL DUPLEX STEAM PUMP,



The Most Simple, Efficient and Durable Duplex Steam Pump in Use
FOR ALL DUTIES.

THE T. H. RISDON TURBINE WATER WHEEL,



SUITABLE FOR ALL FALLS. ADAPTED TO ALL CONDITIONS.
Built Specially for Durability.
HAS THE HIGHEST RECORD FOR PERCENTAGE OF POWER.
Catalogues Sent on Application.

HEALD'S

BUSINESS COLLEGE,
24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.
SEND FOR CIRCULAR.
E. P. HEALD, President.
C. S. HALEY, Secretary.

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
One 3-inch Sergeant Drill.
One 5-ft. Double Screw Drifting Column with Arms.
One 4-ft. Single Screw Stoping Bar.
One 3½x13 ft. Air Receiver.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the
PAYMASTER MINING CO.,
Yuma, Arizona Territory.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron bangers for top saw. Friction feed-works, patent steel screw double-throw head-blocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,
San Francisco, Cal.

ADAM SCHILLING & SONS,

117-119 Main St., San Francisco.
Practical Machinists and Engineers.

Repairing of every description of Machinery promptly attended to.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leffer, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 94 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Supt, or Hugh Murray, Sec'y.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

WANTED.

A situation as Mine or Mill Superintendent. Am good assayer and understand concentrating of all classes of ores. Can put up and run any mining or milling machinery. Best reference. Address "J. A.," Box 2517, S. F.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

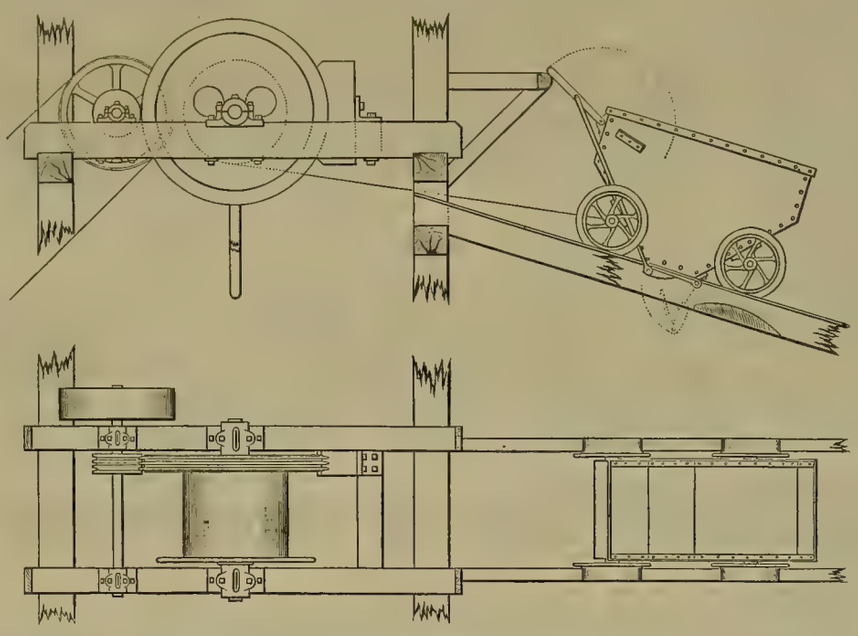
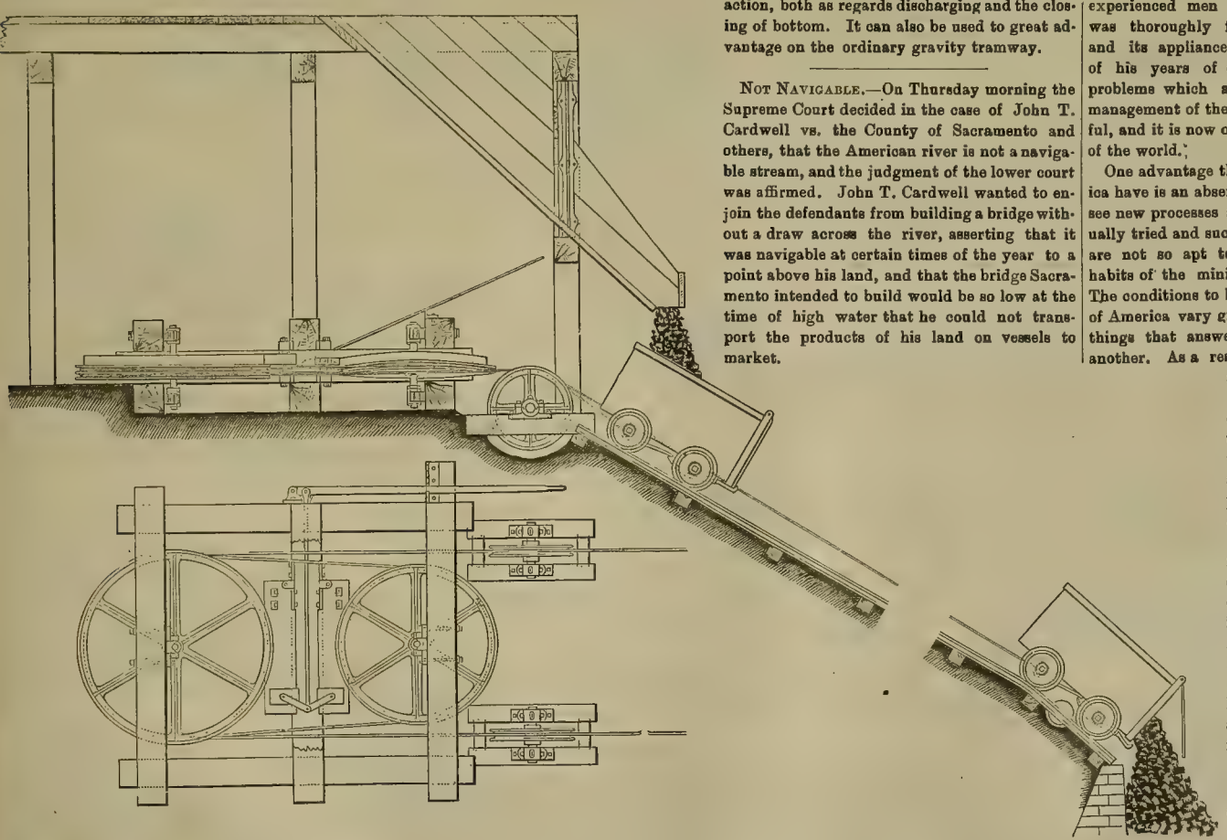
Incline Gravity Tramways.

In the last few numbers of the PRESS we have given several articles on mine tramways, arrangement of tracks, etc. On this page we give engravings of an incline gravity tramway and a hoisting tramway, as designed and built by the Fulton Iron Works of this city. The gravity tramway figured is the form most generally used for lowering ore from the upper levels of a mine to the mill when situated below. Two cars are operated; the loaded car going down draws the empty one up. A three-rail track is laid with switch in the middle to enable cars to pass. This tramway has an additional sheave to prevent slipping of rope, which is liable to occur in cold or frosty weather. Each sheave has a brake-wheel cast to it, both of which are brought into action by the same lever.

The other cut shows a hoisting tramway with Behr's self-dumping car, which can be used either for hoisting tailings to the mill should it be desirable to treat them again, or for bringing ore from the lower tunnels. Power can be delivered either by belt from any convenient shaft in mill, or, should the distance be too great, by wire rope. The small friction shaft runs constantly, the large friction or drum shaft being thrown in or out of gear by means of eccentric-box and lever. The same movement which throws friction out of gear also throws it against the brake-shoe for lowering. The car shown in cut is entirely automatic in its action, both as regards discharging and the closing of bottom. It can also be used to great advantage on the ordinary gravity tramway.



HOISTING TRAMWAY WITH BEHR'S SELF-DUMPING CAR.



INCLINE GRAVITY TRAMWAY BUILT BY FULTON IRON WORKS.

NOT NAVIGABLE.—On Thursday morning the Supreme Court decided in the case of John T. Cardwell vs. the County of Sacramento and others, that the American river is not a navigable stream, and the judgment of the lower court was affirmed. John T. Cardwell wanted to enjoin the defendants from building a bridge without a draw across the river, asserting that it was navigable at certain times of the year to a point above his land, and that the bridge Sacramento intended to build would be so low at the time of high water that he could not transport the products of his land on vessels to market.

American Miners.

U. S. Consul Griffin at Sydney, in the course of a report to the State Department, says there has been a decline of the gold product of all the colonies except Victoria, and even there the increase is very slight. It seems that as mining speculation in shares has increased the mine products have decreased, but the same thing has been noted here and elsewhere. Mr. Griffin calls attention to the extraordinary developments in the Broken Hill silver mines, where Mr. Patton, formerly of the Comstock, is in charge. The Consul says modern American processes are wanted in Australia, and that the handsome profit realized at Broken Hill is the result of the help of American experts.

The Australians are pretty good gold miners, but have not had so much experience in silver mining. They did a wise thing when they imported Mr. Patton from the Comstock, who took other experienced men with him. This gentleman was thoroughly familiar with silver mining and its appliances, and brought the result of his years of experience to bear on the problems which arose at Broken Hill. His management of the mine has been very successful, and it is now one of the noted silver mines of the world.

One advantage that the mining-men of America have is an absence of conservatism. They see new processes and appliances being continually tried and successfully introduced. They are not so apt to stick to old systems and habits of the mining-men of other countries. The conditions to be met in the mining regions of America vary greatly with the locality, and things that answer at one mine do not at another. As a result, system, processes, and appliances vary greatly.

Our American mining machinery is now sent all over the world, or is copied elsewhere. The mining appliances are ingenious and simple and adapted to meet most conditions.

Experienced mining-men from this country are now employed in managing large enterprises in South America, Mexico, Central America, Australia and Africa. They have been chosen by reason of their peculiar practical knowledge and experience, and have been very successful.

THE ore yield of the Comstock lode the current month will not fall short of 30,000 tons.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Rebel Creek District.

EDITORS PRESS:—A few weeks ago an article appeared in your paper regarding the mines in the Rebel Creek mining district, Humboldt county, Nevada.

The writer of that article has seen fit to deal more with fiction than in facts. It is the regret of all well-meaning men in the camp that such an article should appear. The actual facts as regards the mines, or rather the prospects of the Rebel Creek mining district, are these:

There is one good mine in this district which has paid from the "grass roots," viz., the Ohio mine. Your correspondent says the average of the shipping ore from this mine is 900 ounces. The gentleman is mistaken in this. A few choice lots have gone some considerable over that amount, but the *average* is some considerable less than 900 ounces, as stated by your veracious correspondent. Now as regards the 40-stamp mill and its proposed erection. This has been contemplated—upon paper. The execution of the plans has been from time to time postponed, and I am not aware that any immediate action will be taken upon them. It is estimated that this company has about 15,000 tons of milling ore upon the dumps. The Wild Deer mine is a fine and well-developed prospect, having all the indications of a good mine. There has been found in it small pockets of very rich ore, one pocket assaying over $20,000. A small amount of work will undoubtedly show up a very valuable piece of mining property. These are the only two claims to which the name of mine could be applied.

The property of the Boston Globe Company is in a state of development. Their mill is simply a prospecting one of small capacity.

The Gold Hill property, as described by your correspondent, exists only in the fertile brain of that writer. The entire property is simply a prospect. There is not over 100 tons of ore on the dump, and I doubt if $35 in gold would be its average value.

The so-called "Boone" property, *not mentioned* in the letter of your correspondent, is considered as fine a prospect as any in the camp at present. It is a mine in embryo.

The Penobscot, Moonlight, Bismarck and Black Jack are simply prospects more or less developed. The Penobscot is as promising, perhaps, as any of this group. There are many locations made here, some of them promising well at the surface, but the amount of work done on them is so small that they possess no commercial value at the present time.

Prospectors with capital would find it to their advantage to work here. The country as yet is simply scratched by the prospector's pick.

To judge from the present indications, this camp will soon awake from its "Rip Van Winkle sleep," and, no doubt, as your correspondent says, will be "one of the leading camps on the coast." CHAS. L. BRAMAN.

CHINESE MINERS IN LOWER CALIFORNIA.—Milton Santee of San Diego has returned home after having made an important deal with the Chinese Six Companies. Mr. Santee is vice-president and secretary of the Lower California Mining Company, of which Theophilus Masac of Los Angeles is president. Masac obtained the mining concessions from the Mexican Government three years ago. While here, Mr. Santee sold to the Chinese Six Companies a two-fifths interest in the company's mining properties for $80,000. The mines are located in the Real del Castello and include two old Mexican mines that have been worked successfully for many years. In the past, great difficulty has been experienced in obtaining workmen for the mines. The Indians and Mexicans on the peninsula prefer to prospect and pan for gold on their own account. An agent of the mining company came to San Francisco some months ago for the purpose of employing a large force of Chinamen to work in the mines. The Chinese Six Companies, however, would not consent to furnish laborers unless they had a voice in the conduct of affairs at the mines. More recently overtures were made the Chinese company, and, as a result, four wealthy Chinamen of this city visited Lower California last month to inspect the property. They were well pleased at the progress of the work at the Real, and when Mr. Santee arrived in this city he found no difficulty in completing the deal. The Chinese syndicate will send about 1000 coolies to the mines, where they will be employed in hydraulic mining. The Real del Castello mines are located about 60 miles north of the district where the recent Santa Clara bubble exploded. The property includes the most valuable mining claims on the peninsula.

NINETEEN KNOTS.—Irving M. Scott of the Union Iron Works says: "The Charleston is a fast boat, and without doubt will make 19 knots an hour. All the weak spots developed in the trial were weak in the specifications, and had been observed by us and brought to the notice of the Secretary of the Navy while the vessel was building. The corrections will soon be made, and as soon as her guns and carriages are at Mare island there can be no cause for delay in putting her into commission."

Nautical Mining Reports.

Yesterday at noon a nondescript of the Bohemian type entered the *Chronicle* office and asked for employment. His appearance and general make-up indicated the printer-journalist, far from the comforts of the old-fashioned farm-house and little red barn. He had evidently long since forgotten the liquid contents of the moss-covered bucket and use of the gourd by the spring. His orphan-like condition and trembling grip touched one of those responsive chords, like which all other Order links and ties are fragile imitations.

He stated that he was an all-round newspaper man; could write a variety of editorials without the aid of current exchanges, and looked with contempt upon any one who used works of reference; he had quotations and synonyms down pat. As an interviewer and an originator of fakes he had few peers, but was particularly strong on marine topics. He could discount associated and special telegraph services by underground and grapevine methods peculiarly his own—in fact, was an editor of the Greeley school and a reporter from the village where reporters were—to use his own expression—*nascitur non fit*. The mining editor was indisposed, and his chair was vacant for the day. The arrival of this invaluable general utility man was a godsend. Geology was with him a side-line amusement. He knew it all, from the Archæan period to the present sun-dried adobe. He would fill the void with some of the Spar's first grade, and no sorting or sampling required. The gentleman was engaged for the occasion, with the request that he furnish, if possible, two columns of reliable mining news that would pass rigid examination, without showing the trace of a dip to close a deal or bolster waning stock. He reports:

Chief among the properties on the contact which forms the outcrop of the ridge on the mountain south of Aspen's treasure vaults, is the None Such lode, discovered and located by Australian Jack in the fall of 1887. It is named after the gallant clipper ship on which Jack had sailed as second mate in the Australian trade. The approach to the main hatchway of the mine is reached by a zigzag path, worn smooth by a small herd of degenerate yet hardy animals of the Jerusalem strain, acclimated by missionaries in Mexico and trained to carry burdens in the same manner as the llamas of South America, only more so. The passage leading into the Silurian period of the mine is roughly yet comfortably lined with heavy lumber suitable for shipbuilding.

The miners number 80 and are divided into three watches, starboard, port and dog. The skipper is styled the superintendent, and the mates are bosses of the shifts. On going below into the forecastle, the first thing to strike the beholder is the tackle used in getting the ballast out of the hold. A huge iron cask, with the head stove in, is strapped to an inch and a half four-stranded cable, which is coiled by the donkey engine around a sheave-like substitute for a block and tackle arranged for inboard hoisting and lowering.

Into this cask your reporter stepped with the obliging Jack-of-the-Dust and went below. The descent was as easily accomplished as if done with a boatswain's chair, the only drawback being the bilgewater in the bottom of the cask.

On reaching the lower deck, the reporter witnessed a sight far surpassing in richness the famed wealth of the Peruvian Incas. Those who had been in charge of the batteries on the gun deck had just returned after the broadside, and were busily engaged in stowing chunks of sulphide, chloride, oxide and seaside rocks, rich in the metal used by silver-tongued orators for purchasing original packages that had passed the custom-house office. The bunkers were filled to the heads with large-sized ditty-bags containing finer specimens, ready to be wiped out on the spar deck.

An expert opinion, based on the geological formation of the lode, which has a lift to port sufficient to clear the scuppers, justifies the assertion that the owners will have a full cargo, outward bound, if they continue before the wind, keeping her course northeast by east, half east, along the blue lime-wall, heaving the lead and walking the gangue-plank until some lubber heaves in sight with more doubloons than doubts.

After a critical examination of the pumps, we were satisfied that there was no danger of springing aleak before the run was made. It may be well to remember parenthetically that a majority of mines are worked either by the run or old-fashioned blubber-hunter's lay, technically styled leasing.

A lease which expires on Sunday at eight bells, meridian, is liable to yield $25,000 a day until expiration of the last watch, when, *mirabile dictu*, instead of going below, they go aloft, furl sail, and Arab like, mount the long-eared steeds of scriptural fame.

All hands and the cook are now engaged in breaking cargo, and the grog-tub is doubled between watches to clear the hold before the mine-owners arrive at quarantine.—*Aspen Chronicle.*

THE WEST COMSTOCK.—The Virginia *Enterprise* says: To W. E. Sharon belongs the credit of the present agitation to explore the country west of the present known Comstock ledge. Over 18 months ago he urged the *Enterprise* reporter to advocate the scheme. A few days ago ground was broken on the 500 level of the Yellow Jacket, starting a drift westward intended to cross the black dyke, forming the so-called west footwall, and to explore a ledge whose croppings of gold-bearing rock lies about 2500 feet west of the Yellow Jacket shaft. It will tap the ledge at a depth of 1500 feet. Upon the present calculation of its dip, the drift will tap it at a distance of about 2000 feet. A more sensible move could not be made in that direction from any other point on the lode. The ledge is known to be there. They cannot miss its location by more than 100 feet. It is a gold-bearing ledge of rock in place, and a promising one. The Yellow Jacket is unaffected by Sutro tunnel complications, and the ground is their own to own, to hold and prospect. The entire community cannot help but feel kindly and "pull" for the success of the enterprise, as upon its results much future work depends, and the fate of the Comstock itself in a measure depends. The Yellow Jacket is now running the Brunswick mill, and the battery samples of its ore runs average $30 a ton.

The Ontario Mine.

The Development of a Utah Property.

One of the best-known mining properties in the United States, or in the world, for that matter, is the Ontario mine in Parley's Park, Utah, owned by Haggin, Tevis & Hearst of New York and San Francisco.

The Ontario was discovered on July 19, 1872, by a man named Herman Dudden. He, with his partners, did considerable work on the vein, which showed up so well that R. C. Chambers offered them $30,000 for it a few weeks later, and his offer was taken. Mr. Chambers was the representative of Messrs. Haggin, Tevis & Hearst. During the succeeding two years the life of the mine was not as bright as might be wished for. Nearly $200,000 was expended in development and other necessary expenses incidental to opening the mine, and their income only reached about $40,000 which came from the sale of the ore.

In January, 1874, a stock company was formed and operations were continued with rather more encouraging success. Two years later, in December, 1876, the company was reorganized with a capital stock of $10,000,000, divided into 100,000 shares of $100 each.

For nine months prior to this the company had leased two silver-mills near the mine and treated 16,000 tons of ore, which yielded $900,000, though the milling process employed only saved about 80 per cent of the assay value of the ore.

Previous to this a 40-stamp dry-crushing mill had been designed and was ready to drop its stamps in January, 1877. It cost $250,000. Additions made later increased its cost to $360,000.

In October, 1878, a fire destroyed large and costly buildings and machinery, the loss reaching $200,000. Forty days after this "incident" in the life of the Ontario the pumps were again in motion, and by the following January the hoisting works had been rebuilt and work proceeded as formerly.

The Ontario paid its first dividend of 50 cents per share in April, 1877, nearly five years after its discovery and a little over three years after the mine was first incorporated. The owners and the company had expended in purchase, development work, machinery, etc., and sustained in losses by fire about $1,500,000. Ore had been sold and milled which returned about $1,000,000.

Besides several extra dividends, a regular dividend of 50 cents a share has been paid ever since, excepting a period of eight months, but during that time nearly $500,000 was expended in new property. The total dividends to date reach the handsome figure of about $10,000,000.

The surface improvements on the Ontario are something which can only be appreciated by those who are familiar with them, while the underground workings are extensive indeed.

Water has been a source of trouble and expense in the Ontario ever since active work was commenced. A drain tunnel with a length of 5765 feet was completed in 1883. It cost $200,000. A hoist and pump was erected at a cost of $752,000 the same year. Two other smaller hoists and a large number of smaller necessary buildings swelled the expenses about $200,000 more. The total expenditure for surface improvements and the drain tunnel reaches nearly $3,000,000.

The total amount of cuttings in the Ontario exceeds 30 miles in lineal measure. The ore runs from $40 to $100 per ton. About 90 per cent is saved in the mills. The total cost of operating is about $30. The mine has produced over $23,000,000 in silver bullion, and is still in good condition, promising many years of successful output.

MONO COUNTY'S GLACIER.—The great glacier of the northern flank of Mount Lyell, in Mono county, near Lundy, has moved at least ten feet within a year. Last May they built two monuments of rocks five feet high, one being placed at the edge of the ice, the other at a distance of 15 feet. The upper monument has disappeared and the lower one is but five feet from the ice. Accurate measurements from several permanent points show conclusively that the glacial movement northward has been considerable all along the line—*Virginia Chronicle.*

No Discovery of the Lode.

Last week one of the most extensive mining contests ever begun in California, involving $40,000,000 and two of the largest companies that do business in the State, was initiated in Los Angeles by lawyer A. H. Ricketts of San Francisco, for the Waterloo Mining Co. of Milwaukee. Affidavits have been filed contesting John S. Doe's patent to the Oriental mine No. 2, in the Calico Mining district, San Bernardino county.

Emil A. Sanger, superintendent of the Waterloo, alleges that the Oriental patent is illegal because there was no discovery of a lode before the location of the claim. Many affidavits of old miners and engineers are filed setting forth that no vein was discovered before the location of the claim, and that no lode exists in the mine. Deputy United States Mineral Surveyor Smith says: "No regular vein in the Oriental was discovered, but the ore comes in streaks."

The Waterloo Co. avers that the only ledge in the Oriental is a streak of the Silver King lode, property of the Waterloo Co., and affidavits to this effect were filed by Deputy United States Mineral Surveyor Malcolm C. King, by John J. Allison, a miner, who originally located the Oriental claim, and by Daniel F. Edwards, Charles A. Hamilton, William K. Aldersley, William H. Hardy, W. P. McCullough, A. B. Garnett, and many other miners and engineers who are familiar with the mines.

A suit for $50,000 has also been begun by the Waterloo Co. for silver ore alleged to have been taken from the dip of the Silver Plume mine. The suit really involves the larger part of the Waterloo Co.'s property, for its mine is above the Oriental claim, and is said to be the only valuable lode in that mine.

The North Star Mine.

James D. Hague, President of the North Star Gold Mining Co., reports that the gross product of the mine for the first quarter of 1889 was $73,563.16. The 10 new stamps are dropping on tribute ore principally, while the original 30 stamps are kept busy with company ore. The total gross product of the mine since it was reopened, a little over four years ago, is 42,267 tons of ore, yielding $818,884 57—an average of $19.50 per ton. It is estimated that the total working expenses do not exceed $11 per ton.

The company has a surplus in the treasury of about $70,000, and it is understood that a permanent surplus of $50,000 is to be maintained.

Mr. Hague informs the *Engineering and Mining Journal* of New York that he has devised a system of mine book-keeping which is immeasurably superior in every respect to the orthodox system.

The new hoisting reels are operating smoothly. They have capacity for raising ore from a depth of 3500 feet on the incline, now down 1900 feet.

The following resume of the work done during 1888, and the result, is furnished for publication:

Ore raised	17,420 tons
Ore milled	17,269 "
Realized value of product	$334,120 85
Average yield per ton	19 33
All expenses (less sundry credits) for materials sold, tribute, ores milled, etc.	194,803 14
Cost per ton raised	11 18
Net profit in operation	139,317 71
Not including about $3000 for unsold sulphurets of 1888, making total profits, say	142,000 00
Dividends for 1888	140,925 00

A GREAT MINING TUNNEL.—A correspondent of the San Diego *Sun* writing from Iquiqui, Chili, says: In my last letter I mentioned the greatest mining enterprise in the world, a tunnel from Iquiqui to Hantagia. It will be about 8 miles long, 14 feet wide and 20 feet high. Before a distance of 200 meters is run it will have a depth of 400 meters, and at the end it will cut the lode of the Desculadoca mine at a depth of some 1000 meters. It will cut about 80 lodes. This great undertaking will require five or six years for its completion. I am of the opinion that they won't run one-quarter of the entire distance before they will be able to take out more than enough metal to pay expenses. The scheme was conceived by Colonel Harris, a pioneer, and one in every way qualified to put it through successfully. I hope soon to be able to tell you that this great work has been commenced.

MEXICAN MINING LAWS.—The Mexican Mining law provides that the original locator shall have his choice as to ground. It also provides that the possession shaft 18 feet deep, with a tunnel at the bottom 18 feet in length along the vein, shall give the mine its course, the owner having the right to say in which direction from that shaft his ground shall extend. This bars out would-be jumpers, for if the spurs or float rock denounced by them falls within the limits of the boundary lines of the mines, the jumper loses all that he has paid for locating on his spur.

THE mica mines in the Potlatch country, 20 miles by wagon-road from Julietta, were sold last fall to an English syndicate for $100,000, and a large force is now at work developing, 10 men having been employed there throughout the past winter. Good placer ground can be found throughout the entire length of the upper Potlatch. This is the southern extremity of the Cœur d'Alene mineral belt.

Meteors, Comets and Fire-Balls.

[Written for the PRESS by FREMONT WOOD.]

The new year beginning as it did with one of the most striking natural phenomena of the heavens, has had a tendency to create, even in the minds of the most unscientific, a languid interest in the myriad constellations that nightly stud the firmament. In the young, particularly those who never beheld an eclipse before, a strong propensity to star-gaze has been developed. The simple occupation of gazing at the sky of a clear night, when the stars are shining brightly, has assumed a new interest. On such a night the patient watcher is sure to be rewarded by the sight of one or more luminous objects in rapid motion among the constellations. The most casual observer cannot but have had, at some time or other, his attention enlisted and his admiration created by the brilliancy and splendor of these falling luminaries as they sweep across the sky.

Those who have pursued their observation with any diligence will have noted that these "falling" or "shooting" stars, as they are commonly called, are visible on every clear evening. They present many attractive features in their movements, and exhibit a variety of speed, form and brilliancy. Occasionally one will descend toward the horizon in a vertical path, and others again obliquely. Some sweep through space with almost horizontal courses, and now and then one will move apparently upward in the sky. Some dart along in rapid, transient courses, like a flashing ray of light; others may remain visible for several seconds, their movements being comparatively slow and majestic. Some will leave a trail of phosphoric streaks, allowing their paths to be conveniently traced; and there are those on the other hand which retain a star-like form as they speed along, devoid of train or spark.

As irregular and complicated as their movements may appear to the uninitiated, careful observation proves them to be following natural laws as capable of being reduced to harmony as those which pervade the solar system. They all diverge from certain definite points in the sky, converging, like the spokes of a wheel, upon a common center. The same may be said of those allied phenomena, comets, meteors and fire-balls.

Humboldt, it is said, witnessed a great fall of meteors on the night of November 11, 1799, and also a splendid recurrence of the phenomenon on the 13th of November, 1833. Careful observation of their courses proved that a large majority of the meteors had a common point of departure in the constellation Leo. The speculation as to thirty-three-year recurrence of the phenomenon was further proven by another brilliant display of meteors on the night of Nov. 13, 1866. A considerable number of these objects have also been observed to depart from Perseus regularly every St. Lawrence's Day, from which fact they were called "St. Lawrence's Tears." Other meteor showers have been systematically observed and their directions recorded, so that they have finally come to be designated after the constellations from which they emanated.

Our first illustration shows the appearance of a remarkable meteor observed on the night of the 12th of February, 1875, near Des Moines, Iowa. It was about the size of the full moon. It moved earthward a brilliant globe of fire, throwing a bright light over the landscape and greatly terrifying the populace.

On the 20th day of July, 1860, a very singular meteor was seen at New York, stretching horizontally across the sky, composed of several fiery spots with scintillous sun-like rays, and the usual trail marking its course.

Still another remarkably formed meteor was observed on the 27th of November, 1877, the general appearance of which is shown in our third cut. An irregularly formed molten mass, it moved through the air leaving a trail of bright particles which clearly defined its course. These trails occasionally remain for some little time clearly traced on the night sky and assuming singular forms. In our fourth drawing we show two effects of this kind, left by the meteor of October 19, 1877.

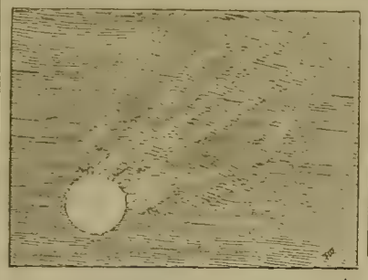
Prior to 1833, but little was known of these singular phenomena. The ideas prevailing as to their origin, etc., were most crude. They were generally supposed to be purely atmospheric apparitions hardly worthy of consideration. There was a prevalent theory that they originated in phosphoric fluids, emanating from the earth, which, when reaching the higher regions, took fire at the head from decomposition and burned rapidly backward along the column of fluid until reaching the moisture-laden current which surrounds the earth, when it was extinguished. Still another theory, which was received with considerable credence, was that meteors were simply ejections of burning masses from the moon's volcanoes, drawn toward the earth's surface when, perchance, they entered the sphere of her attraction. Later research has exploded all this, however, and proven beyond a doubt that they are of celestial origin, revolving around the sun in certain well-defined orbits.

Prof. Olmsted, after a careful study of the subject, arrived at the very reasonable hypothesis that meteors are combustible bodies constructed of light and transparent materials, which, when massed together, form a body bearing a strong analogy to the comet. What is called a meteor shower, some very remarkable instances of which were observed off Sandy Hook Nov. 14, 1867, and also in the Arctic regions, is caused by a comet which happens at the time to be pursuing its path along with the earth around their common center of attraction, the sun. Their luminous appearance is accounted for by the fact that when the two orbits (that of the meteor and the earth) intersect, and the meteor enters the earth's atmosphere, a concussion results sufficiently great to ignite the combustible material of the meteor. They are most always consumed by their own fires before reaching the earth, yet masses of stone, iron and other substances have been known to fall from them to the earth and bury themselves deeply therein. A fine specimen of this kind, called a meteorolite and seen to fall in Arizona, if we remember aright, is now on exhibition at Pioneer hall, this city.

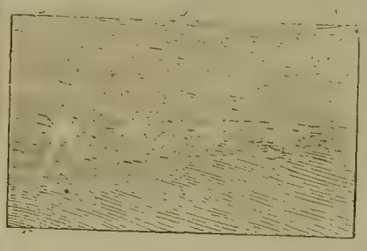
Prof. Kirkwood estimates that during the transit of the comet of 1872, when we had a notable meteor shower, the earth was immersed in the rear of the nucleus some 290,000,000 of miles. "It is evident, therefore," says Prof. Denning, "that if at a point so distant from the real body of the comet the particles are so thickly strewn as to present showers of considerable intensity, we might expect, in the event of the earth's collision with the actual nucleus of a comet, a meteoric display or illumination far beyond the experience of anything recorded in our annals. The heavens would be alive with the swarming and seething of a vast host of falling stars, chasing each other in densely packed ranks, and exhibiting a parallelism of motion most beautiful to behold. Fire-balls of great size and rare brilliancy would be mingled with a thick rain of meteoric dust, suffusing the whole sky."

As appalling as the sight might be, yet no fear need be felt for the earth's safety in such an encounter. The comet would certainly get the worst of it. As fast as the fiery particles descended they would be destroyed by combustion before reaching the earth, the atmosphere acting as an impenetrable shield against such celestial bombardment.

On a morning in June, 1881, the writer had the pleasure of viewing from Mt. Diablo the splendid comet at that time adorning the eastern heavens. At about half-past two o'clock, cold and spiritless as the morning



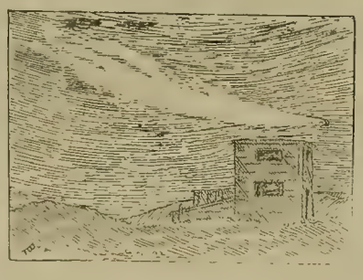
Meteor of Feb. 12th, 1875, seen near Des Moines, Iowa.



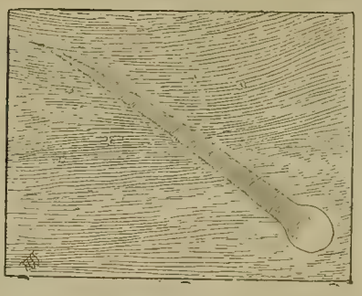
Meteor of July 20, 1860, seen near New York.

Meteor of November 27, 1877.

Two varieties of a luminous trail left by a meteor.



The comet of June, 1881, as seen from Mt. Diablo.



Fire-ball of October 7, 1867.

TYPES OF METEORS, COMETS AND FIRE-BALLS.

course elevation 65 miles above the earth's surface. The velocity of a similar number of meteors, he found, averaged per second 34½ miles. From careful observations it has been ascertained that of 20 shooting stars of the ordinary class, their weight varied between 30 grains and 7½ pounds. They are conspicuous more for their light than size.

A fire-ball is, properly, a meteor. It gains its name from resembling a ball of fire as it passes rapidly through space. It is distinguished from the shooting star by its greater apparent size. A fire-ball observed on Nov. 23, 1877, was estimated to have an apparent diameter of half a mile, but accuracy in such estimate is very difficult, because it is very hard, particularly in brilliant meteors, to determine angular diameter from the effects of glare.

In our closing illustration we give the appearance of a fire-ball seen on the night of Oct. 7, 1867.

itself, we mounted our saddle horses that were waiting before the hotel and started up the steep ascent. The fog drifted in the valleys below us, the wind blew cold and bleak from the snowbanks on the distant Sierras, and even the stars seemed to shine coldly down from the cerulean dome of heaven. The goal attained, we dismounted, and there on the very pinnacle of old Diablo, far above the slumbering world that seemed annihilated from all time and space, we stood amazed, enraptured. We had often read of comets and seen pictures of them, but now the actual phenomenon in all its startling sublimity sailed before us. To the right shone the principal planets of the constellation Aries—Venus, Jupiter, Saturn and Mars. The old moon was very near Jupiter, and all were paling in the gradually increasing light of coming day. We stood for some time deeply impressed with the wonders of the heavens, those beautiful lines of the poet forcibly recalled to mind:

"The very law that molds a tear,
And bids it trickle from its source,
That law preserves this earth a sphere,
And guides the planets in their course."

As regards the hights of shooting stars, we may take the results of Prof. Herschel's observations. Out of a record of 66 which fell during 1863–71, he determined the average hight as 75 miles at first appearance and 53 miles at disappearance, which gave the mid-

---

ROLLING LIQUID METAL.—One of the most interesting and successful inventions of the day in a rolling-mill for producing sheet metal direct from the molten state, instead of rolling it from a billet or bar. Such a machine has been steadily at work for several months at the great can factory of Messrs. Norton Bros. at Maywood, near Chicago. They use it for making steel solder, six or eight inches wide, and 15 1000 of an inch thick, which the mill produces at the rate of 400 feet per minute. The apparatus is provided with hollow rolls having cold water running through them. The water is introduced through the axles, and the rolls are of sufficient size to instantly change the jet of melted metal into solid form as fast as it is fed. The powerful compression exerted by rolls upon the molten metal in forcing it between their two surfaces, and at the same time changing it to a solid body, tends to give to the sheet an even and highly finished surface. The inventors of the machine see no reason why the principle should not be successfully applied to the rolling of Bessemer steel, as well as of the softer metals. With a view to looking into the merits of the invention, Mr. O. W. Potter and other officers of the North Chicago Rolling Mill Company recently visited the Norton Brothers' plant and expressed themselves as being very favorably impressed with the present work and ultimate outcome of this rolling-mill. To accomplish the rolling of the metal direct from the liquid state, many inventors have tried in vain, but not until recently has the attempt been followed by anything like success.

CELLULAR CLOTHING.—The new cellular clothing now coming into use in England is said to be a success. It is woven out of the same materials as the common weaves of cloth, being simply, as its name indicates, closely woven into cells, the network of which is covered over with a thin fluff. Its porous quality allows the slow passing of the outside and inside air, giving time for the outside air to become of the same temperature as the body, obviating all danger of catching colds and allowing vapors constantly exhaled by the body to pass off, thus contributing toward health and cleanliness. The common objection to cotton clothing—that it is productive of chills and colds—is removed, if woven in this manner, and the invention can certainly be said to be strictly in accordance with hygienic and scientific principles.

CON. CAL. AND VA. STATISTICS.—Since the ore discovery in Con. California and Virginia mine in October, 1886, that mine has yielded 364,800 tons of ore. The space left in extracting that amount of ore was nearly 7,000,000 cubic feet. The total bullion yield of the above ore was about $10,000,000, of which nearly $3,000,000 has been disbursed to shareholders in dividends and $1,500,000 in salaries and wages to employes. The Virginia and Truckee railroad received above $300,000 for transporting the above ore to the Carson river mills, and the mill-owners $2,553,600 for crushing it. The Con. Cal. and Va. Mining Company has been paying an interest of 75 per cent in dividends annually on the quoted value of that stock the past eight months.

PAPER FROM SAWDUST.—An important experiment has been tried successfully at Ottawa, Ont. A mill has been established which makes paper pulp out of sawdust. It is now using the product of one mill. The paper made wholly from sawdust is said to form an admirable sheathing that is fit for building after being tarred and dried. A better quality of paper is made by using one-fourth waste paper. The plant cost $15,000, and consists of American machinery, with the exception of the grinders. The mill has a capacity for converting about 12,000 tons of sawdust into pulp annually.

THE great nitrate-fields of Chili are 12 to 40 miles inland from Iquiqui. That city exported 16,700,000 quintals of nitrate in 1888, and is second only in importance to Valparaiso among the cities of the southern coast. The export duty on nitrate brings about $100,000 a month to the custom-house, something enormous to be sure. Every one who has anything to do with nitrate gets rich. It is as good a field for investment as United States bonds, and pays a larger interest.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW DISCOVERY.—*Amador Ledger*, May 25: S. D. R. Stewart, who has been operating the Lincoln ground for some time, has struck a hitherto undiscovered chute of ore of high grade. It is said to mill from $15 to $20 per ton. We have not heard the size of the ledge. It lies close to the surface, and, indeed, the conditions would not admit of its being followed more than about 150 feet deep, as the water in the Lincoln and Mahoney mines would effectually prevent operations below that depth, except at the expense of draining those mines. The roller quartz mill at Quartz Mountain is being moved to Volcano, probably to work the gold-bearing cement met with in the French company's claim. The partial suspension of work at the Bunker Hill will be but for a short time, as timbers for the mine are now on the road. The ten stamps of the South Spring Hill which were crushing the Talisman rock, are now crushing rock, with the other twenty, for the South Spring Hill mine. The Keystone received the first timbers for the season on Tuesday. This mine is progressing very favorably. It is now working as many men as it did before the lay-off some months ago. There is strong talk of an electric plant and the dropping of the 40 stamps pretty soon. The Talisman is now working only two men prospecting. The Gover is taking out good paying rock. They are running full force, and their reservoir is permanently repaired.

AMADOR GOLD MINE.—*Amador Dispatch*, May 23: Deeds were recorded on the 21st of this month, transferring the entire property of the Amador G. M. Co. to a new corporation known as "Amador Gold Mine, Limited." There will be no change in the management of the property. Mr. John L. Minear, the very efficient superintendent, will remain at the helm and push the property to the goal of "dividends" as fast as practical. The company owning the Amador mine are thoroughbred miners. They believe in developing a mine rather than picking out a few dollars here and there. The Zeile reduction works are being thoroughly overhauled. The ovens are being repaired and put in order so as to handle the products of the full 40 stamps of the mill, which will be started as soon as the repairing of the shaft is completed.

BENSON.—Mr. Benson of Calaveras county was in Jackson last Tuesday. He showed us a specimen of gravel taken from the claim which had large specks of gold plainly visible. The owners of this property have just reached the gravel bed by tunneling 800 feet, the face of the tunnel being between 175 and 200 feet from the surface, at which place the specimen was taken from. The claim is situated about eight miles below Mok. Hill, or four miles west of San Andreas, and employs five men. The owners are contemplating the proposition of erecting a mill and working by mill process.

DRYTOWN CON.—The Drytown people have their mine well under way; they are opening the Cosmopolitan. The shaft is 300 feet deep and was filled with water to the surface; about 100 feet of water has been taken out and the company expect to see the bottom by July 1st.

PLYMOUTH CON.—Everything looks well; a new level of fine ore has been opened up. The company will no doubt declare a dividend this month, as the yield for April and May more than pays up the old indebtedness and running expenses.

MAHONEY.—The Mahoney squabble is now settled. Some 2000 feet of pipe will be laid from the Amador Canal to the Mahoney mill, and we are informed by reliable people that the Mahoney will be started up in dead earnest this summer.

MCKENZIE.—The new engine and boiler purchased by Mr. McKenzie in San Francisco have arrived and are being put in position. The whole works will soon be running in full blast.

Butte.

MILLING ROCK.—Oroville *Register*, May 23: Wm. Schneider & Son of Oroville will soon start up the Webber & Chatty quartz-mill at Granite Basin. They have several hundred tons of good milling rock and believe that the mine will prove exceedingly profitable. Since coming into possession of this lode they have had several offers for it, but declined them all, as they fully believe the lode will prove a valuable piece of property.

Calaveras.

MOKELUMNE HILL.—Angels *Echo*, May 22: The mining outlook for Moklumne Hill is daily growing brighter. Placer mines in that locality that have in past years been operated on a small scale, are now falling into the hands of men of capital who intend developing them on a larger scale. The deep gravel deposits of that section are far from being worked out, and it is our opinion that the channel of the deep blue lead which courses through that section from north to south, if properly opened up along its course would afford work for the laboring man for many years, besides richly reward those who would develop claims along this famous lead. But little attention has been paid to quartz mining in that vicinity, but we feel confident that good lodes exist there, and at no distant day this fact will be proven beyond a peradventure.

Fresno.

TEMPERANCE FLAT.—*Republican*, May 25: Gold-mining has always been more or less extensively followed along the San Joaquin river, in this county. Continued washing and rewashing of the banks and bars seemed to exhaust the placer claims in the lower hills, and, owing to the almost inaccessible nature of the higher foothills and mountainous region, little attempt was made until lately to gather gold along the upper San Joaquin. During the past few years, however, rich diggings have been worked as high up the river as Temperance Flat, and at that point considerable mining is now being done. Doc Ball and Ed Baldenebro are now working a placer claim on the flat, from which they are taking $100 worth of gold per day. It is one of the best finds yet made, and is located about 500 feet below Jackson's mill. It is on the east side of the river; their gravel bed is nine feet in thickness and is all good pay dirt, richest, of course, near the bottom. In addition to the placer mining going on there are several very promising free gold quartz mines being opened up and worked. The Temperance mine, owned by Andrews & Whittaker, near the flat, is looking finely. An arastra is kept running on very high-grade ore, while a shaft, now down 75 feet, is being sunk deeper and a tunnel 125 feet long is being driven farther into the hill. The Little John mine, a new location by Albert Austin, promises to make a stir in mining circles at an early day, judging from the preliminary work of development. Mr. Austin has only been in the Temperance Flat district about a month, and he says that he has three other finds, either of which he considers equal to if not superior to the Little John claim.

Inyo.

MAXIM MILL.—*Index*, May 22: In company with the lessee, we visited the Maxim mill last Friday and found everything in first class order and working splendidly. The new Victor concentrator is a complete success. The machine runs smoothly and in construction and operation combines the best features of other concentrators with improvements, altogether its own. That it will save all that is in the rock after going through the battery is certain, and in this is all that can be asked. Repeated trials of the tailings below the concentrator failed to show a trace of metal of any kind. The lessee is now prepared to work custom ores of any grade, and owners are assured of getting all there is in it. The concentrates not infrequently contain most of the pay, and these can be shipped elsewhere for reduction and return handsome profits, when the gross ore would not bear the expense of transportation. The lessee is prepared to sample ores and purchase them on delivery.

NOTES.—Inyo *Independent*, May 24: Nothing is being done at the mill at Panamint. A few men are taking out ore in the neighborhood on their own account, but the Surprise Mining Co. are doing nothing. Mr. C. Anthony has several men at work over at Riley taking out ore. Fitzgerald & Gunn are getting out ore right along from the Minnietta and other mines at Lookout. They are also shipping ore steadily from the old dumps of those mines. The process of concentrating the ores from the dumps is quite successful; on an average seven tons from the dumps are reduced to one, and this pays well for labor and transportation. The process of reduction is on the same plan as the old rockers used by gold miners in early days. Four or five men are employed at the Lucky Jim mine, at Darwin. They are taking out ore right along. Mr. J. A. McKenzie, owner of the mine, is at San Francisco. Mr. J. Wilson has several tributers taking out ore in Lee District. Some of the ore is very rich, running up into the thousands of dollars per ton. The ore body lately found by Dunphy and O'Keefe at Cerro Gordo is developing the features of a bonanza. Appearances indicate that it may turn out as big an ore body as that found in the Union mine, of which this is an extension. If it should yield even a quarter of the product of the Union mine, it will make millionaires of its fortunate owners.

MARBLE.—The marble quarry is opening out better with every advance made. Mr. Luce writes as follows: "We are getting along slowly here, having been short-handed for a month or more. But we are opening one of the finest ledges that was ever uncovered. It is taking longer to get uncovered than we anticipated, but it will be all I ever expected it to be when it is opened. No limit to size, quantity and quality of blocks."

Mariposa.

COULTERVILLE.—Cor. Mariposa *Gazette*, May 23: Our mining interests are about as they have been for some time, but the future prospects are encouraging. The owners of the Tyora mine are expected to put in an appearance soon, as their time is nearly up when they agreed to come and commence work. At the Bondurant mine things are looking much better, as they have got through a large "horse" or dike, that cut the vein and gave them much trouble. They now have a fine large vein of splendid rock and the mill is running on good ore, and making money for the Co. There are a number of miners on Solomon's Gulch and its tributaries, hunting pockets in the numerous strata.

Napa.

COPPER.—*Register*, May 24: J. J. Walters of Pope valley came to town Friday with the news that a rich copper mine had been found near his home. The matter has not been investigated far enough to determine how great the deposit is nor how rich the ore is, but from appearances it is a great find. Mr. Walters will take steps to develop the mine. At present all that can be seen is a ledge of ore. A few months ago mining locations were filed upon by residents of Pope valley, which were apparently rich in copper. We are informed that Mr. Rhodes of the Ætna mines is interested in these copper mines and will develop them.

Nevada.

A PROMISING MINE.—Nevada *Transcript*, May 26: John Curry is engaged in running a 500-foot drain tunnel to connect with an 80-foot shaft which he sank two years ago at his quartz claim on Rush Creek. He has a splendid prospect in both shaft and tunnel, the main ledge being two feet thick and of good quality. Two years ago Mr. Curry took out about $3000, and previous to the time he owned it the claim was made to yield some $20,000 by groundsluicing. That has always been noted as a rich mining locality.

THE DERBEC.—The Derbec drift mine has never looked better than it does right now. Sup't Galavotti is one of the best managers anywhere, and all work under his supervision is done to the very best advantage. About 120 men are regularly employed in and about the mine.

MARYLAND.—Grass Valley *Union*, May 24: An old shaft on the Maryland ground has been pumped out and put in working shape, and some sinking that has been done shows a ledge three feet in width in the bottom, the quartz carrying free gold and good sulphurets.

Placer.

OPHIR.—*Placer Herald*, May 25: The mining outlook at Ophir is brighter than it has been for several years. Mr. Shurtleff expects to strike pay ore shortly. Charley Reed is taking out splendid rock in the St. Lawrence. Prospects at the Adams & Huntley mine are good. Major Hubbard expects to start work in the Gold Blossom next month. The Hathaway mine is paying well and the rock is richer than ever. Adams & Hartley are drifting in their Ophir mine. They are now debating upon the advisability of building a new mill. A man took out $52.50 from crevice diggings somewhere near Ophir, in one day last week. He won't tell where the find is. Two men whom he employed took out $6 from two pans of dirt.

IOWA HILL.—Colonel W. C. Rich of Iowa Hill called Tuesday. Times in that town are rather quiet, according to the Colonel. The mill at the Hohrman is not finished. The Morning Star company is running a tunnel to the background.

PIONEER.—The pioneer mine below Damascus is as good as ever. A great deal of work has been done in the way of opening this mine. The company is thinking of adding more stamps.

Shasta.

WESTERN SHASTA'S GOLD MINES.—*Courier*, May 25: We have been reliably informed and personally know some of the following facts in regard to that important locality around French Gulch. That Greenbaum & Levy of San Francisco are employing 80 men grading roads, building a mill and opening up their Grizzly Gulch mines. And in the one mostly developed an ore body of 4000 tons from the level up to the surface, is opened; this body has sampled $25 a ton in free gold, with two per cent sulphurets that assays as high as $6000 to the ton. After making such a success and enriching the county to the extent in proportion that all mines do, they also deserve praise for their good staying qualities. After expending $30,000 on a prospect six miles from Grizzly and the only success gained was the distribution of this amount, they bravely attacked those claims of Grizzly, which is proving to be a large group of paying mines. At the Highland another mill and road is being constructed to work the ore from this mine. A sale has been made of a one-third interest in the J. I. C. mine. Fox & Van Meter are the purchasers. It is said that the Wheeler group of Kline's Gulch is sold and one-third of the money is deposited. The Gladstone Co. are driving a tunnel 300 feet long into the ledge, and 100 feet deeper than the one working. When drifting along the ledge is done from this tunnel, average backs of 400 feet will be gained in the extensions east and west. The new tunnel is 70 feet deeper than winzes. Since their Paul battery started the mine paid well. There are dozens of prospects working all around this district, any of which are at any time liable to jump into prominence, for they look as well as those mentioned did at one time.

CELESTINE.—*Shasta Courier*, May 25: The Celestine mine works on Grizzly Gulch, above Whiskytown, are going on with energy, and the road from the mine to the mill is progressing rapidly. Also a force of men are engaged in putting a dam across Clear Creek to raise the water into a ditch that is being cut to convey water to the mill, to be erected at Oak Bottom, to work the ore from the mine mentioned above. Forty or 50 men are employed in this enterprise, and that looks like business

Sierra.

DRIFT.—*Mountain Messenger*, May 25: The tunnel at the Golden Giant drift mine, below the Winans ranch, is in over 800 feet, all run since last October. Gravel is overhead at no great hight, probably, in the opinion of the workmen. Ed H. Gale has been contractor for the tunnel. The channel for which the company is prospecting is supposed to be the Monte Cristo lead. All work has been suspended on the Wide Awake drift mine owing to an increase of water, so great that two pumps could not keep the diggings clear. Just what the owners will do is not yet decided. The Alaska company, Pike City, is expected to resume work within the next two months. It is said that the water can be readily removed. The quartz-mill at St. Charles hill is about ready to run. The owners of the Red Ledge mine, below Forest City, have decided to put in waterpower. The Wide Awake Mining Co. has decided to run a new and lower tunnel to the gravel, from which they were recently driven by water.

Sonoma.

MINERAL DISCOVERIES.—Santa Rosa *Republican*, May 23: A specimen of chrome-iron ore, taken from the surface on the lands of J. D. Cooper, about ten miles north of Fort Ross, near the Plantation House, indicates that there must be a valuable deposit of this mineral in that vicinity. The piece exhibited by Mr. Cooper, and picked up by him as a cropping, is almost pure mineral, no steel chisel or sledge-hammer producing any effect upon it. If, as is supposed, there is a ledge of this ore in that locality, it will, when developed, add largely to the mineral wealth, not only of the county, but of the State, as this mineral is not only valuable, but rare. In the same vicinity a considerable deposit of almost pure bitumen has also been found. Being but about three miles from the coast, these deposits may become the means of making that part of the county rich and valuable in the near future.

San Bernardino.

GOLD HILL.—Redlands *Citrograph*, May 22: A new mining find is reported by that veteran prospector, Barney Carter. It is on the border of Death valley, just over the line of Inyo county. He has associated Mr. Nowlin of Riverside with him and active work commences at once. Provisions and tools have been shipped out, and a gang of men will at once be set to work to develop the ledge. The average rock brought in assays $300 in gold. The district has been named Gold Hill.

Trinity.

KNOW-NOTHING MINES.—*Journal*, May 25: From Mr. Hansen, who returned from Know-Nothing Creek last week, we gather the following items: The Gold Run mine, superintended by A. Dannenbrink, has a ledge of first-class ore, on which a four-stamp mill is being run day and night. The ore averages over $100 per ton. The company contemplates digging a new ditch by which to obtain water to run the mill during the entire summer. About 20 men are employed at present, with a probability of more being employed in the near future. The Know-Nothing is looking very well and under the superintendency of P. P. Black, an experienced miner, the mine is paying to the satisfaction of the owners. Good ore is being put through day and night, and 12 to 15 men are employed. The Hansen has been started up again with R. Junkans as foreman. Mr. Hansen recently purchased of Mr. Loftus his one-third interest in this mine. If the mine develops according to present indications there will be considerable work done on it this summer. Haglin, Reilley & Dayton have built an arastra and are running the Wolverine mine; they have some good ore. A new discovery has been made on Methodist Creek by Mitchell, Bennett and Kennon that looks very flattering; the ledge is about two feet wide. A subscription has been started to raise money for the purpose of making a trail between New River and the Gold Run mine. The mine-owners of Know-Nothing Creek have subscribed liberally and it is thought that it will be a success.

WILL RESUME OPERATIONS.—O. P. Powers, formerly superintendent of the Cherokee mine in Butte county, passed through town this week on his way to Cox Bar to take charge of the Lower Trinity Tunnel Co.'s mining interests in that vicinity. Operations will be resumed as soon as the state of the river permits, and from all indications the company should have a favorable season.

NEVADA.

Washoe District.

LANZAC.—Virginia *Enterprise*, May 25: R. T. Brodek has six men at work developing the mine, and the result of his work is encouraging.

HALE & NORCROSS.—On the 400 level the stopes in the north drift from No. 1 west crosscut continue in good ore. Now working in the fifth set above the track floor from the south upraise. Have opened a station for the 300 level and have started a drift north, which advanced 20 feet. On the 500 level the north drift was advanced 17 feet and the northwest crosscut 25 feet. The stopes above this level continue in ore of good quality. On the 600 level are extracting the usual quantity and quality of ore from the several stopes. On the 700 level the new west crosscut was advanced 20 feet; total distance, 252 feet; the last 17 feet showing stringers of quartz which give some fair assays. The stopes from the south drift are yielding fair-grade ore. During the week have hoisted 1205 cars of ore, have shipped to Nevada mill 1050 tons and have milled 1040 tons. Average battery assay, $26.30 per ton. Have bullion on hand and previously shipped for this month amounting to $64,984.

SAVAGE.—On the 400-foot level the joint west crosscut was extended 24 feet. The face is in clay and quartz. From No. 1 and No. 2 west crosscuts are stoping ore of fair grade. Are also extracting ore from the old stopes in the north and south drifts. During the week have hoisted 578 tons of ore, have shipped to the Rock Point mill 439½ tons of ore and milled 490. Average battery assay $20.22 per ton. Have shipped $6312.09 in bullion since last report.

CONFIDENCE.—The joint Challenge and Confidence north drift on the 300 level is now in 183 feet, having been advanced 28 feet during the week. The face shows porphyry. The joint Challenge and Confidence raise from the 300 level has been connected with stopes on the 200 level. The joint Confidence and Challenge east drift on the 1250 level is in 35 feet, 15 feet having been added during the week. The face shows quartz and porphyry.

CROWN POINT.—Are opening the tenth floor, 400 south stope, and find the pay streak eight to ten feet wide. Have found some fair-grade ore at the north end of the old 400 north stopes, but it is impossible at present to tell its extent. Have shipped to the mill during the past week 850 tons of ore, the battery assay of which was $18 per ton.

SEG. BELCHER.—Started a raise from the west crosscut on the 15th instant, and are now up 30 feet. The west streak found in the crosscut has been passed through. It was 18 inches wide and assayed from $30 to $50 per ton, and are now raising vertically to reach the widest streak found in the crosscut, which they expect to strike in a few feet.

BALTIMORE.—In crosscutting from the south upraise have been cutting very good ore in the last few days, and still shows in the face. West crosscut on 225 level is in running ground, which makes slow progress. Good mineralized quartz is washed out from the face with soft material.

EXCHEQUER.—On the 382 level the west crosscut on the north line is out 149 feet; face in porphyry. The east crosscut on the north line is out 155 feet; face in clay and porphyry. The north lateral drift on the 500 level is out north of Alpha shaft 506 feet. The face is in clay and quartz.

CHOLLAR.—The south lateral drift, 750 level, is out 475 feet; the face in quartz giving low assays. The south lateral drift, 850 level, is out 307 feet; face in hard porphyry. The south lateral drift, 950 level, is out 628 feet; face in clay and quartz.

YELLOW JACKET.—Shipping over 100 tons of ore daily to the Brunswick mill, the pulp assays of which average $30 per ton. Prospecting work in the mine is going on vigorously.

BELCHER.—The raise from the 1100 west crosscut is up 37 feet on the slope, the top being in porphyry, with streaks of quartz through it assaying from $10 to $20 per ton.

ALPHA.—On the 500 level east crosscut, 50 feet south of Alpha shaft, is out 82 feet; face in porphyry. The east crosscut on the south line is out 126 feet; face in porphyry.

POTOSI.—North lateral drift, 750 level, is out 233 feet; the face is in clay and porphyry. The north lateral drift, 285 level, is out 284 feet; face in hard porphyry.

SILVER HILL.—The work of opening up the mine is pushed forward with vigor, but there is nothing new to report in the formation.

CHALLENGE CON.—All the work in this mine continues to be jointly with the Confidence, and is described in the letter from that mine.

NEW YORK.—West crosscut, 240 feet north of the shaft, 800 level, is out 200 feet; face in quartz.

OVERMAN.—Extracted 251 tons and 400 pounds of ore. Shipped to the Vivian mill 316 tons.

ALTA.—Mill running steadily. No new developments to report in the mine.

JUSTICE.—Mill running steadily and ore shipments keep up.

ANDES.—Drifting west on 350 level, and doing repair work.

BULLION.—Still drifting north in ledge on 760 level.

Cedar District.

LOOKING WELL.—*Silver State*, May 22: E. N. Clark of Cedar mining district, in the Antelope range, reports the Mohawk mine as looking remarkably well. It has been bonded or bought by Messrs. Sunderland & Barrington, who have a force of men employed in working the mine. They have about 200 tons of ore on the dump, much of which carries over 40 per cent lead, and is rich in silver. This ore will be shipped to Reno to be reduced.

Eureka District.

NEW CONTRACT.—Eureka *Sentinel*, May 25: The Ruby Hill tunnel is now in 1500 feet, and a new contract was let last Monday to run an additional 500 feet, at the completion of which the company are sanguine of getting through the hard belt and striking ore.

Jumbo District.

CHEAP ORE MILLING.—Virginia *Chronicle*, May 25: J. C. Dunlop, owner of the Wild Goose mine, who is erecting a five-stamp steam-mill at the mine, says he can mine and mill the ore from the Wild Goose at a total cost of $2 per ton. There is a vast amount of ore stripped in the mine assaying from $13 to $50 per ton in gold. Another rich streak, assaying over $1800 in gold per ton, was recently cut in following the vein, and the narrow streak struck assaying $32,000 in gold per ton shows no sign of pinching out.

Ploche District.

HALF MOON MINE.—*Record*, May 20: On Monday last the Yuba Mining and Reduction Co. concluded the purchase of the Half Moon, Columbia, Rainbow and War Eagle mining claims from T. J. McMahon. The properties are situated in the western part of this district, about three miles from town, and were bonded last January for six months. The amount paid was $14,000. Of the four claims, but one, the Half Moon, has been developed. On this mine two main tunnels and several side drifts have been run for over 500 feet, showing up the ledge in good shape, and a conservative estimate places the value of the ore now in sight at not less than $50,000. Some portions of the ledge can be mined and smelted without sorting, but the greater part of it is low-grade and will require the use of concentrators for its profitable reduction. These will be provided at the reduction works here now in course of construction. The hills in the vicinity of the Half Moon abound in mineral and the success attending the work of Mr. McMahon in this case will stimulate others to further work in the vicinity.

Tuscarora District.

NORTH BELLE ISLE.—Tuscarora *Times-Review*, May 24: North drift, 500-foot level, extended 12 feet. The face is in better ground and shows more favorable for ore.

NEVADA QUEEN.—The 350-foot crosscut has been advanced 10 feet; face is all in the vein and showing some good ore. Station has been cut out and winze sunk 6 feet. Will get to the ore at a depth of 12 feet and then follow it on the inclination. There is little or no change in the stopes. Two hundred and fifty tons concentrating ore have been sent to the works. Concentrator running much smoother since the new rolls were put in. A drift will now be started from 150-foot level of Commonwealth to follow the ore found on the line.

COMMONWEALTH.—225-foot level: No. 3 east crosscut has been extended 13 feet. 300-foot level: No. 1 south drift has been extended 3 feet, and 30 feet timbered; face is showing some fine ore. The stopes are looking well in all parts of the mine. Two hundred and forty-five tons of ore have been sent to the mill; average assay, $126 per ton. The mill has run without a stop, doing good work. Bullion shipped 22d instant, $20,148.36.

DEL MONTE.—Joint crosscut, east from the 225-foot station, extended 11 feet. North drift, same level, extended 29 feet. West crosscut from the end of the north drift, 100-foot level, is in 30 feet. East crosscut, same point, extended 10 feet. The face continues to show some high-grade ore.

NORTH COMMONWEALTH.—Joint crosscut, east from the 225-foot station, extended 11 feet. East crosscut from the end of the south drift, 100-foot level, extended 22 feet; total length, 39 feet. The face shows a good width of high-grade ore; no wall has yet been reached.

GRAND PRIZE.—400-foot level: West drift from the north crosscut extended 20 feet. Face of the west drift (old vein) advanced 19 feet. South drift extended 18 feet, and west crosscut from south drift 15 feet.

BELLE ISLE.—North drift from west crosscut, 250-foot level, extended 11 feet. North drift from west crosscut, 150-foot level, extended 8 feet, showing some improvement in the face.

NAVAJO.—Crosscut No. 3, west from the end of the south drift, 350-foot level, extended 10 feet. The face shows favorable for ore. South drift, same level, extended 7 feet.

Tybo District.

DIMMICK.—Eureka *Sentinel*, May 25: We learn that Eugene N. Robinson will return shortly with plenty of capital to develop the Dimmick mine. The property has a fine reputation and will doubtless make a big mine.

ARIZONA.

CATOCTIN.—Prescott *Courier*, May 23: Paul S. Johns, who is working the Catoctin mine, under lease, has sent in to Wm. N. Kelly, one of the owners, very rich silver ore from the bottom of the 150-foot winze. Ruby and native silver are to be seen all over the pieces. B. T. Riggs of the Hillside mine will go to Ross' station on the P. & A. C. railway in a day or two, and ship two carloads of rich ore. Timmerman's pack train arrived yesterday from Bradshaw district, with rich ore for Bond & Hayden. The Oro Bella mill was running when Mr. Timmerman left the district.

BRITISH COLUMBIA.

THE REVELSTOKE SMELTER.—Donald *Truth*, May 20: Now that the smelting syndicate has commenced operations in earnest at Revelstoke, a description of the plant may not be uninteresting. The main building will have a total length of 208 feet and a width of 36 feet, and in addition there will be an engine-room and sampling works. The engine for crushing and sampling is of 60-horse power and can crush 150 tons a day. This engine will also be used for hauling up ore from steamboats. There will also be another engine to run the two furnaces. The reverberatory furnace is 10 by 40 feet and the water-jacket smelter 30 by 72 inches, with a capacity of 90 tons every 24 hours. In the construction of the reverberatory furnace 80,000 bricks will be used. The smelter will be located on the banks of the Columbia, half a mile from Farwell and the same distance from the Revelstoke depot. The site has already been cleared, and men are now at work clearing the right-of-way for a half mile siding and will commence grading it at once. The bricks used in the furnace will be made on the west side of the Columbia, about a mile from Farwell.

PORCUPINE CREEK.—The Government has put the trail to Porcupine creek in first-class order, Mr. Cameron finishing up the job Thursday. He reports considerable snow out there yet, but that it is fast disappearing. A few men are on the ground, and more will follow Monday. Holland & Co. will start a boarding-house, intending to charge miners the reasonable rate of a dollar a day for board. The Discovery, the Elsie, and the Donald gold mining companies will all be at work by June 1st. The latter has both shallow and deep ground, and its stockholders will either have much money or all be dead broke in the fall.

COLORADO.

AROUND ASPEN.—Denver *Republican*, May 22: Sam Babbit, at present a resident of Aspen, but who is known as an old-time Colorado prospector, who for almost a score of years has made it his business to visit every new mining camp of any prominence, is in the city. The reporter asked the gentleman what he thought of the possibilities of the country directly tributary to Aspen. "In my opinion all that section is destined to become very productive of precious metals. The mines about Ashcroft have been almost abandoned since 1883, but there is a better day coming for them. Many of them are true fissures, and such claims as the Tam O'Shanter will be worked at a profit long after the present generation is forgotten." "What about the Aspen district?" asked the reporter. "While I claim to know something about mining, that is too hard a question for me to answer. To such a query it would take at least four competent, first-class mining engineers, who had made a careful study of all sections of the camp for months and up to the moment of replying, to answer it intelligently. It is the wonder of the world in a mining way, and every day it becomes more marvelous. Aspen is a district that has come to stay. I believe its mines to be as permanent as the fissures about Central City, and they will last for 50 years to come."

SYLVANITE.—Elk Mountain *Pilot*, May 23: The Chicago owners of the Sylvanite mine have employed V. F. Axtell to secure a statement of the indebtedness against the mine, created by W. S. Baker, who worked it as lessee. The amount is somewhere in the neighborhood of $17,000, we believe, which could be wiped out with one car of ore, if they would only go to work and take it out. This move looks very much as though the owners will take some steps to commence work again, for it is really a shame to allow so valuable property to remain idle.

COKE.—The G. C. & I. mine is still working on about half time. The coke ovens are running in full blast, with an active demand for coke. From seven to ten cars are shipped daily, besides from 15 to 20 cars per week is being stored for stock, to be used in the future, which is the custom every year at this season. The market for coal is very dull; the railroad, for some reason, is not taking as much as usual at this season.

DAKOTA.

PORTLAND MINING CO.—*Black Hills Pioneer*, May 22: The probabilities are strongly favorable toward the early erection of a plant, under the Newberry-Vautin process, for treating refractory ores, by the Portland M. Co., owning valuable property in Bald Mountain district. Fifty pounds of ore from the Trojan mine were tested under the process at Denver. The results showed that 85 per cent of the gold assay value and 92 per cent of the silver assay value had been saved. Subsequently to this the London *Financial News* published proceedings of an annual meeting of the parent company owning the Newberry-Vautin process, which has headquarters in London. Part of the proceedings was a report from Mr. Higginbottom, agent in Colorado for the company, which stated that he was then negotiating with a Dakota company for sale to it of the exclusive right to use the process in Dakota. A few days later a Scotch paper was received containing Mr. Higginbottom's report in full. This proved what we had before assumed to be true, viz., that the Dakota company referred to was the Portland company. Not over two weeks ago a gentleman of this city received from the general agent of the Newberry-Vautin Co. in Colorado a reply to a letter he had written, in which it was stated that as negotiations were already pending for a sale of the territory to a Black Hills company, he was unable to talk business at present. The letter closed by stating that one test of a small quantity of ore had been made and had proven satisfactory. A much larger shipment was expected shortly, and by results obtained from treating, negotiations would be determined. About the time this letter was received here the Portland shipped 20 tons of ore, ostensibly to Boston. The corporation is a strong one, financially, owns some of the best property in the country, and is amply able to expend one or two hundred thousand dollars, if necessary, in building reduction works.

LOWER CALIFORNIA.

DRY WASHERS AT ALAMO.—*Lower Californian*, May 23: The dry washers, the best and largest ones, take out over an ounce a day on an average, with from three to five men at work cleaning up the ground and getting it ready for the machine. The small and crude washers take out from $2 to $8 per day each. There are about 25 machines of all sorts at work, some of them of the crudest design and manufacture. The improved Freeman washer seems to give very good satisfaction. The ground is now getting dry enough to be worked to good advantage. It is cheaper to work the dirt in a dry washer than to haul it to water and wash it out in a rocker.

ALAMO QUARTZ.—The great interest in the strikes made in the Telemaco, Ulises, Lopez and Princesa mines continues. Besides the blowing up of Butler's stamp-mill this is the leading topic of conversation. The size of the veins, the great bodies of very rich quartz, the perfect formation of the veins, the fine foot and hanging-walls, all surprise the natives. These are not the only rich or big mines in the camp. The Visnaga at Santa Clara is turning out rich ore daily. The Centipede proves to be very rich and a large vein. The Maud S. shows very fine ore on the dump, and seems to improve with depth. The Scorpion grows better every day. Every foot of depth in these mines adds thousands of dollars to their value. The Grandisima, Jupiter, Buena Vista, San Vicente and Quinota are all turning out rich ore. These veins are not large, running from 16 inches to two feet in width, but the ore is good. The Elsinore, Encantada, Placer and other veins are showing up well. Heise, Bryant & Moore have closed a trade with Juan Moreno & Co. for the Minerva, Oro Fino and Aurora prospects. Continuous reports of blasts are heard on every side of camp day and night. Work is being done on 38 mines out of the 100 locations in the two camps. As the four months which the law gives to do the possession work draw to a close, all those who have anything in view in their locations, or whose rock prospects at all well, are hurrying up their work.

IDAHO.

BOTH GOLD AND SILVER.—*Statesman*, May 23: Mr. Joseph Voshay of Idaho City, one of the owners of the Washington mine, is here to contract for the transportation of the machinery for a ten-stamp mill for his mine from this city to the point near the mine where the mill is to be erected. The mine is located about nine miles northeast of Idaho City, in the immediate vicinity of the old Sub Rosa mine. The Washington lode was discovered several years ago, but only partial developments were made upon it until recently. At the time of discovery the surface croppings indicated a width of 65 feet between walls. At a depth of 250 feet the lode was narrowed slightly, where it now shows two quite distinct and separate veins, one of gold four feet wide, and the other of silver ore 30 inches wide. The vein of gold ore works up to $100 per ton, while the vein of silver ore shows, by careful and accurate assay, a value of 200 ounces per ton. The silver vein is well defined and lies in immediate contact with the foot-wall of the lode, while the gold vein is similarly situated with regard to the hanging-wall. This is a very meager description, but it will suffice to show the great value of the lode and the singular character of the veins within it. From the tunnel which pierces the lode at a depth from the surface of 250 feet, there is a shaft or "upraise" on the gold vein, which has been extended to the surface, showing the same character of rich gold ore all the way. This development brings in sight a large body of rich ore, more than sufficient to warrant the expense that is now being made in preparation for working the mine on a liberal scale. A force of 27 miners are now at work grading the site for the mill and in other work connected with the mine. Operations at first will be restricted to working the gold vein, though the batteries of the mill will be calculated for and adapted to the working of both gold and silver ores. The Washington is owned by Mr. Charles Balbach of Omaha, Nebraska, and Messrs. Joseph Voshay, W. J. Fox and J. C. Regan of Idaho City, Boise county, Idaho.

THE MINNIE MOORE.—Wood River *Times*, May 21: The Minnie Moore mine shipped over 600 tons of ore and concentrates last month. As about six tons of ore are required to make a ton of concentrates on an average, the shipments represent the extraction of about 3600 tons of mineral for the month, or over 100 tons per day. Our properties are evidently gradually climbing up to the rank of first-class mines. The Minnie Moore is reported as showing greater reserves of ore than ever.

CŒUR D'ALENE.—Wardner *News*, May 22: There are less idle men to-day in Cœur d'Alene than in any other portion of the United States containing the same population. This is easily accounted for. It is no place for idlers, and the ambitious and energetic man encounters no difficulty in providing a field for his labor, as it immediately presents itself to his view in as many and pleasing forms as his fancy can picture or desire. If he is a miner he feels at once at home, and in his mind determines that he has struck the best country on earth. Opportunities for employment and profitable work are noticeable on all sides.

EMMA AND LAST CHANCE.—As announced in last week's *News*, operations were resumed in the Emma and Last Chance concentrator on Monday morning. The whistle blew at 6 o'clock A. M., and the mill has been running steadily every day. Night work will commence as soon as the air connections are made, which are rapidly progressing in the mine, and after the first of next month the mill will be kept going perpetually.

MONTANA.

NEW CARBONATE CAMP.—Montana *Mining Review*, May 25: The mineral field in the neighborhood of Dearborn canyon up to within the past year had received but little attention from prospectors and mining men, but the recent discoveries of fine carbonate ores in that section have resulted in bringing it before the mining world in a very favorable light, and many prospectors and miners are now in the field pursuing the work of investigation. Development work will be vigorously continued, and the prospect now is that this portion of Montana's mineral field will soon rank second to none. Recent developments on the Sweetheart lode, on the north fork of the Dearborn river, have brought to light an immense body of fine hard carbonates and galena, a specimen of which was left at this office. The ledge is said to be from 75 to 100 feet wide, lying between granite and lime walls and cropping out for several hundred feet. The pay chute is next to the granite hanging-wall, and shows up on the surface for about 400 feet, and the surface developments prove it to be 30 feet wide across solid pay ore. The owners, Messrs. Willett & Burtch, after doing considerable preliminary work, have dropped a shaft down 20 feet, which they have well timbered with square sets and lagged. The shaft is now all in ore, and they have just got through the iron cap which overlies the pay at this point. There are several other fine properties in the canyon, which only await development by the lucky owners to prove their worth.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, May 25: The Colchis mill is fast being put in shape for business. Zach Redding of Hanover has opened out a large body of zinc carbonates. Concentrates this week are being shipped from the Aztec mill. There are about 300 tons of them to be shipped. The Silver City National Bank this week shipped $4542 in bullion, and the First National, $2130. Four or five tons of ore was shipped from the Alhambra to El Paso this week which is worth about $1.50 per pound. The Alhambra produces richer ore, but that is not so bad for a shipment. Paul Curtis and T. N. Childers were in from the Old Man on Monday. They both have leases on the mine, and are taking out good ore. Curtis had one pocket of $1200 ore. They regard the strike in the Old Man as immense. All of the leasers are working in ore.

SALE OF A MINE.—*Southwest Sentinel*, May 21: Mr. Nat Bell of the firm of Bell & Stephens at Pinos Altos, was in town Monday concluding the sale of the American mine at Eureka to Mr. Downey, who has had the mine under bond and lease the past year, during which time the mine has always paid dividends. The price paid for the mine was $15,000. The Mountain View M. Co. recently organized at New Orleans and operating at Pinos Altos, are pushing the work of development upon their mine. The old shaft is being extended and a new one, designed to be the main shaft, is being sunk on the ledge 70 feet west of the former. The ore taken out in these workings, both as to quality and quantity, is quite satisfactory.

OREGON.

AT CRACKER CREEK.—Cor. Bedrock *Democrat*, May 20: The explorations on the Eureka and Excelsior mines during the past six months have developed those properties into as magnificent mines as can be found anywhere on the Pacific Coast, and their wealth and permanency have been sufficiently determined to justify the erection of a stamp-mill. Several acres of dense forest have been felled and removed in order to make place for the purpose of building a large 20-stamp mill.

QUARTZ.—The report was brought to the city that a wonderfully rich find of gold quartz was made a day or so ago back of the old slaughter-house in Robinsonville. The ore is said to be of the same character as that from the Berry mine and equally as rich, gold specimens being found all through the ledge. The owner of the new discovery is a man by the name of Johnson. The Berry mine is being worked by a force of nine miners, and the ore still continues extremely rich in gold. The ore is being worked by an arastra. Last week a cleanup of 40 pounds of amalgam was made. The Worley mine is proving a bonanza and is showing to be an extensive ore body. The placers of Travillion & Mann, near Robinsonville, are being worked this spring with very flattering results, notwithstanding that water is somewhat limited. The Bowman placers are being worked with great success and the output for the season's run will be considerable. All the mine-owners of the Robinsonville section are much encouraged by the favorable showing made by their properties under development work the past winter, and they feel confident that their district is the richest in the county.

UTAH.

A FRISCO MINE SALE.—Salt Lake *Tribune*, May 23: W. S. Martin came up from Frisco for the purpose of closing the deal by which he turns over the Fisherman and Stalwart mines in North Star district to the purchasers. He returns at once with J. W. Smith, who will superintend the property for the new company. It is proposed to put on eight or ten men to get in a good working shaft, and then a larger force of men will be put on. A whim and rope are being shipped to help expedite operations. This will make things more lively about Milford.

BLUEBELL DISTRICT.—John Williams and his associates were in the city yesterday looking after their mining interests and laying in supplies for the summer. They are interested in the mines in the Bluebell district at the south end of Rush valley and a few miles from the Salt Lake & Western railway. The Morgan, owned by Hughes & May, has 2½ feet of galena running 18 to 20 ounces silver and 56 per cent lead, and it is very pretty ore. A carload of it was received yesterday. The Black Hawk, owned by Williams & Ajax, has eight feet of galena that assays 21 ounces silver and 47 to 52 per cent lead. Three men take out about a carload per week, besides doing some deadwork.

WASHINGTON TERRITORY.

THE CONCONULLY MINES.—Ellensburgh *Capital*, May 16: Mr. L. D. Davis and Mr. Thomas Clohecy, experienced miners and gentlemen of the highest character, arrived in Ellensburgh on Tuesday from the Conconully mines, and inform the *Capital* that they are well pleased with the country and its prospects. They regard it as a country of merit, with great possibilities before it, but were surprised at the limited amount of development and the apparent lack of energy displayed by the miners and prospectors. Instead of going to work and shipping ore, they have permitted it to accumulate on the dumps unsorted and uncared for, whereas by shipping they could have realized working expenses and at the same time advertised the country. The transportation facilities have been equal to any new district, as the teams which have been engaged in transporting merchandise to the camps have generally returned without loads. A little more display of energy and more reasonable prices placed upon prospects, these gentlemen think, would have placed the whole district far in advance of its present condition. Less dependence upon outside capital and more dependence upon good solid muscle, will work wonders in the mines of Conconully.

MECHANICAL PROGRESS.

Discoverers of the Telegraph.

Credit to Whom it is Due.

EDITORS PRESS:—In your issue of May 11th, page 338, in article headed "A Delayed Invention," you have the following:

"In this narration it should not be forgotten that Prof. Morse did not discover the first principles of the telegraph; they were communicated to him by Dr. Charles T. Jackson of Boston, but Prof. Morse is entitled to the credit of reducing them to practical use."

Now, as a matter of full justice, as well as history, I feel it a duty to correct in part the above.

Dr. Charles T. Jackson of Boston stated in my presence that he and Prof. Morse were fellow-passengers on a steamer returning from Europe, and that Prof. Morse asked him if he did not think electricity could be used for conveying ideas by making marks representing words. Dr. Jackson said, "I answered, yes, for I took it in at a flash," and he further stated: "We had frequent conversations during the voyage on the subject, and it was understood that on our arrival a patent was to be applied for." Dr. Jackson, as he expressed himself, expected to be interested in the patent, as he claimed he gave the professor valuable information on the subject. Dr. Jackson did not care so much for the pecuniary loss, but he seriously felt the loss of not having the credit he considered his due. Taking Dr. Jackson's side of the question, judging from his earnest declarations, there is no question in my mind but to Dr. Jackson much credit should be accorded; still the first thought was the brilliant one, as bright as the lightning's flash in a thunder-storm. This stands paramount to all after-ideas or workings. Inventions are one thing, practical application another; but the first new thought of grand conceptions is what sends the chariot of progress onward. To Prof. Morse is unquestionably due the conception. He certainly made all ideas practical.

ALMARIN B. PAUL.

[We are perfectly aware of the above facts, having known Dr. Jackson personally, and talked with him fully in regard to the same.—EDS. PRESS.]

A Disturbance in Our Iron Industry.

The situation of the iron and steel market at the present time is curious. Both metals are advancing in Europe but declining in Pennsylvania, and this, too, notwithstanding there is a decided promise of an increased demand for iron in almost all branches of industry, and especially in the line of railroad iron. The situation is somewhat anomalous, especially to those not directly interested. One who evidently knows, says that the disturbing element consists in the cheap production of iron and steel at the new iron center in Birmingham, Alabama, and that it is difficult to see when it will stop or what will be the final outcome in relation to the Pennsylvania iron workers. We quote as follows:

At the bulk of the old furnaces in Pennsylvania a good profit is made with iron at $20. There is no loss when the price is $18, but when it falls below $17 the furnaces must blow out, or bankruptcy is inevitable. This is not the case with the new open-hearth furnaces, which can work closer; but still there is little money even for them when the price falls below $17. Now, at Birmingham they get their ore, their fuel and their flax so cheaply, it is said, that they can turn out pig iron at an average cost of $11 a ton, and can pay freight on it to New York to sell there at $15, so as to have a tidy profit. The receipts of Southern iron at New York have latterly been so large that the Thomas Iron Company of Pennsylvania has just felt bound to protect its customers, to whom it had sold iron on contract deliverable throughout the summer months at $18, by reducing the price to $16.50. This, it is thought, will close most of the furnaces in the Lehigh region.

The Pennsylvania iron-makers affect to believe that the cut will only be temporary. They say that more furnaces have been opened in Alabama and Tennessee than there is capital to work, and that some of them will have to shut down. This may be so; but if the Southern furnaces can supply iron to New York at $15, while the Pennsylvania furnaces must get over $16 50 to live, capital will not long be wanting.

The English iron merchants seem to have foreseen the cut in prices, for they have reduced their shipments to this country to quite a considerable extent. During the nine months ending March 31st our imports of pig iron only amounted to 149,387 tons as against 277,005 tons in the nine months ending March 31, 1888, our imports of steel bars to 24,210 tons as against 123,671 tons during the nine months ending March 31, 1888, and our imports of ingot steel to 176,564,423 pounds as against 345,441,014 pounds. The English seem particularly to have withdrawn from the market in favor of the Southern furnaces, being the better reconciled to do so by an increased demand for English steel on the continent of Europe.

The iron and steel industry of the South is yet in its infancy, and nothing positively can be predicated regarding its future. It is nearly ten years since Abram S. Hewitt declared that Alabama was better fitted to be the seat of a prosperous iron industry than any other section of the country except the Menomonee Range in Michigan; and certainly, so far as ore, limestone and fuel are concerned, it has nothing left to wish for. But the question of labor is undetermined. When the Birmingham furnaces first blew in they used colored labor at $1 a day. Presently the laborers demanded higher pay, and the furnacemen imported help from Pennsylvania. At the present time most of the hands employed are white. It would seem that sooner or later, conflicts must occur between the two races. The recent collisions between the iron men and the authorities indicate that if they take place they will be troublesome. Such occurrences would impart unstability to the industry, and would render contracts for future delivery precarious.

Some of the New Uses for Copper.

An Eastern technical journal says that the collapse of the French copper syndicate makes it reasonably certain that copper will be for months to come at from 10 to 12 cents a pound, the price which ruled in 1885, 1886, and 1887 until the syndicate was formed. This is two-thirds of the price under the syndicate, one-third the price before the great expansion in copper production, which began 15 years ago, and a fifth the price at which copper stood during, and at times before, the war. This makes copper 10 or 12 times the value of iron, instead of 20 or 30 times, as it was a few years after the war, and often was from 40 to 50 years ago. It is now only three or four times the price of lead instead of being five, six, or seven times as it once was.

This is a great relative cheapening, and while it has occurred once before, it seems to have come now to stay. Commercially, the cheapening will be most felt in telegraph and telephone wires, which are in great bulk of copper, and in which its increase in cost was most felt. In fact, one of the demands on which the syndicate counted was the increase in this demand.

But the most visible change wrought by permanent cheap copper will be in architecture, according to the Philadelphia *Press*. Before sheet iron was cheapened by the discoveries of the past century, and when heavy freight made slates too dear to those more than 40 or 50 miles by land from a slate quarry, copper was a favorite and cheap roofing material, as it is a most beautiful one, weathering to a color which artists love and which delights the eye, while its permanence makes repairs light. If copper settles to a ten-cent price we shall see it freely used for this purpose, and the same cause will lead to a great extension in its employment for projecting details, like bay-windows and balconies. For this purpose it is far superior to iron, and we do not doubt that the next ten years will see our American streets, not overrich in color, owing a new charm to the free use of copper, which some of our architects have begun to employ with the happiest results, as in the University Library building and residences on Rittenhouse square and Spruce and Fifteenth streets.

Cheap copper ought to lead to its use for kitchen dishes; but this requires a patient labor in keeping this somewhat dangerous material bright and clean, which it is not easy to secure in an American kitchen. With this care, however, for a host of such uses, copper is far superior to iron or enameled ware, and if its price remains steadily at 10 cents or so, the copper saucepan and its like bright and shining kin are sure to appear on our ranges.

MACHINERY IN HORSESHOE MANUFACTURE.—An attempt is just now being made in England to induce English makers of horseshoes to employ machinery to a greater extent than hitherto. The representative of a firm in Denmark, which manufactures machine-made shoes, has recently arrived in England with the view of endeavoring to persuade a number of English horseshoe-makers to combine for the purchase of a process which, it is said, has proved very successful upon the continent. The system comprises 13 or 14 patents, and the purchase-money (including plant) would amount to several thousands of pounds. One of the chief difficulties hitherto experienced in the employment of machinery has been the varied nature of the many descriptions of shoes which firms have to supply for the numerous home and export markets. This is one of the main reasons why some of the horseshoe makers of the mid lands prefer to retain hand labor. At the same time, they admit that, if it were a question of turning out one class of goods only, then machine methods would, on the score of economy, prove preferable. If the new machinery can get over this difficulty, it will stand a much better chance of finding favor in England than have other descriptions which have been previously introduced; and it is understood that this adaptability to various sizes and classes of shoe is one of its strong points.

A CUBIC INCH OF WATER evaporated under the ordinary atmospheric pressure (15 pounds on the square inch) is converted into 1700 cubic inches of steam, or, in a unit of measure, very nearly one cubic foot, and it exerts a mechanical force equal to the raising of 2120.14 pounds one foot high.

MECHANICAL STOKING.—It is evident from the patents issuing that there is no decrease of interest in England in mechanical stokers. The question is asked, Why is there not greater interest on the subject in this country?

SCIENTIFIC PROGRESS.

A Rediscovered Valuable Pigment.

Prof. Fouque, of the College de France, at the last meeting of the Academy of Sciences, (February 18), read an important memoir on the blue pigment used by the ancient Romans for wall decorations. It is a magnificent color, as bright to-day as when first applied, and is found in the fresco paintings of Pompeii and other monuments, dating from the Roman period. Its production is one of the lost arts, as there is no record of the pigment being used after the invasion of the barbarians.

Modern chemists have more than once tried to ascertain the nature of the compound, but, beyond the point that it contains copper, nothing definite has heretofore been discovered. M. Fouque thinks the lack of success is owing to the fact that the ancients followed no exact rules or proportions. Having secured comparatively copious specimens of the cæruleum—such is the old name of the pigment—he has succeeded not only in analyzing it, but also in finding a process for making it regularly in quantities.

The compound is, according to M. Fouque, a quadruple silicate of copper and silica, which may be prepared with silica, oxide of copper, and lime, with or without any fluxes. The ancients simply made it with sand, calcined or roasted copper and lime, but kept to no regular proportions. He worked differently and managed to obtain an exact chemical combination, which is neither a glass nor an enamel, but a crystalline substance of the composition already mentioned. The crystals are perfectly definite, and strongly dichroic, appearing deep sky-blue when viewed from the surface, and pale rose edgeways.

The only difficulty in the preparation is the heating. A bright red heat is necessary to effect the combination, but on heating too much the blue color is lost and an adventurine green glass is obtained—a circumstance which must have rendered the process a delicate one in old times. Nowadays, however, with the means at our disposal, the difficulty is trifling, and kilogs of the cæruleum could easily be made in the College de France laboratory.

It is a very stable pigment, so far as chemicals are concerned, as it stands, unaffected, boiling with sulphuric acid or potash lye, as well as quicklime and hydrogen sulphide. That it will be air and waterproof is abundantly shown by the old fresco paintings. M. Fouque considers, therefore, it would be a great boon to the arts to produce the blue commercially, and promised his assistance to any French manufacturer who will undertake the fabrication.

While examining the fine specimens of the rediscovered blue presented by M. Fouque, M. Berthelot, who is well versed in ancient chemical lore, remarked the cæruleum in question was no doubt the Alexandria blue, known in Egypt about the beginning of the Christian era, and taken to Pozzuoli, whence its use spread all through Italy. He agreed with M. Fouque that the pigment was unknown to the Assyrians and ancient Egyptians, and is, no doubt, a most valuable one.

Atmospheric Pressure on Steam Pressure

The question of the effect which the pressure of the atmosphere exerts on the walls of a steam boiler having excited considerable interest in certain circles in the East, a correspondent of the Boston *Journal of Commerce* propounds the following questions to that journal:

1. Suppose that a boiler is placed near the level of the sea, and fired up, and the safety valve set to blow off at 60 pounds, weight of atmosphere 15 pounds. If this boiler is transported to Denver, Col., without changing the weight on the lever, would it blow off at 60 pounds as before, assuming the pressure of the atmosphere to be nine pounds?

2. If a boiler is just strong enough to withstand a pressure of 50 pounds near the sea, if taken to Denver, would it burst under the same pressure by gauge?

3. Would the ordinary spring steam gauge register the same pressure at both places, provided it was the same in the boiler, or would the weight of the atmosphere make a difference?

The editor of the *Journal* answers as follows: A steam gauge indicates the unbalanced pressure in a boiler, the difference between the absolute pressure inside and out, and 60 pounds unbalanced pressure is the same no matter where a boiler is situated. A boiler is exploded by the unbalanced pressure, and if sunk to the bottom of the ocean it would require an enormous absolute pressure to explode it, because the pressure outside would be so great. The same unbalanced pressure would explode it, however. It is by a difference in pressure or unbalanced pressure that we make steam do work, consequently it is idle to consider the question in any other way. Replying then to your first inquiry, a safety valve blows off at a certain unbalanced pressure, and will blow off when gauge indicates 60 pounds at Denver, Col., as at the sea coast; the absolute pressure required, however, would be by your figures six pounds less. To your second question, yes. Third question: The gauge would register the same unbalanced pressure, but if you intend the words "same pressure" to mean same absolute pressure, the gauge would register higher an amount equal to the difference in weight of the atmosphere at the two places. It is like weighing one's self on a pair of scales on which a weight is already standing, and then on another pair on which stands a less weight. Our weight does not change although the beam records a greater weight in one case than the other. A steam gauge records, a safety valve blows off, and a boiler explodes at a corresponding net pressure in one place as another.

Remarkable Display of Phosphorescence.

Captain Dunlap and crew of an Allan line steamship were recently very much startled when, a short distance northeasterly from Cape Henlopen, on the Atlantic Coast, they met with an unusual display of phosphorescent light upon the sea. The phenomenon, in a moderate way, is common, but in this instance, the night being very dark, the captain was roused out to witness it. "I found the sea," he says, "like a mass of flame, presenting a scene of sublime grandeur." As a remarkable feature of the display it is stated that whenever a sea broke over the bow of the vessel the drops of fire spread over the rigging and decks like the flying embers of a genuine conflagration, where sparks are driven by a strong wind. Usually such phosphorescence disappears almost instantly as the flow of water passes off the deck or rigging of a ship, but in this case it is reported that everywhere on the decks were found tiny sparkling phosphorescent beads which did not disappear until the next morning. For two hours the vessel was steaming through this sea of fire, causing considerable alarm to many of the superstitious sailors and passengers. In the distance the sea appeared to be breaking on a strand, but a dip of the log without finding bottom indicated that shoal water was not near at hand. This report and a similar occurrence, a few months ago, in the Bay of Bengal, and still others of a similar character which have been noticed within a few years, have widely and intensely interested and puzzled the scientists. The old theory is that this marine phenomena is due to the presence in the ocean of myriads of phosphorescent insects, but such unusual displays would seem to either call for some other theory to account for the phenomena or a widely different and more numerous class of insects than are usually met with.

A CURIOUS NATURAL INSTANCE OF AN EARTH BATTERY.—It has long been known that if two plates of different metals are buried in the ground and connected by wire above the surface, an earth battery is formed and a current of electricity is found in the wire. A curious natural instance of the kind recently occurred at Bridgewater, in Nova Scotia, as related by a contemporary, whence a telephone line was run to a gold-mining district. A steady current was found to flow through the wire; and the explanation is that the mineral lodes in the neighborhood gave rise to it. There are gold, silver, copper, lead and iron ores there, and it is supposed that the gold, silver, copper and lead formed the negative plate of the battery, while the iron formed the positive, the moist earth and rock completing the circuit with the wire. The natural current is observed to be stronger on rainy days, probably owing to the increased moisture of the earth. Being a steady current, it does not interfere with the working of the telephone. This case is evidently to be distinguished from the ordinary "earth current" observed in telegraph lines, when the "earth plates" at their extremities are of the same metal; and it seems to be a real case of natural battery formed by mineral deposits underground.—*Ex.*

THE MINERAL CONSTITUENTS OF PETROLEUM. The solid matter present in mineral oils has recently been examined by J. A. Le Bel, who has satisfactorily established the fact that asphalt obtained from petroleum and bitumen contains, in addition to an oxidized organic coloring matter, a large percentage of inorganic constituents. The ash from a specimen of asphalt obtained from a mineral oil procured from Egypt contained 11 per cent of lime and sulphur, while the asphalt derived from the Crimean oils yielded six per cent of ash. Purified asphalt from Lobsann, in Alsatia, gave 5.4 per cent of ash, consisting of lime, oxide of iron, silica, sulphuric acid, and a trace of manganese. The presence of silica in the ash, the author considers, supports the hypothesis of Mendelejeff, that the mineral oils are formed by the action of steam upon the heated rocks of the interior of the earth. In the asphalt from Lobsann, Le Bel has also obtained 4 9 per cent of sulphur in combination with silicon. The above refers to mineral oils of the Eastern Hemisphere. We are not aware that even any trace of sulphur has been found in American mineral oils.

ASTRONOMICAL WORK AT MOUNT WILSON.—The work of photographing the stars of the Northern Hemisphere has been commenced at Mount Wilson with the Harvard 13-inch photographic telescope. The first plates were made of the small stars in the constellation "Ursa Minor," near Polaris, the north star. The report that the great telescope has not been ordered and is not being built is untrue. A 40-inch glass has been ordered by M. M. Bovard, president of the University of Southern California.

GOOD HEALTH.

Increase of the Cancer Malady.

By reference to the monthly report of the State Board of Health, a synopsis of which was given in our last issue, it will be seen that 32 cases of death are credited to this dreadful malady during the month of April—making this the fifth in point of fatality among the total number of 21 diseases which are regularly enumerated in the monthly reports.

Health reports, not only in this State, but in most others of the Union, and in European countries as well, show that cancer is rapidly increasing in frequency all over the world. It is held by physicians to be a mysterious disease—no cause can be assigned for its appearance, and no remedy has ever been proposed by the regular faculty for its cure. In fact, the medical faculty pronounce it incurable. The only treatment given is extirpation by the knife or caustics. No constitutional treatment is proposed in medical works, or, with a few exceptions, employed by medical practitioners.

Cutting No Cure

Notwithstanding the almost universal practice of cutting, statistics show that the knife is of little avail in any case and does not even *prolong* life. A writer in the *British Medical Journal*, which stands at the very head of medical literature, says: "The popular idea that operating prolongs life is quite wrong. I believe it to be a *perfect delusion*. I believe that all of these patients would live longer if they had never been touched"—[with the knife.]

The statistics of 3974 cases of cancer which came under the observation of Leroy d'Etoilles, a celebrated French physician, 1192 of which were operated on, show that if there was any difference in the continuance of life it was in favor of those not operated on. Moreover, medical statistics show that in the best European hospitals, 1 in 11 actually dies while under the knife!

We might multiply statistics indefinitely all to about the same end. The truth is, the knife, especially when used upon the female breast, is worse than the lancet quackery which was so much in vogue 75 or 100 years ago. A medical report upon this subject made some time since by Dr. Moore, a prominent physician, says the use of the knife in cancer will soon "hold the same rank among the barbarians of the healing art which New England witchcraft and witch-murder holds among the barbarians of religion." Any amount of evidence of this kind can be produced, and of the highest character.

Sir James Paget of St. Bartholomew's hospital, Surgeon John McFarlane of Glasgow, Scotland, and numerous other prominent living surgeons of Europe, have unqualifiedly denounced the use of the knife in cancer. So did Alexander Monroe of Scotland, and so did the late Dr. Kearney Rodgers of New York, after a terrible experience in the practice. Dr. Mason Warren of Boston once said that he hoped he should never hear anything more of cancer-cutting as long as he lived. Dieffenbach, the celebrated German surgeon, came to the same conclusion before he died. He also remarked that many other of his own country surgeons agreed with him. Dr. I. C. Warren of Boston made about the same statement to the Medical Society of Boston at their meeting Nov. 12, 1888.

Why Use the Knife?

With the accumulating evidence of the inutility and positive injury from the use of the knife, why is it that surgeons still persist in that "barbarous practice"? Perhaps the question may be satisfactorily answered by saying that the surgeons themselves are deceived by the suppression of the facts in the case during their college education, that such practice is worse than useless, and of the further teaching that there is no cure for cancer.

We agree with all those higher lights of the medical profession—and they are many—who hold that the prevalent cancer practice is a shameful imposition upon patients. We have repeatedly, within the last few months and before, been told by people afflicted with cancer, that in consultation with the most prominent physicians and surgeons of this city, to whom they have applied for advice, that if they would submit to an operation they would surely be cured—that the cancer would never come again. Now these physicians know that such words are a deceit; that not one operation in 20 effects a permanent removal of the malady.

Can Cancer be Cured?

There are scores of witnesses in this city who are living evidences that cancer *can* be cured. We have given the names of many in previous issues. That number is constantly increasing, at least they have been cured of what the leading physicians have pronounced cancer—in some cases after repeated operations by the knife. There is one physician in this city, whose patient left him and went to Dr. Cook, at 124 Post street, and was cured. She afterward called upon the physician, who admitted the fact. That physician is *convinced*, and recently sent a patient to the same party for treatment. The practitioner to whom this patient was sent has at this time about

Thirty Patients Under Her Care,

Nearly every one of whom has been pronounced by well-known medical doctors genuine cases of cancer, and several of whom have been operated upon—of course the malady again making its appearance. Probably eight-tenths of these cases will be successful. Those in which cures will not be effected are either of so long standing as to be in actual extremity, or have been once or twice subjected to the knife, which usually puts the patient outside of all possibility of subsequent cure.

Every medical practitioner before he receives his diploma solemnly pledges himself that in his practice he will use every possible means in his power to save the lives of his patients. Now every physician in this city and vicinity is more or less familiar with the matter which we have above set forth. Why do they not take the trouble to inquire into the truth of the same? Simply because of a "rule of medical ethics" which forbids them to take notice of any practice outside of their associated capacity. These two rules conflict, and the one who breaks the latter is denounced and ruled out of the profession. One practitioner in this city who, in the name of humanity, sought to inquire into the truth of this matter, was immediately degraded and threatened with further action if he continued the inquiry. Another was threatened with like proceedings, but with a moral courage worthy of the man, he told them he felt that he was in the way of duty, and should continue therein. He had gone far enough to feel quite sure there was truth ahead and he should continue his investigations and take the consequences. He was unfortunately struck down with smallpox, a few weeks later, or the great fact which we are endeavoring to establish would soon have found an advocate who would have been heard in this community with no uncertain voice. Who will be the next to ignore prejudice and stand up for the truth and humanity?

The evidence of the good work which Mrs. Dr. Cook is doing is accumulating so rapidly that San Francisco will soon become the Mecca of those afflicted with cancer. She is now treating several most important cases, the outcome of which we feel well assured will be important. She has just discharged, as cured, a lady who was operated upon for cancer in Washington City, and the return of which was pronounced a fact a short time since by Dr. Lane of this city, with the further assurance that nothing but the knife could save her. She has already had several patients from the East and more are making arrangements to come. Respectable physicians there are advising such a course.

We have taken up this cause, not in the interest of Dr. Cook, but in behalf of humanity. We wish it to be distinctly understood that we have never received a dollar for what we have written or done. On the contrary, we are many dollars out of pocket. Our object is to *prove* that a San Francisco practitioner can *cure* cancer by constitutional treatment alone, no knife and no caustic being used, except in cases where the patients have been improperly treated by the regular faculty. Armed with this proof, we are assured that ample funds will be provided to give the remedy to the world. If our cotemporaries of the press would aid us in the matter, the time would be greatly shortened and thousands of valuable lives, to say nothing of an immense amount of suffering, would be saved.

USEFUL INFORMATION.

About Ropes.

A German paper calls attention to the quantity of inferior hempen ropes now manufactured, in some cases the rope being made with inferior kinds of hemp inside, but well covered with yarns of good material, this deception, however, being easily brought to light by dissecting a portion of the rope, or, in practical hands, by its behavior in use; a dark or blackish color indicates that the hemp has suffered from fermentation in the process of curing, and brown spots show that the rope was spun while the fibers were damp, and must consequently be weak and soft in those places; again, inferior ropes are made with short fibers, or with strands of unequal strength or unevenly spun, the rope in the first case appearing woolly, on account of the number of projecting ends of fibers, and in the latter case the irregularity of manufacture is evident on inspection by any good judge. Briefly, a hemp rope is hard, but pliant, yellowish or greenish gray in color, with a certain silvery or pearly luster.

Leather Ropes.

The English journal *Industries* says: Some experiments recently made in India with leather ropes of a square section are deserving of attention. Square leather ropes have for some time been used in England, and with success. They are especially suited for what are called "quarter twist" belts, not being affected by the diagonal strain as a hat leather band is. The sections are square, equilateral, and the grooves in which they run are made to an angle of 45°, so there is a perfect fit of one-half the surface of the rope, and more than is possible with a hat band of equal weight; not only this, the traction is more because of the angles. The square leather ropes employed for main driving are about 1¾ inches square, made up of layers of leather cemented so the whole is uniform and continuous. A rope of this size weighs a pound for each foot of length, and will sustain a pull of 600 pounds. A single rope of this size will, at a speed of 2500 feet a minute, transmit 25-horse power. They are, however, driven at much higher speed than this, in some cases to 6000 feet per minute; a safe or suitable speed is from 4000 to 5000 feet a minute.

Origin of Strong Liquors.

Strong liquors are a modern invention. The ancients knew of nothing more powerful than lightly fermented wines, and have left warnings enough of the abuse of them. Alcohol was not discovered till the seventh century, although an older story exists of a monk, Marcus, who collected and condensed in wool the steam of heated white wine, and then pressed out from the wool a balsam which he applied to the wounds of those who fell at the siege of Rheims, in the reign of Clovis I. He also mixed this balsam with honey and produced a cordial which brought the moribund back to life. Clovis, however, did not wait for the approach of death before claiming his share of the cordial. According to Dr. Stanford Chaelle, the distillation of spirits from wine was not discovered until the twelfth century, and spirits did not come into common use until the fifteenth, sixteenth, and seventeenth centuries. Prof. Arnoldus Villanova, in the fourteenth century, made a panacea of the water of life, which gave sweet breath and fortified the memory, besides being good for sore eyes, the toothache and the gout, and having other wonderful properties.

Distilled spirits came into use in London in 1450, and had to be prohibited in 1494. Michael Savonarola produced a treatise on the making of the water of life in the fifteenth century, which became a standard authority on the subject, and was followed by the work of Matthioli of Sienna. These books gave the start to brandy-making in Italy, whence the trade extended to France. About 1520, the Irish usquebaugh began to acquire reputation in England. Before 1601, "brand wine" had begun to be distilled in the Low Countries from apples, pears and malt; and in that year an ordinance was passed at Tournay forbidding the sale of the liquor except by apothecaries, "partly because of the dearness of corn and partly because of the drunkenness which this cheap brand wine caused, to the great prejudice not alone of home and lives, but to the extreme danger of the souls of its drinkers, many of whom had died without confession."—*Druggists' Circular.*

WILL MAKE OUR OWN ROPE.—Mr. J. M. Bailhache of San Diego, says the *Sun* of that city, is now in negotiation with Oakland and San Francisco capitalists with the view of establishing in San Diego a rope factory to utilize the tract of henniken plant which he owns in Lower California. This fiber is similar to that grown on the eastern coast of Mexico and at Yucatan, and it is now used for making sisal rope. The fiber can be brought here at a small cost, and is two cents a pound cheaper than manilla hemp. Mr. Bailhache has been engaged in the matter for several months, and has already been approached by owners of large tracts of land with liberal offers to get the factory on their territory. Yucatan alone exports 4000 bales of fiber monthly to New York and other Eastern cities.

HOW TO DETECT POTATO FLOUR IN WHEAT FLOUR.—Adulteration of flour with potato flour may be detected by means of acids. Take a spoonful and pour upon it a little nitric acid; if the flour be of wheat, it will be changed to an orange yellow; if wholly of potato flour, the color would not be altered but the flour formed into a tenacious jelly; if, therefore, the flour be adulterated with potato flour, it will not be difficult to decide. Again, take a spoonful of the flour and pour upon it a little muriatic acid; if the flour be of pure wheat, it will be changed to a deep violet color, without odor; but if potato flour be mixed in it, it will then have an odor like that of rushes.

ANOTHER BRAVE LADY.—We last week chronicled the feats of several ladies in the killing of rattlesnakes. The Fresno *Expositor* of the 15th inst. tells of a lady in that city who killed two of these venomous reptiles by hitting them alternately with a club while they were doing their level best to spring upon her. She was engaged in hanging out clothes at the time they made their appearance. One had five rattles and the other six. They were respectively 4½ and 5 feet in length.

TO RETAIN THE NOXIOUS EMANATIONS OF GAS.—A single plate of perforated zinc about a foot square, suspended over a gas jet, is said to retain the noxious emanations from burning gas, which it is well known destroys the binding of books, tarnishes the gilding, and vitiates the atmosphere for breathing.

THE OLDEST BANK NOTES are the "flying money," or "convenient money," first issued in China, 2797 B. C. Originally these notes were issued by the treasury, but experience dictated a change to the banks under Government inspection and control.

ASBESTOS POWDER, made into a thick paste, with liquid silicate of soda, is used with great advantage, it is said, in making joints fitting tops, connecting pipes, filling cracks, etc. It hardens very quickly, stands heat and is steam tight.

IRISH RENTS.—James Redpath says the continuation of the rent agitation in Ireland has had the effect of causing a reduction of the rents in Ireland—at least $25,000,000.

ELECTRICITY.

INCREASE OF ADHESION BY ELECTRIC CURRENT.—It is still a matter of dispute as to whether or not the passage of an electric current between the wheels of a motor and the rails increases the adhesion available for traction. In a recent issue of *Electric Power* is a brief account of a demonstration recently made in Washington. The experiment was conducted by Mr. Joseph Lyons. A pair of wooden strips were connected to form a frame, and a pair of short parallel strips of sheet iron, set up edgewise, secured to the frame, and a toy electric motor was arranged to move the miniature truck along the sheet-iron rails. The experiment consisted in closing the motor circuit and then lifting the forward end of the frame until the grade was such that the motor could not climb it, that is, until the adhesion due to the weight of the motor was not sufficient to overcome gravity. On closing an independent circuit through the rails and truck-wheels and shaft, the motor would start again up grade and travel a considerable distance. There was no mistaking the action of the motor. It was positive and pronounced, "like the scramble of an army mule" under the traditional stimulus. Mr. Lyons estimated the increase of traction at about 40 per cent.

REFINING SILVER BY ELECTRICITY.—Electric refining has been brought into such bad odor, says the *Modern Heat and Light*, by the fraud connected with the electric sugar scheme, that people will naturally be disposed to look askance at all statements on the application of electricity for such purposes. Yet, if the *Chronique Industrielle* is to be relied upon, the method of M. Moebius for refining silver by electricity is likely to be brought into extensive use. It is especially suitable for the treatment of auriferous silver containing about 11 per cent of gold. In an ordinary electrolytic bath, composed of a weak solution of nitric acid, at one per cent, M. Moebius employs anodes of argentiferous matter, and a thin plate of pure silver as cathode. The anodes, which are about 12 millimeters in thickness, are placed in muslin bags, which retain the gold, platinum, peroxide of lead, and other foreign bodies contained in the matter. The current employed is 150 amperes, with a difference of potential between the plates of one volt. During the whole operation brushes pass and repass over the surface of the cathode, and cause the silver deposited to fall to the bottom. If the matter contains copper, it dissolves in the nitric acid, but it is not deposited in the cathodes.

ELECTROSENTIENCE—THE COMING SENSE.—The alarm felt by the public about the effects of electricity, writes Reginald A. Fessenden in the *Electrical World*, cannot be caused by the danger which any individual citizen incurs, for gas is killing hundreds where electricity kills one. The reason is that gas is something more or less under the individual's control, and when a leak occurs it can be perceived by the senses. An electric leak may occur blocks away, and there is, moreover, no sense to warn us of it. We have touch to determine the limits and surface of bodies; taste, their chemical action; smell, the effect of the small particles they throw off; sound, the wave movements of the air; and sight, the waves of the ether; but we lack a sense that shall tell us when our hand is in a dielectric and approaching a conductor. Evolution has brought us many things, and it cannot be doubted that it will bring us this also; but till our nerves have been educated so that they are capable of perceiving etheric vortices, the electric current will always remain more or less of a mystery that provokes awe and fear.

THE PART ELECTRICITY PLAYS IN MODERN WAR VESSELS.—Electricity plays an important part in the modern war vessel; not only is it used for lighting, but it is now also applied in several ingenious forms of firing guns and for determining the range and direction of the shots. The latest application is in the use of an electric motor for hoisting shot and shell from the magazine below to the level of the guns, and for loading the guns themselves. This apparatus is the invention of Lieut. Bradley A. Fisk, and is so arranged as to prevent any possible accident resulting from the wounding or death of the gunner. This provides for all contingencies, besides reducing the number of men required to handle a large gun—a very important point where guns are mounted, as is the case in most armored ships, in turrets or barbettes where the space is very limited.

APPLICATION has been made for a patent for an electric apparatus by which an instantaneous photograph may be taken of a burglar while engaged in his nefarious operations. It is claimed for this invention that the moment the marauder touches the door of the safe or any other place to which the tell-tale wire may be fastened, a correct photograph is taken. A number of cameras placed about the room brings about the possibility of reproducing his features in all the degrees of success or failure naturally incident upon such excursions.

ARTIFICIAL EMERALDS have been produced by a French scientist by fusing silica, alumina and glucina with traces of oxide of chromium, with acid molybdate of lithia at a temperature of from 600° to 700° for 15 days.

SAN FRANCISCO

Saturday Morning, June 1, 1888.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Incline Gravity Tramway Built by the Fulton Iron Works; Hoisting Tramway with Behis Self-Dumping Car, 393. Scenes on the Upper Sacramento River, 401.

EDITORIALS.—Incline Gravity Tramways, 393. Passing Events; American Miners Abroad; The New Warfare; What Becomes of the Bullion; The Magnetic Variation at San Francisco; Wonderful Results in Water-Power, 400. The Upper Sacramento River, 401.

CORRESPONDENCE.—Rebel Creek District, 394.

MISCELLANEOUS.—Chinese Miners in Lower California; Nineteen Knots; Nautical Mining Reports; The Ontario Mine; No Discovery of the Lode; The North Star Mine; A Great Mining Tunnel, 394. Meteors, Comets and Fire Balls; Rolling Liquid Metal; Con. Cal. and Va. Statistics, 395.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 396-7.

MECHANICAL PROGRESS.—Discoverers of the Telegraph; A Disturbance in Our Iron Industry; Some of the New Uses for Copper; Machinery in Horseshoe Manufacture; Mechanical Stoking, 398.

SCIENTIFIC PROGRESS.—A Rediscovered Valuable Pigment; Atmospheric Pressure on Steam Pressure; Remarkable Display of Phosphorescence; A Curious Natural Instance of an Earth Battery; The Mineral Constitutents of Petroleum; Astronomical Work at Mount Wilson, 398.

GOOD HEALTH.—Increase of the Cancer Malady, 399.

USEFUL INFORMATION.—About Ropes; Origin of Strong Liquors; Will Make Our Own Rope; How to Detect Potato Flour in Wheat Flour; To Retain the Noxious Emanations of Gas, 399.

ELECTRICITY.—Increase of Adhesion by Electric Current; Refining Silver by Electricity; Electrosentience—The Coming Sense; The Part Electricity Plays in Modern War Vessels, 399.

THE BUILDER.—Paper for Building; A New Departure; Miscellaneous, 405.

STEAM BOILER NOTES.—Kinetic Energy the Secret of the Injector; Miscellaneous, 405.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 408.

Business Announcements.

Passing Events.

The U. S. Debris Commissioners, Majors Benyaurd, Heuer and Hanbury, are busy in the mountain counties examining the rivers and hydraulic mining sections. They seem to be making a pretty thorough study of the subject.

In the Comstock mines large forces of men are employed and the pay-rolls are heavy. Last week the ore shipments aggregated 7188 tons, valued at $155,000.

The silver districts of Thunder Bay, on the Canadian side of Lake Superior, are attracting attention, the region showing great value as developments progress. Americans have already secured valuable tracts of mineral ground.

One of the men employed about the electric works on the Sutro tunnel level of the Chollar shaft, Nevada, came near being killed by touching a wire where the insulatory material had worn away. The employment of electricity in mines adds a new danger to mining work.

IN Juneau, Alaska, laboring men earn $3 a day, without board. Mechanics get $5. There is plenty of work ahead for all summer.

What Becomes of the Bullion?

The sworn statements of the superintendents of the bullion-producing mines on the Comstock for the first quarter of this year have been slow in coming to hand; in consequence we could not give them sooner. The total number of tons produced, total yield in bullion and total cost of production are from sworn statements as published in the Virginia City papers, but the average yield to the ton is our figures, which can be verified by any one desiring. The following are the statements:

*Mine.	Produced tons.	Total yield.	Average to ton.	Cost of Product'n, etc.	Av'ge to ton.
Challenge	1,413	$26,410	$18.78	$28,775	$20.36
Chollar..	2,425	40,322	16.62	49,187	20.28
Con. Va..	32,006	720,816	22.20	467,448	18.32
Confid'ce.	6,025	110,523	18.32	97,3 9	16.16
Crown P.	3,940	49,587	12.56	50,139	12.98
Gould & C	250	3,381	13.53	3,6?7	14.75
Hale & N.	9,963	175,027	17.56	177,894	17.95
Justice ..	2,519	32,883	13.05	4',308	16.40
Overman.	3,645	24,352	6.68	25,515	7.00
Savage...	5,940	82,502	13.88	95,169	16.02
Totals .	68,125	$1,275,803	$18.72	$1,036 481	$15.21

*Alta, Potosi and Six-Mile canyon not included in above, owing to their sworn statements not being on file.

The above for outside stockholders is food for serious consideration in several respects, not the least of which is the wide range in the cost of extraction, transportation and reduction, running from $7 a ton in Overman to $20.36 a ton in Challenge.

In this connection it may prove of interest to stockholders to learn that it was developed on the trial of the Kentuck Mining Co.'s suit in Department 6 of the Superior Court of the city and county of San Francisco, that Gov. Stevenson of Nevada made a contract with said company similar to all contracts that have been made in years past between mill-owners and the mines. In these it was particularly specified that the mill company shall take the ore and mill it, providing they (the mill company) returned to the miner 65 per cent of the assay value of said ore at the mines, thus limiting the mill company to a waste of 35 per cent, and no more, of the car-sample assays. Taking these contracts as a basis, we find the Savage Mining Company gave in 1886 and 1887 its mine assays from $50 to $35 a ton, which, at an average, is of $42 50 per ton. Now when this grade of ore comes from the mill company its pulp assays are from $19 to about $21 a ton, showing a loss of more than 50 per cent between the mine and mill assays. This is a large falling off, and what became of the difference admits of explanation to stockholders. The mill company now only returns 65 per cent of the pulp assays and not 65 per cent of the car-sample assays as in former years. It is asserted by those who ought to be in position to know, that the Hale and Norcross mines' ore is managed even worse; carload after carload has assayed above $100 per ton, and one even went about $240 per ton, yet the mill company returned only about an average of $30 per ton pulp assay, of which only 65 per cent went to stockholders. The returns for the month of April caused the management of Hale and Norcross to say "that the mill company were either incompetent or else they were stealing bullion." In view of the above, superintendents of the Comstock mines, in justice to shareholders, should again resume the assaying of ore at the mine and report the same officially.

The New Warfare.

Modern warfare is different from the times when our fathers repulsed the British with their slow-working flintlocks. If the brave 800 who made themselves famous by holding the pass at Thermopylæ had been armed with the Maxim gun or other of our rapid death-dealing inventions, it would not have been such an act of heroism. One man securely intrenched and so armed might defy a regiment with the ancient muskets. Stanley, the African explorer, charmed the natives and made them consider him almost superhuman because he was armed with a Maxim gun. The boy who invented it is an American who has added to our already famous list of inventors, and in giving it his name we have built his monument. Before its time the great guns were the Gatling, Hotchkiss and Nordenhoff, but while they were rapid they had defects; no aim could be taken on account of turning the crank. If a cartridge did not explode at the proper time, as the crank kept turning, it would explode at the wrong time and its effects be wasted. The rapid firing superheated the gun, rendering it more dangerous to the firers than those fired at. The Maxim is automatic, avoids the crank and continues to load and fire itself by simply pulling the trigger so long as the supply of cartridges lasts. The operator takes aim and fires 700 shots a minute, the gun keeping itself cool and ready for action by shooting a jet of water along the barrel by the force of its own recoil.

Wonderful Results in Water-Power.

The activity of the works of the Pelton Water-Wheel Company indicates the interest that is everywhere felt in the utilization of water-power in all parts of the country.

At a recent visit, we were shown the wheel that is to run the 120-stamp mill now in process of construction for the Alaska Mining Company at Douglas Island. This wheel is eight feet in diameter, and is speeded at 195 revolutions, which gives a peripheral velocity of 5166 feet, or nearly a mile a minute. It is fitted with an adjustable nozzle, which, with a two-inch opening, will develop 300 horse-power, running under a head of 480 feet. A governor is attached to the nozzle, which will control perfectly all the variations of load. That so simple and comparatively inexpensive a piece of machinery is capable of developing such energy, is well-nigh incredible.

Two small wheels have recently been sent to the London Hydraulic Power Company, to be operated under a pressure of 700 pounds to the square inch. One of these wheels, 18 inches in diameter and weighing but 23 pounds, is expected to develop 10 horse-power, using a nozzle only one-fifth of an inch in diameter. These small wheels are now set up in iron cases, all ready for connections, giving them a very neat and excellent mechanical effect. The capacity and high efficiency of the Pelton wheels, under such extraordinary conditions, has created a large demand for them from all parts of the world.

This company have also recently built a large and very powerful hoisting rig for the Amador Company, consisting of double, reversible wheels, with three streams applied to each, the gates being all operated by hydraulic valve-gear. This, probably the most complete and effective water hoist that has ever been constructed, will be illustrated and further described in a later issue.

The Magnetic Variation at San Francisco.

Hon. F. M. Thorn, superintendent U. [S. Coast and Geodetic Survey, has authorized Prof. Davidson to publish the results of the late magnetic observations made by Mr. Fremont Morse of the Coast Survey at the Presidio station.

The Presidio station has been occupied by the Coast Survey parties since 1852 for the determination of the magnetic elements, especially the variation of the compass which has nearly reached its Eastern maximum variation. A year since we published two important papers upon this subject and showed that the maximum would occur in 1893.

This year the observations for the magnetic variation extended through six days in the latter part of April and the first of May, and they gave an average of 16° 36′.4 east, with a comparatively small probable error. This value is 0′.9 greater than the computed variation, as last year's observation was 0′.9 smaller than the computed.

The observed value of the variation is the arithmetical mean between the greater variation of the needle at 7½ hours A. M. and about 1 o'clock P. M. The change between these two times of the day ranges from 4′.3 to 9′.9, and by an average of 7′.1 the direction of line would apparently differ if run by the compass in the morning or in the afternoon.

The dip of the magnetic needle from six days' observations is 62° 24′.2; last year, about the same date, it was 62° 23′.4. The observed horizontal intensity was observed 5.4665, and the resulting total intensity computed from this, and the dip is 11.79 in English units, or .5435 dynes.

SECRETARY TRACY has issued an advertisement calling for proposals to build the three new armored cruisers, for which Congress has appropriated $700,000 apiece. Each vessel must be finished within two years, and have a speed of 18 knots per hour.

Mexican Mines and Miners.

We present further notes on this subject which we have obtained from Mr. Dubois:

Retracing our steps, we again pass by Los Cuetes, whence one long day's ride brings us to Santiago de los Caballeros, a small mining town of some former importance, surrounded by numerous workings on veins producing mostly smelting ores, consisting of galenas, fahlerz and pyrite. These mines are at present almost abandoned, capital and enterprise being at present lacking here.

Only a few miles from Santiago is a very promising mine worked by some Spaniards—MM. Ururburu, in

Potrero de los Medinas.

This mine is developed on a considerable ledge carrying mainly pyrite, but is remarkable for the large number of bunches of ruby silver, which occurs intermingled in the pyrites. Considerable quantities of rich ores are raised and exported, the lower grades being successfully worked by the leaching process.

From this place, traveling due east, we reach Maturipa, on a small creek, with fine groves of orange trees and sugar-cane plantations. A few miles north from this is a group of veins, with free gold at the surface, but much charged with pyrite below. These have barely been prospected.

Up on the ridge, east of Maturipa, is a small ranch named Alisitos, in the immediate vicinity of which I lately saw a prospect on a vein two or three feet in thickness, bearing pyritous ores, rather coppery, assaying on an average 100 ounces of silver and a considerable amount of free gold.

The ridge here, which is the alleged divide between the States of Sinaloa and Durango, is all seamed with numerous strong lodes bearing evidences of base (pyritous) silver ores and gold. These have mostly not even been prospected on.

On crossing the divide we come into the deep Apomal valley crossed by the trail leading from Copalquin to Culiacan. In February last I had occasion to tarry some days in this place in order to measure off and stake out four new mining claims which had been registered but shortly before.

Mineral Wealth.

I was struck by the evidences of mineral wealth in a district about one mile square, seamed with veins of divers strikes and underlies. One of these as yet undeveloped prospects is the San Jeronimo, on a vein over six feet in width, striking northwest to southeast, with a dip of nearly 46 degrees to the northeast.

The vein stuff is white quartz much shaded with chlorite, and carries argentite and some dark-colored pyrite (highly gold bearing), besides zinc blende and steel-grained galena.

The other property, Ascencion, striking N. E. and S. W., dipping steeply to the N. W., shows a well-defined vein of white quartz on the hanging-wall and toward the footwall a large body of gray flinty quartz speckled with antimonial silver ore.

Both of these prospects were so far undeveloped, but, in all likelihood, will prove valuable properties.

This district of Apomal, in close vicinity to Culiacan, and only 10 miles from the actual wagon-road, will undoubtedly soon be developed, as it deserves and promises to become a flourishing camp.

Following down the trail leading to Culiacan, some three hours' ride brings us to the village of Atotonilco, famed for its hot springs.

Here is an old mine—Mina Grande—which has long been abandoned and drowned out. A tunnel has just been completed by Mr. Crawford, and he has struck in the bottom of the old workings a vein of very rich silver-lead ores.

Farther east of here, a few hours' ride brings us to Tecuane (Indian tiger), on the confluence of the Limon river with the Humaya. Here very limited working is being done by gambusinos on numerous veins, carrying spots and bunches of copper-silver glance and sometimes furnishing argentite.

Returning to Atotonilco and proceeding a couple of miles down the creek, we find a 20-stamp steam-mill with Frue vanners, etc., erected by a St. Louis, Mo., company, with the view of working a large deposit of ore, claimed to be extraordinarily rich. This is the San Jose del Oro. The natives had worked on the outcrop and abandoned it because they could not make their salt. However, the property was purchased for a large sum of money; a mill was put up for the beginning with only 20 stamps but with power sufficient to drive 60. Flaming reports of mountains of ore glittering with golden treasure made the rounds of the St. Louis papers. At last the mill started up and it was found that they had a large amount of stuff that would mill $1.25.

This swindle has thrown a shade over all mining enterprise on this coast, but in time it will wear off and legitimate enterprise will ultimately have fair play.

Beds of Gravel.

The Humaya river runs near San Jose del Oro, and on the banks of which are considerable beds of gravel; and farther down in front of the village Torribito are two large banks of gravel, one of which seems to be over one mile square. Here the river has cut its bed into the granitic or syenite bedrock on which lies a bed of coarse gravel with bowlders cemented with tough red clay some 40 to 50 feet in thickness. I found one or more colors of coarse gold about the size and shape of a tomato seed

in each pan of dirt, which I washed from all parts of the deposit. I believe it would be well worth looking into. From San Jose del Oro a good wagon-road leads us back to Culiacan.

I am in hopes that these brief and incomplete notes will attract the notice of mining parties to these districts, which, besides being fairly accessible from Culiacan, and more so if the much-talked-of line of rail from Mazatlan to Guaymas be constructed—seem to me to cover some of the most desirable mining ground (mostly imperfectly known and prospected) that I have encountered in all Mexico.

The Upper Sacramento River.

One who forms an idea of California rivers by the broad sluggish watercourses which intersect our broad valleys, running bank-full and fringed by tules, might conclude that our streams are quite devoid of the picturesque beauty which fills the poet's verses and covers the artist's canvas. This conclusion would be a sad injustice to California rivers, for if one will pursue them toward their sources he will come at length to clean-banked streams flowing through beautiful meadows and further beyond to the mountain torrents dashing along between rocky barriers through which they have cut their course. Instead of California rivers being sluggish and dreary, they are, in parts of their courses, at least, as active and as full of picturesque life and beauty as nature can make them.

IN THE UPPER SACRAMENTO VALLEY—THE SACRAMENTO RIVER AT REED'S FERRY, NEAR REDDING.

The two sketches on this page will serve to illustrate this statement. The Sacramento river in the broad valley is wide, quiet, indolent, good to run steamboats on, but not calculated to awaken much admiration. The river in the upper valley is quite another creature. About on the southern boundary of Shasta county the great floor of the valley terminates, and above that is the upper valley with its many arms with their inclosing hills and mountains, forming a country rich and picturesque, which extends northward many miles before the higher mountains close in and place the crown of eternal snow on Shasta's brow. It is in this upper valley that our scenes are to be found. The first, of the Sacramento river, shows the clean-sloping banks of the river, here and there shaded by overhanging oaks, and just behind the verdant meadows which are now radiant with the beauty of myriad wild flowers and redolent of their perfume. The landscape is as pretty and varied as the most *blase* tourist could insist upon.

The lower engraving shows another phase of our river scenery, where the stream has rocks and not meadow loams to contend with. Here, too, there is certainly no prophesy of the dull stream of the lowlands of which these waters will ere long form a part, but a restless, swift current pouring down from mountain sources, seeking quick exit from its chilly dawn to its midday murmurs in the vales below.

We trust these views will remind many that the season is at hand when tasks should be laid aside and the summer vacation amid unwonted scenes should be enjoyed. Follow almost any stream toward its source, and you will find picturesque beauty to admire. If time and money allow, take a large stream and follow it into the heart of the Sierra; if not, then hitch up your team and follow the shorter runs to the canyons of the Coast Range; if not even this, pack a lunch-basket and start on foot along the creek that crosses your farm into the little hills of its birth. In all of these you will find scenes similar in kind but different in degree; in all you will gain diversion and rest and recreation, of which this generation has far too little.

EVERY MAN HIS OWN ASSAYER.—An advertisement with this title has appeared in several numbers of the PRESS, but will appear no longer. It was received in the business office and inserted in the ordinary course, but the attention of the publishers being called to its tenor, it was considered unjust to our readers to publish it again. The powder advertised may possibly do what is claimed for it, in "separating the silver from the ore instantly," in some instances. At the same time we have seen no proof that it can do so, and do not care to advertise a chemical "for testing the value of all kinds of ore" when we do not believe such a thing exists. We regret that the advertisement referred to was ever permitted to appear in the columns of the PRESS.

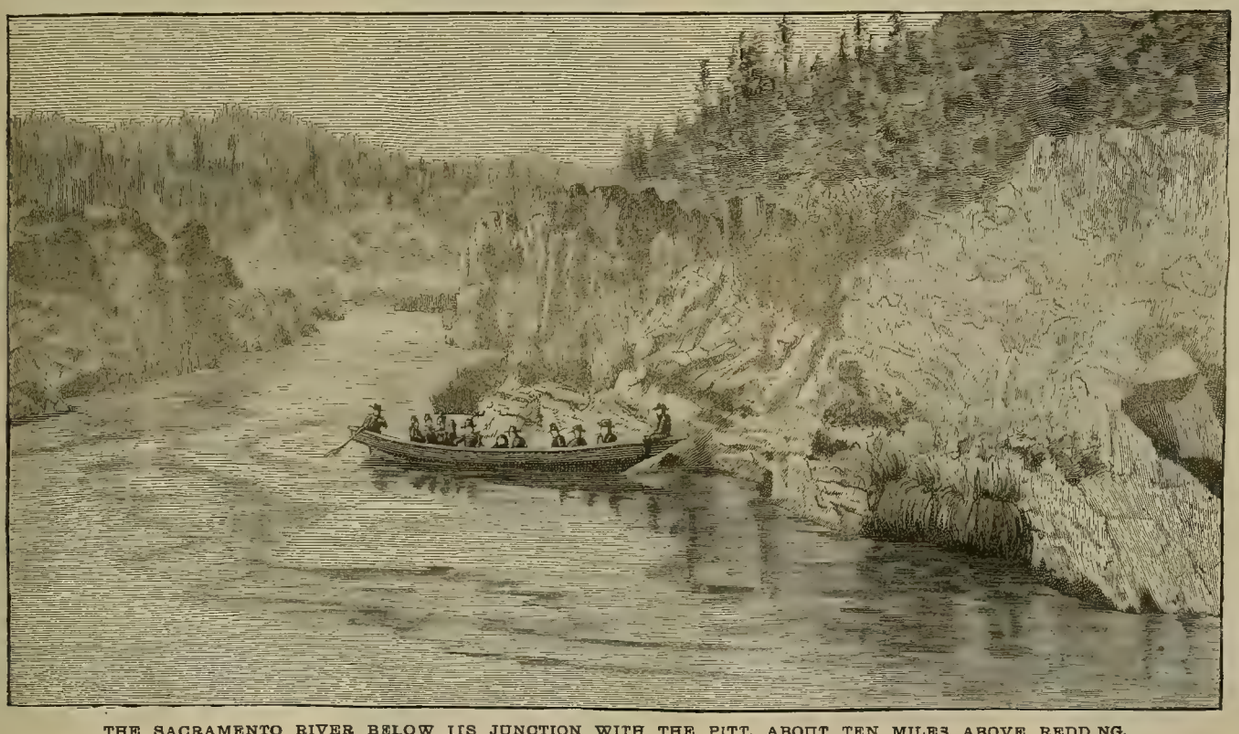
UNDER the present construction of the law, it is shown that 600 pounds of lead are brought in free with every ton of ore carrying silver. In 1866, 8000 tons of lead were brought in free from Mexico. In 1887, the amount was increased to 50,000 tons, and in 1888 was still further increased to 86 000 tons, and the indications are that in 1889 it will be even larger. There ought to be no misunderstanding in regard to the proper definition of lead ore, and the law certainly intended if ore had lead in it, and came into competition with lead produced in this country, that it should pay duty at the rate of one and a half cents per pound, provided by Congress as a protection to domestic producers.

WELLINGTON BURT, of Michigan, and Charles Burges, of New York, have been visiting England as representatives of the movement to unify American salt interests. The English Salt Union say Burt and Burges have entered into an alliance which assures harmonious relations between the English and American markets and full prices.

THE ASTRONOMICAL SOCIETY of the Pacific held a meeting at the Lick Observatory on Saturday last. W. M. Pierson read a paper on "The Corona." The astronomers of the observatory gave a short account of their observations of the solar eclipse of last January, and the important results which had followed from the work of the Amateur Photographers' Association. A report on the subject will be shortly published by the regents of the University of California.

A NEW DEPARTURE.—There is every indication that San Francisco is entering upon a new era in architectural advancement, both with regard to the materials used in construction and in architectural design. The prevailing characteristics are beauty in design, stateliness in character and durability of material. Wood is giving way to brick, iron and stone. Common brick, covered with cement, is succeeded by pressed brick ornamented with terra-cotta and sandstone, etc. Iron is also entering more largely into use. A notable instance of this is the tall *Chronicle* building now in course of construction at the corner of Kearny and Market streets. The Bancroft building, the new Parrott building, the reconstructed California theater, the Alvinza Hayward building, the bank building, corner of Bush and Sansome streets, and numerous others of lesser note, form striking examples of the transition from the old architectural structures of the past. The new Academy of Science building will soon present another example of the new departure.

The fear of earthquakes is no longer felt by our citizens, as is evidenced by the increased hight which is now being given to our principal structures. It is now known that tall buildings, properly constructed and tied, are quite as safe as the low and indifferently constructed buildings of the past.



THE SACRAMENTO RIVER BELOW ITS JUNCTION WITH THE PITT, ABOUT TEN MILES ABOVE REDDING.

The Strasbourg Clock Outdone.

The Work of a Boston Watchmaker.

A clock has just been completed in the City of Chelsea which is probably the most wonderful piece of mechanism in its line that has ever been invented. The maker, Lucius L. Robbins, has been over nine years engaged in his favorite project of manufacturing a clock of a kind the world had never seen.

In 1879 he first became impressed with the idea of making a wonderful clock, and without considering the expense of the project he went to work and began to make the plans.

His ambition has been to understand practically, and to show to the world through other than theory and words, the correct movements of the earth and the planetary system. With only limited means at his command, and depending solely on his vocation as a watchmaker to provide the necessaries of life, he has struggled along these ten years, devoting every spare moment to the accomplishment of his purpose.

The clock was started in Boston, where he lived for five years. It is 12 feet high, 5 feet wide and 3 feet deep. It is run by weights weighing over 200 pounds, while the total weight is almost a ton. The large weights are wound every eight days, and in running down they wind the smaller ones.

The face of the clock contains seven dials, two balconies and five alcoves on the upper section, while the lower part is taken up by an immense dial three feet in diameter. The topmost dial has three hands. Two are white in color and the other is red. The long white hand indicates the lunar month, the short white hand points to the day of the lunar year and the week of the year at the same time, and the red hand shows the age of the moon.

There are also two circles that fall until the 21st day of June, the longest of the year, and then rise until the 21st day of December, the shortest day of the year. In this dial representations of the sun and moon rise and set regularly every day. When the moon is in the eastern or western quarter it is accurately shown in the proper position on the clock.

There are three rows of figures on this dial. The outside row represents the days of the lunar month, the middle row the day of the year, and the inside row the week of the year. On the left side of the lunar dial is a small alcove, showing a cuckoo perched on the limb of a tree, which sings for every hour. Opposite this, on the other side of the dial, there is another small alcove, where old Father Time strikes the hours as they pass. Below the lunar dial there are two small dials. The one on the right indicates the time of the sun's rising, and that on the left the time of its setting.

In the center of the upper part of the clock is an alcove in which is hourly represented the four stages of manhood. At ten minutes past the hour an infant appears, and at the first quarter hour strikes one; at 25 minutes past the hour the infant is replaced by a youth, who, on the second quarter hour, strikes two; at 20 minutes of the hour the youth retires and a man comes in view and strikes three on the third quarter hour; at five minutes before the hour, an old man appears, and at one minute of the hour strikes four. Directly in front of the four stages of manhood is a small balcony, on which a sentinel is constantly marching back and forth. He turns about face at both ends of the balcony, and can be made to go either on the "double-quick" or "slow time."

The rise and fall of the tide is shown on a pretty scene representing the city of Boston and its harbor. The city is painted on canvas in the background. The harbor, with the shipping, is painted on glass that moves up and down with the tide. At high tide the city is seen through the rigging and masts of the shipping.

Opposite the tide indicator is another portico in which the parable of the ten virgins is shown every 15 minutes. Two doors open on either side, and from one side appear ten virgins dressed in pure white garments and file across to the opposite doors in two lines. One line have lighted lamps, while the lamps of the other are out.

The bride bids the wise virgins enter, and the other five foolish virgins go back to secure oil for their lamps, and on their reappearing they find the door has been shut and they are obliged to return from whence they came.

Below on the left is another dial, with two sets of hands, one set being painted red and the other black. The red hands indicate the time of the morning tide and the black hands the time of the evening tide.

On the right side is another dial, which is a perpetual calendar, showing the calendar months, day of the week and day of the year. One hand indicates the day of the week and the day of the month at the same time. A wonderful feature with this dial is that every four years the clock allows 29 days for February. Between these two dials are two more dials that tell the time of day.

At the foot of the upper part is a balcony in the form of a semicircle, and every fifteen minutes a general on horseback rides out and takes up a position in the center. Immediately a door in front of him opens and a full company of infantry marches out to music, with the captain at their head. When just past the general the captain turns about face and marches backward, looking at his men. After the company retires the general continues his march straight ahead and also retires. The same company of soldiers appears each time, while every other time a different general appears.

The lower portion of the clock is taken up by the astronomical part. The dial is 36 inches in diameter. There is a five-inch globe to represent the earth, inclined at 23 degrees and 28 degrees, and revolves on its axis once in 24 hours. A short distance from the earth is the moon, that revolves around the earth once in 29 days and 12 hours, and also on its own axis during the same time. The earth and the moon revolve around the sun in the center of the dial, once in 365 days and in 366 days in leap year, which is regulated by machinery. The sun revolves once in 25 days.

From the center is a projecting axis to which is attached by long thin rods the planets Mercury, Venus, Mars, Juno and Ceres. Mercury makes the revolution around the sun once in 88 days, Venus in 224 days, Mars in 686 days, Juno in 1593 days and Ceres once in 1681 days. Around the side of this dial there are the 12 signs of the zodiac, and the earth is always at the proper sign at the proper time.—*Boston Globe.*

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 15th day of May, 1889, an assessment, No 13, of Five Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 327 Pine St., Room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 16th day of July, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

O. H. BOGART, Secretary.

OFFICE—327 Pine St., Room 9, San Francisco, California.

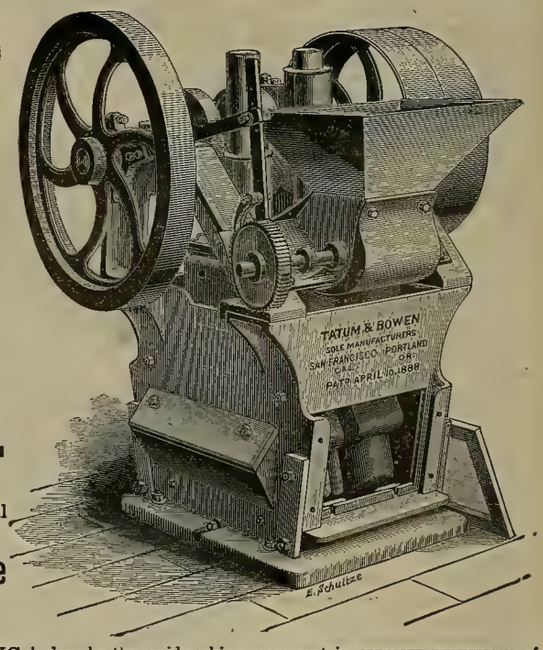
—THE—
PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

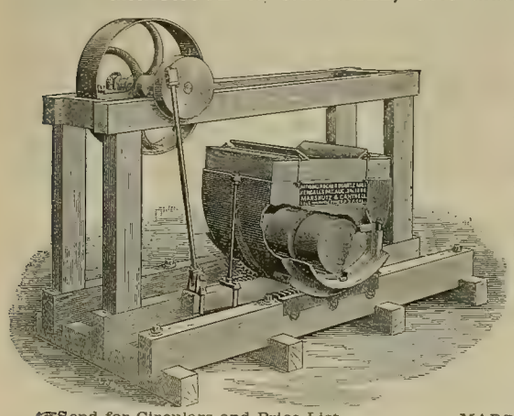
CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

ESTABLISHED 1866.

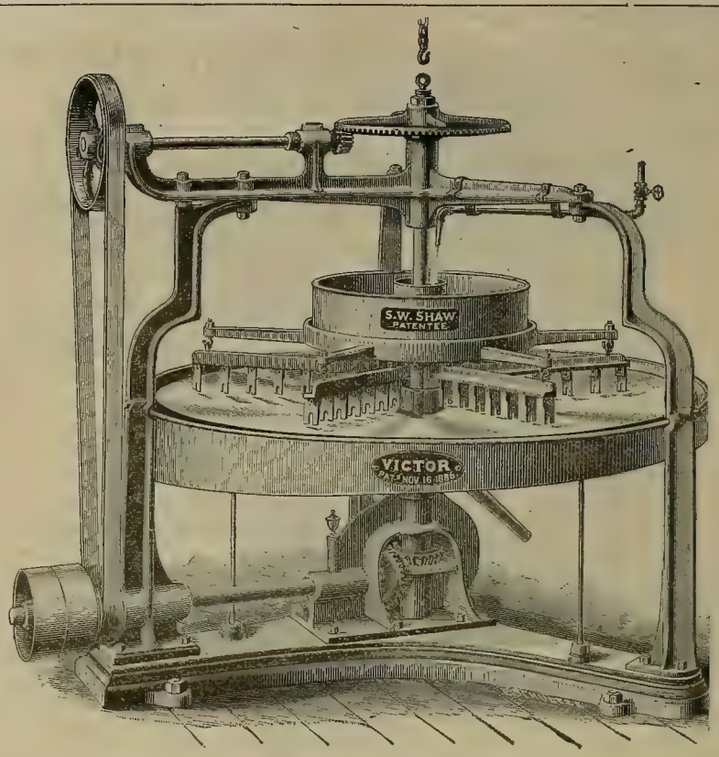
Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.



THE VICTOR CONCENTRATOR

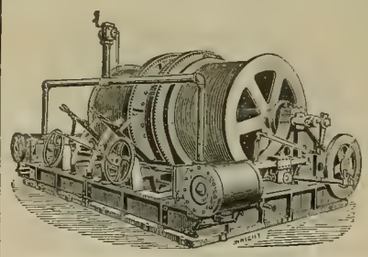
Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,
17 and 19 Fremont Street, SAN FRANCISCO.

HOISTING ENGINES FOR MINES.



1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

LIDGERWOOD M'F'G COMPANY,
96 Liberty St., New York.

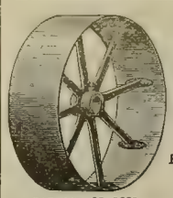
PACIFIC COAST AGENTS,
PARKE, LACY & CO., San Francisco.

New Catalogue for 1889 now ready.

"RED FLAX TRADE MARK RED CORD CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. ☞ Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.



PAT. OCT. 25, 1881.

PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884.

CLOT & MEESE,

Sole Licensed Manufacturers of the

MEDART PATENT WROUGHT RIM PULLEY

For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of

SHAFTING, HANGERS AND APPURTENANCES.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SCHOOL DESK.—Chas. B. Towle, S. F. No. 403,796. Dated May 21, 1889. This patent covers an adjustable sliding top which serves as a complete top to the desk and also as a cover for the book receptacle and for the place for pens, pencils and inkwell. The seat and foot-rest are also adjustable by peculiar means of construction.

SCHOOL DESK.—Chas. B. Towle, S. F. No. 403,795. Dated May 21, 1889. This invention relates to that class of school desks in which the seat can be vertically adjusted to different hights and in which the foot-rest can be adjusted in position to suit different pupils. The object of the invention is to provide a desk in which the several adjustments can be accomplished in the simplest and readiest manner and yet keep the desk free from complications and within the bounds of economy.

WELL-BORING AND DRILLING APPARATUS.—J. E. Day, S. F., assignor of one-half to Joseph Pracy. No. 403,877. Dated May 21, 1889. This relates especially to that class of drilling apparatus which is employed in drilling in rock or hard material. The patent covers the drill rod having undercut beveled shoulders at the lower end and the spear head extending below these shoulders, in combination with the independent drill shanks lying upon each side of the drill rod and spear head, the shanks of the drills being provided with shoulders corresponding with and engaging those of the rod when the latter is lowered, and having concavities or depressions within which the spear head is inclosed when the rod is raised.

SLEIGH.—Felix J. Mette, Ruby Hill, Nev. No. 403,766. Dated May 21, 1889. This covers improvements in that class of sleighs known as "bob-sleighs," which have two independent sets of runners, supporting respectively the front and rear ends of the body or box. The invention consists in connecting both front and rear bobs with the sleigh body by means of king-bolts, so that both may be turned about these king-bolts, and in connecting the front and rear opposite sides of the two bobs together by links having turn-buckles for adjusting the tension and taking up the slack. By this construction it is possible to drive a team at a high rate of speed around short corners and to turn rapidly. Different bodies may also be used and easily secured or detached. During the working hours a suitable body for the purpose may be secured to the running gear, and when desired it may readily be removed and another substituted for pleasure or other purposes, the same runners being employed for all.

CABLE-RAILWAY CONDUIT MOLD.—Ira Bishop, S. F. No. 403,728. Dated May 21, 1889. This mold for concrete work is specially adapted for the formation of conduits for subways, having narrow or contracted top openings, such as the tubes or tunnels of cable railways. The invention consists in separable opposing plates forming between them the space for the conduit and serving as the mold against which the concrete is tamped, said plates being adapted to be readily removed, through the contracted top opening without having to remove or disturb any portion of the work; and in a spreading frame between the plates, and adapted to hold them apart and in position while the concrete is being tamped and is setting, said frame being adapted to be readily removed from between the plates by drawing it out through the narrow top opening, whereby the plates themselves being relieved may also be removed. The invention also consists in the construction and arrangement of the removable mold plates, the spreading frame for holding them in position and relieving them, and the locking bar for the frame.

SURFACE CONDENSER.—Edwin W. Tucker, S. F. No. 403,799. Dated May 21, 1889. This invention relates to that class of surface condensers in which the tubes are arranged in groups or sections, adapting any group or section to be readily removed and replaced when desired. The invention consists in the novel framing of the sections, their arrangement with relation to each other and to the shell or casing of the condenser, and their novel connection therein. It further consists in a novel plate secured to the face of the tube-sheet and receiving and holding the forward ends of all the tubes; and it finally consists in a novel construction of the tubes themselves. The general object of the invention is to provide a practically constructed condenser in which the groups or sections of tubes may be readily removed and replaced without interfering with other groups or sections. The object of the securing plate in the face of the tube-sheet is to avoid the use of separate gland-nuts for each tube, and to permit any or all of the tubes of any given section or group, or of the whole condenser, to be readily taken out upon the removal of said plate. The object of the peculiar construction of the tubes is to avoid interference with the steam by affording it a clear passage, thereby reducing back pressure and also to effect the required condensation with less cooling surface than is usual with the ordinary tubes.

EXCAVATOR.—Isaac P. Lambing, Ione, Amador Co. No. 403,762. Dated May 21, 1889. This is an improvement on the excavating bucket which is in use at the Arroyo Seco mine, in Amador county. In a patent issued last July to this inventor and S. N. Knight, they showed a dredger bucket composed of sections which when closed together form a hollow hemisphere, these sections being opened and closed by means of a piston and certain connecting rods and links. Certain objections have arisen in the actual operation of this apparatus which it is the object of the present invention to overcome. The excavating bucket is formed of sections which when closed together form a cup or continuous vessel shaped something like a flattened hemisphere. The method of application of the power to close these sections is better than in the old plan and insures the perfect closing in hard material. Experience has shown that a segment of a perfect globe does not do satisfactory work because the excavated material piles up in an irregular manner when the sections are closed together. The improved construction allows the excavated material to slide well up from the point toward the sides, thus filling the bucket more evenly than when hemispherical sections are used. The bucket sections are also strengthened and the steam-power applied to better advantage than formerly.

MACHINE FOR HEADING CANS.—Wm. H. Smyth, Berkeley, Cal. No. 403,784. Dated May 21, 1889. This machine consists of but few main essential parts, namely: A stand, a reciprocating cross-head having a jaw on each side for receiving the cans, a movable carriage having a jaw in each end opposing the jaws of the cross-head, pressers for forcing the heads on the can bodies, and suitable runways and guiders for directing the can bodies and can heads. The cross-head operates between the jaws of the carriage, which are separated sufficiently, and through the intervention of a can body picks up the carriage and moves it first one way and then the other, and by this movement of the carriage the pressers are operated. A can body is placed in the runway, and, passing down, drops on to the top of the cross-head, thence in front of its jaw, and is then carried by said jaw into the jaw of the carriage, and is thus held between the jaws, and while both cross-head and carriage are moving the heads which have been properly directed down upon each side are forced by the pressers upon each end of the body. A second body having followed the first is meanwhile directed in front of the other cross-head jaw, and as the cross-head returns it is caught between said jaw and the other carriage jaw, and while both cross-head and carriage are moving on their return stroke two heads are forced by the pressers upon said body. Thus the machine is a continuous acting one, of double capacity, turning out a headed can at each stroke from each end. Minor details of construction, arrangement and adjustment go to make the machine complete.

ACCORDING TO *Invention*, a new process has been discovered by Mr. J. B. Hannay of Glasgow. By means of an entirely new method of chlorination, the cost of extracting the precious metals from refractory ores is said to have been greatly reduced. A strong syndicate has been formed by capitalists in Glasgow and Brighton, in conjunction with Mr. Fitzgerald Moore, "The Australian Silver King," to work the process.

GOVERNOR WATERMAN is making arrangements to build a 40-stamp mill at the Stonewall mine in San Diego county. The mill will cost completed about $60,000.

THE steam that blows the whistle doesn't help to make the train go.

STEAM BOILER NOTES

Kinetic Energy is the Secret of the Injector.

In a work on the steam engine, by Thomas Goodeve, the *Engineer* finds this explanation of the action, or the principles upon which the injector acts. It quotes:

"Since action and reaction are equal, it is abundantly clear that a simple jet of high-pressure steam issuing from a pipe could never drive back a jet of water issuing from another orifice of greater diameter—under the same pressure. It was a great step in science to conceive the idea that the absorption of heat which takes place at the meeting of the steam and water, could furnish a source of energy directly available for work. There has been no parallel to this discovery in any analogous direction, and it is difficult to account for its action.

"On the steam side there is the 'kinetic' motion of the molecules of steam; and on the water side there is the motion of translation of a quantity of water, and the problem is to show a possible method of passing from one to the other."

Here ends the quotation, and one need not follow it further to find the gist of the argument, which is, in brief, that kinetic energy is the secret of the injector's action. We have no right to dispute this belief, for we cannot prove to the contrary; but what does "kinetic" action, or "kinetic" energy, mean in this application? It means simply the momentum of a mass in motion—live-force, in other words; and water is the mass when we are considering the injector.

The value of the kinetic action in work is stated to be the product of the mass into half the square of the velocity, and under this view of the matter, the water is driven into a steam boiler by an injector, simply by the velocity of the mass of water, and the power developed by such velocity.

This is plausible and probable. The only elements which seem to conflict are that the velocities must be greatly reduced by tortuous passages, small orifices and condensation of the steam on meeting the water. The fact remains, however, that the water goes in, passages or no passages, and in spite of condensation.

THE IDENTIFICATION OF DRY STEAM.—At a late meeting of the American Society of Mechanical Engineers, Prof. J. E. Denton presented a paper on the above subject of which the following is an abstract: Jets of steam show unmistakable change of appearance to the eye when steam varies less than one per cent from the condition of saturation either in the direction of wetness or superheating. Further investigations show that the instrumental error of portable condensing calorimeters does not theoretically interfere with the measurement of about one per cent of variation in the heat of saturated steam. But in the use of such calorimeters there has always been found to exist an accidental variation of error considerably in excess of the theoretical instrumental error, even Regnault's magnificent work not being an exception in this respect. Consequently if a jet of steam flows from a boiler into the atmosphere under circumstances such that very little loss of heat occurs through radiation, etc., and the jet be transparent close to the orifice, or be even a grayish-white color, the steam may be assumed to be so nearly dry that no portable condensing calorimeter will be capable of measuring the amount of water in steam. If the jet be strongly white, the amount of water may be roughly judged up to about two per cent, but beyond this a calorimeter only can determine the exact amount of moisture. A common brass pet-cock may be used as an orifice, but it should, if possible, be set into the steam drum of the boiler and never be placed further away from the latter than four feet, and then only when the intermediate reservoir or pipe is well covered.

FEEDING BOILERS.—Mr. Plumier, mining engineer, recently read a paper at the monthly meeting of the graduates from the Engineering School of Liege, on the best manner of feeding steam boilers. He is opposed to the ordinary method of feeding in the coldest part, the most remote from the furnace. The boiler sheet has always about the same temperature as that of the water in contact with it. The feed should not be introduced in such a manner that the hot and cold water rest in strata; for in this case the plates in contact with the feed water (which goes to the bottom by reason of its greater density) will have at times a much lower temperature than the rest of the boiler. Hence there will necessarily result a different amount of expansion between the upper and lower sheets, which will tend either to open the riveted joints or to produce corrosion and rapid deterioration of the boiler. This is proved by numerous practical examples. Mr. Plumier concludes, therefore, that the feed-water must be mixed at once with the heated water in the boiler, thus preventing the former from sinking in a mass to the bottom and remaining there for some time at a comparatively low temperature. The engineers of the Boiler Inspection Company advise that the end of the feed pipe should be curved so as to discharge into a small vessel placed in the steam space, from the edges of which vessel the water flows gently in minute quantities. Other engineers feed in the steam space, discharging into a long pan, where a large portion of the impurities are retained, because water suddenly heated to a high temperature precipitates its saline matter.

DANGEROUS PRACTICES.—The fifth annual report of the State Inspector of Workshops and Factories in Ohio is full of instructive matter. Among other things he makes some good suggestions regarding the care of boilers and fittings, which we quote and commend: "Another dangerous practice is the calking of joints in steam pipes while pressure is on. If pipes or fittings are corroded, as they very frequently are, there is danger that the chisel or calking tool may be driven through the pipe. In such a case the workman is likely to be seriously scalded. The practice of screwing up man hole, hand-hole, and similar plates, while boilers are under pressure, to stop leakage, is of a similar nature and should be as strongly discountenanced. A great many accidents have been caused in this manner. The following occurred some years ago: A battery of three horizontal tubular boilers was fired up, and on raising steam the joint of one of the man-hole plates was found to leak quite badly. Instead of letting down the steam and repacking the joint, a wrench was applied and the attempt was made to stop the leak by screwing up on the bolt. This proving insufficient, a long piece of pipe was slipped over the handle of the wrench and more force applied. The immediate result was the fracture of the man-hole frame, the explosion of the boiler, the destruction of about $10,000 worth of property, and the loss of three lives."

GAS UNDER STEAM BOILERS.—An officer of the Philadelphia Natural Gas Company, at Pittsburg, is credited with the following statement: Experiments prove that with the present method of boiler heating it requires 2½ cubic feet of gas to evaporate 1 pound of water. The use of a proper burner will enable 1 pound of water to be evaporated by 1 38 cubic feet of gas. When we consider all the boilers in the two cities that daily evaporate hundreds of gallons of water, we can see that the excess of gas used amounts to millions and millions of feet weekly. The same principle applies to the making of salt and the puddling of iron. To puddle a ton of the latter, the mills now use 28,000 cubic feet of natural gas. The same work may be done with 14,000 feet. About the same facts obtain in the use of crude oil, as burned in this State. We shall soon have something to say in regard to economy in the use of appliances for burning oil.

Complimentary Samples.

WANTED.

FIVE OR SIX THOUSAND DOLLARS

Are required by the Owners of a

Well Developed and Very Valuable Gold Mine

To complete its mill and means of output of ore, etc. For this advance of capital a valuable interest will be given at a very low price. The mine is remarkably well located, with abundance of wood and water and every facility for mining, and can soon become one of the notable gold properties of the State. The owners are responsible men and practical miners.

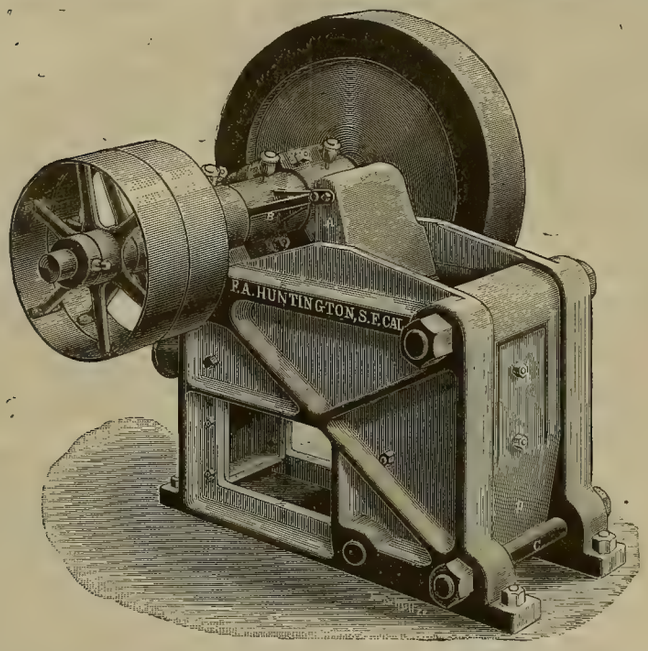
P. O. Box 502, Los Angeles, Cal.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

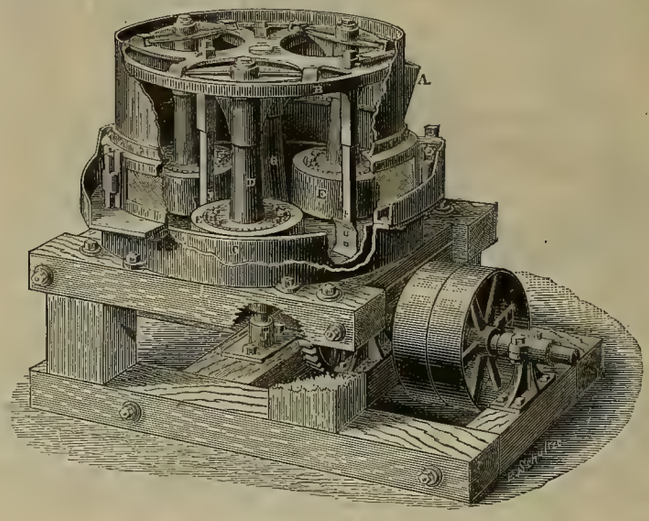
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock o Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we fee confident from our experience we can well suit the de mand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 28 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, May 29, 1889.

General trade continues fairly active for the season of the year. In view of the favorable prospects for large crops and liberal water supply in the mining districts, interior merchants by not buying freely appear to be controlled by a conservative spirit, which is very commendable. There is no doubt but the State and coast in general are gaining in population, and of a class that is very desirable. This year, so far, is noticeable for an absence of land booms; the buying and prices appear to have drifted to a more substantial basis. All advices are confirmatory that in every direction improvements are going up, particularly residences in the larger cities. In this city and Oakland, it is stated that so far this year there have been expended in new buildings over $2,500,000, of which amount nearly $700,000 was paid out in Oakland. It is claimed by many that 1889 will be the banner year in building in this and adjoining cities. Iron workers, as a rule, report slack business, yet they are very hopeful of a turn in the tide for the better at an early day; already there are signs of improvement.

Money is still reported to be easy, and in excess of immediate requirements, but present indications point to an active call setting in soon for crop purposes. It now looks as if more money will be tied up in grain than for several years past; yet the money advanced on the grain will go into general circulation, so that no friction will be had even if the grain is not sold for export. For the other crops considerable money will be required, but as they will go almost immediately into consumption or be shipped, the money advanced will soon be returned. The rates of interest at commercial banks range from 4 to 8 per cent per year, according to security and time wanted.

The steamer Belgic, hence for Hongkong on May 25th, took out the following treasure: To Hongkong, Mexicans, $382,204; gold coin, $3730; gold-dust, $325; silver bullion, $107,000; total, $493,259. To Hiogo, silver bullion, $45,000.

The clearing-house returns continue to show an increase in clearings and balances over last year at this time; and this, too, in the face of an absence of any speculative movement in this month.

SILVER—The market held to firm prices abroad up to Monday, when they shaded off one-sixteenth, with another drop yesterday of another one-sixteenth. In this market 92¾, and even a point or two higher was paid for bullion for shipment by the last steamer for China, but on Monday the market dropped to 92¼ to 92⅜ cents. The receipts of silver bullion continue surprisingly light, with the outlook not at all favorable for an immediate increase. It now looks as if in the summer months the receipts from the coast mines will be very light. The vain endeavor made to induce the administration to increase the silver coinage is not calculated to improve the outlook for bullion. Friends of the metal affirm that they will be able to pass a more favorable law through Congress, the coming winter.

To-day's (Wednesday's) cablegram quotes silver at 41 15-16@42d in London, and at 91⅛@91⅝ cents in New York. Our markets also quoted lower, with no sellers at the bids. Buyers give 91¾@91⅞ cents here; holders want more money.

MEXICAN DOLLARS—The market held strong up to Monday at 74 cents for new, but fell on that day to 73¾ cents in sympathy with a decline in silver bullion and an absence of buyers. For old, the prices generally ranged about ½ cent below new. The shipments by the last two steamships for Hongkong were quite heavy.

Owing to a decline in silver, buyers are trying to get more concessions on Mexican dollars. Quotations are nominal at 73¾ to 73½ cents for new.

QUICKSILVER—The market has held to very strong prices throughout the week, under continued light supplies, a fairly good demand and a strong market abroad. Receipts the past week aggregate 227 flasks.

LEAD—Shipments by sea the past week aggregated 20,078 pounds to Victoria, B. C. The market is fairly steady. The consumption on this coast compared with the like time in last year shows an increase. At the East the market fluctuated to some extent the past week. The demand consumption there appears to be increasing.

TIN—The shipments by water the past week aggregated 700 boxes tin plate to Victoria, B. C., and the imports 33,588 boxes from Liverpool. The market is heavy and weak at lower prices for tin plate, both spot and prompt shipment. Canners and other consumers confine their wants as much as possible. Pig tin on spot is only in fair stock, but near by shipments keep prices down.

BORAX—Receipts the past week aggregate 1510 centals. The market is quiet but firm.

LIME—Receipts the past week aggregate 5385 barrels. The demand continues free with prices unchanged.

IRON—The market for pig continues inactive, but bolders are reported to be firm in their views, owing to the active and strong markets abroad. Consumers confine their purchases as much as possible.

COAL—Imports the past week were as follows: Seattle, 602t tons; Nanaimo, 5640; Tacoma, 6000; Coos Bay, 860; total, 18,321 tons. The market for coast is easier under liberal supplies and a light demand for household purposes. Australian is very strong with the tendency to higher figures, owing to the sale of 50,000 tons (reported in last week's PRESS) being off the market. Other foreign descriptions are also firm.

Eastern Metal Markets.

By Telegraph.

NEW YORK, May 29, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	92¾	$12 25	$3 70	$20 40
Friday	42½	92⅝	12 20	3 77½	20 35
Saturday	42½	92⅝	12 20	3 80	20 40
Monday	42 3-16	92¼	12 25	3 87½	20 65
Tuesday	42½	92	12 00	3 90	20 50
Wednesday	41 15-16	91⅝	12 00	3 87½	20 45

NEW YORK, May 28.—The dictated price of 12c to consumers for Lake copper is still quoted, with only moderate sales. Casting brands, mainly Arizona, 11¾@11½. A Paris cablegram announces that the American copper-mine delegates, with the exception of Tamarack, ratified the provisional arrangements concluded with M. Moreau, the liquidator of the Comptoir d'Escompte. The agreement is binding without the adhesion of the Tamarack Co. The Lake Superior production in April was 4572 tons; April of last year, 4475; January to date, 18,070 tons; last year, 16,194. Pig lead is quiet for speculation or consumption; closing cash prices, $3.80@3.85.

Mining Share Market.

The market the past week, or up to last evening (Tuesday), so far as the Comstocks are concerned, has been an almost constant sinking in prices. It looks as if the manipulators have instructed their brokers not to bid for stocks, but take them in at steadily declining prices. By this means a panic is prevented, the large shorts kept from filling and the inside get margin stock. The street wears a deserted look, but this is not at all the unusual occurrence when prices drag around about bottom. As soon as the inside is ready and throw out the bait, suckers rush in to buy.

At the 9:30 session this A. M., the market for the Comstocks opened weak and lower, but began to rally when the Gold Hills were called. After the board, prices did better. The advance is looked on by many as a natural reaction, while others again think that the mines justify an upward move. In the outside stocks there was a steady tone in the Quijotoas and Tuscaroras, as if insiders were preparing for a small move. An attempt was made to galvanize the Bodies into life under the old contest for election racket. They moved up about 40 per cent, but with some of the outside holders attempting to realize, the market began to break this forenoon.

From the Comstock mines the news continues of a meager and unsatisfactory character. Either there is nothing new to report or else the pool is purposely keeping information back. Those having correspondents at the front assert that it is nearly impossible to keep information back, consequently, if this is the case, there is nothing to report outside of the stale old statistical work reports. From Con. Virginia our advices report an improvement on the 1400-foot level near the Ophir line. From the Middle and Gold Hill mines all advices are of favorable character, as they are from the North End mines. The work is still westward. In several of the drifts or crosscuts, stringers are expected to be run into as work progresses, which ought to make a livelier market here. There is no doubt but the inside has some cheap stock which they will want sooner or later to sell out at a good profit. When this time comes outside holders who do not want the earth can get out and wait for developments. As it now looks, there ought to be quite a number of assessments levied in the near future. Owing to this being a broken week—to-morrow being a legal holiday—not much can be said either on the market or on the mines.

Elsewhere an editorial appears on the bullion output of the Comstock lode, together with cost, etc. It will be seen by referring to the article the cost of extraction, milling, etc., is very high in some of the mines, which contrasts strongly with the following from the Virginia City *Chronicle*, May 25th: "J. C. Dunlop, owner of the Wild Goose mine in Jumbo district (west side of Mt. Davidson), and who is erecting a five-stamp steam mill at the mine, says he can mine and mill the ore from the Wild Goose at a total cost of $2 per ton."

The Comstock lode is on the east side of Mt. Davidson.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A VALUABLE PAPER. — THE MINING AND SCIENTIFIC PRESS of May 18th devotes considerable space to Tuolumne county and the mines. On the first page is a photo-facsimile of Sonora with an article descriptive of her county. An entire page is devoted to the early history and description of Tuolumne mines and another page to an interesting history and description of the Bonanza. The PRESS is a valuable paper and ought to be read by every one interested in mining and scientific matters on the coast.—*Sonora Democrat, May 25.*

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

AN expert representing a New York company will arrive on the Comstock next month to inspect the North Bonanza mine in Flowery district, with a view to its further development.

THE Bear's Nest mine will have its first 120 stamps up this fall, making a total of 480 stamps across the slough from Juneau, Alaska.

PACIFIC IRON WORKS

1850. —BUILDERS OF— 1888.

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

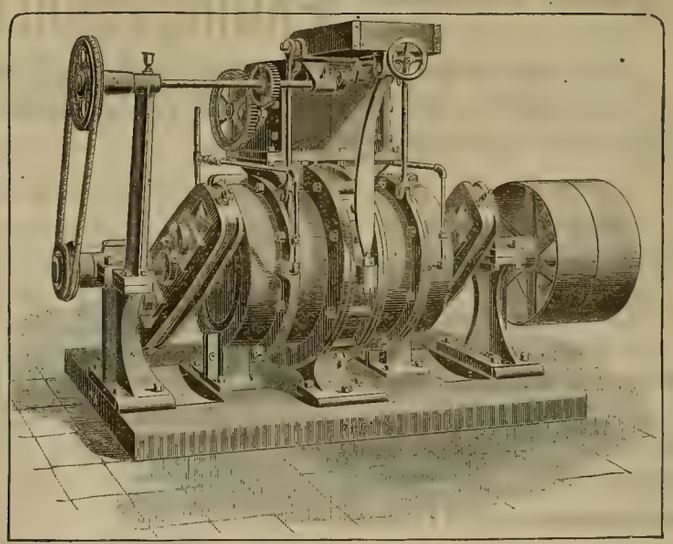
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

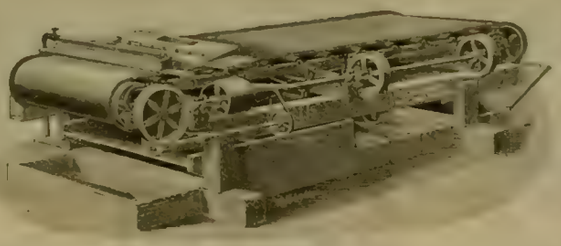
IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

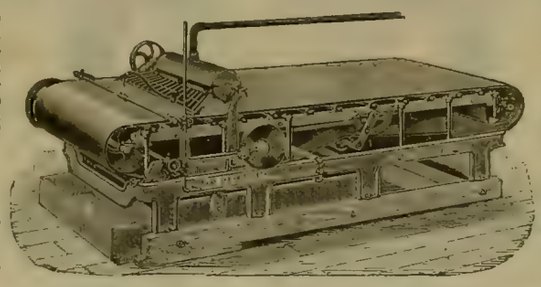
The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

STEEL BOILERS IN TWO PLATES.

Steam Users, Attention!

The engraving represents our standard Boilers. These boilers are made of STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are bought which have a small hand-hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

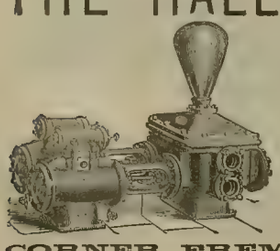
1 Boiler, 1 Steam Drum, 1 Breeching, 1 Smokestack, 300 Feet Galvanized Strand for Guys, 1 C. I. Front Complete, 1 Foundation Plate for Front, 1 Set Grate Bars for Coal or Wood, 1 Back Bar Bearer, 1 Ash Cleaning Door and Frame, 1 Back Arch Plate, 1 Set Binder Braces and Bolts for Brickwork, 1 Stand for Back End of Boiler, 1 Steam Gauge for Syphon, 1 Glass Water Gauge Complete with Column and 3 Gauge Cocks, 1 Safty Valve, 1 Feed Valve, 1 Blow-off Valve, 1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds.

Boilers of the following Sizes in Two Sheets kept Constantly on Hand ready for Shipment: 60 Inches Diameter x 16 Feet Long; 54 Inches Diameter x 16 Feet Long; 48 Inches Diameter x 16 Feet Long; 42 Inches Diameter x 16 Feet Long.

SEND FOR CIRCULARS.

THE HALL DUPLEX STEAM PUMP,



The Most Simple, Efficient and Durable Duplex Steam Pump in Use
FOR ALL DUTIES.

THE T. H. RISDON TURBINE WATER WHEEL,
SUITABLE FOR ALL FALLS. ADAPTED TO ALL CONDITIONS.
Built Specially for Durability.
HAS THE HIGHEST RECORD FOR PERCENTAGE OF POWER.
Catalogues Sent on Application.

A Frame for Dumping Cars.

Illustrations are given herewith of Behr's car-dumping frame, which can be used to great advantage in gravel and drift mines where cars are run in trains. The frame is hinged on each side, and after car has been run upon it is released by a catch operated by treadle: a slight shove then throws the car into position for discharging, as shown in dotted lines in one of the cuts. The same catch working automatically, holds car and frame until car has discharged, when the center of gravity having changed, the car falls back to its usual position upon releasing catch. This method of dumping not only permits a large number of cars being dumped in a short time, but also does away with the necessity of having any device on car itself for dumping.

The engraving representing the car-dumping frame and car shows in dotted lines the position assumed by the frame and car when dumping. The car is designed for use in gravel and drift mines where trains are used. As no dumping arrangement is required on a car when used in conjunction with this dumping-frame, the body of boiler iron is placed directly upon a pine frame and securely bolted and held to it by wrought braces at each end. A drawbar runs the length of frame, with a hook on each end for coupling up. Side frames are carried out and capped so as to act as buffers. As will be seen, this car is very strong and simple in construction, insuring long wear and reduced first cost. These cars and dumping-frames are manufactured in this city by the Fulton Iron Works.

LARGE deposits of aluminum and beds of blue clay of peculiar tenaciousness have been discovered at El Toro station, south of Santa Ana, Los Angeles county. It is thought a fine quality of cement can be manufactured there.

GOLD-DUST is shipped daily from Folsom, and on Monday of last week $12,000 worth of it went from that town by express.

BEHR'S CAR-DUMPING FRAME AND CAR.

Buffalo Duplex Compound Steam Pump.

The duplex movement in steam pumps has always possessed an interest from a mechanical standpoint, and excellent results have been obtained by its adoption and use.

In the form of pump illustrated on this page not only is the duplex theory exemplified, but an admirable valve motion is adopted by which concussion, jar and noise are entirely obviated.

It will be noted that two steam pumps are practically placed side by side, and so arranged as to act reciprocally upon the steam valves of each other. The one piston acts to give steam to the other, after which it completes its own stroke and waits for its valve in turn to be acted upon before it can renew its motion. The slight interim allows all of the water valves to seat quietly and thus prevents anything like concussion of action.

As one of the steam valves by this arrangement must always be open, there can be no dead point, consequently no jar, and the pump is always ready to start when steam is admitted; nothing is required to be done but simply to open and close the throttle valve. This arrangement is the perfection of simplicity in its own action, the operation of each pump being dependent upon its counterpart, while each is directly and arbitrarily dependent on the motive-power, the steam, and the whole on one simple throttle.

In the matter of comparison it is, of course, evident that the duplex pump, being as stated, in fact, two steam pumps working side by side, only taking steam from one valve, and discharging water into one pipe, has double the capacity, for any given period of time, of any single cylinder steam pump of same diameter of plunger, and to possess the same capacity of service, a single cylinder pump must have a plunger or water piston of twice the area of one of the plungers of a duplex pump.

Northern Counties of California—No. 3.

Auriferous Gravel and Quartz.

EDITORS PRESS:—Referring to an article under the above caption in your issue of May 25th, with Mt. Shasta, in Siskiyou county, as the focus of disturbance, we find the formation of the surrounding country changed, broken and shattered owing to the previously described violent convulsions caused by dynamic influences. Intrusive masses of porphyry and granite appear with dykes of trap and lava-filled fissures breaking the continuity of the strata and in places faulting entire belts with their metalliferous lodes, throwing them for greater or lesser distances, invariably, however, appearing in place on the same line of strike and angle of inclination. The trend of the stratification is north 20 east in contradistinction to the strike of the metamorphic slates that flank the Sierra Nevada range proper in more southerly counties, which strike is west of north, corresponding to the axis of the main chain.

In this vicinity sections taken from east to west show the following results:

[Reference is here made to the Eighth Annual Report of the State Mineralogist for the year ending Oct. 1, 1888, under the headlines of "Metallic Wealth," pages 583 and 584, in which much data relating to the mineral belts of Siskiyou county has been published. The facts submitted in this article were excluded for want of space.]

Commencing at the extreme northerly boundary of Siskiyou county, in Tp. 48 N. R. 7 and 8 west,

An Important Gold-Bearing Belt

Which is as yet comparatively virgin, was accidentally discovered last year by a prospector. Crossing the divide that separates the waters of Cottonwood and Bumblebee creeks, he saw a long line of quartz croppings that presented a marked feature. He broke a few pieces of the rock, took it with him to his camp, and, to his surprise, by the horn-spoon test, proved it to be very rich in gold. The next day he made several locations, and, with others, has since been quietly developing the mines with good results. The fortunate discoverer is an old prospector and has made repeated trips with his mining outfit from Alaska to Mexico. He has made many discoveries of metalliferous lodes, but considers this the "last and best of all." He holds three locations, for which he asks the modest sum of $250,000, and "won't take a cent less."

This and other veins in this belt have undoubtedly been the feeders and source of supply of the rich placers found on Cottonwood, Hungry and Bumble creeks.

Thence southerly in the same formation we encounter Beaver, Little Hungry, Barkhouse, Deadwood, Indian, Greenhorn, McAdams, Oro Fino creeks, Quartz valley and the Pinery placers, all of which have been fabulously rich in placer gold.

At a point a short distance southwesterly from the last-named place the

Salmon Range of Mountains

Intervenes, and has evidently been the disturbing element that broke the continuity of the belt. This range is largely composed of eruptive rocks—porphyries and granites. Auriferous rocks do not come to the surface for a distance of 12 miles in this formation. Their first appearance is in the Black Bear district on the waters of the Salmon river. Here nature apparently endeavors to make amends for the barren waste of unproductive ground by an oasis of gold-bearing veins of mammoth proportions, resembling in many respects the celebrated mother lode that courses through the middle and southern counties of our State.

The principal vein is composed of a black slate—several hundred feet in width—magnesian, talcose, and in places chloritic, soft, unctuous and greasy to the touch (technically known to the miner as plumbiferous slate). We find here that the stratification has changed to N. 10 E. and S. 10 W., a divergence of 10 degrees. This vein or belt is inclosed in walls of a stratified silicious slate of a peculiar structure on the west with porphyry on the east. It contains kidneys of lenticular-shaped masses of auriferous quartz of mammoth proportions, forming bonanzas of great value, in many respects resembling the deposits of a similar character found in the Keystone mine of Amador county. Several of these bodies have been found and exhausted after having yielded many millions of dollars to the fortunate owners. The Black Bear mine, from which the district takes its name, has been the most productive. For the history and full particulars of this remarkable property see pages 621 and 622 of the Eighth Annual Report of the State Mineralogist.

On the Same Belt

There are other mines of note, the Uncle Sam, Mountain Laurel, Evening Star, Klamath and Mistletoe, that are being exploited with encouraging results. Were it not for the inaccessibility of this mountain region and the want of capital, mining would be prosecuted here with more vigor. Wagon-roads are unknown and the hurricane deck of a mule a luxurious mode of traveling.

From the latter point westerly we cross alternate belts of granite, limestone and syenitic rocks, and enter still another belt of auriferous slates of which but little is known, as the country in this region has not been prospected to any extent.

At a point eight miles northerly from Happy Camp, on the Klamath river, in Tp. 17 N. R. 7 E. on Indian creek (in the same belt), extensive bodies of talcose slate occur reticulated and seamed with stringers of quartz that are unusually rich in free gold. The mass being soft and decomposed, the hydraulic system with water under a heavy head has been successfully introduced in working the deposits. This process is wasteful in the extreme, as but a small percentage of the gold is saved, but from the unusual richness of the material, large sums are yearly extracted, particularly from the Classic mine, which is owned and worked by a company of Chinese. Southerly from this point the serrated peaks of the Trinity range of mountains stand in bold relief against the horizon, a marked feature in the landscape, their highest points reaching elevations of from 8000 to 10,000 feet, forming the boundary-line between the counties of Siskiyou and Trinity. At a point on the headwaters of the South Fork of the Salmon river in Tp. 37 N. R. 10 and 11 E., small areas of tableland or mesas occur on which we find

Several Lakes

Which have been used as storage reservoirs for the conservation of water by Mr. Geo. C. Spooner, who owns and works large tracts of auriferous gravel banks below this point on the South Fork of the Salmon by the hydraulic process. These lakes are fed from the perpetual snows laying on the westerly flank of the range. My informant, Mr. Spooner, states that he has visited this source of supply, and that what to all appearances is snow is simply an iceclad sheet, the remains of a glacier of considerable area and thickness. This is not improbable, as g'acier marks and furrows are visible in many places wherever the bedrock is uncovered and exposed. The main south fork of the Salmon takes its rise in a small mesa or tableland known as Big Flat, where the waters divide. It contains a superficial area of 600 acres. Its center forms the dividing line between the two counties. The flat to all appearances once formed the bed of a lake, being cup shaped and filled with rich auriferous gravel and subsoil; this deposit is worked as a drift mine.

The central core of this mountain range is granitic, flanked on the west by a secondary transition granitic formation composed largely of quartz, feldspar, magnesium and trappish rock, which is in turn flanked by gold-bearing metamorphic slates carrying strong veins of auriferous quartz in which some work of development has been done and a prospecting mill of two stamps erected, forming

An Inviting Field

For the quartz miner. The large deposits of auriferous earth and gravel situated on the banks, high bars and terraces of this river extend for many miles on its course with an abundant supply of water under a heavy head, ample dump and in no possible event trouble from the "anti-debrite" (as there are no agricultural lands to interfere with or injure), rendering it a promising field of operation for the hydraulic miner.

Southerly from this point the Coast Range of mountains and Sierra Nevadas commence to diverge and take form and shape as separate and distinct chains. The blending and confusion caused by the previously described plutonic effects are no longer apparent.

JAMES H. CROSSMAN.

The 13-14-15 Puzzle.

EDITORS PRESS:—The statement is often made that the '13-14 15 Puzzle" has never been solved. Having published directions for working this puzzle successfully in the Denver *Republican*, May, 1883, I will give the following key, which will enable any one to master it:

The chances are even if the blocks are put on at random that it can be done with 1, 2, 3, 4 on upper line, with 13, 14, 15 on the lower. The first two lines are filled without difficulty, counting to 8. The key to the puzzle is placing the 9 in left hand lower corner with the 10 directly over it. There is no necessity in moving the 9 or 10 or either of the blocks from 1 to 8 in now placing the 13, 14, 15 in right corner, the 15 over the 14. If the 12 now stands over 11 with blank space over 13, one move of 12 to right allows the 11 to be raised and complete the count from 1 to 15. If, however, the 11 stands above 12, with blank space over 13, then the reverse count must be made from 15 back to 1, with 12, 13, 14, 15 on lower line.

The next line above will be 9, 10, 11, which should all be moved to right. Now drop 5 from above, making 5, 9, 10, 11. Move those on line above—6, 7, 8 to left; raise 11 to line above; move 5, 9, 10 to right, drop 6, making 6, 5, 9, 10; move 7 and 8 to left; now raise 9; now move 5 to right under 9; now drop 8; move 7 to the right; raise 6; move 8 and 5 to left; drop 9; move 7 to right; raise 5; now move 9 and 10 to left and drop 11, thus: 8, 9, 10, 11; now drop 4; move 1, 2, 3 to right; raise 6; move 5, 7, 4 to the left; drop 3; move 6, 1, 2 to the right; raise 5; move 7 and 4 to the left; drop 1; move 6 to the right; raise 4; move 7 to the right; drop 5; move 4 and 6 to the left; raise 1; move 7 to the right; drop 6; move 1 and 2 to the left; raise 3; move 5, 6, 7 to the right; drop 4; this completes the count from 15 back to 1, with 1, 2, 3 on upper line.

The transposition of two blocks changes the order of sequence, but the numbers can be arranged to count from 1 to 15 if the above formula be observed.

When skill in moving the blocks has been gained by practice, it will enable a person to place the numbers in regular sequence from upper line to lower and back in reverse order within three minutes. If the blocks are not removed from the board, they will invariably count one way. EDWARD E CHEVER.

San Francisco, Cal., June 1, 1889.

Mexican Lead Ores.

EDITORS PRESS:—The *Engineering and Mining Journal* in attempting to prove that importation of lead ores free of duty is working no injury to our country, balancing resulting benefits, falls into a grave error. One patent fact must be admitted: Mexico is now supplying our country with an enormous amount of lead, and this influx has operated to shut down many of our own great lead mines, thereby throwing out of employment thousands of our miners, and shutting down contiguous smelters. Against this injury the *Journal* says manufacturers of machinery have profited in a new demand from Mexico. This demand has come by destroying old values, and preventing a like new demand for men working at home in the development of new mines. Where, then, is the gain? At the same time thousands of miners at home have been prevented from earning their three dollars per day, that a like number of Mexicans may earn fifty cents or one dollar per day, and the mine-owner from realizing on his investment.

Again, the *Journal* says that if prices of lead were to advance by the collection of the duty of 1½ cents, the stimulus to production would soon overstock the market, and the present low price soon return. Then the free-trader or the consumer should not object to the tax. He is not going to suffer but temporarily, while our mines will be worked, large money disbursed to the American miner and smelter. But it makes no difference with the smelter. The foreign ore is smelted here. Yes, big smelters along the line of the Atchison, Topeka & Santa Fe, but nowhere else. Without this influx, they will all live on home ores.

As to the railroads, the *Journal* says that it is only a question of one or another getting the freight *on this lead ore*. Is this true? Subtract the mining industry proper from Leadville, leaving the smelting industry. Let the railroad carry from Mexico to the smelters here the tonnage taken from the mines there, reducing the city to the village, a few smelters would work; would their receipts equal the business made by a city ten times the size of such a village? Who does not know that great mines make a city, and that city ramifies every industry with its demands? Who does not know that Leadville was built up by the *mines*, and that Leadville mines also gave Denver its grand increase in population and wealth? Could we possibly have built up mountain towns and cities in mining districts if we had let foreign countries do our *mining* though we smelt their ores? The miraculous development of Colorado alone, through the development of Leadville mines, is worth more to the country at large from ocean to ocean, to every industry in the country, than all the lead aggregates in value that has come from Mexico, or will come, in the next decade. Why do we stand and haggle over 1½ cents on the product, even if it were to cost that much more, if the duty be collected? Shall we destroy the immense value of our mines themselves? Destroy this means of labor and the general demand it creates in the hope of saving a trifle in the price by giving the work to *peons?* But the *Journal* says the price will adjust itself again by the production. Then let it do so under *American* conditions.

The *Journal* endeavors to show by specious reasoning that it makes no difference to the miners, as the smelter charges less for smelting dry ores. Does that save the lead mines? But this is not true, as the schedules of the smelters show.

Again, the *Journal* says we *must* take of Mexico ores in payment for working or must import as much as we export. Then let Mexico furnish us what we cannot produce at home. We cannot afford to kill a great industry at home to support a like industry there or in any other country.

The long and short of the argument is, *mines* build up cities and towns and create enormous demands upon *every* industry. Smelters do not. Foreign trade is but one-tenth of the domestic. Develop and take care of our home trade first, last and all the time.

The ruling of the Government that lead shall come free, if in combination with a free metal, seems without reason or rhyme. The law collecting 1½ cents duty absolutely, it is as much as to rule that if a contraband commodity gets shipped in company with an article not contraband it ceases to be contraband. There is no such ruling in the case of copper. It has to pay even if gilded all over with gold. Where is the reason for the distinction?

Another fact should be understood. The Government does not sample the ores to see if their silver contents are really more valuable than the lead, leaving large opportunities for violations of even the ruling.

There can be no doubt but that it is the interest of *every* industry in the United States that this Mexican importation of lead ore be checked by imposition of the duty laid by custom laws and which was intended by the framers of the law to protect the lead industries of our country. This ruling has been made by the connivance of a few smelters along the line from Kansas City to El Paso rather than by any public interest. We protect iron and other industries. The law intended protection to the lead industry. It is thwarted by a mere ruling.

G. P.

Paper for Building.

The use of paper fabric for building purposes is now advocated by some builders on the following grounds: First, continuity of surface; that is, it can be made in rolls of almost any width and length, is flexible, or by gluing several layers together may be made stiff, and will stop the passage of air because there are no joints. Second, it has no grain like wood, and will not split. Third, it is not affected by change of temperature, and therefore has an advantage over sheet metal as roofing material. Fourth, whereas in its natural condition it is affected by moisture, it may be easily rendered waterproof. Fifth, it is a non-resonant, and well fitted to prevent the passage of sound. Sixth, it is a non-conductor of heat, and can be made also of incombustible material like asbestos, or rendered fire-resisting by chemical treatment. The combination of paper with other substances, and solidifying the mass by pressure, renders practicable the production of a material capable of replacing wood for many purposes; and not the least among its characteristics of adaptability is the ease with which it may be made into sheets of any width and thickness, that will not warp or shrink from heat, cold or dampness.

There is a paper house in Atlanta, Ga., in which no wood, brick, iron or other material, except paper, is used about the building. It is used as a store, painted sky-blue and attracts considerable attention. The gaudy color is not the cause of the little building being the object of so much attention, but the material of which it is constructed makes it a novelty. It is made entirely of paper. The store was built by a Frenchman who is agent for the paper of which it is constructed. The rafters, the weather-boarding, the roof and flooring are all made of thick, compressed paper boards, impervious to water and as durable as wood. The house cannot catch fire as easily as a wooden building, because the surface of the paper is smooth and hard. The building is warm in cool weather and comfortable when the weather is warm.

Salt-Making in England.

The quantity of brine used annually has been estimated at 9,000,000 tons, which will yield (allowance being made for waste) 1,800,000 tons of white salt. A gallon of fully saturated brine contains 2 pounds 8 ounces, sometimes 2 pounds 10 ounces, of salt. The general average of sea-water does not exceed 3 to 3½ per cent. The manufacture of white or table salt, and practically of commercial salt of every description, is effected by evaporation in shallow pans, either over a coal fire or by the utilization of waste steam from engine boilers. The heat applied varies according to the quality of salt which it is desired to produce. Domestic salt of the finest grades requires for its manufacture a temperature of 226° Fahrenheit—the boiling point for brine. As the liquid evaporates the solid particles sink to the bottom of the pan, forming in the aggregate the lumps with which every housewife is so familiar. For commoner salt the temperature is 160° to 170° Fahrenheit. This salt is close in texture and clustered together in larger or smaller pyramids, according to the heat applied. For large-grained flaky salt the temperature is 130° to 140° Fahrenheit, and for large-grained fishing salt 100° to 110°—the slowness of the evaporation allowing the salt to form in cubical crystals. What used to be called bay salt, or salt formed by the operation of the air and heat of the sun, although still extensively practiced in warmer climates, seems now to be a thing of the past in this country. In the earliest times this process was probably the only one carried on. Ether brine or sea-water was run into shallow pits or reservoirs, where it evaporated to a certain degree, the work being afterward completed by pouring upon twigs, and sometimes, it is said, by pouring the liquid upon burning wood and collecting the salt deposited upon the ashes. Until long after historic times, wood was the only fuel used; it was not until the year 1656 that the substitution of coal, at Nantwich, is mentioned as a novelty. This might be explained by the difficulty of carriage in those days, as no coal-beds exist within a good many miles of the salt districts.—*Chambers' Journal.*

IMPROVEMENT IN THE OTTO GAS ENGINE.—It is reported that M. Otto, the inventor of the gas engine, has constructed a new machine which automatically prepares its own gas by means of the Dowson apparatus. The new model is of eight horse-power, and only consumes two pounds of coal per horse-power per hour.

ROTTEN BOILERS, says the Baltimore *American*, and careless employes are sending more victims out of the world unprepared than would be slain in a battle.

New Silver Region.

It will scarcely be disputed that the anticipations of the French Copper Syndicate were mainly upset by the enormous increase in the shipments of the metal from American mines, and notably from the Calumet and Hecla and Montana properties, which have done so much to make American copper famous. But Americans are not to have matters all their own way, for there has sprung up within the last two or three years on the Canadian side of the lake an industry which threatens to throw completely into the shade the commercial value of the southern shore. We refer to the silver region, actually discovered nearly four years ago, but only practically tested in the early part of last year, situated in the Thunder Bay district, near Port Arthur, a rapidly rising business center in Ontario, Canada. In this country, comparatively little has been heard of the discoveries, but American experts have visited the district in large numbers, and have secured valuable areas which are already yielding enormous quantities of silver, and promise in the future to rival, if not to surpass, in productiveness the world-famed Comstock mines of Nevada and the Broken Hill properties of Australia. This may seem a somewhat sanguine view to those who have not looked into the matter, or have only done so in a casual manner. A closer study of the progress which the Port Arthur silver industry has made within the past 12 months shows, however, that, judging from actual experience, it would be really difficult to overestimate the geological value of the district which is now being opened up. We should be within the mark, at all events, in saying that for the short time which has elapsed since the district was first proved to be argentiferous, a greater amount of valuable ore has been discovered and laid over for future working than has ever taken place in anything like the same space of time.—*Montana Mining Review.*

A United West.

Colorado deserves the thanks of the States and Territories on the Pacific Coast for its efforts to secure Government aid in redeeming the arid, desert lands by means of irrigation reservoirs. The first convention of the West to consider that subject was held in Denver, about one year ago, and as a result of that convention the Government has sent out explorers to locate sites for these reservoirs, and Congress has made an appropriation for this work. Now Governor Cooper of Colorado proposes that Western States hang together in irrigation and other kindred matters regardless of politics. He suggests that there are certain broad subjects in which all the West takes interest, but which have no pertinence in the East. Although politically divided, yet both parties combine when a measure is introduced which is beneficial to their section, and they get about what they want while the West goes begging.

The number of Western States interested in irrigation have a representation in the electoral college nearly equal to the State of New York, which will give them influence whenever it is felt that they will vote together where their own interests are concerned. Such a course would secure nearly every improvement we need, and bring in a crowd of home-seekers which would increase our power in the Union.

CARE IN USING FORCED DRAFT.—Instructions by the British Admiralty are to the effect that more care must be taken in the use of forced draft. The appliances for creating draft are not to be used at full power except for brief periods in emergencies, and not, under ordinary circumstances, for the purpose of getting up steam quickly. All rapid changes in the temperature of boilers are to be avoided.

THE NICARAGUA CANAL.—Men, tools and stores are now on their way to Nicaragua.

NO ESCAPE FROM LABOR.—The motto, labor conquers all things, might be changed to nothing without labor, and be equally true. There is a foolish desire on the part of American youth to avoid work, or, at least, what is termed hard work, but no one need expect to succeed without work and plenty of it. That which appears easy looks differently when we can get at the actual facts. Many, tired of farming amid the stones and stumps of New England, come to California, buy an orange grove or a fruit farm, and imagine that all they have to do is to sit down and watch their fruit grow. They soon learn, however, that the scale attacks their orange, and nearly every variety of fruit has its pest. We are not saying this to discourage the would-be immigrant, for it is not to be compared with the endless work and small profit per acre of Eastern farming, but we believe it is better for one to know the difficulties before he enters upon them. He will be surer of success. The successful California producer has work before him.—*Rural Press.*

CALIFORNIA RURAL VIEWS AND RECREATION SCENES.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GARDNER.—Amador *Ledger*, June 1: An Englishman named Stephenson is negotiating for the purchase of the Gardner property near Irish Town. He was up two weeks ago to look at the Kelly mine in Hunt's gulch, and while here, the Gardner mines were brought to his notice. He visited the ground, and after prospecting, took about 150 pounds of rock with him to San Francisco for treatment. The result is so far satisfactory that he has sent word for the necessary deeds of conveyance to be made out. It is believed that it will prove a sale this time. The price is $25,000. At the McKenzie mine it is expected to have the steam-power for the mill in running order this week. They have about 200 tons of rock accumulated on the dump for crushing.

KENNEDY.—Sinking at the main or south shaft of the Kennedy will soon be resumed. The ore bodies are small, and are soon worked out. At least this has been the case with the pay rock so far encountered. There is one encouraging feature about it, namely, that the ore is improving in quantity and quality as depth is reached. In the lowest level the ore is of better grade than the level above, and it is also noticed that the quartz shows a tendency to concentrate into a solid, well-defined ledge. It is hoped that the ore in the lower level is the top of an extensive pay chute or chimney, and that the mine is only commencing its career as a gold-producer.

AT SUTTER CREEK.—Grading for the additional ten stamps at the Wildman mill is about completed, and the material for the mill will soon be delivered. The mortars are cast and ready to be placed in position, and will be on the ground in a few days. Mr. Tregloan, the superintendent, has been below, and procured an air compressor, Burleigh drills and other machinery to develop the mine in good shape.

DRYTOWN CON.—*Dispatch*, June 1: Some very fine ore was encountered at a depth of 200 feet from the surface last Thursday. The rock is soft and of the ribbon character and will easily go $7 or $8 to the ton. Its extent at the present is unknown, yet it is said by those who were acquainted with the old mine when last worked, that sufficient rock to run a 20-stamp mill several months was left at this point in the shaft. The stock is strong and has an upward tendency. Charles Kellogg has struck a fine body of paying ore on Graham's ranch at Forest Home. A shaft 20 feet has been sunk on the ledge, which is but a few inches in thickness but exceedingly rich. It is probably a good fat pocket.

ACME.—Timothy Hanly, Jr., is still at work developing the Acme, which is situated near the Mokelumne river in Hunt's gulch. He has encountered a fine body of paying ore.

NEW LONDON.—The erection of the new mill on this property has been unavoidably delayed for some time, but will shortly be pushed to completion. The mine, under the efficient management of Mr. H. Reese, is progressing favorably.

COSMOPOLITAN.—Sinking at this mine is progressing, also running the drifts on the 300 and 400 levels. They have abundance of ore in sight, and will have their mill running by the 1st of August.

HENRY CLAY. — A contract has been let to run a crosscut or drain tunnel 300 feet. The contractors are in about 60 feet, and are making about five feet per day.

GOVER.—This mine is running along in its steady old way. Since the rock-breaker has been placed at the ore chute at the mine, the ore is distributed more evenly at the mill.

VOLCANO.—This company is engaged in its clean-up on a whole winter's run. Water is very scarce and the indications look anything but favorable. It is doubtful whether the company will run next winter.

CLEVELAND.—A French company is hard at work on this claim, formerly known as the Sam Bono, near Volcano. The ore is a hard cement gravel under a lava bed. They are erecting a small mill on the property and will no doubt make it pay well, as it prospects high.

DANE.—This claim, owned by Cassinelli Bros. of Volcano, has been sold to J. Sallie of San Francisco for $2500.

Calaveras.

FULL HANDED.—*Mountain Echo*, June 1: The mines in and around Angels now in operation are all running full handed, and as nearly as we can ascertain are yielding good returns. The monthly shipments of bullion from this town give evidence that our mines are productive and profitable ones.

El Dorado.

RICH ORE.—San Jose *Mercury*, June 1: J. J. Jermyn, who is largely interested in coal mines at Scranton, Penn., owns a gold mine at Kelsey, El Dorado county. Last evening he showed samples of ore which assayed 3230 and $410 per ton. The specimens shown were completely seamed and studded with free gold. Mr. Jermyn, in speaking of the prospect, said: "I believe the gold is there. These specimens were taken from the mine by my own hands, and I know the hole is not 'salted.' We traced and tapped the ledge for 450 feet. It is three feet wide. Water can be secured within a mile, and it is my intention to start a tunnel in the side of the hill and tap the ledge and thus secure the ore with greater facility. There is already a shaft sunk 75 feet in depth. As soon as I see that the output will warrant it, I shall erect a stamp-mill. Mining in the vicinity of Kelsey is awakening a greater interest than it has heretofore done, and many old and abandoned shafts are being re-prospected."

Nevada.

RICH ORE FROM THE W. Y. O. D.—*Tidings*, June 1: It is with pleasure we record another important strike in the W. Y. O D. mine. This strike consists in that the eight-inch solid ledge uncovered in the shaft at a depth of 500 feet, and developed in the north drift from that level, has been cut in the south drift and rich ore extracted. Pieces of the quartz brought to town are ribbed with coarse gold, and there is in addition heavy galena sulphurets that will yield $400 or $500 a ton. As noted by the *Tidings* several days ago, a test crushing of ore from this ledge, extracted in the shaft and in the north drift, returned very remuneratively. In the upper drifts the ledge was decomposed. That now referred to is solid and of high grade, and as above stated is found in the shaft and in both the north and south drifts. From indications, the plucky Work Your Own Diggings Co. now have a mine.

A COMING MINE.—*Tidings*, June 1: An old, half-filled shaft on the Good Hope claim at Cabbage Patch, near Spenceville, has been cleaned out this week to satisfy a gentleman who is negotiating for the property that the ledge is something more than "a pocket of quartz." This work was done by Wm. Eddy, Sr., father of one of the three owners of the claim, and a practical miner of 25 years' experience. He had never before seen the mine and was somewhat skeptical as to its value, but his inspection and the developments made under his own eyes have changed his opinion. Although the deepest shaft is down only 30 feet, a strong, solid ledge ranging from 10 to 16 inches in size, showing free gold and liberally sprinkled with sulphurets and lead, has been drifted on a distance of 50 feet. So solid is the ledge even at this superficial depth that blasting is imperative. Fifty pounds of the ore, brought to town yesterday, is undoubtedly of a higher grade than that crushed recently and which paid $46 a load, exclusive of sulphurets. Mr. Eddy is now as enthusiastic in regard to the property as are the owners, he declaring that the quartz "is the prettiest milling ore I have ever seen." The price to be paid for the Good Hope, if the pending sale is consummated, is $15,000, but the owners are no longer anxious to sell for that sum.

PITTSBURG MINE.—Grass Valley *Union*, June 1: The prospects of the Pittsburg mine are now very encouraging. Within a short time the north drift from the No. 9 level has improved remarkably, the ground becoming much easier to work, and the ledge increasing to 2½ feet in width, carrying largely in heavy sulphurets and galena, and showing in free gold. This opening of the ledge is the best exhibit made in the mine in years, and goes to establish the theory that has been entertained that the old pay shoot would be found to the north of the shaft. The striking of this new ore body has determined the company to continue the sinking of the main shaft to the 10th level (1100 feet), and this work is to be prosecuted diligently, in order that the new ore body may be opened up with extensive backs as soon as possible. A London mining expert, who has examined the new ore body within the last few days, has expressed the opinion that it is going to prove extensive and very valuable. The encouraging prospects of the Pittsburg will be received with much satisfaction locally, as the Pittsburg Company has shown much enterprise in developing the property and erecting a mill upon it of the most substantial character and with all the latest improvements.

THE COE MINE.—Grass Valley *Union*, May 29: The water below the 300 level of this mine is now being pumped out, and a heavier pump is to be put in. The water does not make as fast now as it did when the upper levels were being drained. A fine-looking ledge is showing on the 300 level.

Inyo.

NEW MINING DISTRICTS.—*Index*, May 29: If the Utah Central railroad builds southward through this county near our eastern boundary, as now seems quite probable, it will open up a new and very promising field for prospectors—several of them in fact. A veritable mining boom may be looked for in Eastern Inyo with the advent of the new railroad.

Placer.

GRAVEL.—Placer *Herald*, June 1: At the Eureka Con. mining gravel claim, located between the Hidden Treasure and the Hogsback, two tunnels have been run, one 860 feet and the second 300 feet. The latter tunnel is expected to tap the main channel at the depth of 1300 feet. Messrs. A. Clark and F. Chapellet are largely interested in this mine, and have every reasonable expectation that it will be equal in richness to any mine ever opened on the Forest Hill divide.

Shasta.

STACY CREEK.—Shasta *Courier*, June 1: A. C. Ellis says the Stacy Creek mines on Upper Clear creek are the richest discoveries made in the county for years. In ledges, well defined, where from $50 to $100 per day can be and has been taken out by a couple of men, there is cause for enthusiasm.

ACTIVE.—The amount of mining machinery and appliances hauled through town for various camps northward is immense, and shows the great activity prevailing in mining circles.

San Diego.

HELVETIA.—Julian *Sentinel*, May 30: Messrs. Murray and Smith have commenced work on the Helvetia. This is another mine that has been idle so long that the shafts have all caved, and work will have to be prosecuted from the surface. They are well pleased with the camp and propose to push work on their property and lend a helping hand in the development of the camp. We hope soon to see the Washington, Eagle, High Peak and Tom Scott working. They are all paying mines, but are in about the same condition that the San Diego was a few weeks ago, and the Stonewall was considered no better in 1884. The Stonewall, Owens and San Diego mines have proven to be good; why not others?

SAN DIEGO.—Messrs. James and King are pushing things at the San Diego mine. The shaft is down 90 feet, and they have a four-foot ledge of $40 rock. Mr. James informed us Tuesday that they have $10,000 worth of ore in sight. While we were there they brought up some quartz that would make a 49er's eyes water. It was literally covered with free gold. They are hauling this rock to the Owens mill and turning it into cash as fast as ten stamps can crush it. Perhaps it would be of interest to miners to know that this mine lay idle for 11 years. The old shafts had all caved in, and the present development work was commenced on the representation of old miners in this vicinity. It bids fair to become a second Stonewall.

STONEWALL.—Excavating is in progress at the Stonewall mine for a new 40-stamp mill.¶

Siskiyou.

NEW MINING PROJECT.—Yreka *Union*, June 1: Mr. Harry Pugh, an old-time and experienced miner and bricklayer, has started an enterprise which, if successful, will solve a problem that has long vexed miners of low-grade ore, and do more to develop the mineral resources of the county than any other project we have yet heard of. It is to work low-grade ore by water-power. He has purchased a tract of land extending from the Old Shasta road to Kanaka gulch, covering the whole of Salt creek, and comprising about 40 acres. His design is to build a series of dams to catch the rain-water that goes to waste in the winter and hold it for the dry season. At the first dam there will be a current-wheel that will throw the water into a reservoir on top of a hill, for the purpose of irrigating such land as he will not need for milling and road purposes, and where he will make his home with orchard and garden attachment. Then the water will be turned back by means of ditches into the second dam, where there will be a turbine-wheel which will operate the first quartz-mill of five stamps. After passing through the first wheel it will be carried on to the third dam, where there will be a second five-stamp quartz-mill, after which it will fall over into the creek, where, in the course of time if things work all right, there will be a third mill, thus allowing the water to be used four times. He will also have side gates on the dams that will work automatically for their relief in case of a cloudburst or unusually high water from other causes. The material for the dams, except cement, are all on the ground. The mills are intended to work low-grade ore with which the neighborhood abounds. He figures out that he can afford to work ore at $3 a ton, so that a miner having five or six dollar ore can have it worked at a profit, which is impossible by steam.

Sierra.

YOUNG AMERICA.—*Mountain Messenger*, June 1: The Young America Co. will soon put an air compressor and power drill into No. 4 tunnel, the rock in which is costing them about $25 a foot.

KENTUCK.—The little mill at the Kentuck quartz mine was started last week, and report says that in less than three days' run cleaned up 42 ounces of amalgam.

Trinity.

THE OZARK.—*Journal*, June 1: John Day was in from East Fork Thursday and informs us that work is progressing satisfactorily on the Ozark. There is plenty of ore on the dump and the arastra is running on good ore. As soon as lumber can be obtained, a tunnel will be run to tap the ledge at a depth of 300 feet. Work is now being done on the upper level; the incline is in 175 feet and taps the ledge at a depth of 100 feet; there is a year's work in sight in the upper level.

NEW RIVER.—Cor. *Northern Advocate*, June 1: The miners have all resumed work in a very promising condition. John Colby is foreman in the Excelsior, and Jack Leas in the Mountain Boomer. John Thyng has taken the contract for running the 700-foot tunnel in the Ridgeway, and, as he is a good pusher, the work will go on rapidly. There are several buildings going up around the new tunnel.

Tuolumne.

CLOSED DOWN.—Tuolumne *Independent*, June 1: The Platt and Gilsen mine shut down on Tuesday, until further developments are made, by putting the shaft down 100 feet deeper. The work will be commenced at once. Mr. Pine, the new superintendent, is a thorough miner, and was a pioneer of the Tuolumne in the ancient days of '49. He will show up the true inwardness of this valuable mine.

MILL.—The Tuolumne river mine, formerly known as the Mary Ellen, will have a 10-stamp mill in a short time. Wm. Sharwood of Soulsbyville will go down next week to commence operations. Only five stamps will be used until the mine is more thoroughly developed.

KANAKA.—The Kanaka mine, on the Tuolumne, northeast of Groveland, is being developed in a systematic manner, and the outlook is most encouraging. Water being obtainable, at present, only a part of the year, arrangements are being made to put in steam-power.

NEVADA.

Washoe District.

UTAH.—Virginia *Chronicle*, June 1: On the 600 level, east crosscut No. 2 from the end of the main south drift is advanced 78 feet; formation, vein porphyry. Raise No. 2 above the south drift is up 20 feet, the top wholly in quartz, showing value.

OCCIDENTAL CON.—On the 550 level, 115 feet on the slope below this level, in the winze connecting with the 650 level, a north drift is out 16 feet in quartz from which ore is being saved.

NORTH OCCIDENTAL.—On the 300 level west crosscut No. 2, 70 feet from the main tunnel, a north drift is advanced 7 feet. Formation, quartz and porphyry, from which ore is saved.

SIERRA NEVADA.—On the 520 level from the shaft station, an east drift is advanced 461 feet and is in porphyry and clay showing some water.

UNION CON.—On the 1465 level at a point in the north lateral drift, 220 feet north from the south line of the mine, west crosscut No. 1 is advanced 182 feet and continues in a formation of porphyry and clay with some water.

MEXICAN.—On the 1465 level west crosscut No. 1 from the north lateral drift is extended 379 feet, showing streaks of quartz and porphyry in the face.

OPHIR.—On the 1465 level, operations confined to cleaning out the southwest drift from No. 2 upraise, 36 feet above the track floor of this level.

GOULD & CURRY.—On the 300 level the north drift is extended 45 feet. Formation, porphyry and quartz. On the 400 level, at a point 50 feet north of the south line, directly over the upraise above 625 level, an upraise is carried up 25 feet. Formation, porphyry, clay and quartz.

CON. CALIFORNIA & VIRGINIA.—The usual quantity and grade of ore is being extracted from the various openings on the 1400, 1435, 1500, 1600, 1650, and 1950 levels. On the 1400 level, from winze No. 2, 91 feet down, a southwest drift is advanced 30 feet, and will be advanced to connect with southeast drift from the stopes below the 1435 level. On the 1650 level: The stopes on the seventh and eleventh floors above this level continue to show ore of fair quality. At a point 70 feet south of upraise No. 1, upraise No. 5 is up 23 feet. During the week 1104 tons and 420 pounds of ore were shipped to the Morgan mill, 1792 tons and 1510 to the Eureka. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $31.82. Bullion valued at about $54,000 on hand in the assay office.

BEST & BELCHER.—On the 625 level the southwest drift, 175 feet above the 625 level, is extended 126 feet. Formation quartz giving low assays. On the 1000 level the west drift is cleaned out and repaired a distance of 468 feet.

SCORPION.—The joint east drift from the 520 level of the Sierra Nevada shaft is out 590 feet.

ANDES.—Advancing No. 2 upraise above the 350 level.

SAVAGE.—Shipped during the week 486 tons o ore showing a value of $20.22 a ton from battery sample assays. Bullion valued at $8847.91 shipped since last report.

HALE & NORCROSS.—During the week shipped 1125 tons of ore showing a value of $27.04 by battery sample assays. Bullion valued at $8360.84 was shipped during the week.

CHOLLAR.—Shipped to the Nevada mill 440 tons of ore during the week, battery sample assays showing a value of about $20 per ton.

POTOSI.—The 750 level north drift and 850 level south drift are both in porphyry and low-grade quartz.

BULLION.—Explorations still in progress in the quartz belt on the 760 level.

ALPHA.—The joint 500 level east crosscut at the Imperial line is in 142 feet.

EXCHEQUER.—The north drift on the 500 level is now in clay and porphyry.

IMPERIAL.—A substantial house is being erected over the hoist plant.

CONFIDENCE.—A joint Challenge east drift on the 1200 level is in 72 feet, showing porphyry and quartz.

YELLOW JACKET.—Shipping 125 tons of ore daily showing a value of $29.75 per ton. The 500 level west drift is being rapidly advanced.

CROWN POINT.—Shipped during the week 850 tons of ore.

BELCHER.—Ore streaks still showing in the raise above the 1100 level, west crosscut. The 1000 level south drift is still in soft porphyry.

SEG. BELCHER.—The raise above the 1300 west crosscut still showing ore streaks which are widening.

OVERMAN.—Shipped 298 tons of ore during the week.

BALTIMORE.—The crosscut from the south raise above the 338 level is still in ore.

NEW YORK CON.—A new cable has been placed on the reel and air pipes put in the mine. Work is resumed in the 800 level east crosscut.

JUSTICE.—The mill is in full operation on ore from the mine.

ALTA.—Mill temporarily shut down for repairs.

SILVER HILL.—The 116 level northeast drift entered quartz 325 feet from the shaft which assays well in gold.

Golconda District.

MANGANESE ORE.—*Silver State*, June 3: J. R. Jennings shipped a carload of manganese last Saturday from Golconda to San Francisco. The mine from which the ore was taken is situated about half a mile from the railroad, east of Golconda station. There is plenty of it, and it is probable that two or three carloads of it will be shipped weekly.

Paradise District.

RICH GOLD ORE.—*Silver State*, June 4: The Sadorus and Pratt mine in the Eden range is said to be looking remarkably well, and producing very rich, gold-bearing quartz. The mine is situated about 26 miles northeast of this place, and about 18 miles from Golconda.

Pioche District.

SOLD.—Eureka *Sentinel*, June 1: The Half-moon mine has been sold to the Yuba Co. for $14,000. There is said to be $50,000 worth of ore stripped in the mine.

Silver King District.

IRON MINES.—Virginia *Chronicle*, June 1: The iron mining locations in Silver King district, Lincoln county, have been bonded to San Francisco capitalists and development work on the claims will soon begin. A small working capital is to be put up at once, and before, or when it becomes exhausted, the San Francisco parties may erect a 40-ton furnace, and within three months after its operation may elect to purchase a half interest for $10,000 cash. Interested parties will handle the working fund and will make it go as far as possible. Silver King district lies 25 miles northwest of Bristol and is somewhat difficult of access.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, June 1: North drift, 500-foot level, extended 17 feet, showing seams of spar. No increase of water.

BELLE ISLE.—North drift, 250-foot level, extended 14 feet. North drift, west lateral, 150-foot level extended 9 feet.

NAVAJO.—West crosscut from the end of the south drift 350-foot level, extended 27 feet, passing through some vein matter giving low assays. South drift from the same crosscut extended 25 feet.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 9 feet; rock somewhat harder. East crosscut from the end of the south drift on the 100-foot level, extended 9 feet; total length, 58 feet. Still continue in vein matter with seams of high-grade ore in the face.

GRAND PRIZE.—400-foot level: The following extensions have been made during the past week. West drift old vein 14 feet, west drift from north crosscut 17 feet, and showing improvement in the face.

NEVADA QUEEN.—Winze from north drift, 450-foot level, has been sunk 6 feet; total, 13 feet. Crosscut from north drift, 350-foot level, has been advanced 20 feet, cutting seams of low-grade ore. Stopes above 350-foot level continue about as last

reported. South drift from 150-foot level of Commonwealth has been advanced 17 feet, 200 tons of ore have been sent to the concentrator.

DEL MONTE.—East crosscut from the end of the north drift, 100-foot level, extended 17 feet; total length, 49 feet. The crosscut continues in vein matter, showing high-grade ore seams. Considerable ore is now showing in the face.

COMMONWEALTH.—Stopes throughout the mine all look well; 245 tons of ore have been sent to the mill, which is running nicely and doing fine work. Bullion shipped Monday, $11,803.92.

Tybo District.

NEW LEDGE.—Eureka *Sentinel*, June 1: A new ledge has been struck in the Dimmick mine which is yielding large quantities of rich ore.

ARIZONA.

THE UNITED VERDE COPPER MINES.—Cor. Prescott *Courier*, June 1: In the tunnel run by W. A. Clark to drain the United Verde Copper Co.'s mines, work has been suspended for the present. The tunnel has been looked upon as a kind of a mystery and many questions made about it since the flow of water; and for the satisfaction of your many readers I would say after the flow of the vast amount of water in a few hours the tunnel was filled with sediment and sulphuret ore, while the gulch extending to the Verde river was strewn with the same, which after the exposure to the air and sun now carries all the beautiful hues the corroding copper sulphurets can produce. It is hard to tell the amount of sulphuret ore that passed out of the tunnel in the flow in a few hours; some might estimate it at 500 tons and it might have been many thousand. Soon after the flow had ceased, men were put to work cleaning out the tunnel, which took from four to five weeks, and arriving near where the cave took place, J. L. Geroux had heavy timbers placed in the drift to save the face of the tunnel; he went in after to take a look and saw everything was on the move, and ordered the men to get out, and he at the head made for the incline, followed by the men catching hold of the ropes just in time to save themselves, for the cave followed close after them, crushing the timbers like pipestems, and they had a very narrow escape with their lives. The face of the tunnel soon filled with slag and stuff that came from the cave, 200 or 250 feet above, stopping up everything, and being of a coarse nature, it allowed the water to flow through it, draining the mine. J. L. Thomson, superintendent, and J. L. Geroux, overseer, were well pleased to think it drained this mine, which will be a great benefit to the company. About 150 inches of water now flows from the tunnel to the Verde river; some are complaining that it affects the river water so it is unfit for use and believe it will destroy vegetation. A few days sinking on the hoisting shaft they found a cave about 100 feet in length, which I have been told is a grand sight. There are a great many heavy pieces of sulphuret ore found below the north end of the tunnel. The opinion of many is that the copper and sulphur left a solution, which, with the cave, had formed an acid which dissolved the sulphuret ores and a heavy body of water broke through the surface, causing the cave. The shaft is now being sunk and some very fine ore found. The United Verde Copper Co. is running with good success. Its ores carry considerable silver, gold and copper. Its mine is one of the finest properties in Arizona. There are other mines joining the United Verde copper mines and vicinity, which are showing some very fair grades of ore, which will soon come to the front, and any one wanting mining property would do well to examine the United Verde Co.'s mines. The company has two smelters running; no idle men in camp; about 50 to 60 men at work; no place for bummers around the works of the company.

ORO BELLA MILL. —*Journal-Miner*, May 30: Mr. Sarle, the millwright under whose direction the Oro Bella M. Co. has constructed a fine stamp-mill at its mines in the Bradshaw mountains, while here informed the *Journal-Miner* representative that the company's mill started up on the afternoon of the 15th, and when he left camp was running very successfully. The mill is solidly and substantially built of the best material, the structure being inclosed and covered with heavy corrugated iron, the machinery consisting of stamps and Frue vanners, with power necessary for a 20-stamp gold and concentrating mill, and is from the well-known manufacturers Messrs. Frazer & Chalmers of Chicago. The cost of the plant is about $40,000, and $13,000 have been expended in the construction of a fine wagon-road from a point near Minnehaha Flat to the company's camp, which is known as Bayard. We understand that nearly $50,000 more have been expended in developing the company's mines and in making internal improvements, and that the mines and mill are arranged with the special object of enabling the company to mine and handle its ores cheaply and economically. The two mines, Oro Bella and Oro Bonita, are opened quite extensively by tunnels, the lower, or sixth, level opening the ground to a depth of 600 feet. All the tunnels are run on the lead, following a continuous vein of ore from one to five feet wide. The concentrates are sufficiently rich to bear the cost of shipment to smelters and yield a good profit, but we understand the company contemplates adding a chlorination plant to its other works and treating its concentrates on the ground.

SILVER KING.—*Alta*, June 1: No. 1 winze below 1200-foot level, 22½ feet sunk during the week. Total depth, 181½ feet. Formation, porphyry and quartz. Miners in this winze will now be put to work opening the 1200 station. No. 2 winze, total depth below 1080 level, 73½ feet. Progress, 13½ feet. Fair headway is being made in moving hoisting engine from the King to the Bilk shaft.

WELDON.—Fair progress has been made in shaft No. 3 during the week, with the vein showing strong in the bottom and ore of good grade in bunches through it, which is being saved.

PEERLESS.—Continue to take out ore of good quality from the stopes on the 200-foot level, but at other points through the mine, owing to some of the stopes lowering in grade and others that need further prospecting to get ore in shape for breaking, after this month will not be able to keep up a sufficient supply of ore of milling grade for running the mill until further development is made. During the week 140 tons of ore were crushed, which samples, according to battery, $20.43 per ton. Continue to make repairs at the well in the way of recribbing and timbering.

CROCKER.—During the week work was suspended for the present in the south drift from west crosscut No. 2 on the 300-foot level. The face still shows four feet of milling ore. In the south drift from upraise No. 1, on the 300-foot level, 75 feet above the track floor, good progress has been made during the week, with the face showing five feet of ore of good milling grade.

BRITISH COLUMBIA.

SMELTER.—Donald *Truth*, May 28 The claim-owners of the mining districts along the line of the Canadian Pacific have long complained of the lack of smelting facilities. These facilities are about to be furnished them at the Revelstoke. Now the claim-owners are called on to prove that they really needed what they claimed they lacked. If they have ore, let them begin getting it to the front.

TOAD MOUNTAIN.—All reports received from the Toad mountain country are of the same tenor—that the camp is a good one; another thing that all are agreed on is that the trail from Sproat's Landing to Nelson is a bad one for the money expended. A gentleman who arrived from there last week gives it as his opinion that the Government should adopt *Truth's* suggestion, and expend the money appropriated for roads, trails and bridges in the west division of Kootenay district in starting a wagon-road from Sproat's Landing.

COLORADO.

SENATOR.—Georgetown *Courier*, May 29: A large force of men is now employed on the Senator mine on Capitol mountain, and it is stated that there is an abundance of ore of a good grade in sight. Shipments are being made regularly from this property. The Ashby tunnel is being pushed ahead as rapidly as power drills can do the work. The Dunkirk vein may be intersected by the tunnel any day, when it is thought a fine body of ore of a good grade will be opened up. A vein of nearly solid ore 13 inches in thickness was uncovered in Harris & Co.'s workings on the Mineral Chief mine, Republican mountain, on Saturday last. The Keith tunnel on Mill creek is being pushed into Keith mountain. The indications in the heading show several feeders which indicate the near approach to the first lode, namely, Monongahela, which shows a very large outcropping upon the surface. Hall's tunnel is being driven steadily ahead. Its value to this section is unquestionably great. Clear creek's output from Old Leavenworth will make itself felt when this tunnel is complete. The Colorado Central mine makes a fine showing, its dividends are unfailing, and its ore reserves are constantly increasing, as well as the large cash surplus that the company always carries. The respective lessees on the Pelican, situated on Republican mountain, have splendid showings in their workings. Ear-marks point to extensive development work being prosecuted on this property this summer.

DAKOTA.

PLACER MINING. — Deadwood *Pioneer*, May 29: Placer mining on an extensive scale has commenced on the Norton-Balsley grounds below Fink's Flat. The water-wheel to drain the shaft and tunnel is working satisfactorily, and miners are making good headway. Good cleanups are looked for.

CHLORINATION WORKS.—Roasters were charged and fires started at Keith's chlorination works yesterday. Leaching begins within a few days, and it is anticipated that definite results will be obtained by, if not before, June 10th.

EL REFUGIO AND ONTARIO.—Prof. Zahn, Geo. V. Ayres, Judge McLaughlin and E. R. Collins visited the El Refugio and Ontario mines, Galena, yesterday. Both were found looking most favorably, and at each a shift of men was working. Both properties are now shipping ore to Omaha.

IDAHO.

RICH COPPER DEPOSITS.—Cor. *Oregonian*, June 1: There is a region of country along the Snake river beginning some 20 miles above Lewiston and extending for 30 miles on both sides of the river that offers the best field for prospectors after mineral wealth. This region abounds in innumerable ledges of copper, carrying paying quantities of silver and gold. Almost any of these ledges are quite rich in copper. Several of them have been assayed and found to carry from 30 to 70 per cent of copper, showing this as rich in that metal as the famed Seven Devils country. This region has the great advantage over that of being accessible by steamers on the Snake river. The Seven Devils country is being taken up and the mines developed, and capitalists from Montana are eagerly investing their money and making that investment pay them well where they have to haul the ore 90 miles with ox teams. Here these rich deposits lie untouched by any one except by the enterprising owners of the Butcher Boy mine, who are now pushing ahead with commendable vigor. Their ore runs 65 per cent copper, $23 silver and $7 gold per ton. Counting copper worth 10 cents a pound, this makes their ore worth $160 per ton, which looks like there was something in it. The only disadvantage holding this district back from immediate development is the crying want of a copper smelter in Portland. There is plenty of copper ore in this region alone to supply such a smelter with all the ore needed.

CLEANUP.—Cœur d'Alene *Record*, May 28: The product of the last cleanup at the Mother Lode was purchased by R. Mackenzie. It is a fine bar about one inch thick, three wide and five long, and weighs but a few pennyweights under 100 ounces. Its mint value will probably vary but little from $1700. A very rich placer discovery was made a few days ago on the hillside near the mouth of Fancy gulch. It can be worked at almost any season of the year, and with very little water. At present all the water is being utilized in the hydraulic operations in the main channel. Monday the Simmonds Co. finished the season's cleanup, which included considerable ground washed last year. They were able to get water only a few days this year on account of the extensive Missoula and Dream gulch operations in which the owners of the California ditch are largely interested. The California ditch water was turned into Dream gulch yesterday, and hydraulic operations commenced on the Niagara and Rosa Hill claims, on which little but assessment work has been done since 1884. The old wash which has never been uncovered on the east side of the gulch will probably be found to cross one or both of these claims. The product from another arastra cleanup at the Baby Fraction was brought to the Bank of Murray, Wednesday. A much smaller run was made than heretofore on account of a lack of quicksilver. Nine and a half tons yielded 19 1-15 ounces, or a little over two ounces to the ton, worth, according to the Government certificate for the last bar, $16.20 per ounce. The property is certainly making a splendid showing.

SILVER CITY.—Cor. Idaho *Statesman*, May 29: For many years this camp has not enjoyed such prosperity as now. Within the past year not less than 20 mines were bought and placed with a strong English syndicate in two separate groups, both of which have been producing for months. Several other, though smaller sales, have been made during this time, and altogether there must have been several hundred thousand dollars paid as purchase-money, mostly to citizens of this place, making this, as a community, so much better off and correspondingly happy. The mines are all looking well and those being worked are doing well. All the mills in town are running, and this camp is producing more bullion than at any time for several years. The Oro Fino mines (limited) are working a large force of men at their mine and are keeping 10 stamps of their mill constantly employed with a good grade of ore. The arastra is working on ore from the Phillipps & Sullivan mine on Florida mountain. This ore is rich and is the second crushing taken out by the lessees, Alf Hicks and others. Leonard's mill is kept busy on small lots from various mines taken out by private individuals during the past winter and spring. Bailey's new mill has been running on the Nellie Stoddard ore, but just now is testing ore from various mines, as Mr. Bailey wishes to prove his ability to work these ores cheaper and as effectually as by the old pan process. Much interest is taken in these experiments. The Poorman group has been shut down for a few weeks, but will start up again next week. The last crushing from this famous mine yielded $180 per ton. The old Golden Chariot has been leased to Mr. Lamb, Mr. Matthews and the Exner boys, and is looking as well as old-timers say it used to look before it took its prolonged bath. The pumps in the Oro Fino have lowered the water in the Chariot 100 feet and opened to the boys ore that has been out of the reach of chloriders for many years. They had their first crushing a few days ago and from 45 tons of ore obtained over $6000.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, May 30: Great interest was noticeable last week over the visit of Gov. Torres to give legal possession of the Aurora and Quinota mines. After due consideration Gov. Torres and Engineer Sanchez effected a compromise by dividing the line between them, giving the Quinota 20 meters on the north side instead of 25 meters which they wanted, and obliging the Aurora to take 28 meters on its north side while they wanted but 20. This gave to the Aurora all of its workings by 12 meters, and the Quinota all of its work by one meter. The question between the Suerte and Baby mine, both locations covering the same ground, was amicably settled by Engineer Sanchez, who called Col. D. K. Allen to act as referee. Col. Allen has a full force of men at work setting out the center and boundary of each of the company's mines, as surveyed by Government Engineer Sanchez, who is assisted in his work by Engineer Scott. Supt. Sutherland effected a settlement with the jumpers of the Spider mine by paying them for their possession work, which now answers for the possession of the Spider. The Spider is said to open up splendidly and may become equal to any here. A rich strike was made in the Moran mine at eight feet, which promises something good yet to come. The Texas, owned by Baines & Co., adjoining the Cocinero, made a wonderful strike last week. The vein is not large, but is one of the richest in Alamo. Some truly dazzling specimens were taken out, the ore for awhile running $20 a pound. The owners were compelled to put it in sacks to prevent its being carried off. The men at work in the placers uncovered the Cocinero vein in the gulch where it crosses it, and found it to be very rich. The Princesa comes to the front with very rich ore at the depth of 22 feet in the new shaft. The Brooklyn is also reputed to be turning some very good ore. Very rich sulphurets were struck in the Penelope mine at the depth of 23 feet. This shows that the mills and machinery necessary to reduce the ore and save the gold must be very different from that used to save free gold only.

VALLEDARES AND JUAREZ DISTRICTS.—Some months ago this paper announced that the General Government had conceded to Col. Castro de Beraza two districts containing gold workings, both placer and quartz, besides other valuable minerals. One district embraces the old Juarez diggings, situated some 65 miles northeast of Ensenda, which have been successfully worked since 1874. The other district is in the Valledares and Socorro region, northeast of San Quintin. The Bonanza mine, owned by the J. W. Blundon Co., is located within a mile of this concession, in Santa Cruz canyon. There is no doubt that the Bonanza is the equal of anything yet discovered at Alamo. Since receiving his concessions, Col. Beraza has been busy organizing a company to develop the concessions.

MONTANA.

DRY GULCH.—*Mining Review*, May 29: A movement is on foot, we understand, to give the name South Helena to the mining camp at the head of Dry Gulch, and the indications now are that it will soon be a very important suburb to the city.

CLEVELAND MINE.—This mine is located at the head of Dry Gulch, and is owned by Dave O'Rear, now being worked under lease by Marks & Harrah, lease to expire in August next. Last fall about 60 tons of ore were worked by Schaffer in his little five-stamp mill, yielding on the average about $52 a ton in gold. Another batch of 26 tons, a few months later, was sent to the Helena smelter for treatment, netting about $145 per ton. Work has been constantly prosecuted on this property by two men, and there are now about 600 tons of ore on the dump.

GRANITE MOUNTAIN. — About 300 feet south of the Cleveland the same parties are working the Granite Mountain lode, under one year's lease. The Granite Mountain is owned by a stock company of Helena capitalists, and has been allowed to lie idle for some years past. Work was actively commenced on this property last April by the lessees, and has been constantly moving since that time by a force of five miners. About 150 tons of ore are now on the dump awaiting treatment.

VANDERBILT.—Work still progresses on this property, though development has not yet progressed far enough to show up much. The owner, Mr. Horton, informed your correspondent that the indications were daily getting better.

NEW MEXICO.

CARLISLE.—*Bullion*, May 31: The Carlisle Gold Mining Co. (limited) is operating its Carlisle mine and 60-stamp mill and 36 Frue concentrators, and now employs 75 men. When to this number the teamsters and others are added, over 100 men are upon the payroll. The ore body of this property is of phenomenal width and continues in depth 550 feet, the depth now attained by the development shaft. From the character of the ore now being extracted from the work performed in the excavation of 200 additional feet shaft work, it is generally believed that high-grade ore bodies will be intersected. The company has decided to sink a new triple compartment shaft, 200 feet from the main vein and 300 feet west of the present opening. The shaft will be sunk 1000 feet with the view of more economically reaching the deep ore bodies. The mill treats on the average 160 tons of ore daily and produces six tons of concentrates every 24 hours. The management is not running through its base ore. A careful computation by Prof. Clayton of Salt Lake City placed the amount of low-grade ore now blocked off and in sight in this property that will pay to work, at 200,000 tons. When the 1000-foot shaft has been completed, and the necessary tunnels and drifts, the mine will have no less than 600,000 tons of ore in sight that will pay to extract and treat. For the first four months of 1889 the Carlisle mine produced $61,500 gold bullion; $9500 net value of concentrates; $5000 various profits; a total of $72,000. Cost and total expenses, $48,000, which leaves a net profit for four months of $24,000.

BULLION.—Silver City *Enterprise*, June 1: The shipments of bullion for the past week have been rather light. Thos. B. Pheby of the Mimbres Consolidated Mining Co. shipped about $8000; the Key, $2400; and the Deep Down, $2100. An accident which occasioned some delay occurred at Tom Knott's mill in the Burros last week. The boiler-head blew out, but fortunately no serious damage was done. The mill is being regulated, and will soon be running on regular time.

PINOS ALTOS.—The west crosscut on the Aztec at the 300 level is in good ore, and the pay vein is one foot in width. The latest deal is the bonding of the Night Bird, one of the prominent mines in the district. The claim is 1500 feet in length by 450 feet in width. On the location there are three distinct veins all well defined, and each carries ore which, if milled, would give a handsome net profit over all expenses attendant upon the operation of a mine.

OREGON.

THE SANTIAM MINES.—Cor. *Oregonian:* The Santiam mines, better known as the Quartzville Mining district, Linn county, Oregon, were discovered in 1855, or near that time, and were worked and scratched over for free gold, not knowing anything of the silver ores of to-day. Later they were worked some in tunnels and open cuts. These mines and prospects are lying on both sides of the north fork and of the south fork of the Santiam river, and run in a southeast and northwest direction, parallel veins or lodes of quartz between granite and white porphyry and black slate and about one mile wide; length unknown. There is gold and silver on the west side of the belt or zone, and galena on the east side. On the southeast side of the Santiam, the mountains and ridges run nearly east and west with the rivers, yet small spurs run in various directions, forming deep canyons, and are covered with heavy timber of cedar, hemlock, sugar-pine, and red fir, sprinkled with larch, making thick undergrowth. The ledges or veins cross these ridges at right angles, and crop out on the steep points covered with moss. The Galena mining camp is about four miles southeast, direct line, or seven miles by trail from Quartzville, and is a fine group of mines, mostly gray carbonates; yet some of them contain galena and low grade of ores. The Queen has old marks of works many years ago; shows very fine blue galena and red oxides; has also a large tunnel about 280 feet long, through granite, porphyry and a body of blue-gray quartz, partially crystallized, bearing galena, lead, chloride of silver, gold (native) and pyrites of iron and sulphur. About one-half mile southeast from the Queen is a natural tunnel about 30 feet long which contains lead carbonates similar to Leadville, Col., and ore rich in silver and galena. The old Quartzville and burnt mill are on the west side of the Santiam, and the northwest side of the parallel range with the river, known as the White Bull mountain, is the center of the gold belt. Some of the finest ledges of quartz in Oregon are found in this district, containing gold, silver, lead, and tin. The White Bull mine was patented about eight years ago; has several tunnels with black sulphurets of silver, blue galena, pyrites of iron and copper. Assays average $100 in gold per ton, and silver $60, though some assays run very high; about $10,000 per ton have been found. The extension of the White Bull on the northwest is called the Golden Ridge mine, located in September, 1888, by Dr. E. O. Smith of Portland. Old tunnels with trees growing in their entrances have been discovered. One tunnel, 250 feet long, 4 feet wide, in solid quartz, assays $100 in gold per ton and an average of $60 in silver. The camp has been run over and located without regard to the mineral until 1888. Visitors from Cœur d'Alene and Arizona state we have a fine camp of good ore. We have had a mine meeting and made a camp named Golden City Mining district, No. 3, Linn county, Ogn.

MECHANICAL PROGRESS.

Wooden Beams Displacing Iron.

In view of the largely increased production of structural iron and steel, it is interesting to note that in many so-called fire-proof buildings there is a tendency not to use iron or steel in the long floor beams, but to return to wood. The reason given is that while the wood is, if exposed to fire long enough, destructible, it will stand a greater heat for a longer time without giving way and ruining the structure. It is asserted that iron and steel beams, though they will not burn, expand and contract so under the influence of heat and water that is thrown into the building, are much more liable than the wooden beams to destroy the building, the expansion and contraction being made greater.

In regard to the substitution of wood for iron, E. M. Show of the London *Architect* says: The contents of a building have undoubtedly much to do with its safety or danger, but in estimating the whole risk the materials of which the building is constructed must never be put out of consideration. Every building cannot be erected with brick columns and groined arches, but there is a vast range between these and the miserable cast-iron posts too commonly to be seen, many of which have been put in without having been tested for strength, even at the ordinary temperature of the atmosphere, much less at that of fire.

The following, from *Fire and Water*, may also be given in support of the above: A fire recently occurred in a warehouse of enormous proportions, and raged with great fury for five hours, at the end of which time it was extinguished and a very large portion of the building and its contents saved. The warehouse was constructed of brick walls, it had wooden floors supported on wooden beams, which, in their turn, were carried on wooden story-posts about 12 inches thick, and, although serious damage was done, not one portion of the heavy woodwork was destroyed.

After the fire the proprietors allowed the Chief of the Fire Brigade to remove one of the story-posts, with a section of the beams and other parts surrounding it above and below. This post had been subjected to the full action of the fire during the whole of its duration, as already mentioned, or, making full allowance for everything, including the delay of the fire attacking the particular spot on which it stood, and the time at which the cooling process commenced, certainly not less than four and a half hours. As large quantities of water had been used, and it was probable that everything had been saturated, the wood was carefully dried before a strong fire until not a trace of moisture remained in it. It was then set on end in an open yard, exactly as it had stood in the warehouse, with the pedestal underneath, the cap above, and the beam across the cap. More than a ton of shavings, light wood and heavy wood were placed around it, and after the whole heap was saturated with petroleum a light was applied to it, and, after this, large quantities of petroleum and turpentine were pumped on it.

At the end of two and a half hours the post, beam and other parts were withdrawn from the fire, and within a few minutes from the time they were withdrawn they ceased to burn. A few feet were then sawn off horizontally, at that part which suffered most from the flames, and afterward the same place was split longitudinally with steel wedges in order to examine its condition. The post was of pitch pine, about the most inflammable wood known, and yet after exposure for seven hours to fires, the fury of which could not be exceeded except in blast furnaces, it contained within a quantity of perfectly uninjured and apparently fresh wood, probably capable of supporting the whole weight which the original post was designed to carry. Immediately after the saw-cut, and again, after the cleaving with steel wedges, the center was carefully examined, and found to be just perceptibly warm to the touch, but nothing more, thus proving that the fiber, in which the strength lay, was quite uninjured.

A LINK GRINDING MACHINE.—Messrs. Pedrick & Ayer of Philadelphia, Pa., have just brought out an interesting new piece of machinery. It is a tool designed to quickly fit up hardened links and blocks. After the links are planed up they are case-hardened and always spring some. This makes it necessary to grind the space and the block. When ground free hand, the usual way, the space and block being ground so as to work freely, the true radius is always lost as the curve straightens. With the machine in question any radius, it is claimed, can be quickly ground true, either the block, link or face of the link. It consists of a frame, carrying an arm mounted with an emery-wheel. This has an automatic feed up and down, exposing all the surface of the wheel to the work, keeping the wheel true. It has also an automatic swinging movement over the arc of the circle to be ground. It is driven by an overhead countershaft and occupies small floor space.

THE TOBIN BRONZE—A NEW METAL.—The Tobin bronze is a metal recently placed on the New York market, which is said to possess many remarkable characteristics, among which are great torsional and tensile strength and high elastic limits. Chief Engineer Hine, U. S. N., says the *Scientific American*, after making tests, found the metal to withstand the action of certain acids with a loss that was infinitesimal. It can be forged into bolts with great facility, and is used in large quantities for this purpose in several of the naval steamers now in course of construction for the navy, and for various other purposes, such as dyehouse and sugar machinery. It has been used successfully for cylinder linings and pump rods by some of the leading pumpmakers of the country. Owing to its non-corrosibility and high torsional elastic limit, which is equal to that of the toughest grade of machinery steel made in this country, it is being generally used for steam launch and yacht propeller shafting. Another important feature is that it can be drop-forged in the same manner as steel, making it essentially valuable where strong and intricate bronze pieces are required that cannot be obtained by casting. It has been carefully tested and found to withstand the action of sea-water in such a manner as to commend it to favorable notice for sheathing ships and piles. The ingot metal is adapted for railroad car journal boxes and bearings of all kinds, for land and marine machinery, and in point of endurance and anti-frictional properties, has given results equal to the best in use.

ENGLISH AND AMERICAN IRON WORKERS.—We see from a report just published on the production of steel in Great Britain and the United States, 1048 hands in the latter country produced 4500 tons of Bessemer rails in a week, which would average 4.3 tons per man; In Great Britain, on the other hand, 600 workmen produced 1500 tons in the same time, or only 2½ tons per man. The average wages in America were, however, fully 35 per cent higher than in Great Britain, which nearly equalized the cost of labor per ton in both cases. The difference in the actual cost of production in the two countries must then principally be attributed to the great distances from which the American works have to obtain their supplies of raw material for the manufacture of Bessemer steel, and this obstacle to the development of the rail industry in the United States would be obviated if the basic process were introduced into this country, since in many instances suitable mineral could then be found in close proximity to coal-fields. There is, however, no probability of the manufacture of Thomas steel being developed in America at present, since a group of the Bessemer works has bought up all the patents referring to the product, and can consequently prevent all new works from producing it.

IRIDIUM ANTI FRICTION METAL.—An anti-friction metal has recently been introduced into use in this country to take the place of babbitt metal and other similar alloys. We do not know why it is called iridium metal, unless from the fact that it does not contain a particle of iridium. Perhaps, however, it is because iridium is a very hard metal, and this is thus named from the fact that it is a hard alloy, though with a low melting point. It can be cast around journals in the same manner as babbitt metal. It can also be cast and machined in the same way as gun metal. Our object in this note is to call attention to the fact that this metal is now being introduced in England. The London *Builders' Reporter* speaks very favorably of it.

FIRE-PROOF IRON HOUSES.—The *Societe Central d'Architecture* of Paris has just received a very curious communication. A system of building houses entirely of sheet iron has been devised. The walls, partitions, roofs and wainscoting are composed of double metallic sheets, separated by an air mattress, which is surrounded by different substances non-conductive of heat. The great merit of this discovery is the non-combustibility of this building. The metal employed allows of the most varied forms of ornamentation, so that the general aspect may be made as pleasing as that produced by any materials hitherto in use.

THE STRENGTH OF STEEL is reduced by being hardened in water, but both its hardness and toughness are increased by being hardened in oil. Iron heated, and suddenly cooled in water, is hardened, and the breaking strain (if gradually applied) is increased, but it is more likely to snap suddenly. It is softened and its breaking strain reduced if heated and allowed to cool gradually. Iron if brought to a white heat is injured if it be not at the same time hammered or rolled.

A SQUARE-HOLE BORING MACHINE.—It is said that Mr. Young, a telegraph operator at Charles City, Iowa, has invented a square-hole boring machine. His patent has been granted in 15 countries, and he is backed by two manufacturers of that town. An exhibition of the machine was recently given before prominent mechanics, and it was pronounced a perfect success, the machine boring an even square hole of any desired dimension.

CASTING A BIG INGOT.—A 75-ton ingot was recently cast at the Parkhead Forge, Glasgow. It is the first of a set of crank shafts for the London Electric Supply Corporation, Limited, and is 20 feet long. The shaft into which it is to be forged is 25 feet long by 36 inches diameter, being for the largest electric-lighting machine in the world. This shaft, with a 12-inch diameter hole through the center, will itself weigh 23 tons when completed.

SCIENTIFIC PROGRESS.

Contrast of Colors in Nature.

Nature is very sparing of showy contrasts of warm and cold colors. Red and blue are very rare, and of yellow and blue the cases are but few, and black and blue are found in lepidoptera more often than white and blue are seen in our flora or fauna. It is not uncommon for one of two strong colors to be overcast with a tinge of its fellow, or for both of them to be reconciled by a common touch of black or of some third color, or for one of them to be lightened by a dash of white, while the other is lowered by as much black, and so red, off-hued with black—russet and green unbrightened with white—often meet in the autumn in dead and dying patches of fading leaves. It may be shown, I believe, by the refractions of light in crystallized gypsum, that brown is the complementary color to lavender gray; and how true to herself is Nature we may go forth and see in the fall of year, in the dead and curled leaves of the mugwort, or meadow-sweet, which are beautiful even in their death, with one side brown and the other the brown matching gray; and if brambles be cut in the leaf-greeny season, their two surfaces soon wither into the harmony of gray and brown.

And what use are we to make of these hues of Nature? They are warrants for a gray mantle under locks of brown hair, or a brown bonnet or trimmings, or a gray room wall with brown furniture; and if, on a hot summer's day, I see the dark leaf shades playing on the gray bark of a young beech, I can boldly lay darkish leaf shades on a wall of the beech-bark's hue; or if, after the winter rains, I find a barkless pole in railings, tinted with the palest blue-gray, and on breaking off a splinter of it I find its inner wood of its true color of pale brown-yellow, why should I not take the inner tint for my wall and the outer one for the skirting? Or if I pick up a piece of lichen of dull green on one side and dull gray on the other, why should I not bind my book in one color and lay on it a lettering piece of the other? Nature is the best school of art, and of schools of art among men those are the best that are Nature's best interpreters.

All colors have their complementaries, which add to or detract from the beauty of the adjoining colors, according to what they may be. Thus, the complementaries of red are green; blue are orange; yellow are violet. If you cut out pieces of gray paper in an ornamental form, and stick a piece on each of the three colors I have named, you will find, in a shaded light, the gray will be fully tinted by the complementaries of these colors. But you cannot lay down precise rules. An experienced artist can bring any two colors together by properly modulating them. Nothing is so charming and so refreshing to the eye as a harmonious arrangement of colors. They are "like a sweet chord of music to the sense." The hand of Nature never errs, whether it brings together scarlet and crimson, as in the cactus; scarlet and purple, in the fuchsia; yellow and orange, as in the calceolaria; or the colors in the varied plumage of exotic birds—the harmony is always beautiful, ever perfect. The laws of harmonious coloring are a necessary part of the knowledge of the manufacturers of colored fabrics. I will suggest a few contrasts: 1. Black and warm brown. 2. Violet and pale green. 3. Violet and light rose-color. 4. Deep blue and golden brown. 5. Chocolate and bright blue. 6. Deep red and gray. 7. Maroon and warm green. 8. Deep blue and pink. 9. Chocolate and pea-green. 10. Maroon and deep blue. 11. Claret and buff. 12. Black and warm green.—*J. G. Grace, London Architect.*

Peculiar Motions of Lightning.

Photographing lightning and making good pictures, representing the forked and irregular light as it shoots across the sky, or from cloud to earth, has become quite common and is easily done in a dark night; having first focused the lens for distant objects, one has only to point it in the direction he expects the flash to appear, expose the plate and wait for the lightning. If the night is dark, one can obtain several flashes of lightning on the same plate, as they often occur near together. The only difficulty is to have the flash come within the field of the lens.

Photographing the current itself so as to get detail in the track, showing how the electrical currents travel, is quite another thing; this we have been able to do.

From such photographs we see that the electrical current may travel without dividing, or it may divide and sub-divide, twist and meander in its passage from cloud to earth, its image on the negative presenting such a variety in form that many names have been given descriptive of its general appearance, without any reference to the real motion of the current itself. Three of these motions have been observed, viz., the twisted, the curled and the straight-forward.

The twisted motion resembles a loosely twisted rope; it twists both ways, usually from left to right, as the twining vine winds around its support. There are exceptions to this rule in the electrical as well as the vegetable kingdom, for we find it twisting not only both ways (*i. e.*, from left to right and right to left), but it reverses its motion in the same course.

The curled motion resembles a twisted ribbon or shaving as it curls from the carpenter's plane, and in some respects is most remarkable.

The straight presents straight lines in its track, and is evidently traveling with great force.

PROGRESS OF INDUSTRIAL CHEMISTRY.—It has only been within the last 30 years that the manufacture of chemicals and the study of chemistry as a powerful auxiliary to the arts attained any eminence whatever in this country. Industrial chemistry has had its largest development in France and England, where general manufacturing has also attained large growth, and Germany has also made marvelous strides in this field of progress. In France alone, the annual production of chemicals has reached the great value of $300,000,000. By the side of this giant development the chemical manufacture of the United States seems mere boy's play; nevertheless the progress of the last 20 years in this country has been very striking. The manufacturers have ventured to undertake something besides the staple products of sulphuric acid, soda, vegetable dyes, and medicines, and they have, within the period named, entered upon the production of a large variety of rarer chemicals, and have evidently planted the foundation of a great industry. The exigencies of home manufacture will give an impetus to this industry from which the largest results may be expected and which will place it on a par with the older and more firmly established manufactures.—*Pittsburg Pottery.*

THE ANCESTORS OF THE DOG.—Mr. M. Boule, in a note to the French Academy on the predecessors of the present Canidæ, shows that, in the Miocene epoch in France, there were animals that offered some affinities with the dogs. In the Quatenary epoch numerous species are found, and these seem to be identical with the present species. The deposits between the middle Miocene and the Quaternary furnish but a small number of data. Upon studying the remains of dogs taken from the Pliocene formation of Puyde-Dome and Velay, Mr. Boule has found that, far previous to the Quaternary epoch, the Canidæ offered a large number of species, and that these latter already realize the types of the present wolves, foxes, jackals and dogs. The *Canis Borbonicus* of Perrier, while offering some affinities with the civets, may be considered as an ancestral form of the foxes. The *Canis Etruscus* was a very near relative of the present wolves. Another species had the dental formula of the coon. Finally, a jaw from the Pliocene near Puy exhibits the character of certain races of domestic dogs. In the presence of such facts as these, it becomes difficult to admit, as has often been done, that all our races of domestic dogs are but artificial modifications of their congeners, the wolves and jackals.

PHOTOGRAPHING BY HEAT.—Prof. John Trowbridge in May *Scribner* says: It may be said that photographs can be taken by heat as well as by light. The action of the shorter waves of energy, which we call light, is quicker and sooner manifest to the eye than the action of the long waves which we call heat; but the invisible heat rays in the solar spectrum have been photographed. The slow action of heat in changing the molecular state of bodies is well known. It is probable that an emulsion could be formed which would give an image of a hot black kettle in a dark chamber. The element of time, however, would probably be an important one. Indeed, we are often presented with evidences of the picture-making facilities of the heat rays. A fern-leaf upon ice is soon represented by the difference of molecular action. A stationary carriage-wheel standing in the sun upon the frozen ground is found to have left its photograph upon the ground when it moves on.

A LAMP FOR THE MICROSCOPE.—A new lamp for the microscope, specially constructed for use with that instrument, has been invented at Bonn by the Doctors Wolz and Kocks. Mirrors, condensers and other usual accessories are not needed, and it has the advantage of being completely covered. The light can be cast on any portion of the object under examination; it is very suitable for the illumination of opaque objects, and its chief claim as an invention of practical utility lies in the fact that it adapts the law of total reflection to microscopic purposes. Light, says the *Chemical Trades Journal*, in a review of this interesting patent, is totally reflected by its passage through glass into air, so long as the angle of incidence does not exceed 40 degrees, and, by means of a bent rod, a soft, diffused radiance is transmitted from the paraffin lamp to the under side of the stage. As no light is transmitted laterally by the rod, the eye of the observer is not taxed by extraneous rays.

WATER DISCHARGES.—The quantities of water discharged in the same time through different sized apertures, under different heads, are to one another in the compound ratio of areas of the apertures, and of the square roots of the hights of heads above the centers of the apertures.

VOLATILE HYDRO-CARBONS.—The application of volatile hydro-carbons in lieu of water for producing power is just now attracting considerable attention in London. Mr. Yarrow was to have read a paper on this subject at the Society of Arts on the evening of May 22d.

GOOD HEALTH.

Lager Beer.

Lager beer, says the *Scientific American*, from its name, implies a beer that has been kept for a certain period. A year or six months, at least, is the time given by authorities as that which should elapse before such beer is tapped. The German and Austrian Governments impose both fine and imprisonment for any infraction of this rule, because of the deleterious effect of such drink before such lager or keeping shall have expired. There is not any such law here, and, as everybody knows who has had the time and inclination to investigate the subject, many of our brewers have greatly curtailed this time of keeping and constantly seek for expedients and processes for cutting it down still more, so eager is the market, so uncritical the consumer. Indeed, the American beer-drinker has little regard for his liver and kidneys, or he would have stoutly protested long ago. He takes his beer unsuspectingly, and without inquiry, till a time comes when, the liver being affected, or the kidneys, or both, nature protests, and the beverage once so pleasing to his lips is like so much acid. A chemist recently investigating this matter says:

"Brewers are using materials other than malted barley, such as corn and oats, etc., mixed with barley and hops, by which they accelerate its manufacture, making a sweetish, pleasing, heady beverage, but alcoholic, and people using this kind of beer in large daily quantities, with the idea that it is innocuous, have brought on a marked increase of renal complaints."

This statement was shown to a medical inspector of the Board of Health of this city. He could not say if these particular ingredients were used, but the general charge, he said, was undoubtedly true, neither colored as to the intent of the brewers nor exaggerated as to the effect on the health of the consumer. The Health Department, he said, had not sufficient force to look into this matter just now, so full were its hands with the routine of inspection.

If it can be shown that beer is injurious to health, the makers can be held and punished.

Buttermilk as a Medicine.

With the rapid growth of reconstructive medicine comes opportunely the reintroduction of old and well-known domestic remedies, among which buttermilk demands a respectable place.

A young lady patient of the writer was suffering from a severe consumptive cough. None of the usual anti-spasmodics, expectorants, etc., seemed to do any good, simply because her stomach was too weak to bear enough medicine to effect the purpose. Finally I suggested to her mother the use of hot buttermilk. It was adopted at once. Her first night's experience was one of comparative freedom from cough and pain, and a pleasant slumber for hours. It was continued for a long time with an unvarying relief of all her previous distressing symptoms, and an almost perfect freedom from cough for several hours after each draught of the hot buttermilk.

Lingering at one time for weeks from an attack of congestive fever, dosed with calomel and quinine almost beyond endurance, the writer began to desire buttermilk to drink. The physician "didn't believe in humoring the whims of patients," as he expressed it; besides, he contended that a single drink of the obnoxious fluid might produce death, as acids and calomel were incompatible dwellers in the same stomach. But I was a good persuader and my mother was a susceptible subject. The buttermilk "fresh from the churn" was procured and drank. No evil resulted; instead came perspiration and speedy recovery.—*Dr. S. F. Landrey.*

ORANGES FOR HEALTH.—While the orange was so highly esteemed by the ancients for its medicinal qualities, it is surprising how little attention the present generation gives to the many virtues inclosed in this little golden ball of fruit. A prominent physician once remarked that were his patients to eat an orange or two every morning they would require but little medical attention; for throughout the entire range of fruits that have attracted the attention of the medical profession as a means of alleviating many of the ills of mankind, there has been found none has so many diversified uses as the luscious orange, particularly in cases of low fevers and malarial complaint, and it should more largely take the place of unpleasant drugs so extensively used, to the great disgust of the patient. No fruit compares in cheapness with the beautiful and luscious orange, and particularly so now that our own country is raising the finest oranges in the world, the fruit selling at a price within the reach of the most moderate purse.—*American Grocer.*

A PRECIOUS PRESCRIPTION.—Dr. Henry Gibbons, Jr., recently closed a lecture at the Cooper Medical College with the following valuable advice: In conclusion, let me reveal to you a great professional secret, through which you will be able to diminish your doctors' bills at least one-half. It is this: Be cheerful; avoid despondent thoughts and gloomy forebodings; your labor will be light in proportion as your spirit is in it, or it may be magnified to corresponding proportions. Make exercise your nurse, diet your apothecary, and cheerfulness your physician, and the days of the years of your life will be better and your pockets will be fuller.

DEGENERATION OF THE HUMAN TEETH.—The law of retardation exhibits itself in the teeth of the higher races of mankind in a highly inconvenient manner. The greatly developed brain requires all the available room in the skull; there is no space left for the attachment of muscles of a powerful jaw. There is consequently no room left for either the wisdom teeth or the upper incisors; the wisdom teeth are retarded, often cause great pain, and decay early. The second incisors appear in startling and unexpected places, and often (in America especially) do not cut the gum at all. Prof. Cope says that American dentists have observed that the third molar teeth (wisdom teeth) are in natives of the United States very liable to imperfect growth or suppression, and to a degree entirely unknown among savage or even more civilized races. The same suppression has been observed in the outer pair of superior incisors. This is owing not only to a reduction in the size of the arches of the jaw, but to successively prolonged delay in the appearance of the teeth. In the same way men and the manlike apes have fewer teeth than the lower monkeys, and these again fewer than the insectivorous mammals to which they are most nearly allied. When this difference in dentition has been established, civilized man may claim to place himself in a new species, apart from low savages as well as from high apes.—*Popular Science Monthly.*

REMEDY FOR PALPITATION OF THE HEART.—Mrs. O. Thiessen of Pleasanton sends us the following: Take the lower part of the leaves of the century plant and peel off the green part and then squeeze out the juice. One teaspoonful taken in water several times a day will cure it.

RESULT OF A BASEBALL HIT.—A curious result of being hit with a baseball is reported from Philadelphia. A stuttering man was struck in the mouth, and when he got well the impediment in his speech had disappeared.

DANGER IN OCEAN AND RAILROAD TRAVEL.—Out of 100,000 people who cross the Atlantic from New York to Liverpool, the loss of life is not as great as among 100,000 who travel between New York and Pittsburg by rail.

USEFUL INFORMATION.

Cellular Clothing.

A new cellular clothing is coming extensively into use in England. It is the utilization of one of Count Rumford's ideas, expressed a century ago, but its value is now for the first time recognized, as in the case of so many of his theories. The manufacture of the material for this clothing is claimed to be based upon strictly scientific principles, and the fabric claims to fulfill all the requirements of a perfectly healthy clothing.

Rumford, in his essay on the propagation of heat in various substances, affirmed that clothing to be healthy must not only be light and warm, but allow the slow passage of a constant current of air to and from the skin, thus permitting the vapors which are constantly being exhaled from the pores to be carried off, and keeping the body surrounded with fresh air, instead of air made impure by waste products. This idea the material in question carries out by being closely woven in cells, as its name indicates. Silk (for more expensive fabrics), wool, cotton and wool (merino), cotton and silk, and pure cotton (for cheaper grades), are used, the distinguishing characteristic of the goods in each case being simply the cellular form in which they are woven. The common objection against cotton, which is the material most used (the aim being to reach the masses), viz., that its use for clothing is productive of chills, colds, etc., it is asserted, is removed as soon as it is manufactured in the cellular form. The evaporation and escape of the perspiration, and the passage of gases and air, then go on without impediment, while the customary feeling of chilliness wholly disappears.

The cellular fabric, of whatever material it is woven, consists of small cells—a network which, while open, is covered with a thin film or fluff, allowing the air to pass in and out, slowly and gradually, giving it time to become of the same temperature as the skin before it reaches it, and thus obviating all danger of catching cold. It is claimed to be equally satisfactory for summer and winter wear, to be durable, warm, to wash with less trouble and expense than almost any other material, and to be of all the cleanliest. It is made up chiefly into underclothing, the theory being that, so long as this is porous, impervious outside garments may be worn with impunity, since they are usually loose enough to allow an envelope of air inside of them. It is also made into night garments, sheets, counterpanes, and cricket and tennis caps and jackets. Ladies are beginning to use it for dress linings, and it claims to be equally well adapted for linings to men's coats and waistcoats.

A NOVEL CAR.—J. M. Toucey, superintendent of the New York Central & Hudson River railroad, has one of the most ingenious, comfortable, and speedy cars in existence. Substantially it is a Wagner palace car on top of a locomotive, filled with easy-chairs, the front seat being on a line with the smokestack. The passenger receives the impression of being the driver of a very fleet horse. As a matter of fact, this horse was recently driven 180 miles in four hours. It followed ten minutes behind the Chicago Limited, running up to Rhinebeck in two hours without a stop, and leaving there on the return trip at 2 o'clock, was in New York at 4.

CLOTHES-CLEANING.—Soiled and faded black cashmere may be made to look almost as good as new by washing in soapsuds, rinsing in water, and then putting in water with so much bluing in it that it looks black. The cloth is to lie in this for some time, as long as over night if it is much faded. Do not wring the cloth after taking from the water, but hang up to dry in a shady place. If the gown is elaborately trimmed, the trimming may better be ripped off and treated in this separately. Dark-blue cashmere can be made to look beautiful if renewed in this way. For silk cleaning, paper and a hot iron is the old and best method. Put brown paper under the grease-spot on a board, and over the spot place several sheets of the paper. With a medium heated iron press firmly on top and several times renew the sheet of paper next to the silk on top. The paper will finally absorb all the grease. This method is applicable to any unwashable cloth except velvet, plush, etc. Ammonia is a favorite substance for cleaning clothing. The ammonia should be well diluted with water. A piece of flannel is saturated with this dilution and rubbed on the grease-spot until it is removed; after which, that place on the cloth is sponged off with clear water. Dry somewhat and iron when damp. Ammonia-water is also recommended to remove the shiny look from a black coat, but it is not good for much for this purpose. Strong black coffee, to which has been added a few drops of ammonia, is said to be good for cleansing a black coat that needs a thorough renovating.—*Good Housekeeping.*

A QUEER KINK, which has been brought out in the technical press of late, is that a hogshead or barrel filled with water may be prevented from bursting, even though frozen solid, if a stick of wood be inserted in the water. A correspondent of the *American Machinist* tells of a new hogshead which was preserved in that way: "We had no faith in it," writes the correspondent, "but thought we would risk a bottom, so we put in a stick 3x2 inches or 4x3 inches, I have forgotten which. The upper end rested on one side, and the lower wherever it happened to strike. When winter came, the hogshead froze solid, and the ice bulged up in a great hump all around the stick. Neither the bottom nor any of the staves started. We used that hogshead six or seven years, and it was all right then."

GRAIN GAMBLING OUTLAWED IN ST. LOUIS.—On April 27th the Missouri Legislature passed the "Grain Option" bill, prohibiting the sale of grain, stocks or bonds when the seller does not actually have the full amount of the article sold in his possession. The Governor signed the Act May 9, and the dealers in "options" are panic-stricken. The statute is so worded that the issue cannot be dodged, and the St. Louis grain-gamblers are said to favor closing the Merchants' Exchange and opening a "Board of Trade" over in Illinois, at East St. Louis.

A CHEAP ICE-CHEST, says *Invention*, is made as follows: Take two dry goods boxes, one of which is enough smaller than the other to leave a space of about three inches all around when it is placed inside. Fill the space between the two with sawdust packed closely, and cover with a heavy lid made to fit neatly inside the larger box. Insert a small pipe in the bottom of the chest to carry off the water from the melting ice, and you have a very cheap and tolerably effective ice-box for family or grocer's use.

THE CHANGES OF TRADE.—An old experienced stove and tinware dealer, in speaking of the changes and mutations in trade, says: The small tin shops in large cities are now only repair shops. If to-day I was going to start a shop I would seek a frontier town, for that would be the only place I could make money. A quarter of a century ago there was more profit in making $10,000 worth of tinware than there is in selling $50,000 worth of stoves to-day.

A NEW ADVERTISING DODGE.—A firm of great genius has offered the British Government an immense sum for the use of the national postage stamp for advertising purposes. The advertisement is to be printed on the back of the stamp before the gum is put on, so that the purchaser of every stamp must see the announcement before he moistens the gum. This is an Australian idea.

A CORRUGATED STEEL BARREL HOOP has been invented, which is said to be elastic and firm, hugging a package tightly. Four steel hoops will take the place of ten wooden hoops on a flour barrel. They are made at Worcester, Mass.

STEAM VS. POWDER.—It is stated that a pint of water thrown into a redhot boiler has 75,000 times the explosive power of a pound of powder.

ENGINEERING NOTES.

A GIGANTIC RAILWAY BRIDGE.—Arrangements are being made to begin the erection shortly of a gigantic railway bridge at Quebec, which will very materially affect the traffic of the two great railways of Canada—the Grand Trunk and the Canadian Pacific—as well as an important part of the railway system of the New England States. The great depth of the St. Lawrence river, opposite the ancient city of Quebec, has hitherto been an effective argument against the building of a bridge, but engineering skill has overcome this obstacle with a scheme to build a cantilever bridge which will cost close upon $10,000,000. The width of the current from shore to shore is 24,000 feet. The two main piers will be constructed of solid granite in 40 feet of water, about 500 feet from each shore. These two piers will support a cantilever bridge of 1442 feet. The total length of the bridge, with the approaches, will be 34,000 feet. The top of the bridge from high-water mark will be 408 feet, and the masts of the largest ocean steamers will be able to pass under it. The principal object in building the bridge is to connect the Intercolonial railway from Halifax and St. John to Quebec, which is run by the Canadian Government at a great annual loss to the country, with the Canadian Pacific railway. This is the only link uncompleted necessary to give the Canadian Pacific railway an uninterrupted line from the Atlantic to the Pacific oceans through Canadian territory.

OUR COMING SHIP CANAL.—An effort is being made at Pittsburg to have a committee of competent gentlemen appointed by the Governor of Pennsylvania to investigate the practicability of building a ship canal from Lake Erie to Pittsburg, and if the investigation will warrant the expenditure, the General Government will be asked for sufficient aid to complete the work. The Pittsburg *Gazette* has the following in reference to the proposed canal: "The Northwest will be especially benefited, because ore can be transported to Pittsburg and coal can be taken back to the Northwest at a cheaper rate than it is now done by the railroads. If the lake cities, such as Erie, Cleveland, Chicago and Milwaukee, can only be interested in the canal, there will not be much trouble in bringing the matter prominently before Congress.

A PREHISTORIC FIND.—A mine of scientific material is opened in Spain by the excavations of Belgian engineers along the coast from Carthagena to Almeria. Abundant remains of the stone age are found, in which is no trace of metal; polished axes, perforated shells, pottery, grinding-stones, chipped flints and primitive stone walls are the features of the prehistoric neolithic period. In some places, bronze and copper implements are found. Evidences that cremation was practiced and smelting of ores understood are also apparent.

ECONOMY IN STEAM USE.—At the last meeting of the American Society of Mechanical Engineers, Prof. R. H. Thurston predicted the early attainment in the steam engine of a horsepower with the expenditure of 12 pounds of steam per horse. The quadruple expansion engine at Warren is said to be running on a consumption of less than 13 pounds of steam per indicated horse-power per hour, and its builders are now at work upon the triple expansion engine for the Narragansett Electric Lighting Company on a guarantee of 12½ pounds.

THE PANAMA CANAL SCHEME dies hard. Report says that the French Government will revive the work, a measure that, under the Monroe doctrine, the United States will not allow. A heavy subsidy to a private corporation to complete the canal, however, would meet with no objection. The old corporation is a bursted concern, and dead, but the works instituted by De Lesseps are valuable, and an effort to utilize them will undoubtedly be made as soon as the necessary capital and enterprise can be combined.

HIGH WATER PRESSURE.—France claims the honor of utilizing a higher water pressure than that recently put in operation in the Chollar shaft on the Comstock lode in Nevada. At Brignoud, two kilometers from the valley of Gresivaudad, near Grenoble, a turbine 9 feet 10 inches in diameter was put in operation in the year 1875, utilizing a head of 1638 feet. It is still working and gives a force of 1500-horse power with a flow of 300 liters of water per second.

POPPIES ON EMBANKMENTS.—It has been discovered that the planting of poppies on embankments proves a great protection to such works. They form a network of roots that can be exterminated only at the expense of great difficulty. Eminent French engineers are said to have made successful experiments in this direction.

UNSAFE DAMS.—A civil engineer who has been inspecting the water-powers of Massachusetts says there are no less than 13 dams in that State liable to give way at any hour and cause great loss of life and destruction of property.

PROF. AYRTON estimates that the power wasted at Niagara Falls exceeds that which could be produced by the annual consumption of 150,000,000 tons of coal.

TABLE OF CONTENTS.

EDITORIALS.—A Frame for Dumping Cars; Buffalo Duplex Compound Steam Pump, 413. Passing Events; The Exposition at Detroit; Every Man His Own Assayer; The Idaho Mine Fire, 420. The Great Disaster in Pennsylvania, 421.

ILLUSTRATIONS.—Main Building of the Detroit Exposition; Buffalo Duplex Compound Pump; Behr's Car-Dumping Frame and Car for Gravel Mines, 413. California Rural Views and Recreation Scenes, 415. The Conemaugh and Adjacent Valleys—Scenes Amid which the Great Accident Occured, 421.

CORRESPONDENCE.—Northern Counties of California—No. 3; The 13-14-15 Puzzle; Mexican Lead Ores, 414.

MISCELLANEOUS.—Paper for Building; Salt-Making in England; Improvement in the Otto Gas Engine, 414. New Silver Region; Care in Using Forced Draft; A United West; No Escape from Labor, 415.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 416-7.

MECHANICAL PROGRESS.—Wooden Beams Displacing Iron; A Link Grinding Machine; The Tobin Bronze—A New Metal; English and American Iron Workers; Iridium Anti Friction Metal; Fire-Proof Iron Houses; A Square-Hole Boring Machine; Casting a Big Ingot, 418.

SCIENTIFIC PROGRESS.—Contrast of Colors in Nature; Peculiar Motions of Lightning; Progress of Industrial Chemistry; The Ancestors of the Dog; Photographing by Heat; A Lamp for the Microscope; Water Discharges, 418.

GOOD HEALTH.—Lager Beer; Buttermilk as a Medicine; Oranges for Health; A Precious Prescription; Degeneration of the Human Teeth; Remedy for Palpitation of the Heart, 419.

USEFUL INFORMATION.—Cellular Clothing; A Novel Car; Clothes-Cleaning; The Changes of Trade; A New Advertising Dodge; Grain Gambling Outlawed in St. Louis; Steam vs. Powder, 419.

ENGINEERING NOTES.—A Gigantic Railway Bridge; Our Coming Ship Canal; A Prehistoric Find; Economy in Steam Use; High Water Pressure; Poppies on Embankments; Unsafe Dams, 419.

OUR LUMBER INTERESTS.—A Theory of the Redwoods; Durability of Timber; Disease in Wood; Mississippi Lumber; Oregon Lumber, 422.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 428.

Passing Events.

Public attention is absorbed in the awful disaster which occurred at Johnstown, Penn., and which destroyed thousands of lives and millions of dollars worth of property. No such overwhelming catastrophe ever before happened in this country. It will have the effect of causing an immediate and very thorough inspection of all large dams which are in situations where damage would ensue in case of their breakage. It seems that the Conemaugh dam was by no means considered safe, even under ordinary circumstances, and the sudden cloudburst caused its collapse. The possibility of overflow does not seem to be properly considered in these large dams.

There is trouble brooding up in the Yukon river region, Alaska, over the boundary question. The jurisdiction of the American Government to certain mining ground is questioned.

The transmission of electricity, a distance of 15 miles from falls on the river to Portland, Oregon, has been satisfactorily accomplished. Light and power both will be supplied. The idea is not new, but the practical carrying out of the project is of interest.

The Exposition at Detroit.

On September 17th a World's Fair and Exposition will open at Detroit, Michigan. It is to be a combination of agricultural and industrial fair and exposition, and cash prizes of $100,000 are to be given. The main building, of which we give a cut on page 413, has a frontage of 500 feet, and the exhibit area is 200,000 square feet. The great central tower over the main entrance rises to the elevation of 200 feet, and is, therefore, one of the very highest towers on the continent; indeed, but six towers in the United States surpass it in magnificence of elevation. The sunlight streams into the great structure through unnumbered panes represented by 20,000 square feet of glass, an amount sufficient to cover 4½ acres, or bound a surface one foot wide and four miles long. The aggregate exhibit surface contained in all the buildings is over 14 acres. The Art building has a frontage of 150 feet, and the stock buildings are very extensive.

Detroit's situation is in the highest degree favorable toward building up an immense metropolitan center. She has over 200 incorporated companies, engaged in a great variety of industry, and annually turning out products that are valued at millions. She has one of the largest seed industries in the world. In the manufacture of fine-cut tobacco, her position is unrivaled. Her car-shops and wheel foundries are among the most extensive. She is the center of the stove industry. Her drug and chemical trade is very extensive. Two hundred thousand dollars per year for public gas and electricity implies that she is one of the best lighted cities in America. Three millions have been expended for parks and public buildings. Her avenues are broad, beautifully shaded with oak, elm and maple, and scrupulously clean; and travelers are loud in their praises of the long and delightful drives. Belle Isle park, the gem of the lakes, attracts hosts of strangers. The broad Boulevard encircles the city from Belle Isle bridge to Springwells, over 12 miles in length. The water and sewerage systems are estimated at over six million dollars. The vast commerce of the Great Lakes passes through her beautiful river, with a greater aggregate tonnage than enters the river Thames, or in six months surpassing that of the Suez canal for one year. On an average, a lake craft passes Detroit every 7½ minutes throughout the season. The coming exposition will be one of her greatest undertakings, as everything is to be carried out on a grand scale. The admirable site, 70 acres in extent, is bounded by two streams, and is but a thousand yards beyond the city's western line. The grounds are penetrated by street car, electric railway and railroad, while the river offers the delightful diversion of a water trip to the fair and exposition. All exhibits can be unloaded from the cars or steamers directly into the buildings.

THE BARNARD COMET.—Prof. E. S. Holden, Director of the Lick Observatory, in speaking of the comet discovered by Mr. Barnard in September last, says: While observing the comet on June 3d at 3 A. M., Mr. Barnard noticed that the normal tail of the comet, which should be directed away from the sun, had disappeared. An anomalous one, a degree long, was visible, however, directed toward the sun in the position of an angle of 90 degrees. This is an interesting and somewhat rare phenomenon. The explanation probably is that the comet is now so far past its perihelion that the sun is no more able to exert a force on the body sufficient to cause the formation of a tail of the usual type; at the same time the comet is probably breaking up from the effects to which it has previously been subjected, and is leaving behind it fragments of its original mass, which will doubtless go to form a stream of meteors. These doubtless constitute the tail which has been observed.

S. SHIROSI, one of the solid men of Japan, arrived in this city Saturday by the Arabic. He is accompanied by a suite of eight persons. Mr. Shirosi is worth over $1,000,000, and is president of three big copper mines near Osaka, whose output is 3,000,000 pounds of pure copper per annum.

AT the Great Eastern quicksilver mine, near Guerneville, about 35 men are now employed, turning out about 100 flasks of quicksilver per month.

"Every Man His Own Assayer."

EDITORS PRESS:—At your request I have investigated the powder recently advertised by Prof. Herman, under the heading of "Every Man His Own Assayer," and the professor has kindly applied it to two samples of silver ore in my (and your) presence, as follows:

Sample A, consisting of chalcopyrite, tetrahedrite, zinc blende and antimonial galena containing (by the assay previously made) 52 ounces of silver per ton, the gangue being quartz. Prof. Herman assigned a value of 100 ounces per ton by his test.

Sample B. The same mixed with one-half its weight of calcite, therefore containing 41.3 ounces silver per ton. The professor's estimate of the value of this sample is 50 to 75 ounces per ton. The professor said these samples should be roasted.

The powder in question consists of a mixture of salt and bluestone, or some other soluble compound of copper producing cupric chloride when dissolved in water. A black substance, which seems to be manganese dioxide, is added, apparently for the purpose of disguising the nature of the mixture, as it is quite needless. The quantity of the powder sold at $2 is actually worth about three cents.

This method of testing silver ores is fully described in a little book, published by Messrs. Dewey & Co. in 1876, and still on sale under the title of "Testing and Working Silver Ores;" also in a pamphlet published some years earlier, and it is remarkable that the printed directions accompanying the professor's powder are couched in almost the precise language of those publications. The method is also mentioned in "Assaying Gold and Silver Ores," by C. H. Aaron.

The test is useful to prospectors, enabling them to ascertain whether the ore which they may find contains silver or not; but, in order that it may be effective, the powder must be added until the hot pulp gives a distinct coat of copper to a knife blade dipped in it and then washed without rubbing, after which the copper strip is used in the same way and receives a white coat of silver if any considerable proportion of silver is present.

My attention has been called to the fact that an ore containing arsenic may give a gray coating to the copper, which may be mistaken for silver.

The test is nothing more than a test; that is, it is not even an approximately quantitative assay, though it may enable very rich ore to be distinguished from poor ore by the character of the silvery deposit. The prospector who may wish to use it needs only to provide himself with a few ounces of powdered bluestone mixed with twice its weight of salt, a strip of sheet copper, and an enameled cup in which the powdered ore may be mixed with water and heated. I am not sure that it is in any case absolutely necessary to roast the powdered ore, with or without an addition of salt, but it is safer to do so if much sulphuret is present. The ore may be roasted on a piece of sheet iron smeared with moist clay and dried. It should be stirred during the operation, and the heat gradually increased to dull redness until no odor of sulphur is perceptible. Unroasted ore containing cinnabar will yield a deposit of quicksilver on the copper which becomes brilliant by rubbing and is driven off by moderate heating. When the test is applied to pan tailings, it is capable of showing whether or not the tailings still contain extractable silver; in this case the pulp should be thinned with water enough to enable any quicksilver it may contain to settle, and the copper strips must not be dipped too deeply.

The instructions state that this test is the invention of a practical man. This is true. I made it myself, and published it many years ago for the benefit of poor miners.

C. H. AARON.

ELECTRIC TRANSMISSION AT PORTLAND.—The Willamette Falls Electric Company started up on one of its Brush arc dynamos on Monday, and one of the systems in Portland, Or., was lighted by electricity sent 15 miles. The experiment proved a grand success, the loss of electricity in transmission being much less than was anticipated. The company has now six large copper wires strung and intends to supply power for running all kinds of machinery at once.

Buffalo Duplex Compound Steam Pump.

(*Continued from page 413.*)

The compound arrangement of steam cylinders in these improved duplex pumps is for the purpose of using steam expansively, the same as in regular cut-off steam engines, thereby saving nearly one-third of the fuel necessary to operate a plain duplex pump, and, consequently, requiring proportionately less boiler capacity.

The steam, after being used in the high-pressure steam cylinder, is expanded into the low-pressure steam cylinder without complication of the working parts or the use of expensive valve gear.

Owners and occupants of large buildings, managers of public institutions, officers of city, town or village water works, those who are interested or contemplate becoming interested in mining or irrigating enterprises, will appreciate the advantages necessarily gained by the use of the compound system, as the saving in the cost of fuel will amply justify the expenditure of the additional primary cost over and above that of the ordinary duplex steam pump.

These pumps are very compactly and substantially constructed, all working parts being made extra strong and of the best material, and are interchangeable, so that in the event of accident to any part, or by reason of wear a replacement is rendered necessary, the parts can be duplicated without delay.

This form of pump is particularly desirable for use when the required duty is constant or economy of operation is important.

The Joshua Hendy Machine Works of Nos. 39 to 51 Fremont street, this city, are the agents for the sale of these pumps, and carry a large stock of all the usual sizes or numbers. The considerable sales which, as we are assured, have been effected since their appointment as agents, is evidence of the superiority of these pumps, and the favor with which they have been received for different requirements of use attests the same; and it affords us pleasure to note that the Tulare Water Company of Tulare, Tulare county, this State, have recently purchased from them and placed in operation a No. 66, 12x18½ compound duplex steam pump, having a capacity of 1000 gallons per minute, or 1,440,000 gallons per day of 24 hours.

The Idaho Mine Fire.

On Monday evening, at 5 o'clock, the Idaho mine, Grass Valley, was discovered to be on fire. The night crew were just going on, and had got to the 1000-foot level, where the fire was, when the alarm was given. All the working is below that level, and so the night men did not get below the fire. All escaped except two, Thos. Dunstan and John C. Ralph. They fought the fire in the level until they were overcome by gas and the rescuing parties could not reach them. The fire occupied a small space. It caught at the head of the incline, 500 feet east of the main shaft in the 1000 level. The smoke and gas went up from that level to the next above, and then into the main shaft and down to the 1000-foot level again, and took the workers in the rear and cut them off from the hoisting cages.

Brave men went into the deadly gas, and by using precautions dragged out all the men excepting the two named. Soon the gas got as high as the 800-foot level, and then the air shaft, 1000 feet from the main shaft, was closed on the surface, and the main shaft just below the 800-foot level.

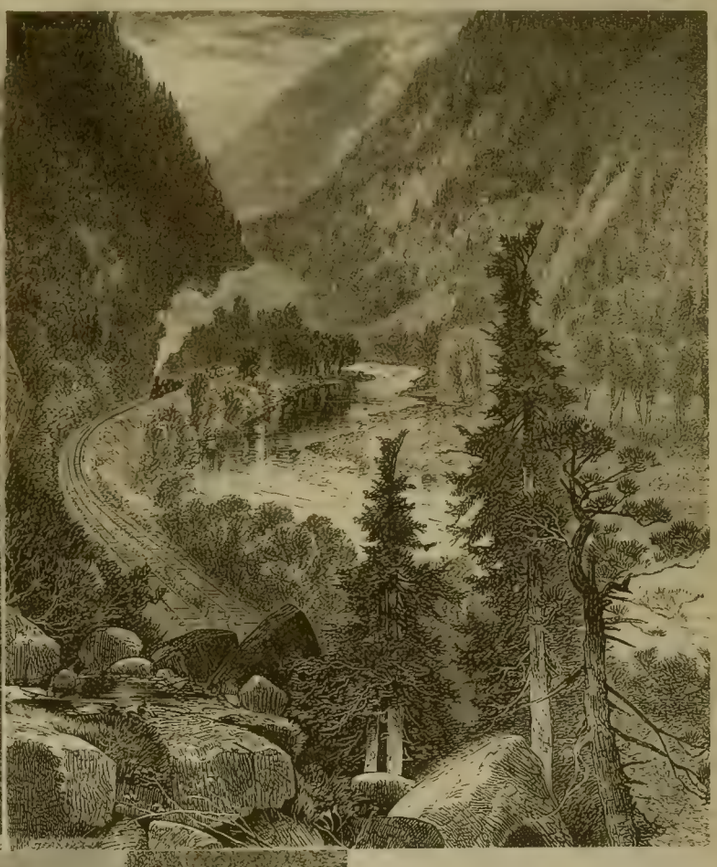
Frank Carter, an engineer, was beyond surgery when he reached the surface, for his head was taken off between the ascending cage, on which he lay unconscious with his head projecting over, and the descending cage that was going to the rescue of the men overcome in the 1000-foot level. Every effort has been made to rescue the two imprisoned miners. Carbonic acid gas is now being generated in the shaft so as to put out the fire, and professional divers in submarine armor will go into the mine.

THE Colton Sampling Works are running day and night on ore from the new mines in San Bernardino county.

ONE oil well in Cholame valley, Monterey county, 540 feet deep, is said to be yielding 120 barrels a day.

The Great Disaster in Pennsylvania.

Amid such charming natural scenery as is portrayed in the engravings on this page has just occurred a calamity which the London *Daily News* describes as the "saddest and most striking and most overwhelming misfortune that ever befell the people of the English race." At five o'clock on Friday morning, May 31st, a tremendous reservoir at the headwaters of the Conemaugh river, Pennsylvania, burst its retaining dam under the pressure of an unusual fall of rain upon its watershed and precipitated its immense volume of water upon the valley through which the river flows. This reservoir, the accounts say, was maintained for the pleasure of a Pittsburg club, who were supposed to have given bonds of three million dollars as a surety to the dwellers along the river bank who protested against the maintenance of a body of water three miles long, one mile wide and 70 feet deep as a constant menace to life and property in the valley below. The bonds had not been signed, however, it has since been ascertained. When the floods came the water was thrown into the Conemaugh, a bright little stream which empties into the Alleghany river about 30 miles above the point where it joins the Monongahela to form the great Ohio river. One of our engravings shows the Conemaugh at what is termed the "Packsaddle." The other engravings are of scenes in the same vicinity and similar to those through which the roaring waters passed until they reached and destroyed the villages and towns in the broader valley below.



THE CONEMAUGH AND ADJACENT VALLEYS—SCENES AMID WHICH THE GREAT ACCIDENT OCCURRED

Governor Beaver of Pennsylvania, in his account of the disaster which is telegraphed as an appeal for aid and succor for the distressed people, says:

The valley of the Conemaugh, which is peculiar, has been swept from one end to the other as with the besom of destruction. It contained a population of 40,000 to 50,000 people, living for the most part along the banks of the small river, confined within a narrow limit. The most conservative estimates place the loss of life at 5000 human beings and the property loss at $25,000,000.

Whole villages have been utterly destroyed and not a vestige remains. In the more substantial towns the better buildings to a certain extent remain, but in a damaged condition. Those who are least able to bear it have suffered the loss of everything. The most pressing needs, so far as food is concerned, have been supplied. Shoes and clothing of all sorts for men, women, and children are greatly needed. Money is also urgently required to remove the debris, bury the dead, and care temporarily for the widows and orphans, and for the homeless families.

Other localities have suffered to some extent in the same way, but not in the same degree. Other accounts place the loss of life at far higher figures, even as high as 12,000, summoned into eternity almost in the twinkling of an eye by the relentless waters. The river was so filled at places with the wreckage of buildings, etc., that the raging waters beneath could not be seen. In this debris were hundreds of people, and as burning lamps and stove fires were borne along on the flood the accumulating masses of debris took fire and a conflagration completed the destruction of life and property which the waters had begun. The scenes are altogether beyond description and still the peril is great. Bodies are found by dozens and scores all along the banks of the streams to which the waters have taken their course. Hundreds more are held in the debris which chokes the channels, and the cities below which depend upon these streams for their water supply fear the pestilence which will follow unless the waters are freed from their burden of the dead.

Relief work is progressing as rapidly as possible. The General Government, the people of other States and of foreign countries are telegraphing large sums of money to aid in giving food and shelter to the homeless, and in rescuing the unburied dead from the places into which the waters have hurled them. It will be weeks before the full extent of the disaster can be known.

The collapsed reservoir was originally built by the Pennsylvania Canal Co., and was used as one of its feeders, and was generally known as Conemaugh lake. It is from 200 to 300 feet above the level of Johnstown, in the mountains. It is about 3½ miles long and from a mile to a mile and a quarter in width, and in some places it is 100 feet in depth. The lake has been quadrupled in size by artificial means, and was held in check by a dam 700 to 1000 feet long. The dam was 90 feet in thickness at the base and its hight was 110 feet. The top had a breadth of over 20 feet.

The dam has been a constant menace, and its owners have watched it closely and believed it to be secure. Its breaking, they contend, must have been caused by a cloudburst, but the feeling against the company is nevertheless intense, the disaster being attributed to their negligence.

The breaking of the dam and the sudden letting loose of so large a volume of water would have been disastrous in a level country, but much more so in a mountain gorge. The course of the torrent from the broken dam at the foot of the lake to Johnstown was almost 18 miles, and with the exception of one point the water passed through a narrow-shaped valley. Four-fifths of it has been swept away.

The dam broke in the center at 3 o'clock, and at 4 o'clock the lake was dry, that great body of water having passed out in an hour.

An effort was made to avert the disaster by digging a sluiceway on one side to ease the pressure on the dam, but without avail. The water passed over the dam about one foot above its top, beginning at 2:30. Whatever happened in the way of a cloudburst took place during the night. There had been but little rain up to dark, and by the morning, when the workmen woke, the lake was full and kept on rising, until at 2 o'clock it began pouring over the dam and undermining it. Men were sent three or four times during the day to warn the people below.

When the final break came it was with sounds like tremendous continued peals of thunder. Trees, rocks and earth shot into mid-air in great columns, and then the wave started down the ravine. A man named Maguire said he was standing on the edge of the lake when the walls burst. The water was rising all day and was on a level with a pile of dirt which he said was above the walls of the dam. All of a sudden it burst with a report like a cannon and the water started down the mountain-side.

A mine-owner who had property near the reservoir had the dam examined by his engin-

eers, and says the embankment was principally of shale and clay, and that straw was used to stop the leaking of the water while the work was going on. The engineer who had charge of the construction says, however, that the masonry was solid granite and limestone, and was believed to be as enduring as the pyramids of Egypt

J. B. Montgomery, the railroad contractor, in explaining the bursting of the Conemaugh dam, says if it is true, that the waste-gates were never opened after the Pittsburg men leased the lake, the explanation of the bursting of the dam is found right there. It may be that the dam had not been looked after and strengthened of late years. It was undoubtedly weakened in the course of 25 years, during which the lake had not been used. Montgomery was one of the party of engineers who inspected the dam when it was leased by the Pennsylvania Co., five years ago. It then needed repairs, but was in a perfectly safe condition if water was not allowed to flow over it.

On Wednesday a coroner's jury proceeded to South Fork and investigated the cause of the breakage of the reservoir dam. Witnesses testified that slight breaks had appeared in the dam several times in past years, but had each time been clumsily repaired with straw, sticks, and rubbish. The general impression is that the jury will declare that the Pittsburg Fishing Club, that owned the reservoir, was guilty of gross negligence. In that event many suits for damages against this millionaire club will doubtless follow.

It is impossible at this time to estimate either the loss of life or property. Some 6000 men are engaged in the work of removing the rubbish in order to take out and bury the corpses in the wreck at the bridge where the fire occurred among the houses that lodged there. There are fears of a pestilence being caused by the decomposing bodies.

The Cambria Iron Works alone met with a loss of between two and three million dollars. At Williamsport 200,000,000 feet of logs and 40,000,000 feet of sawed lumber were carried off and the mills destroyed. Thousands of miners are thrown out of work in Pennsylvania. At Mount Carmel ten mines have indefinitely suspended, and 6000 men have been discharged. The wreck of the Chesapeake & Ohio canal is the most serious result of the flood in the Potomac. The canal cost more than $11,000,000. Since its commencement the total expenditure has reached nearly $40 000,000. Senator Gorman says the canal will have to be abandoned, as the company will be unable to raise means with which to make the repairs needed.

The body of the man who rode down the valley Friday morning, warning the people of the approaching danger, has been recovered. It was badly disfigured. The features were almost unrecognizable. The name of the rider was Daniel Peyton, son of the millionaire, Jno. W. Peyton. He knew when he started that the dam was about to burst, was pursued by a wall of water down the valley, overtaken and destroyed at the bridge.

All over the United States subscriptions are being collected for the surviving sufferers of this catastrophe. San Francisco has forwarded $20,000 and more money is coming in for the same purpose.

THE PROGRESS OF THE RUSSELL PROCESS.—A private letter from Mr. Russell says: "The works now running on the process are the Marsac, Yedrass, Lake Valley, Chloride, and I think it is still running on tailings at Silver City." The letter also states that works are about to be built at several other points in Colorado and in Arizona. At the Bluebird, in Montana, the change to leaching is to be made if the cleanup of a four months' run at the Marsac is satisfactory, a carload of roasted ore having been tested at the Ontario mill and yielded 29 per cent more than was got by amalgamation of similar ore at the Bluebird mill. A carload of ore from Idaho is also on the way to the Ontario to be tested. Mr. Russell says: "The prospects are very favorable."

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

GLACIAL MOVEMENT.—The Virginia *Chronicle* says: The great glacier on the northern flank of Mount Lyell in Mono county, near Lundy, has moved at least ten feet within a year. Last May parties built two monuments of rocks five feet high, one being placed at the edge of the ice and the other at a distance of 15 feet. The upper monument has disappeared and the lower one is cut five feet from the ice. Accurate measurements from several permanent points show conclusively that the glacial movement northward has been considerable all along the line.

WE WANT HIM HERE.—There is said to be a dog in Americus, Georgia, that lives on English sparrows, which he catches by slyly creeping upon them. Such a quadruped *Vedolia* would be welcome here in California. "May his tribe increase."

OUR LUMBER INTERESTS.

A Theory of the Redwoods.

Theories and explanations in regard to the question why redwood should only be indigenous to a limited portion of the Pacific Coast, have been promulgated and answered ever since redwood lumber became an article of general consumption. Mr. Belleisle, a gentleman connected with the Southern Pacific railroad, has made a study of the question and gives his ideas as follows:

One of the matters over which I have pondered for many long years is the cause of the difference between the trees in the three districts comprised within the redwood belt—Santa Cruz, Mendocino and Humboldt. I have a theory of my own, which I think is both original and correct. You are aware, of course, that so far as is generally accepted, the belt I have mentioned practically contains all the timber redwood of the State. Occasionally, however, are to be found a few scattering trees along the coast ranges. Upon the latter fact I base one portion of my theory. To carry it out, we must go back almost into the mystic dreamland of ages and ages ago. My firm belief is that in times primeval the whole of the Coast Range and the mountains, as far away down south as they stretch, were covered with gigantic redwoods and other forest trees, recalling Longfellow's opening lines in his poem of "Hiawatha." I believe that very ancient buildings, if they could be unearthed, would substantiate this. How they were destroyed, who but the Omniscient knows? Scarcely to any immense extent by man, unless the mortals who used them have passed away, leaving no greater trace behind them than the grand old trees themselves. If the trees died a natural death, beaten and buffeted by the over-warring elements, and finally succumbed to old age, gout in the roots, rheumatism in the branches, neuralgia in the heart, and a feeble brain, what marvelous climatic and physical changes must they not have witnessed, but caused. To their death or destruction—presuming this portion of my theory is correct—may we not attribute to a very marked degree many of our sterile plains, deserts and barren mountains down south? Forests destroyed prevent the moisture and the fertile leaf-mold requisite for agriculture. The absence of traces of these trees—except occasionally, as I have said—may be attributed to the tender shoots being dried out and poisoned, as it were, for lack of protecting cover. Gradually, too, the ground would become too arid for even the support of the roots and stumps, and they, in the course of ages, would disappear.

Now, then, the next step will be to Monterey. You have seen those grand old cypresses between Monterey and Carmel Mission, festooned with their garlands of trailing moss; with their gnarled and contorted trunks golden green with lycopodiums and a thousand and one species of mosses; silvery gray with many-hued lichens and other parasites, and with the poisonous mistletoe pendent from their branches—all sapping away the life-blood from these venerable and gloomy-hued patriarchs. They have lived for thousands upon thousands of years, but are now fighting a fearful battle for bare existence; they are like a brave warrior in the agonies of death, and praying only for a brief respite to settle his worldly affairs and make his peace with God. They are doomed—although they may exist for centuries—for the pitiless elements are waging an irresistible war against them. They appear to have a stronger vitality than the redwood, for they have outlasted them, as comparatively few are to be found here, while the other trees are of much younger and more rapid growth, and of a different character.

Now we cross the bay to Santa Cruz, without discussing what geological changes may have happened in the eras of the past. Here we find that, although still somewhat protected by the Monterey forest belt, the redwoods are getting ready for their final fight with nature's forces. We leave man and his invasion into their domains out of the question. Do you see how closely the grain and fiber cling together, as if the tree shuddered and shivered, as a man does in a chilling, icy-cold wind, which contracts closer every nerve in his body? As with the man, so with the tree—both feel the advance of decay and death.

Mendocino comes next, more vigorous in youth than Santa Cruz, and consequently slightly more open in fiber, but already beginning to feel the threatened attack. Last comes Humboldt, younger and lustier, and of more rapid growth, fostered by the greater moisture and better protective influences. Consequently the wood is softer and more readily worked for many purposes than the harder of the southern woods.

Another portion of my theory, and resulting from what I have said, is that the redwoods have, as it were, crept up from the south, slowly driven from there to a more congenial climate. As to the manner in which this grand army of evergreen leviathans marched into our State, this must be left to be discovered by wiser heads than ours, although the student of forestry can find many similar examples among forest trees. We must be thankful that we live in our age, when they are with us to enrich the grand resources of our State, and in our gratitude we should treat them as kindly as we can—utilize them, but not willfully and wastefully destroy them. Hitherto it has been the practice to waste the butts and stumps, and hundreds of serviceable logs are lying idly on the ground; but ere long it will be found that they will all become very valuable, and perchance the most valuable.

Before many years have passed away, there will be no more blasting, by dynamite, of roots to make a potato patch, for it will be found that half a dozen such roots are worth more than an acre of potatoes. No; economy in redwood will soon necessarily be the order of the day. The demand for it in this State, to say nothing of the rapidly increasing demand for it outside, will enforce a careful use of it. We do not yet know to how many uses this invaluable wood can be put. There scarcely seems to be any restriction upon its availability and adaptability to modern demands. Each day brings forth some newly discovered merits. The latest, and perhaps one of the most important, discoveries is its use as an ornamental wood for paneling purposes. It takes a very high polish, or can be polished to any extent desired. It is most durable, and not liable to split or warp, and has a grain of most beautiful texture and beauty, of varying and innumerable designs.

Durability of Timber.

We condense from the report of the Commissioner of Agriculture at Washington, D. C., in relation to the above subject, as follows: With proper after-treatment of the wood, the time of felling seems not to affect its durability. Early winter (December) should have the preference, because there is then less fermentable sap in the trees, and the timber will season with less care, more slowly, and more evenly, and before the temperature is warm enough for fermentation to set in. If the wood is cut "in the sap" it is more liable to fermentation and to the attacks of insects, and more care is necessary in seasoning; for the rapid seasoning, due to the warm, dry atmosphere, produces an outer season coat which envelops an unseasoned interior liable to decay. When cut in the leaf it is advantageous to let the trees lie full length until the leaves are thoroughly withered (two or three weeks) before cutting to size. With conifers this is a good practice at any season, and, if it can be done, all winter-felled trees should be left lying to leaf out in spring, by which time most of the sap is worked out and evaporated.

Always remove bark from felled timber to aid seasoning. Never allow the log to lie directly on the moist soil.

If dried too rapidly, wood warps and splits, the cracks collect water, and the timber is then easily attacked and destroyed by rot.

With sawed lumber, sufficient thorough seasoning for most purposes is obtained in from 12 to 18 months, while for the special work, according to the size, from two to ten years is required.

The best method of obtaining proper seasoning without costly apparatus in shorter time is to immerse the prepared timber in water from one to three weeks, to dissolve the fermentable matter nearest the surface. This is best done by running water—if such is not at hand a bath may be substituted, the water of which needs frequent change. Timber so treated, like raft timber, will season more quickly and is known to be more durable.

Never apply paint or any other coating to green or unseasoned timber, for if the wood was not well dried or seasoned, the coat will only hasten decay.

DISEASE IN WOOD.—There appears to be such a thing as a diagnosis of disease in wood, and the botanical physicians profess to know that it may be contagious or sporadic. Dry rot is called contagious, and it is said that the germ of that disease may be communicated to sound wood by tools which have been at work in diseased. It is thought possible that the theory accounts for many incomprehensible breakages of timber. The suggestion is that sound lumber should not be cut with the same saw that has passed through stuff affected by dry rot without cleaning.

MISSISSIPPI LUMBER.—The Minnesota State Deputy Surveyor estimates that during last winter 290,600,000 feet of lumber in the log were cut in the Mississippi river camps, or 69,400,000 feet less than in the previous winter. The stock of logs, both old and new, on hand last spring was estimated at 375,600,000 feet, against 480,000,000 feet a year ago—a decrease of 95,000,000. The prospect is for a lighter production of lumber this year than last.

OREGON LUMBER.—Lumbermen from Oregon tell of trees there 180 feet to the first branch that will scale 12,000 feet, and say there are thousands of acres of just such timber along the valley of the Deep river, which is being rapidly taken up at the Government price, $2 50 per acre for quarter-sections. This land will soon be very valuable.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1889, an assessment, No 13, of Five Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 327 Pine St., Room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of June, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 16th day of July, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.

OFFICE—327 Pine St., Room 9, San Francisco, California.

Kodak A Camera with which any one, without previous knowledge of photography, can make excellent pictures. Photography reduced to three motions—point the camera, press the button, turn the key—and the rest will be done for you at the San Francisco or Portland Agency, unless you prefer to do it yourself. Weight of Camera, loaded for 100 pictures, 26 ounces. Enclosed in sole leather carrying case with shoulder strap and is no larger than a field glass. Price, complete, $25. Reloading for 100 pictures only $2. The Kodak will photograph anything, still or moving, indoors or out, and can be brought into use without a moment's notice, as no tripod is required and it is not necessary to focus. Call and see the instrument or send 2 cents in stamps with request for Kodak "Primer" with sample photograph.

FOR SALE.

One 10x18 inch Clayton Belt Air Compressor.
One 3-inch Sergeant Drill.
One 5-ft. Double Screw Drifting Column with Arms.
One 4-ft. Single Screw Stoping Bar.
One 3½x13 ft. Air Receiver.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the
PAYMASTER MINING CO.,
Yuma, Arizona Territory.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron bangers for top saw. Friction feed-works, patent steel screw double-throw headblocks, with track iron, saw carriage and frame complete.
RISDON IRON & LOCOMOTIVE WORKS,
San Francisco, Cal.

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.

Ships under advances to smelting works in Boston, New York, Baltimore and Liverpool.
Twenty-one years' experience in Shipping Ores and Managing Mines.
Solicits Consignments of Copper Produce and Management of Mining Matters
All business conducted on Cash Basis.
Purchase and shipment of Mining Supplies A SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

WANTED.

FIVE OR SIX THOUSAND DOLLARS
Are required by the Owners of a
Well Developed and Very Valuable Gold Mine
To complete its mill and means of output of ore, etc. For this advance of capital a valuable interest will be given at a very low price. The mine is remarkably well located, with abundance of wood and water and every facility for mining, and can soon become one of the notable gold properties of the State. The owners are responsible men and practical miners.
G. M., Box 2617, San Francisco, Cal.

Sargeant Rock Drills For Sale.

The undersigned, having seven new 3-inch Sargeant Drills, complete with clamps and columns and three extra tripods, more than they can make use of, will sell all or any one, delivered in San Francisco at much below cost, the price depending on the number ordered.
ILEX GOLD MINING CO., Limited.

and all kinds of MACHINERY.

DEEP WELL PUMPS

This paper is printed with Ink Manufactured by Charles Fneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago Agent for the Pacific Coast—Joseph H. Dorety 529 Commercial St., S. F.

ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?
Are you going to make any change in machinery? Are you freighting by team or packing on mules? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of **THE DODGE PATENT INDEPENDENCE**

WOOD SEPARABLE or SPLIT PULLEYS.
They are the Lightest, Strongest, Best Balanced and most Convenient Pulleys made in the world.
Adapted to any power required. Time, trouble and money saved by using these Pulleys.
Price List and Catalogues mailed free.
Also **SIMONDS' SAWS** furnished to order as follows: **Inserted Point** (Mill and Edger), **Inserted Tooth, (California Pattern,) Solid, Shingle and BAND SAWS,** all sizes, **Crescent Ground Cross-Cut, etc. Also Planer Knives.**
SIMONDS SAW CO., 513 Mission St., San Francisco.

ESTABLISHED 1866.
Pacific Chemical Works.
HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist,
718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

CITY HOTEL.
Sonora, - - - - - - Tuolumne Co., Cal.
HEADQUARTERS FOR MINING AND TRAVELING MEN.
Office of all Stage Lines leading out of Sonora. Fine Bar, Billiard, Reading and Sample Rooms. Everything first-class. Terms reasonable. C. S. FITCH, Proprietor.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents,
220 Market St., Elevator, 12 Front St., S. F.
TELEPHONE No. 658.

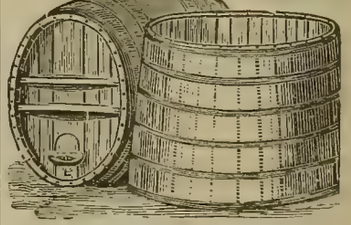
To Every Pump Maker,
Owner! Runner! Agent!

If there is ANY PRACTICAL QUESTION CONCERNING ANY APPLICATION OR ANY ADJUSTMENT OF ANY KIND OF A PUMP which is not answered in MR. ROBERT GRIMSHAW'S PUMP CATECHISM," we would like to have it for answer in the next edition or volume.
The Author will answer any such question in our columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if they have a practical bearing.
"Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps int he market. This information can be had in no other shape or place. Price of the book, post-paid, only $1, and worth $5.
DEWEY & CO.,
220 Market St., S. F



WATER TANKS, WINE TANKS!
CALIFORNIA WINE COOPERAGE CO.,
FULDA BROS., Proprietors,
30 to 40 Spear St., San Francisco.
ALL KINDS OF CASKS, TANKS, Etc.
SHIP, MINING, and WATER TANKS a Specialty.

INVENTORS, TAKE NOTICE!
L. PETERSON, MODEL MAKER,
258 Market St., N. E. cor. Front (up stairs), San Francisco.
Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

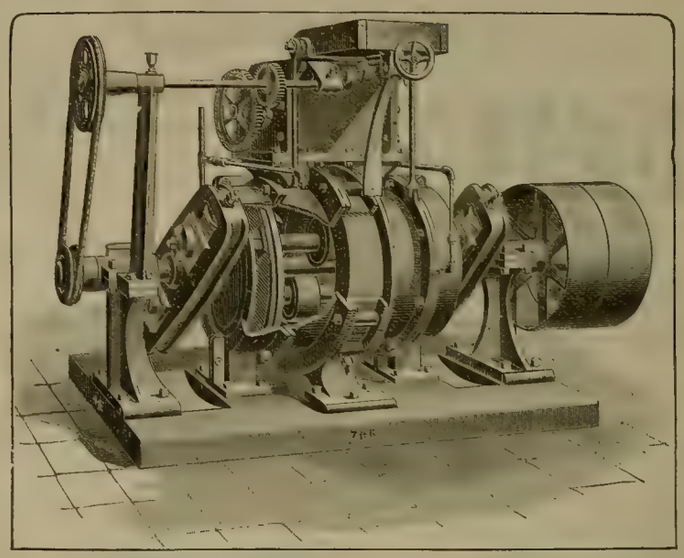
ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.

H. D. MORRIS.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

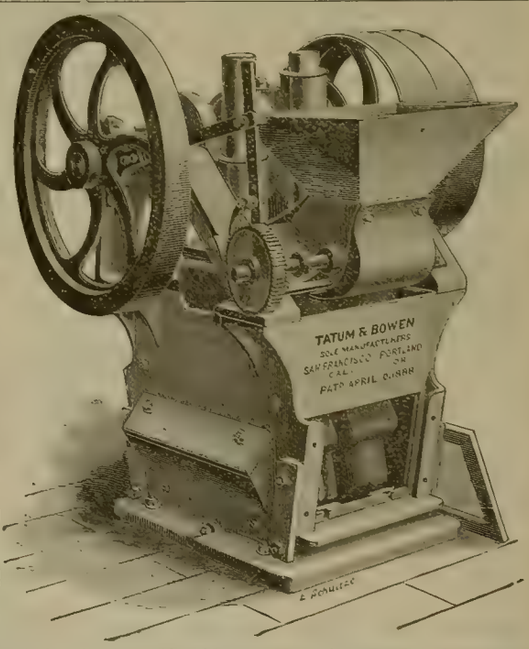
FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 32 First Street, San Francisco.

HOOKER & LAWRENCE, Gen'l Ag'ts. 145 Broadway, New York.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

TATUM & BOWEN,

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING MAY 28, 1889.

404,249.—PEN—H. Beichling, Wilkeson, W. T.

404,155.—BUNDLE BINDER—Berry & Lambert, Crescent City, Cal.

404,167.—CARRIAGE JACK—E. F. Curtis, Sacramento, Cal.

403,928.—HAND-BAG—F. Emeric, S. F.

404,222.—HAY STACKER—T. H. Palm, Sacramento, Cal.

403,959.—FIRE-ARM—J. H. and S. H. Redfield, Linkville, Ogn.

404,305.—MICROMETER GAGE—J. Richards, S. F.

404,080.—LOCK—H. C. Frost, Farmington, Cal.

403,999.—GRAVITY CLOCK ESCAPEMENT—F. Gundorph, Portland, Ogn.

404,200.—TENSILE STRAIN-TESTING MACHINE—Samuel Jump, S. F.

404,202.—VALVE—Samuel N. Knight, Sutter Creek, Cal.

404,235.—SLOT-MAKING ATTACHMENT FOR BOLT-HEADING MACHINES—Stephen Uren, Sacramento, Cal.

404,326.—NUT LOCK—C. O. Vinyard, Navajo Springs, A. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HAY-STACKER.—T. H. Palm, Sacramento. No. 404,222. Dated May 28, 1889. This is an apparatus for taking hay from a wagon or other vehicle and transferring it to a stack. By the mechanism employed the inventor is enabled to unload wagons at one point and build a stack of any required length and hight from that point without changing the setting after it is once placed.

BUNDLE BINDER.—Eugene Berry and Homer Lambert, Crescent City, assignors of one-third to J. Marhoffer. No. 404,155. Dated May 28, 1889. The invention relates to the class of binders for confining and holding bundles of any kind, and the invention consists in a novel and peculiar expansible and contractible frame. The particular object is to bind bundles of "shooks," a term applied to the parts of boxes in a "knocked-down" condition, and which are usually tied with manila rope and so shipped from the mill to the manufacturer of boxes.

TENSILE STRAIN TESTING MACHINE.—Samuel Jump, 426 Kearny St., S. F. No. 404,200. Dated May 28, 1889. The object of this invention is to simply and accurately arrive at the strength of any material by dead weight. Its uses, primarily, are for testing by such strain the strength of metallic substances, such as iron or steel bars, wire, springs, spring-balances and ropes, whether vegetable or metallic, it being also applicable to organic substances, all of which can be tested more accurately than by the known hydraulic appliances with less liability to error in calculating the results, the dead-weight system removing it practically beyond errors.

CARRIAGE JACK.—E. F. Burtis, Sacramento. No. 404,167. Dated May 28, 1889. This is one of that class of carriage or wagon jacks in which is employed a bowed arm having a bearing at one end on top of the axle and having in its other end a rod or bar forming an inserted continuation of the spindle of the vehicle axle; and the invention consists in connection with a carriage jack of this description of a novel nut-remover. The object is to provide, in connection with the bowed arm and inserted continuation of the axle spindle of jacks of this description, a simple and effective device for readily removing the nut from the end of the axle spindle whereby the wheel may be moved off the spindle on to the continuation bar of the jack.

AUTOMATIC VALVE ATTACHMENT FOR POWER MECHANISMS.—Samuel N. Knight, Sutter Creek, Amador Co. No. 404,202. Dated May 28, 1889. This invention relates to an automatic mechanism whereby a power-producing engine or water-wheel is stopped or started by variations in the pressure of the air which it is used to compress. It consists of a valve controlling the wheel or engine, pistons of different diameter secured to the stem of the valve so that by the varying pressures upon one or the other of the pistons the valve may be opened or closed. The invention is applicable to any form of motor which drives air-compressors, the increase or decrease of the air-pressure serving to stop or start the engine through the medium of an unequal pressure upon pistons of different diameters and a valve actuated by said pistons. When applied to air-compressors driven by momentum water-wheels, the regulation is effected by the variation in the pressure of the air from the compressor, which acts directly upon a piston moving within a cylinder, which piston is counterbalanced by a smaller piston fixed to the same rod and subject to a counterpressure of water under a high head or other medium. The stem or rod to which these pistons are secured connects directly with the valve which controls the passages supplying water to move the piston by which the water-wheel gate is opened and closed, thus making the supply of water regulate itself.

SLOT-MAKING ATTACHMENT FOR BOLT-HEADING MACHINES.—Stephen Uren, Sacramento. No. 404,235. Dated May 28, 1889. The invention relates to that class of bolt-heading machines in which the bolt is confined and gripped between opposing dies, while a reciprocating plunger operates against the end of the bar and upsets it so as to form the head of the bolt; and the invention consists in novel arrangement of parts whereby a keyway or slot is punched in the end of the bolt while it is clamped between the dies. The object of the invention is to provide a simple and effective attachment for bolt-heading machine, whereby a slot may be formed in the end of the bolt at the same time said bolt is being headed so that but one operation is needed to head the bolt and make the slot or keyway in its end.

Naturalists in Lower California.

Walter E. Bryant, one of the curators of the Academy of Sciences, has returned from an expedition to Lower California. The party consisted of Walter E. Bryant, ethnologist; T. S. Grandegee, botanist, and C. D. Haines, entomologist. They were accompanied by two Mexican guides and packers, and had a pack-train of ten mules. They traversed a space of 500 miles never before explored by naturalists, and after 3½ months' travel, embarked at San Quintin, Lower California, for home. At the meeting of the Academy on Monday evening, Mr. Bryant spoke of the results of the trip. He reports that the expedition succeeded in bringing back 100 specimens of small mammals, 200 birds, a collection of small reptiles in alcohol, a number of birds' eggs and 1000 specimens of plants. It cannot be stated how many of these specimens are new until they are compared with known specimens, though there will be many. The explorations covered most of the territory on the peninsula from Magdalena bay to Cape St. Lucas.

"Three weeks," said Mr. Bryant, "were spent in and about Magdalena and in going up the estero (a slough) 120 miles north of Magdalena to San Jorge. From San Jorge we went to Comondu, almost to the gulf shore of the peninsula. From Comondu we traveled 500 miles in 40 days with pack animals, following the mountains northward, and emerged at San Quintin, on the Pacific shore, about 140 miles south of San Diego.

"Some of our specimens were shot, but our most valuable aids we had in the way of collection were the boys at Comondu. While preparing for the expedition I got the boys in the neighborhood to bring in squirrels, foxes, mice and rabbits. I told them I would pay 5 cents apiece for each animal and 25 cents for large ones, such as foxes and squirrels. I also loaned the boys steel traps, with which to catch the animals. This plan I followed throughout the entire campaign, and by that means we were enabled to collect more animals than we ourselves could have done in a whole year."

Among the specimens are a large number of lepidoptera, many of which were new to naturalists.

At Comondu the ground squirrels were found a little larger than the California squirrel and much blacker, to which the name *Spermophelus grammurus atricapillus* (black-cap ground squirrel), was given. A male and female civet cat of a new species are among the collection.

Mr. Bryant says the country in that section is not inviting. The coast is low and sandy, and there is much mesa land, covered with thick, thorny brush and various species of cactus. There is little or no timber.

"About the only thing that would ever populate the country," he says, "would be the discovery of mines. There are indications of mineral wealth. If a population once got into the country, through a mining craze or otherwise, no doubt agriculture would receive some attention, and, perhaps, like it was in California, uses would be found for the broad wastes of land now condemned by the natives as useless."

BELTING AND PACKING.—Messrs. W. D. Allen & Co., Chicago, who represent the New York Belting and Packing Company in that city, have just issued a new and attractive catalogue containing full description of their large line of vulcanized rubber goods. The cover, which is of a good quality of paper, is of a buff tint and printed in red and bronze, a view of the company's warehouse and salesrooms, 151 Lake St., being shown on the back. It is a pamphlet of 40 pages profusely illustrated, and great care and much labor has evidently been bestowed in its preparation and production. Its perusal cannot fail to be of benefit to those interested in the line of goods which Messrs. W. D. Allen & Co. handle.

THE Napa Consolidated Quicksilver Mining Company has declared a dividend of 10 cents per share, payable July 1st to stockholders of record June 15th.

Manufacture of Mummies.

Mummies are now manufactured to order in Egypt by the cheating Arabs. Kings, queens and princes are furnished at reasonable prices. These mummies are made from honest cadavers, which are bought or stolen and treated much in the same way as bodies were treated in the days of the Pharaohs. The process is thus described by an eye-witness, Zenas Madden of Berlin and a correspondent of the Detroit *Journal*:

The body was put on a slab and the entrails were removed. The brain was drawn through the nostrils in precisely the same manner as Herodotus describes the embalming process in his Euterpe. After that the corpse was thrown rudely into a large vat of brine. After remaining there for a period of 15 days it was removed and hung by the heels from a rafter. A small brazier was put under the head and filled with some sort of sweet-smelling wood and fired. After this all the doors were closed, and the corpse was smoked like a ham.

In ten hours this operation was completed, and I beheld a most remarkable change.

The body had turned almost black. It was shrunken fully one-third. The features were pinched, just like those of a mummy, and it bore the appearance of great age. Some aromatic drugs, the nature of which I did not learn, were then prepared, and the corpse was filled with them, and by the same process that the brains were removed the skull is filled with a gummy substance smelling like sandalwood. A mummy case made the day before, but looking ready to fall apart from very age, was produced, and the corpse of the peasant, previously painted and gilded, was put in it, and a long scroll of parchment was prepared by one of the rogues, giving a history of the dead man's deeds some time during the reign of Thotmes, about 1450 B. C., when, in fact, he was a few days before gasping out his last breath on the burning sands near Gournah. The body I saw prepared, sold, I think, for $200 to the Academie des Sciences in Paris.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

The cash balance of the California mine embraces a value of $133,400 in unsold bullion on hand, besides the cleanup for May to hear from.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

ARRANGEMENTS are being made by the employes in the machine-shops and ship-yard of the Union Iron Works for a proper celebration of the completion of the United States cruiser Charleston. The affair will take place at Odd Fellows' hall on June 10th, and the leading feature of the occasion will be the presentation of a fine silk banner to Irving M. Scott, president of the works.

AT Alamo, Lower California, somebody put giant powder into the tubes of the boiler of Butler's mill, so that when the fireman started the fire the whole country was aroused by a terrific explosion, which utterly ruined both engine and boiler.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Pacific Business College.

There are few men in this day and generation who have the hardihood to decry the utility—nay, the glory of our public schools and free system of education. But while there are millions who could testify to an all-round education fitting them for the ordinary vocations of life, there are many special occupations requiring special training and preparation, which for obvious reasons are not to be found in our public schools, and it is to supply this want that such institutions as the Pacific Business College have been established. To the perfect system and thorough course of instruction given in this establishment thousands of successful business men in this city and all over the Pacific Coast owe their start in life and all the prosperity which has attended them since. In response to the invitation of the president, an attache of this paper called and was courteously shown through the college, and its system of education explained to him, from the primary to the finished course. For terms, etc., see advertisement.

Books on Assaying.

BY C. H. AARON.

PART I.—**Gold and Silver Ores.—Price $1.**

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

reface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth: 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Xanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 166 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

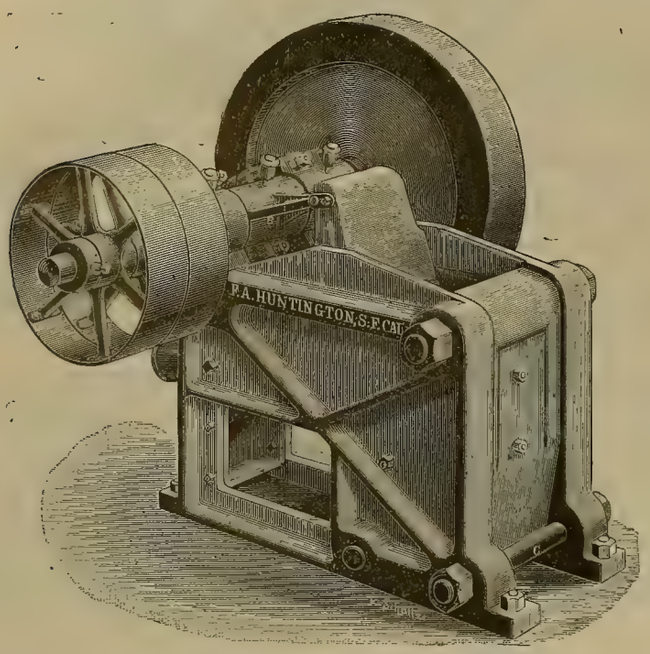
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & Co., S. F.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

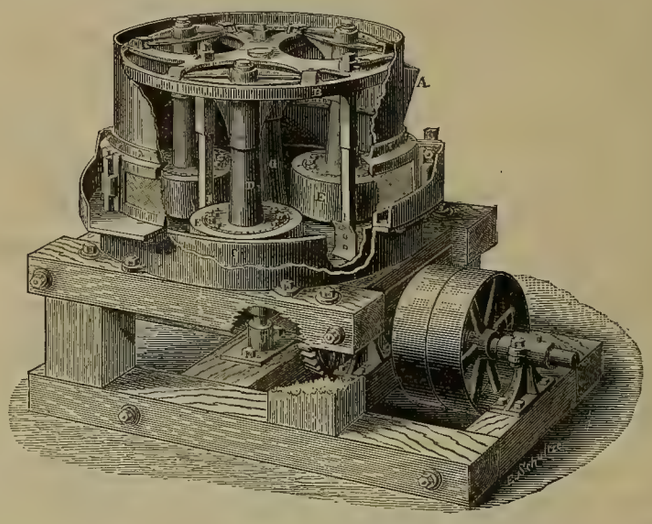
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 6, 1889.

General trade the past week was fairly active for the season. Rarely have merchants and all others engaged in business been animated with so hopeful a feeling as is now clearly discerned on all sides. Labor is well employed, for very few idle hands are to be seen, while employment for capital promises to be fairly remunerative. So far as our advices go, more farm or harvest hands are given employment, and at better prices, than have obtained for several seasons past. The banks report money easy, with only a fair call ruling. A more active inquiry is expected to set in toward the close of this month and continue well into August and September.

The imports by sea of treasure the past week aggregated as follows: Coin, $8667; Mexican dollars, 105,913.

The steamer City of Peking hence June 4th for China, took out treasure as follows: To Hongkong, Mexican dollars, 233,850; silver bullion, $51,000; gold coin, $4195. Total, $289,045. To Japan, silver bullion, $141,000.

The following is a summary of the local dividends paid in May:

	1888.	1889.
Gas and Water Co.'s	$112 750	$117,100
Insurance Co.'s	10,000	16,500
Power Co.'s	27,000	27,000
Street R. R. Co.'s	26,250	25,000
Mining Co.'s	437,920	303,369
Miscellaneous Co.'s	48,750	62,750
Totals	$662,670	$556,719

The coinage of the local mint for May amounted to $1,540,000, including $1,180,000 in double eagles and $360,000 in eagles. The total for the same month last year was $1,613,000. The descriptions coined from July 1, 1888, to May 31, 1889, compare as follows:

	1887-88.	1888-89.
Double-eagles	$11,380,000	$16,417,000
Eagles	6,390 000	5,547,000
Half-eagles	2,995 000	4,500
Standard dollars	2,065,000	108,000
Quarter-dollars	114,000	112,000
Dimes	396,285	155,455
Tota's	$23,319,285	$22,343,955

The mint will be closed some time this month for the annual cleanup and settlement for the fiscal year of 1888-9.

The following was coin on hand in sub-treasury in this city on May 31st: Gold coin, $37,437,931; standard silver dollars, 18,346,428; fractional silver, $6,791,663. There was shipped during the month to interior points the following: Standard dollars, 186,195; fractional silver, $47,060.

The operations of the San Francisco clearing-house in May were as follows:

May—	Clearings.	Balances.
1889	$70,651,204	$11,350,096
1888	70,592,543	11,407,696

New York mail advices report that the April exports of specie and bullion to foreign countries was $6,803,821, and imports $2,254,544, and this, too, in the face of a large trade balance in our favor, as the following comparative statement of the exports and imports for the first ten months of the year show:

	1887.	1888.	1889.
Total exports	$656,397,612	$635,034,387	$699,262,411
Total imports	628,316,869	657,328,261	639,630,812
Excess of exports	$27,580,743		$59,631,599
Excess of imports		$22,289,874	

Commenting on the above, a leading New York financial paper says: "With a balance of trade in our favor for the last ten months amounting to nearly $60,000,000, the continued shipments of specie, which in May have already reached nearly $9,000,000 from this port, may well attract attention. Some explain it on the ground that American securities have been sent out from London to be sold for British account. Others insist that as the specie has been shipped in a great measure to the continent, the course of the London trade can have nothing to do with it. But that is mere sophistry. London is a great financial center, and bills of exchange payable there will settle a debt in any part of the world. It is true that transfer drafts are not yet high enough to call gold from London to Paris, but they are sufficiently high to make it wise for our bankers to ship specie directly to the continent from this port, both to cover their account and to prevent a further rise."

SILVER—The light receipts, or rather light obtainable supplies, of silver bullion in this city is a source of considerable surprise. Take Selby's Smelting Works, which are probably the largest handlers of bullion, the stock is kept small by an almost continuous shipping or other demand. The supply is not only light, but promises to be still smaller, for advices from the Comstock mines point to a more general movement to extend their working into the gold-bearing lode which lies west of the lode (chiefly silver) that has been worked so many years. The inquiry for silver has kept prices here above the New York parity, ranging from 92¼c to 92½c. The last sale is reported at the last-named price. At the close the market is strong at 92¾@93c.

MEXICAN DOLLARS—The market continues to be well held, which allows good prices to be obtained. The call is said to be only fair. It is very generally conceded that after the crops have been secured, freer shipments to China will be inaugurated by Chinese laborers. The market closed strong at 73½@74c.

QUICKSILVER—Receipts the past week aggregate 170 flasks, and shipments by sea 25 flasks to Australia and 30 flasks to Mexico. The market continues very strong with a good home and export demand ruling, although at the higher prices buyers confine their requirements as much as possible.

IRON—The imports the past week aggregated 300 tons from Irondale. While holders speak confidently, yet the tone of the market is not so firm for either spot or to load. The European and Eastern markets are easy. In the latter markets close competition between the northern and southern iron companies has brought prices so low that many of the Pennsylvania furnaces will probably go out of blast. Steel rails recently sold in the East as low as they were sold in Liverpool at the same date.

COPPER—The market is reported "feverish and unsettled." The impression prevails among consumers that prices must go lower, and in consequence they confine their buying as much as possible. Quotations in our market are of a more or less nominal character.

LEAD—The market at the East is stronger and higher in sympathy with the belief that the ruling of the Treasury on silver and lead ore will be favorable to the home interest. With us the market is strong at full prices.

BORAX—Receipts continue light. Last week they aggregated only 364 centals, while the exports to New York by sea aggregated 2080 centals. The market holds strong at full figures.

LIME—Receipts the past week aggregated 4999 barrels. The demand continues active and prices fairly steady.

TIN—Pig is barely steady, while plate is easy. The demand is quiet for the season. The receipts aggregated the past week 3060 boxes by overland railroad, and shipments by sea 300 boxes to Victoria, B. C.

COKE—Under freer offerings both spot and for prompt loading are cheaper.

COAL—Imports the past week were as follows: From Seattle, 10,483 tons; Nanaimo, 5485; Coos Bay, 860; Departure Bay, 6968; Tacoma, 6750; and Baltimore, 1650; total, 32,136 tons. The market for spot is held with much difficulty at current quotations. There is a belief with large consumers that prices for Australian coals must go lower. This opinion is grounded on the following: The Southern Pacific Railroad Company's wants are supplied by their coast mines; the San Francisco Gas Company's wants are met by the recent purchase of 50,000 tons of Australian; the other large local consumers have their immediate wants met and will not buy for future unless offered considerable concessions. They believe that this concession they will secure either from shipowners who will load coal for this port so as to get outward cargoes of wheat, or else from exporters of wheat who will charter ships in Australia to load with coal for this port and wheat here for Europe.

Eastern Metal Markets.

By Telegraph.

NEW YORK, June 5, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	—	—	$—	$—	$—
Friday	42	91⅞	12 25	3 90	20 50
Saturday	42	91⅞	12 20	3 90	20 50
Monday	42	91⅝	12 10	3 92½	20 40
Tuesday	42	92	12 10	3 95	20 25
Wednesday	42 11-16	92½	11 90	4 00	20 35

NEW YORK, June 5.—No positively open market exists for copper mining companies, central supplies naming 12c for Lake ingot and 11@11¼c for casting brands. At these rates they supply all inquiry, but customers are few. Pig lead is held rather firmly at $3.85@3 90. Short trading prevails in small refined petroleum barrels at $6.90 firm; plain cases, $8.80.

Mining Share Market.

The market for the week under review has been tame, flat and unprofitable to the bull interest; but this interest appears to be growing beautifully less as each week rolls by. With so many fizzles in the past on the bull side, it will require a decided showing of ore in several different places to revive the market and draw in new blood for bleeding. The failure of the Tuscaroras and Quijotoas, under street points of large ore developments, is not calculated to inspire the outside public with confidence. Not only have the Tuscaroras and Quijotoas receded in price, but the Comstocks also have failed to respond in prices to street points of what is in store for holders of stocks. Of the Bodies, very little is expected by the general public, owing to the yearly liberal use of street points of a deal, proving a fizzle. What the new move, contest for election, has in store it is hard to say. All recent contests have left the outside public, who took stock in it, worse off than nothing. To give more color to the reported contest, Capt. John Kelley, it is reported, will be in the city at an early day to personally guard his interest against Archie Borland. Even if the Bodies do not pay dividends, they are rich in assessments, for Mono has contributed about $700,000 in the assessment, Bodie over $500,000 and Bulwer over $100,000, and may be worth contending for. Eureka Con. has shown considerable strength, but it is claimed to be purely manipulation based on a report of the mill starting up soon.

From the Comstock mines reliable news of an important nature is hard to get. A report is current of an improvement in Con. Virginia on the 1650-foot level (the same level the deal last fall was made on), an improvement in Mexican; while in Union, Crown Point, Belcher, Alpha and two of the middle mines the work is of a very interesting character. In the joint Alpha-Con. Imperial west crosscut work is being vigorously pushed. Several powerful drills have, so says report, recently been sent to the front to facilitate the work. There is no doubt but all important work now going on in the mines is toward the west, evidently to tap the Red (gold) lode at a greater depth. How long a time this will take is altogether problematic, for much depends on the dip of the lode and the character of the rock through which the crosscuts are to run. On the surface the distance between the Comstock and gold lode varies from 900 to 1200 feet. From the Tuscaroras and Quijotoas the usual large ore reports come to hand, while from the Bodies we are favored with statistical reports of the work going on. The New York *Financial News* of May 28th states that "a new Mining Exchange is to be established in London." In the English mining exchanges absolute merit, not talk, is a requisite quality in a mine to have its shares listed.

One dividend and several assessments were announced the past week. For particulars see tabulated lists elsewhere.

The market opened to-day (Thursday) with a steadier, firmer tone for the Comstocks, but with light trading. The strength of the market s no doubt due to stocks being well concentrated, the near approach to more interesting ground in several of the mines and a report that the California Pan-Mill will start up soon and also to eight-hour shifts in the mines instead of ten-hour shifts.

Baldwin Gardiner, formerly president of the Pacific Stock Exchange, is in the Exchange again, and it looks like old times to see his familiar face once more among the active brokers.

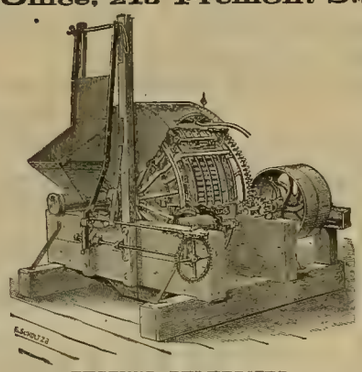
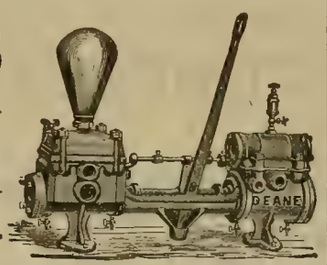
ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 213 Fremont St., San Francisco.


TUSTIN'S PULVERIZER.
—MANUFACTURERS OF—
MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders; Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.
Tustin's Pulverizer
WORKS ORE WET OR DRY.
ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

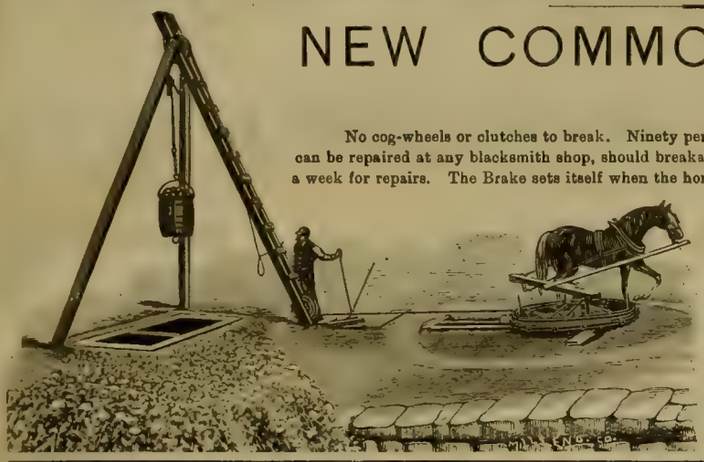
SHEET-IRON WATER PIPE for Mining and Irrigation Purposes.

ALSO SAWMILL MACHINERY.

Exclusive Agents for the Pacific Coast of HEINE PATENT SAFETY BOILER and MACBETH STEEL PULLEY.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.



NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

PACIFIC IRON WORKS

1850. 1888.

—BUILDERS OF—

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

An Open-Hearth Furnace Plant.

In the improved open-hearth steel practice the Lash furnace, illustrated on this page, is believed to be the best yet devised. Alfred E. Hunt of Pittsburgh, Pa., has described a complete plant on this system before the American Institute of Mining Engineers. It is peculiarly adapted to the use of natural gas, and there are, at the present writing, 12 furnaces now erected in Pittsburgh on the Lash system, four of 40 tons, five of 30 tons, one of 20 tons and two of 15 tons, and there are four 15-ton furnace buildings. (See Figs. 1, 2, 3, 4, 5, 6 and 7, in which the parts are numbered for reference.)

The hearth of the furnace (1) is made circular, or, preferably, elliptical, with major axis of 18 feet of hearth inside the linings and minor axis of 15 feet for a 15 ton furnace. This hearth is supported on beams, resting on suitable walls or piers, of such a hight that the charging-doors are accessible from the ground level. The retaining shell of ½-inch thick steel plates extends from the top of the side-walls down to a broad connecting-band (4) a short distance below the charging-doors; from this, the shell slopes inward to the bottom plates of the hearth.

The lining of the hearth conforms to the shape of the shell, and since the bottom-plates and supporting beams prevent any vertical movement downward, the conical shape of the outer walls of the lower portion of the melting chamber prevents almost all of the outward movement due to the expansion of the lining, thus preventing the rupture of the lower side-walls of the furnace.

The single flues (9) in natural gas furnaces at either end of the melting-chamber are five feet wide and are simply large passages inclined down toward the bath at a pitch of about four inches to the foot, to give the flame a strong guide downward upon the metal. In order to provide a firm support for the arched roofs of the melting-chamber and flues leading into it, a water-bosh, Fig. 7, made of ½-inch thick steel plate, is put in the form of a keystone in the arch of each roof, that of the melting-chamber (15), and that over the downtake flues (2) butting against the plates of the inclined sides of the water-bosh, which in this way acts as a double skewback or keystone. This bosh is one foot wide at bottom and five feet long. It is stayed inside at proper intervals by transverse bars, and though exposed on its under side to intense heat, works admirably. These water skewbacks are provided with one-inch pipes (16) feeding water at five pounds pressure, and leading out the waste water which is hardly lukewarm.

The side walls of the flues are held in place by suitable plates, angles, and buckstays (16, 17, 19) and the outer walls of the furnace are also stayed by plates and diagonal rods (18).

Natural gas is led into the sloping flues by wrought-iron pipes (10–17) which enter the brickwork near the "four corners" of the melting-chamber. The gas mixes with the air in its downward rush into the furnace.

The stack (21) is placed in such a manner that the flues leading from each end of the hearth (22–23), which have checker-work in them, alternately act as regenerators to preheat the air before it enters the furnace. The lower end of the stack is connected by a short flue (24) with a four-way chamber (25), to which the flues (22–23) from each end of the furnace converge, and to which the air duct (26) delivers. This air duct (26) leads out from the ladle pit (27) and passes directly under the hearth, in this way not only heating the air, but giving a free circulation under the hearth and preventing an excessive heating of the bottom.

Along the middle of the flues (22–23) leading from the central four-way chamber (25) to the opposite ends of the furnace, is placed checker-work of fire-brick supported on tiles (28), so that the bottoms of the flues are clear openings (29), giving a stronger draught; but as there is a constant tendency of the heated air to ascend, there is a thoroughly uniform heating of the air entering the furnace by this arrangement.

The front portions of the flues are provided with a series of double arches, which not only serve to strengthen the sidewalls and tops of

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Oro Bella Mines.

[Written for the PRESS.]

Much interest is felt about Phœnix in the success of the Oro Bella Mining Company, whose mines are in the Bradshaw mountains, about 18 miles east of the Big Walnut Grove water-storage dam, and one mile south of the old Tiger mine and mill. The property includes the Oro Bonito mine, which was worked years ago by San Jose parties, who built and operated a number of steam arastras on the mine, by which process, however, they were unable to work the heavy sulphurets underlying the oxidized ores nearer the surface. From the latter a large amount of gold was realized, and the free-milling ores were by no means exhausted when work on the property was suspended by reason of the dishonesty of the superintendent.

In December, 1888, this mine and the Oro Belle, adjoining, were purchased by Mr. Isaac T. Stoddard of New York, who has done much during the last ten years to promote the mining interests of Yavapai county. A company was organized by him and he at once proceeded to reopen and extend the several tunnels and other work about the property, which has now been opened to a depth of more than 600 feet, with ore all the way, and from one to five feet in width. A good wagon-road has been built to the mines and a fine ten-stamp gold and concentrating mill, probably one of the best in the Territory, has just been completed at the mouth of the lowest of the tunnels and is now running successfully.

Both the structure and power are designed for double the present capacity of the mill, which may be run by water-power the larger part of the year, though steam-power is used at present.

More than $100,000 have been expended in improvements and development during the last year, and we understand that Mr. Stoddard, the president and general manager, intends adding a chlorination plant, which will enable his company to avoid the great expense of shipment to distant smelters and attain the best possible results from the ore concentrations by working the entire product on the premises.

Near Bayard, which is the name of the Oro Bella camp, are the Boaz and the Crowned King Companies' mills and mines. There is over 600 feet of development work on these properties, with a 20-stamp mill, and 20 stamps more will be added this summer.

A big strike has been made in the Occident, adjoining the well-known Peck mine, which is distant but nine miles from the Oro Bella, and several new and promising prospects are being worked in the immediate vicinity of the latter, where much activity prevails. Numerous parties, who have recently visited the camp, express the fullest confidence in the future of the enterprise, which seems certain to become a dividend-payer at an early day. The citizens of Phœnix and supervisors of Maricopa county are contemplating the expenditure of several thousand dollars in making a "cut-off" or shorter road from Phœnix to these mines. The new railroad from Prescott to Phœnix, which it is expected will be finished within a few months, will run within five miles of the camp.

Mr. J. D. Helm and Mr. Wm. Tyack, both of whom formerly filled, and most creditably, important positions with the old Tip Top Company, are connected with the Oro Bella. We learn that among the directors of the latter are Mr. Richard S. Barnes of the well-known firm of A. S. Barnes & Co. of New York, and Mr. Jesse R. Grant. G. W. I.

Phœnix, Arizona, May 29, 1889.

PACIFIC RAILROADS AND THE WEST.—Along the line of the Pacific railway and its branches more than 127,000,000 of acres have been brought into cultivation during the past eight years, or, as the *Bankers' Magazine* estimates it, the territory opened to cultivation by the joint efforts of the Government and the Pacific railway has an area larger than that of New England and the Middle States and South Carolina combined, or larger than that of Indiana, Illinois, Ohio and Michigan put together. Such a splendid showing in eight years justifies the wisdom of the men who planned and endowed the Pacific road. Its operation has opened an area greater than that of many monarchies to republican civilization. The census of 1890 is likely to reveal almost inconceivable progress, and to indicate even more wonderful events in the erstwhile "Far West," which now is not so far from Chicago as Chicago was from New York 30 years ago. The regions opened by the Government and the Pacific road are sure to be the granaries of the nation, and are likely to be important factors in its metallic industries.—*Chicago Inter-Ocean.*

PNEUMATIC RAILWAY TEST.—Citizens residing at the Mission have been much interested, and even mystified, over the work of track-laying in the lot of the Mechanics' Institute, at the corner of Sixteenth and Folsom streets. A temporary engine-house has been erected and ties for 1000 feet of track laid in a circle. Inquiry shows that the object of the preparations is the testing of an auto-pneumatic railway.

Old Mines in Honduras

Much has been told and written about the "old mines" of Honduras, both here and abroad, says the *Honduras Progress*, and it really seems that in the minds of many mining novitiates, an "old Spanish mine" naturally must be rich, as if it would have gained with the bygone centuries, in a similar manner as a good wine will improve with years.

Without attempting to go into ridicule, we state that outside of the interest which antique work usually presents, an old Spanish mine is full of information for the miner as well as geologist. In passing through the old works left to us by the old Spaniards, we cannot but admire their great pluck and endurance which they undoubtedly have displayed in discovering and working the ore deposits.

Our miners and prospectors know by experience that prospecting for veins and seams in most parts of Honduras is very difficult, owing to heavy undergrowth which usually covers the mineral-fields, as well as to the heavy alluvial and diluvial deposits under which veins and country rocks are hidden. On this account, viewing for example the mouth of an old mine, we are puzzled to find an explanation of the reason why the old work was first started on a place where no mineral outcrops were visible, but where, in spite of it, the old Spanish miner had succeeded in finding a rich vein within a few feet of work underground.

Undoubtedly the old and bygone prospectors displayed an intelligence and skill in finding out locations of veins which even now is not surpassed by the miners of the present period.

In entering the works we also find that most of the "mineros" understood how to "follow" the vein and to extract the mineral by a method which, at the time then, was cheap and economical.

The old "Ordenanza Minera Espanola" contains excellent mining laws; it prevented largely a too crude extraction; it contained laws which protected the mines from a superficial "gouging," and contained valuable inducements for miners and the mining industry, which latter at that time was comparatively more advanced than many other industries, and which same industries to-day in their development show greater improvements than the present state of our mining industry.

The present mode of prospecting for mineral deposits distinguishes itself from that used in olden times, that nowadays large ore deposits, though low in mineral yield, are considered of sufficient interest and value to be examined and eventually made the object of montanic enterprise.

In those olden times, milling and mining machinery was primitive and would not allow the handling of large quantities of ore, while on the other hand our new improved mining machinery, and principally as manufactured in the United States, has revolutionized all former methods of mining and milling. More, these new inventions have given great value to some large but low-grade ore deposits, which, up to now, were left unutilized. These same modern appliances have given to mining investments safety and done away with venture, with which mining enterprise was placed at level with any other gambling investment.

In visiting old mining camps in Honduras we find a certain number of mines deserted, as in their lowest workings the occurring water was too powerful to overcome with the "tanate" or leather bag with which, even up to now, native miners drain the mines, in climbing with their water-bags on notched poles from the depth to the surface.

Other mines we find abandoned as the former owners in their workings struck "horses" or barren places in the vein, which, to penetrate, they perhaps had neither hope nor capital, although we have often noticed that such barren sections in the vein are only of a limited extent and usually followed by large and rich bonanzas.

As it was the custom of the old miners to follow a pay streak in a vein without regard to systematic exploration of the mine, it thus happened that most of the old works are most irregular in their construction, and as soon as a certain depth was reached a decided want of air was experienced which prevented any further exploration. It will be also remembered that only the richest and easy milling classes of ores could be utilized, and thus we find a large portion of ores left in the old mines which are of a refractory character, and at those early times could not be reduced.

WORKINGMEN ABROAD.—One of the most extensive newspaper expeditions ever projected in this country is that which the Scripps League of Western newspapers will send out during the coming July. As Congress took no steps toward sending American workingmen to the Paris Exposition with a view to examining the advance of mechanical arts, this wealthy newspaper syndicate stepped into the breach and have undertaken the work which Congress overlooked. They propose to spend anywhere up to $25,000 in paying all the expenses of 50 American workingmen chosen from St. Louis, Cincinnati, New York, Boston, Detroit, Cleveland, Chicago and other manufacturing points. The details of choosing the men who are to accompany the expedition are now being arranged, and it is not unlikely that representatives from this city may be among those who accompany it. All trades will be represented, including iron-workers, car-workers, shipbuilders, carpenters, molders, printers, etc. Workingmen's organizations are invited to correspond with the Manager Paris Expedition, Scripps League, Detroit, Mich., concerning the selection of men.

A Refinery for Butte.

The Butte *Inter-Mountain* says: The past week has been a quiet one in mining circles in this camp. Mining men generally have found more food for thought in the visit of J. B. Haggin to Butte than in any other topic that has been presented during the week. Although there is no authoritative announcement of the fact, it is generally believed that the Anaconda Company is considering the proposition of refining its own copper, and that Mr. Haggin's visit to Butte had some connection with this scheme. With the practically unlimited capital of the Anaconda, and the manifest advantages to be derived from such a plan, the project certainly seems probable. In speaking of the matter last evening to a reporter of the *Inter-Mountain*, a well-informed mining man of Butte said: "I do not know, of course, the exact constituents of the Anaconda product, but estimating it to be somewhat similar to that of the Boston and Montana, with which I am familiar, I take it that their export from Butte does not contain more than 65 per cent of copper and silver. Their building of a refinery would mean that 35 per cent of the transportation charges on their metal would be saved. With the vast output of the Anaconda you can well imagine what a saving this means. Then, too, the refining, which, of course, would be done electrolytically, would increase the value of the copper manufactured at least three-quarters of a cent per pound, bringing it to within a fourth of a cent of the value of Lake copper. The refining would be done undoubtedly by water-power, which would also mean a wonderful saving.

"Such a plan opens a wonderful future for this country. When it is put into operation it will bring the jobbers and copper manufacturers out here, and the big companies will sell direct to the trade. It will do away with the enormous profits of the middlemen. I look to see the Boston and Montana and the Butte and Boston as well as the Anaconda take this step in the course of a very few years."

No Rail North of Ukiah.

Colonel J. Mervyn Donahue, president of the San Francisco & North Pacific railroad, said to a reporter, with reference to the likelihood of Lake county getting a railroad: "When the stage-road from Hopland (on the Ukiah extension) to Lakeport was to be built, I accompanied the engineers on the road and made a glancing survey. It was a rough country. The stage-road would be too steep for a railroad, but I think I could punch a hole through Ubank hill that would give an easy grade to Lakeport. That is my opinion from a hasty survey of the country. What change the theodolite would make I cannot tell. Instruments will soon be put on the line, and if it be practicable to tunnel through Ubank hill and get a reasonable grade, the company would not hesitate to build to Lakeport if the people would give the subsidy which they say they will. As to going north of Ukiah, nothing has been done. It would be useless to go any farther north unless we went to Eureka, and I candidly believe that it is a little too early for such an undertaking. We would have to do it on borrowed capital, and I don't like the idea of bonding a road heavily. Besides that, until some new people get into northern Mendocino and southern Humboldt counties, it might be uphill work. We find many persons who candidly believe that railroads are the ruination of a country, and I have known of persons, originally living in Petaluma, who have gradually kept moving northward as the railroad approached them until now they are a day's travel on mule-back north of Ukiah. If ever I force them to move again, they will have to pack their duds for Coos bay, for whenever we stick the picks in the ground north of Ukiah, we will not quit until we are in Eureka, on Humboldt bay. There is no hurry about that road, because I'm first on the ground, have made surveys, and can reach Humboldt as quick as anybody if necessary."

GUARD FOR DUMMIES.—The Sutter-street cable line has put wire nettings completely around the dummies and the cars in a number of instances, and contemplates doing so on the entire lot. A test was made last week upon the Sutter-street road of a guard invented and patented by H. P. Montag. This consists of iron rods, running completely around the dummies, barely above the track, over which is a wire netting connecting with the woodwork of the car. Each end runs on a couple of rubber rollers and is fastened in such a manner that it adjusts itself to the irregularities of the track. On the trial trip the inventor threw himself a number of times in front of the dummy when at full speed, and was neatly brushed aside without injury. There was some friction noticeable when the guard rubbed against the Belgian blocks on the rough road-bed, but not sufficient to jar the car or interfere with its progress. It is claimed that when the arrangement is properly adjusted the guard will be perfectly free from any inconvenience of the kind.

State Railroad Statistics.

The annual reports of 36 railroads of California will be due at the office of the State Railroad Commissioners on July 1st. Thus far but one railroad—the North Pacific Coast (narrow gauge) railroad—has made an acceptable report. The Visalia & Tulare railroad made one report, but Secretary Gaskill of the commission had to send it back because the company had failed to answer such important questions as the number of employes, wages paid, cost of fuel, kind and quantity of merchandise transported, average rate per mile on freight and passengers.

Secretary Gaskill said this morning to a *D. R.* reporter: "The Visalia company evidently thought that I had put those questions in my blank forms merely for fun. But every question propounded by me in my blanks has its use. The North Pacific Coast railroad answered every question but one, which was evidently overlooked. Looking over its report made according to my new blanks, one can tell what the company has been carrying, what it has earned, how much it pays to its employes, and, in fact, everything that is necessary for the commissioner's secretary to make a thorough report. Such reports will be valuable to the merchant and the tourist, to the farmer and the capitalist. By them he can see what portions of the State are producing certain kinds of merchandise in largest quantities. For instance, in the North Pacific Coast's report, the total merchandise shipped was 100 per cent. Of that the report shows that only one-fourth goes up the road from San Francisco toward the terminus at Ingrams, in Sonoma county. The remaining three-quarters came down. Of the shipments of the road, 27 per cent was merchandise, 30 per cent lumber, 25 per cent wood, 6 per cent tanbark, and 3.62 per cent potatoes. That tells from what portion of the State certain products come. When I get the reports of every railroad in the State I will know exactly how much goods have been transported, and from where. I flatter myself that it is the most systematic way of gathering valuable statistics, and I have not asked a question which is not authorized by the powers of the commission."—*S. F. Report.*

Mining Experts Not Discoverers.

"Have you ever noticed," remarked one of the pioneers of early '63, "how many mining experts we have in Austin who know it all, and yet have never made it stick when they prospected on their own layout? A number of past foremen, when working for the Manhattan Co. in years gone by, have taken to themselves the credit of discovering bodies or pockets of ore, when the truth is known, they had orders from the Manhattan office to drive for it, and were told about how far to go to get the ledge, as the surveyor had already measured the ground, taken the angles, and had handed in his estimate.

"We have had always plenty of men who jumped the honor as the discoverers of the ore and posed before their fellow-miners as the men who knew what they were talking about, but when it came down to giving their reasons and to estimate the distances, they were not there. For any man to work a mine successfully, he must think for himself and pay no attention to what this one and that one says, for if he does, he will surely go under. In mining on Lander Hill, it is not only the breaks one has to contend with, but the jealousies and heartburns of miners who did not succeed in their ventures. How much better it would be if all would strive for the success of every miner and prospector, instead of wishing he would fail and find nothing, because that is their opinion, and everything should be sacrificed to uphold it. An opinion, in their eyes, is of more consequence than the success of a man who differs in his knowledge of the ground."—*Reese River Reveille.*

The Slickens Question.

Major T. H. Hanbury, United States Engineer, has returned from California, where he has been attending a meeting of the Mining Debris Commission. The commission visited the mining regions in the northern portion of the State on the Klamath, Scott and Trinity rivers, and then went over to Nevada and Sierra counties and examined some of the large hydraulic mines which have been enjoined and are lying idle.

He was much interested in noticing the wonderful changes in the water systems of that section, the old river-bed from which gold was being mined being 2000 feet above the present river and running at right angles with it.

There is a great deal of gold yet to be got out, and in getting it out a great deal of dirt must be washed down, and the question for the commission to solve is what to do with this "slickens."

He saw in one place a deposit of pay dirt 10 miles long, 1000 feet wide and 200 feet deep, awaiting removal as soon as some plan is arrived at by which hydraulic mining can be resumed. He also saw where the slickens from mines had been deposited, covering farms and presenting a scene of desolation. In some places young fir plantations were growing on the slickens, but it takes a long time before this stuff can be fit for cultivation.—*Portland Oregonian.*

White Labor.

The State Board of Trade has issued the following circular, which should receive the careful consideration of the whole people of this State:

So much has already been said, discussions regarding the economic status of the Chinese upon our coast have been so prolific, and the agitation so constant, that it seems almost useless to begin it again; but the State Board of Trade, through its Executive Committee and manager, takes the liberty of again bringing the subject before you, believing that only through an honest agitation of the subject and a persevering reiteration its object will stand any chance of success; and this object is to supplant the teeming and cheap Chinese hordes of laborers with unemployed and equally as good white laborers.

To do this and to do it effectively needs not only your co-operation but your practical every-day observation of the principles and maxims that you, together with the majority of this great country, have laid down during the last twelvemonth. You gave your money, your energies and your time, during the last year and a half, when the principle of protection was struggling against that of free trade; and for what, gentlemen, may we ask, did you do this thing? Was it not that the products of your vines, your trees and your manufactured articles might not be brought face to face, in an open market, with the same products, the result of a cheap and often degraded labor in a foreign country? The labor of the country stood by you and with you in this struggle, helping you, and expecting, when your object was gained, help from you. The laws have thrown the mantle of protection around you and the products of your shops and your field; thanks to the highest legal tribunal of our commonwealth, the laborer is protected from any further invasion. But the fact stares the man of labor in the face that the horde already here is as ready, as willing as ever, to take the bread of labor that by right belongs to him. You gentlemen, employers of labor, asked for your protection from the results of cheap labor; asked that your goods, manufactured by home labor, might not come in contact with the same goods, the result of cheap and foreign labor. You vineyardists asked that the protective duty might not be taken from raisins; and a generous and fair-play loving people stood by you and gave you the protection asked. In view of this the State Board of Trade asks: Is it to be the fate of our white laborer to look into the doors of factories this summer and see the hands of his Chinese enemy busily engaged in labor? Must he sit on the fence this long summer, when the vines are hugging close to earth with their golden burdens, and see this yellow-skinned foreigner reap the reward of labor that by the bond of color belongs to the white laborer?

We truly and sincerely hope that such may not be the fate of the white laborer this summer or any longer. Already our books are becoming filled with the names of men and boys ready for the shop, the factory or the field. There is a principle lying beneath this question of deeper and more important significance than the idea of cheapness. And, gentlemen, that is the only reason why you ever think of taking a Chinaman in preference to a white man to work for you, because of a money cheapness, feeling that for a smaller amount you can get the same work, the same results. You must take into consideration that you are succoring a class of laborers that take all and return nothing; you must take into consideration that your money goes, never to return into your common circulation again; you must not keep alive a parasitic growth in your midst by sustaining it by feeding it; you must not help keep an alien class with you that will not assimilate, will not mix with you, will not traffic with you, and in death wishes his bones to be removed from your country. And yet you wish to build up your State, wish to see it prosper, wish to see family after family come here and locate. And you invite him for what? To seek labor among his own by the side of his own fellow white laborer? Oh, no! By the side of John the Coolie. And yet the cry continually goes out from California that we would do anything to get rid of our yellow countrymen. And we hold him tightly with one hand while pushing him desperately away with the other. There is indeed a principle in this, a principle of consistency if nothing more; and if we cry out against an evil and have the remedy in our own hands, and apply it not, we soon become the laughing-stock of the country, and when next we send our plaintive cries across the continent beseeching help, people will laugh as they do at the fable of "The Boy and the Wolf."

As we said at the start, this is an old subject, a worn-out subject, a subject of much discussion and more agitation and less practical observance than any in our midst. But the State Board of Trade has found in its career that only by indefatigable industry and persevering reiteration has it ever accomplished anything; and as for this subject, we will say that, though the echo and re-echo of the chestnut-bell sounds from all sides in our ears, we will probe this subject until we find whether the manufacturer, the vineyardist, the fruit-grower and labor-employer loves to talk a certain way to a white laborer when he wants his vote and a different way when he wants his labor. When we solve this problem we will drop the subject. JOHN Q. BROWN, General Manager.
J. M. DAVIES, Secretary.

GOLD IN UTAH.—There is great excitement at Grand Junction, Col., over the gold discoveries that have recently been made in Utah. Placer beds have been found in the Henry mountains, and are pronounced by parties who have been there as exceedingly rich, the gold being of a coarse quality and easily saved without the use of quicksilver. A camp has been located, called the Bald Eagle Mining Camp, and supplies of all kinds are being shipped there from this point. Mr. C. C. Moore, who has just returned from the camp, is exceedingly confident that a rich strike has been made, and he will return in a few days, taking with him a large party. Mr. Moore thinks that valuable quartz discoveries will also be made in the vicinity. Jack Butler, formerly of Leadville, is the discoverer. J. W. Carroll, an assayer of known ability, and several other gentlemen are on the ground. The location is a very inaccessible one, more than 100 miles south of Green river, Utah. Forty miles of this is over a barren, sandy desert, where the heat is intense and considerable hardship has to be experienced to reach the desired point.

MT. TACOMA AS SEEN FROM TACOMA, WASHINGTON.

A GLIMPSE OF THE HARBOR AND CITY OF SEATTLE.

SILVER IN ALASKA.—A correspondent of the *Chronicle* says: On the 17th, word came up of a big find on Holkham bay, on the mainland, some 60 miles south of here. Since then parties brought up specimens of this rock which assay about 600 ounces of silver to the ton, with 17 to 25 per cent copper. Great excitement immediately prevailed, and by Sunday, the 19th, everything that would float was hired, borrowed, or stolen. Acres of dislodged rock cover the beach on the spot traveled over by ex-Judge Henry States, formerly U. S. Commissioner, and hundreds of prospectors must have trodden over these very same stones during the past ten years. To him, however, good luck left it to break one accidentally, and have their riches revealed. The new find has been bonded for $100,000. Heretofore Alaska's mines have only produced gold to any considerable extent. Now silver is added to her products.

ANTELOPE AT WASHINGTON.—Senator Stanford has sent to the Smithsonian Institution a young antelope from California to add to the collection for the national zoo. It was 11 days on the trip and reached the park very weak, but is recovering, and Captain Weedin, the keeper, hopes to be able to save it.

Durability of Timber.

We condense from the report of the Commissioner of Agriculture at Washington, D. C., in relation to the above subject, as follows: With proper after-treatment of the wood, the time of felling seems not to affect its durability. Early winter (December) should have the preference, because there is then less fermentable sap in the trees, and the timber will season with less care, more slowly, and more evenly, and before the temperature is warm enough for fermentation to set in. If the wood is cut "in the sap" it is more liable to fermentation and to the attacks of insects, and more care is necessary in seasoning; for the rapid seasoning, due to the warm, dry atmosphere, produces an outer season coat which envelops an unseasoned interior liable to decay. When cut in the leaf it is advantageous to let the trees lie full length until the leaves are thoroughly withered (two or three weeks) before cutting to size. With conifers this is a good practice at any season, and, if it can be done, all winter-felled trees should be left lying to leaf out in spring, by which time most of the sap is worked out and evaporated.

Always remove bark from felled timber to aid seasoning. Never allow the log to lie directly on the moist soil.

If dried too rapidly, wood warps and splits, the cracks collect water, and the timber is then easily attacked and destroyed by rot.

With sawed lumber, sufficient thorough seasoning for most purposes is obtained in from 12 to 18 months, while for the special work, according to the size, from two to ten years is required.

The best method of obtaining proper seasoning without costly apparatus in shorter time is to immerse the prepared timber in water from one to three weeks, to dissolve the fermentable matter nearest the surface. This is best done by running water—if such is not at hand a bath may be substituted, the water of which needs frequent change. Timber so treated, like raft timber, will season more quickly and is known to be more durable.

Never apply paint or any other coating to green or unseasoned timber, for if the wood was not well dried or seasoned, the coat will only hasten decay.

PORCELAINE is the name given to a new material designed for the interior decoration of street and railroad cars. It closely resembles marble, but is not so heavy, can be made in thinner slabs, and is said to be entirely unaffected by atmospheric action or staining elements. It is molded in a melted state into ornamental shapes, and then tempered until it is strong and tough. It is colored all shades at will, and is readily adapted to designs in frieze, wainscoting and general decoration. It is not liable to warp, nor to be disorganized by the motion of cars.

The Seattle Fire.

On Thursday of last week the entire business portion of the thriving and prosperous city of Seattle, W. T., was destroyed by fire. Every bank, hotel, place of amusement, all the leading houses, all the newspaper offices, railroad depots, mills, steamboat wharves, coal bunkers, freight warehouses and telegraph offices were burned down. The fire began near the corner of Front and Pearl streets, in the Seattle Candy Factory building, at 2:30 P. M., and before midnight had consumed the whole business section of the city, northward to Stetson & Post's mill, along Front and Second streets to the water-front. The city is literally wiped out, except the residence portion on the high ground.

Seattle, though one of the early settlements on Puget sound, passed through many vicissitudes in its early history, and it is only within a few years that it has expanded under the impulse of a solid, steady growth. It has a large and rapidly increasing commerce. Its religious and educational facilities are justly famous, and its site all that can be reasonably desired, either for trade or residence.

The rapid growth of Seattle in the past two years has seldom been equaled, and no mining excitement or wildcat boom has caused it. It has been the steady development of a seaport which was the center of an immense coal trade, and was surrounded by one of the richest agricultural and lumber districts in the world. An idea of the rapid advance made by the city may be drawn from the following statements of the population of the city, as given by United States, Territorial and city census returns in the years named: In 1880, 3533; 1883, 6045; 1885, 9687; 1888, 19,116; 1889 (estimated from the returns of the directory canvassers), 28,350.

Seattle is the center of an enormous business trade with Puget sound ports, 87 steamers being engaged in bringing to her wharves the products of the sound country and carrying back supplies. This system of exchange, reaching to every city, town and hamlet, began 20 years ago, and has been of constant growth.

The city is also rapidly becoming one of the important railway centers of the country, and will probably within two years be the terminus of three great trunk lines. A sketch of the water-front of the city is given on this page.

Extensive Manufactures.

Of almost equal importance with railroads are the manufacturing interests of Seattle. Lumber, coal and iron now employ thousands of artisans, and only a beginning has been made. The coal output for 1888 was $2,235,725, and with new mines opened and old ones improved by the addition of the latest machinery, the product of 1889 will fall little short of $5,000,000. The output of 11 sawmills, great and small, is 350,000 feet a day. Foremost among the new enterprises now in progress is the Moss Bay Iron and Steel Company of America, located at Kirkland, on Lake Washington, seven miles from Seattle. The plant will cost $2,000,000 and the works will employ from 1500 to 2000 men. It will be the largest enterprise of its kind west of the Mississippi river. Works for creosoting piles, in which $150,000 has been invested; marine ways, investment, $100,000; brick and stone works in West Seattle, investment $300,000; railroad terminal buildings, investment $150,000; stock-yards, investment $75,000; coal-bunkers for the Gilman mines, investment $100,000; Hall Bros.' ship-yard; ice works, investment $150,000; furniture factory, investment $75,000; reduction works, investment $400,000, are among the more notable industries now under way, while smaller factories, employing from 10 to 40 men, are so numerous that space forbids detailed mention.

Among the more important business establishments were 5 national and 2 private banks, 23 churches, 4 public and 3 private schools, the Territorial University, 3 daily and 5 weekly papers, 5 gas and water systems, 2 electric-light companies, a fine opera-house, 7 sawmills, 2 ship-yards, 1 dry-dock, 3 iron foundries, 1 brass foundry, 4 furniture factories, etc.

GOLD IN GUTHRIE.—An Associated Press dispatch says: Guthrie is apparently on the verge of a gold excitement. For several weeks past a vague rumor has been circulating concerning the discoveries of gold about the city, but nothing worthy of credence has been learned until this evening, when it was inserted in a daily paper that the precious mineral had actually been found. A boomer while digging a well on his claim struck a rich deposit. He came to Guthrie, and, purchasing some hardware, gave in payment several nuggets. The merchant had the ore examined, the result of which, if the boomer's story be true, will be to cause a great gold excitement. The identity of the boomer and the location of the claim are matters, however, veiled in profound secrecy, pending the formation of a syndicate, etc. Meanwhile discoveries of zinc, lead, coal, limestone and iron are daily reported. The richest iron ore so far found will assay 75 per cent.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLEVELAND.—Amador *Dispatch*, June 8: A few days ago a rich bunch of gravel was struck on this claim at Volcano, which shows free gold all through the pieces taken out. It is estimated to be worth $1000 per ton if there is much of the same kind. Fifty men are to be put to work immediately, which will be the means of livening up Volcano to a certain extent. The gravel is worked with the Cannon-ball mill at present; there is to be another mill built on the property shortly. Mr. Parberry has already delivered the lumber on the ground for same.

GARDNER.—Work was commenced on this property last Monday with Jas. Gleeson Jr. as superintendent. At present but four men are working tunneling to tap the old pump shaft. More men will soon be put to work, and proper machinery will also be erected. We will report progress.

KELLY.—A survey of the Kelly mine property in Hunt's gulch was made last Tuesday. Negotiations are about completed, and work on a small scale begun. An English company is at the back of it, which means that operations will be pushed when once a good start has been made.

MINING AROUND JACKSON.—*Ledger*, June 8: There is great activity manifested in mining matters around Jackson, which can hardly fail to lead to a material increase in the number of paying properties. Prospecting is being done on the Gardiner property by the parties who recently bonded it. Some work is being done on George White's quartz mine just east of town, with a view to its purchase by English capitalists, should it open out satisfactorily. S. W. Bright's claim east of town continues to show up very favorably. Overtures have been made to move a portion of the Ilex machinery on to the mine, and spend $2000 in prospecting. The offer was refused, as the sum was deemed too small to accomplish anything of consequence. We understand the Hardenburgh mine at Middle Bar has been bonded to the English company, operating the Morley or Wetzlar mine; it is also reported that the Amador Queen and Doyle properties are also under bonds to the same company. At the Amador gold mine, the carpenters were paid off on Monday and discharged. The intention is to confine the operations as much as possible to underground development. The small hoist placed underground at the 250 station works like a charm. John I. Midear has been formally reappointed superintendent by the new company. There is no lack of means. One pay-day was had last week, and another is looked for on the 12th, to square all indebtedness up to the present month.

MISCELLANEOUS.—Grading for the mill for the New London has commenced. At the Kennedy a tank is being placed in the shaft at the 1050 level to catch the water. This is preliminary to sinking.

FROM DRYTOWN.—At the Drytown Consolidated mine everything is running along in the usual manner. All the water has been taken out to the 280-foot level. New track and ladders and all the timbering is done to that depth. Reservoirs have been put in at the mouth of each drift to catch the water while work is going on below. Everything looks very encouraging. The Gover mill has been shut down a week on account of improvements being made in and around the mill. They are putting in new concentrators and other repairs. Wm. Parsons has had his roller-mill on the Ginocchio claim at the Black Hills ready to run for a couple of weeks, but is unable to get water enough to run steady.

Calaveras.

REPORTED SOLD.—Calaveras *Chronicle*, June 10: It is reported that the Gwin mine has been sold for $400,000. We give it merely as a floating report, however. In connection with the above, it was also reported that the Ilex mine machinery had been sold to the party or parties who purchased the Gwin mine. As to the last, we believe it is without foundation, hence our doubts as to the first.

El Dorado.

GREENWOOD.—Georgetown *Gazette*, June 6: The mining outlook of our little town never was brighter than at present. In the past the miners only waited for the rainy season to do a little work, but now they appear to have taken hold in earnest. Our old friend Col. T. G. Belty has a fine prospect. He has struck a ledge that promises something big, even better than he was expecting. He is busy timbering his tunnel. No mining man in this community is more deserving of the good-will of our people; he has labored under great disadvantage, but has never lost faith in his mine, ever hopeful that his mine will yet prove a source of great revenue to the town he loves so well, as well as to himself. The four Dixon brothers are working the Revenge mine, crushing their ore with an arastra run by horse-power.

RE-LEASED.—We understand that the old lease on the Parsons mine expires this month, and that it has been re-leased by B. F. Shepherd, Geo. Brown and Isaac McCullough, who have been working the mine, quit work last week.

GRIZZLY FLAT.—Placerville *Observer*, June 11: Captain Smith is pushing work on the Mount Pleasant mine as rapidly as possible. Developments being made are decidedly encouraging and it is now fully believed that this old mine, that has turned out so much bullion in past years, will again come to the front. The Sunday mine, which has been idle for several years, has been bonded by a San Francisco company and active operations will be commenced at once. The Black and White Con. mine has been bonded by capitalists of San Francisco, and two tunnels are being driven rapidly into the mine. The Mount Hope mine, which has produced considerable gold in years past, is now being opened up with favorable prospects. The Daley mine, two miles south of Grizzly Flat, is now being successfully operated. The ore is taken from a tunnel and dumped into the mill. Mr. Daley has a cannon-ball mill and one concentrator which reduces the ore and concentrates the sulphurets to his satisfaction.

PLACERVILLE DISTRICT.—At the Gignac mine development work is being prosecuted. The main tunnel is now in 240 feet and crosscuts are being run for the purpose of properly opening up the mine with a view of breasting out cement gravel in sufficient quantity to supply the mill. At the Bassett or Stewart mine the main tunnel is being driven ahead through favorable gravel. The tunnel has already passed through a fine bed of gravel which prospects well.

MUD SPRINGS DISTRICT.—At the Equator mine, north of the Church mine, some interesting developments are being made. For a long time croppings have been noticed some distance north of the Equator's west tunnel. During the last rainstorm, the water running down the hill washed the dirt off so as to expose the ledge to view. Supt. Burdick, becoming attracted by its favorable appearance, has run a crosscut opening a vein 30 feet wide which he informs us prospects well in free gold.

SMITH'S FLAT DISTRICT.—Supt. Coughlin is pushing work actively at the Rogers mine. A level is being run north for a bunch of gravel which they are daily expecting to strike.

KELSEY DISTRICT.—The Big Sandy mill at Kelsey is running regularly. The ledge is from 10 to 15 feet wide containing free gold the entire width. The whole ledge is being taken out and run through the mill, which is reported as giving satisfactory results.

Fresno.

A MILL.—Fresno *Republican*, June 8: The mine owned by James Morrow, and situated about one mile north of the town of Hildreth, has developed into a rich property. The deepest incline shaft is 150 feet, and at the bottom of this a ledge of decomposed porphyry, some two or three feet thick, has been uncovered. The rock assays, so far, about $30 to the ton, and is growing richer. There is already on the dump all the ore mined during the past month, and now that hoisting works have been completed the rock will be mined more rapidly. A five-stamp mill is to be built at once.

Inyo.

THE NEW BORAX WORKS.—*Independent*, June 8: Conn & Trudo have their borax works in Saline Valley in working order and are making borax. In fact they have already made a great many tons. They have 18 crystallizing tanks, each of a capacity of 1000 gallons. Three tanks are emptied each day, and the yield from these is about two tons of borax. In very warm weather the yield might not quite reach that amount, as the borax does not crystallize so well as in cool weather. The crude material is first boiled, the boiler having a capacity equal to three of the crystallizing tanks, and the solution is then run into them and allowed to stand six days. The borax accumulates on the sides of the tanks, which are made of zinc, and on plates of the same metal suspended in the liquid. Seven of these plates are used in each tank. The borax is put in sacks direct from the tanks, and is then ready for shipment. From the works to the railroad at Alvord, the distance is 55 miles. Within a few hundred yards of the works is an Indian settlement. The borax marsh has an elevation of about 500 feet above the level of the sea. The Inyo mountains rise like a wall close to the works and attain an elevation of about 11,000 feet above sea level. This is one of the grandest stretches of mountain scenery in the State.

Mono.

THE BODIE CON.—*Miner*, June 12: During the past week west crosscut, 1200 level, was advanced 12 feet. There were employed 10 miners and 1 foreman. Jointly with Mono, the upraise on the 1000 level was driven six feet, and upraise from south drift, 1200 level, was driven 26 feet.

MONO.—During the past week the southeast drift on the 1200 level was advanced 20 feet. South drift, 1000-foot level, was advanced 8 feet. There were employed 6 miners, 1 foreman, and jointly with Bodie 6 miners, 1 chief and 3 assistant engineers, 3 firemen, 2 carmen, 1 carpenter, 1 blacksmith, 1 laborer, 1 watchman.

Nevada.

A LUCKY FIND.—*Tidings*, June 5: Operations at the Idaho having been stopped, the waters of Wolf creek are clear and pellucid. Remarking on this this morning, Peter Brunstetter noticed a piece of quartz, evidently croppings, in the creek at a point just above the Idaho bridge. Impelled by curiosity, he secured the quartz and was enriched many dollars thereby, for the piece of rock (somewhat larger than a man's fist) carries a band of coarse gold all around, if not through it. This band, so to speak, varies in width from one-eighth to five-eighths of an inch. Mr. Brunstetter has refused $30 for the specimen. Later on, the young man found three pieces of gold-bearing quartz in Wolf creek where that stream passes in the rear of Murphy & Brunstetter's lumber-yard.

A PIGMENT.—*Tidings*, June 11: By combining the oxidized iron (refuse of the copper ore) and yellow ocher found in the mine, Woller & Pietzsch of the Spenceville copper mine have manufactured a paint for which a San Francisco house offers $40 a ton. There are thousands of tons of it in sight, and the necessary works for the manufacture of the pigment are in course of erection.

Placer.

THE GRAY EAGLE.—*Herald*, June 8: Last week several of the directors of this mine arrived at Auburn on the evening train, and next day drove over to the Forest Hill divide. They were accompanied by Mr. R. L. Dunn, their engineer, and interesting developments were looked for by the public. But the public has been disappointed, and the public is puzzled. All that can be learned is that work has been suspended, the force of men taken off, and the shaft is filling up with water. It is reported by some who ought to know that a well-defined channel was reached and gravel which returned a very satisfactory prospect was taken out. It is also said that a tunnel will be started immediately, but there is no movement at present to indicate it. There is an air of mystery about the whole affair which the curious are at a loss to account for. We sincerely hope that this venture for which such brilliant success was predicted is not to pass into history as an expensive failure.

San Bernardino.

GOLD HILL MINES.—Cor. *Press and Horticulturist*, June 8: Our party, consisting of J. R. Jumper, H. Waddington and your humble servant, left Riverside May 14, with the determination of going to the celebrated Gold Hill mines, near Death Valley, the point where Messrs. Nowlin, Beall, Barney Carter, and Taylor of South Riverside, are located. These gentlemen feel very sure that they have something rich. About the gold: What shall I say? The truth, of course. This I am afraid to attempt, but judging from what I have learned I must say that this is a very rich mineral belt, but it will take time and money and hard work to get it out, but these three elements combined can do wonders. The belt is much larger than those who have been there suppose. Interested parties are surveying a new road to reach the mines, which will be a little longer but will take teams and supplies near the mine, also near wood and water. Food for man and beast will have to be hauled from Hintley, the nearest point. In conclusion, I want to say that it is very hot, and that in my judgment it will be best for men to wait until the heated season is well past before going to the desert. That there is mineral, there is no doubt in my mind, and I had opportunity to interview nearly all the prospectors that have been in that country.

Sierra.

JIM CROW QUARTZ.—*Mountain Messenger*, June 8: Jesse Carney, who has been working on some quartz ledges in Jim Crow canyon for a number of years, has at last got matters in such shape that he will be able to develop them. He is said to have interested a company of Eastern people, and that for a certain proportion of the stock, they are to put in order a mill built many years ago, and to thoroughly prospect the property. Amos Hart has gone up to do the carpenter and millwright work.

THE BUFFALO MINE.—Sierra *Tribune*, June 7: The Buffalo Mining Co. cleaned up last Saturday. About seven ounces of gold was obtained. It is estimated by those who ought to know that fully $15,000 must have escaped and gone to the creek below, the amalgamating process that they used not working as the company thought it would. Work was resumed again to-day with Fred Rickard as amalgamator. He says that the gold is easily amalgamated, and thinks no other but that a good cleanup can be obtained. There is only water enough to run five stamps.

THE SIERRA BUTTES G. M. CO. of this place cleaned up $12,000 for last month's run. A party of miners of this place has leased the Colombo mine near Sierra City. They commenced operations at the mine this week. Walter Lawry, Sr., and H. M. Bradbury have been awarded the contract to put down an incline on the Wallis Consolidated drift mine above Forest City.

Siskiyou.

QUARTZ AND PLACER.—Yreka *Journal*, June 12: The Gold Ball Mining Company continues to take out exceedingly rich quartz from their ledge at Salmon river. Their ledge averages from four to five feet wide, and some of the quartz seems to be more gold than quartz. In one day they took out about $30,000, and all of their quartz pays handsomely. Another new ledge has lately been discovered near the Gold Ball ledge, by a man named Roberts, which prospects exceedingly well. The old Humpback ledge, between the Black Bear mine and Klamath mine, has been paying handsomely of late. The Uncle Sam mine in the same vicinity yields rich quartz, but the scarcity of water prevents the owners from being able to run their water-power mill. Splendid reports come in every day from the quartz mines on Know Nothing and Methodist creeks, near the Trinity county border, where an immense quantity of gold will be taken out this summer. The miners at Hamburg Bar and vicinity on Klamath river are all busy, but not far enough advanced with their work yet to get pay, although the prospects look encouraging for rich returns on nearing bedrock in the channel. The Klamath river miners in Cottonwood mining district are getting on with their work. John Waggoner & Co. have pumped out their inclosure and are sinking the pump down through gravel to bedrock. They get a good prospect in the gravel. Wm. Pullen has had an enormous amount of work to do, but is getting along in good shape now. His wing is done and wheels for washing, running derrick and pumping. Waggoner & Co.'s claim is about 75x225 feet, and Pullen's claim about 75x450 feet. Jillson & Co. have closed down their hydraulic for the season, there being no more water. They got a fine prospect considering the amount of ground they were able to pipe down with the small supply of water had.

Trinity.

NEW RIVER.—Cor. Trinity *Journal*, June 8: The great work of the season is being done by the Ridgeway Con. Gold Mines Syndicate. The company is running their tunnel into the mountain a distance of over 700 feet; they are in over 350 feet; they are also preparing to build a fine 10-stamp mill of 750 lb. stamps, with all modern improvements, such as concentrators, electric light, etc., at the intersection of lode. The amount of ground opened for stoping will be about 250 feet. The sawmill will be in operation in the course of another week, sawing lumber for the building of the mill and for the purpose of building a tramway from mine to mill for transporting ore; this tramway will be operated by cable. The tunnel is being run by contract by John Thynge & Co., who are doing excellent work. The Mountain Boomer is also doing good work; they have a force of men at work opening up the ground and keeping their mill running constantly on rich ore. The Excelsior is also employing a force of men on their mine with equally good results. A prospect has been lately struck west of this mine that bids fair to equal the Excelsior. Mr. Irving, who lately came to the camp, is the lucky owner and prospector. The Hard Tack is being worked by parties on tribute, and good paying ore is being taken out. The Golden Gate is also coming to the front as a gold producer. Mr. Gutzen is the owner and has commenced work on some very rich ore, some of which has assayed as high as $800 per ton; he is now engaged in erecting a 5-stamp mill to run by water power, and expects to be able to commence crushing by July 1st. The owners of the Siberia have also started in since the fine weather and have let the contract to run a tunnel 100 feet. This prospect is no doubt one of the most promising on New river; situated at the head of Slide creek, it presents a ledge of quartz matter nearly vertical, running directly into the mountain, going one foot in depth of ledge for every foot run; the prospects of this property vary from $40 to $100 to the ton. It is hard to conceive a more convenient place to open a mine than this, as timber and water are both plentiful. Many other properties are being opened in this district, and many new men coming into camp. It seems to be the prevailing opinion that the work being done this summer by Ridgeway and other companies will decide the question whether New River District is to take its place as a great gold producing camp or not; but in conversation with many old miners here I find every one most sanguine as to the outcome.

EAST FORK.—The Enterprise Co. will have a millman on the mine next week, and it will not be many months before the drop of stamps will be heard on the property. Henry Junkans will have a mill on the North Star as soon as satisfactory arrangements can be made. M. Simmons of East Fork, one of the locators and owners of the Web-Foot mine in that district, says that the prospects of the mine are looking well. The vein runs from six inches to seven feet in width. There are three tunnels on the ledge—one 160 feet in length and two shorter ones. In the tunnel begun last winter, the ledge goes from $10 to $25 to the ton. They have about 100 tons of good ore on the dump, which will be crushed by the mill on the "Fountain Head" as soon as completed, work on which is now being pushed.

Tuolumne.

COAL.—Tuolumne *Independent*, June 5: John Noonan has discovered a coal vein in this vicinity. It is about eight feet below the surface, and the vein dips about 45 degrees. He has followed it about 100 feet. It burns freely, and grows better as it goes deeper.

NEVADA.

Washoe District.

HALE & NORCROSS. — Virginia *Enterprise*, June 8: The last letter says: On the 300 level the north drift from the new station is advanced 85 feet. On the 400 level the stopes in the north drift from No. 1 west crosscut continue in ore of good quality. We are now stoping in the sixth set above the track floor. On the 500 level the north drift was advanced 18 feet. The stopes above this level continue to yield the usual quantity and quality of ore. On the 700 level the prospect drift north from the end of the west crosscut is advanced 30 feet. We are extracting fair-grade ore from the south stopes on this level. During the week we have hoisted 1245 cars of ore, have shipped to the Nevada mill 1080 tons and have milled 997 tons. Have shipped in bullion $75,072.27, and estimate that we will receive about $28,000 more on the final cleanup from May account.

SAVAGE.—On the 500 level west crosscut No. 2 was advanced 25 feet. The face is in vein porphyry. In the south drift are extracting ore from the old stopes. During the week hoisted 578 cars of ore, shipped to the Rock Point mill 503 tons and milled 490 tons. Average battery assays, $24 per ton. Shipped during the week $9216.14 in bullion.

ALTA.—The mine is looking well and the repairs to the mill are about completed.

CON. CAL. & VA.—Ore is being raised from all the levels between the 1400 and 1950. The usual shipments have been made to the river mills, and the average of the battery samples will be about the same as last week.

GOULD & CURRY.—The new upraise above the 490 level is entering into what is likely to prove a fertile formation.

BALTIMORE.—The south raise is still in good ore. The west crosscut on the 225 level is in very wet ground. Quartz carrying some metal is being obtained.

JUSTICE.—Mine yielding as usual, and mill kept running steadily.

UTAH.—Raise No. 2 above the main south drift on the 600 level continues to show quartz carrying metal.

OCCIDENTAL.—The north drift from the winze between the 550 and 650 levels is in quartz that is yielding some pay ore.

NORTH OCCIDENTAL.—Ore is being mined from the north drift on the 300 level.

SIERRA NEVADA.—The east drift on the 520 level continues wet, and is still in porphyry and clay.

UNION CON.—West crosscut No. 1 on the 1465 level is still in a wet formation consisting principally of porphyry and clay. This formation indicates the approach to fertile ground.

MEXICAN.—West crosscut No. 1 on the 1465 level is in a promising quartz and porphyry formation.

OPHIR. — The principal work in progress is in the shape of cleaning out and repairing.

BEST & BELCHER.—The southwest drift, 175 feet above the 625 level, is in quartz that carries some metal.

SCORPION.—Work is still confined to the east drift on the 520 level, joint with the Sierra Nevada.

OVERMAN.—Have extracted 1321 tons of ore. Shipped 1153 tons to the Vivian mill. Have run 397 feet of drifts and upraises from stope No. 3, the material being quartz and porphyry. Have repaired 104 feet of drifts on the 52 level above the track floor. This work was done to open up air connections with the Lambert incline.

CHOLLAR.—East crosscut 140 feet south of north line on the 550 level is out 21 feet; face in quartz giving low assays. The north lateral drift, 750 level, is out 265 feet; the face is in porphyry with streaks of quartz. The north lateral drift, 850 level, is out 343 feet; face in clay.

POTOSI.—The usual prospecting work is in progress. On the 950 level the south drift is being advanced into fertile ground.

EXCHEQUER.—On the 332 level east crosscut north incline is out 161 feet; face in clay and porphyry. No. 2 west crosscut, 150 feet south of north line, is out 16 feet; face in porphyry. North lateral drift, 500 level, is out 500 feet north of Alpha shaft; face in porphyry.

ALPHA.—About the same as Exchequer.

SILVER HILL.—On the 160 level the northwest drift is in quartz that shows well in gold.

ANDES.—West drift being pushed and a considerable amount of repair work in progress.

CROWN POINT.—The 300 east drift is out 46 feet, having advanced 10 feet during the week. The 500 raise is up 51 feet, the top in hard ground showing

a few small seams of quartz. Are opening twelfth floor in 400 south stope. No change to report elsewhere. Shipped to the mill during the week 567 tons of ore, the average battery sample of which was $24.77 per ton.

SEG. BELCHER.—The raise from the 1100 level is in quartz that gives good assays.

CONFIDENCE. — The joint Confidence-Challenge south drift on the 1250 level is in a distance of 20 feet, having been commenced during the week. The face shows a mixture of quartz and porphyry. During the week a great deal of necessary timbering has been done throughout the mine.

YELLOW JACKET.—About 100 tons of ore is sent daily to the Brunswick mill; average assay of battery samples, $30. Much exploring work is in progress.

BULLION.—Drifting north on the 760 level.

BELCHER.—The 1100 raise is up 70 feet, having been advanced 14 feet during the week. The top is in soft porphyry. The 1100 south drift has been advanced 50 feet, making its total length 190 feet. No change to report there. The 1100 south drift is out 68 feet, and the 1200 south drift 72 feet. Both in porphyry.

Columbus District.

THE COLUMBIA MINE.—Walker Lake *Bulletin*, June 5: S. P. Warren and G. H. Hill of New York, owners of the Columbia mine at Candelaria, arrived recently from the East. This is said to be a valuable property, and has a compartment shaft down 420 feet. These gentlemen have spent $125,000 on the property, which has been in litigation several years. The legal questions involved have all been settled, and work will be resumed early this month.

Eureka District.

MINERS IN LUCK.—Eureka *Sentinel*, June 10: A miner, who has had good luck and bad in the camp for a number of years past, tells us that two Italians who went to work in the Hugenot mine on Prospect mountain about a month ago, shipped a lot of ore to the furnaces and the returns amounted to over $500. Said he: "I have passed the place where that ore came from off and on for the last 12 years, but never thought there was any ore there."

Highland District.

PROSPECTING.—Eureka *Sentinel*, June 10: Interest is centering again on Highland mining district. For several years past not more than two prospectors have had courage enough to stay with their locations, but of late several outside parties have become interested in claims there, and some developments may be made this summer.

Pittsburg District.

THE MAYSVILLE MINE.—Virginia *Enterprise*, June 15: Chas. Rulison and George Likens have removed the Atlanta mill from Gold canyon to Pittsburg district, Lander county, where it is being erected for the reduction of ores from the Maysville mine, the property of W. S. Wilson of Reno. Mr. Wilson has been working his property for a few years. He has been sorting his ore and shipping the richest to San Francisco, Salt Lake and Denver, patronizing those mostly who did best by him. The best record of his shipments has been a gross return of $22,000 for one carload of ore. Mr. Wilson now has over 5000 tons of ore on his dump, which he considered of too low grade for shipment, but which is now brought within the line of profitable reduction by having a mill. George W. Likens has sampled the dump very carefully and thoroughly, and he estimates the net value of the dump at $40,000. The ledge of the Maysville mine is well defined for about a quarter of a mile, and averages four feet in width. It is silver-bearing ore and free-milling—easier to mill than Comstock ore, and there is fully $1,000,000 in sight. The Atlanta mill has two Huntington crushers—equal to 10 stamps. It is expected to be in running operation early in July. Mr. Chas. Rulison will run it.

Tuscarora District.

NAVAJO.—*Times-Review*, June 7: West crosscut from the end of the south drift, 350 foot level, extended 34 feet; total length, 76 feet. Crosscut from the south drift, No. 2, extended 16 feet. Rock in both crosscuts shows very favorable for ore.

BELLE ISLE.—North drift on the 250 foot level extended 12 feet. At the face of this drift a crosscut has been started west showing faces of ore. North drift on the 150 foot level extended 8 feet, in favorable looking porphyry.

NORTH BELLE ISLE.—A crosscut has been started west from the station on the 300 foot level. North drift on the 500 foot level extended 15 feet. The water has materially decreased. As soon as the drift is extended a short distance further, several crosscuts will be driven across the vein.

NORTH COMMONWEALTH.—East crosscut from the end of the south drift, 100 foot level, extended 16 feet; total length, 74 feet. The face is still in vein matter, showing some high-grade ore. The greatest width of ore cut during the week was four feet.

DEL MONTE.—East crosscut from the end of the north drift, 100 foot level, extended 14 feet; total length, 63 feet. The face continues to show some high-grade ore with no sign of wall as yet.

NEVADA QUEEN.—Winze from the 450 foot level sunk 8 feet; total 20 feet, and is just cutting into ore; average assay, $112 per ton. From present inclination of the ore will have to sink 8 feet farther to get the bottom of winze all into ore. Concentrating plant is running without change.

GRAND PRIZE.—The 400 foot level has been stulled, and stopes started for the extraction of milling ore, which is high grade and improving in size of vein as they are opened up. The engine for the concentrator has arrived and good progress has been made at the mill in the remodeling of it for a concentration plant.

COMMONWEALTH.—One hundred and fifty foot level: No. 9, north drift, has been extended 7 feet in porphyry. An upraise has been started from near the face of same drift, and is up 10 feet; this upraise is to give an outlet for the ore developed. No. 3 winze has been sunk 11 feet; total, 43 feet, developing a large body of fine ore. South drift, from bottom of east lateral winze, extended 8 feet; total, 53 feet, and will soon be connected with north drift from bottom of No. 1 winze. The ore is high grade the entire distance opened on this level. Three hundred foot level: South drift advanced 13 feet, without change. Stopes throughout the mine look as well as at any time. Have sent to the mill 235 tons of ore. Average assay, $118.35 per ton. Everything at the mine and mill running smoothly. Bullion shipped, $11,917.80.

ARIZONA.

BRADSHAW DISTRICT.—Prescott *Courier*, June 5: Chas. Quinn, Jacob Henkle and other miners of Bradshaw district, who are at present in Prescott, appear to be happy over prospects of the district. The Oro Bella and Crowned King mills, concentrators, etc., were being run successfully. Ledges of the district are of good size and rich in gold, silver and other metals. Owners of other veins were taking out shipping ore.

TIP TOP.—We have the usual good news from Tip Top district. Shipments of rich silver ore are every week made to the smelter at El Paso, Texas. Owners of the Boaz 20-stamp mill are going to add 20 more stamps and some concentrators. Mr. Listen says the mill at Del Pasco is running and doing well.

PECK.—P. Donlan is elated on account of the recent rich strike in the Occident, Peck district. The ore is worth thousands of dollars per ton. Farley of Humbug creek says miners are doing well there.

BIG BUG.—Wm. VanName of Big Bug district will shortly have a new mill in place of the one he lost by fire a short time ago.

WALKER.—Walker district miners keep right along developing their properties. Dixie Company people are building mill and mining. B. T. Riggs, who has been mining ever since 1849, accomplished quite a feat a few days ago. He sampled about 30 tons of Hillside mine ore, packed it into a railroad car and started it for Denver, Colo. He did this at Ross' place in Big Chino; tried to hire three tramps to assist him, but they were opposed to hard work. Senator teams are kept busy bringing in shipping ore from the mine. A rock-breaker and other large castings have just been forwarded to the Congress by its manager, F. M. Murphy. Rock-breaker weighed 8800 pounds. R. J. Holmes, who has passed the winter and spring months prospecting near Ehrenburg and Signal, says he saw in Plomoso mountains near Tyson's Wells a 1½-inch streak of gold rock in a vein that would pay $20,000 or more to the ton. It was being guarded by armed Mexicans. He also stated that he had heard that the McCrackin mine near Signal was recently purchased by a company.

SEVENTY-FIVE THOUSAND GALLONS A DAY.—Mohave *Miner*, June 8: Last evening at 5 o'clock as the workmen at the Sterling silver-mill were taking out the diamond drill to extract the core, a flow of water followed which averages over 75,000 gallons per 24 hours. The size of the hole is 1⅞ inches, but the pressure has not yet been gauged. Superintendent Fisher feels very exuberant and will now make all haste to start the mill. The flow of water comes from a point 85 feet south of the bottom of the well, which is 57 feet deep and is very clear and cool and good for drinking purposes. The pump will be kept going until the drill has been hoisted from the well. The Ground Hog, Vizini and other mines of the company will be started up in a short time, and the drill, which has made such a splendid success, will be used in these mines to prospect with. Should this latter prove a success, this camp will soon be in a far better condition than in its best days. Holes will be sunk thickly on the hillsides and in the valleys, and an abundance of water and large bodies of ore will be discovered with little labor and small expense. The fact of striking a 75,000-gallon flow of pure water in this city means volumes to southeastern Arizona. It demonstrates that water can be found almost anywhere in the granite formation in sufficient quantity for agricultural and stock-raising purposes.

COLORADO.

BULLION KING.—Elk Mountain *Pilot*, June 6: The Bullion King is doing well as regards the production of the precious metals, and as depth is gained, more bodies of ore are exposed. There is considerable first-class ore on hand and several hundred tons of concentrating ore that is awaiting shipment as soon as the roads will permit. They are almost free from snow at this writing, and they will soon dig up and then we look for more life and activity around the King mine. Roat and Corbett have shipped a car of first-class ore to Denver from their lease. They also have considerable concentrating ore on hand. Nelse Bergh is sorting up the ore from the Little Crown that was taken out during the winter. The Metzler concentrator is started on its season's run. No new developments about the Sylvanite mine, we are sorry to say.

ORE.—Idaho Springs *News*, June 11: Jas. F. Mathews & Co. handled for the month of May, 1,220,000 pounds of ore carrying 18,210 ounces silver, 780 ounces gold, 45,000 pounds lead and 4800 pounds copper. The Idaho Custom Mill is operating the Grover Cleveland lode at the head of Virginia canyon. The vein of mill dirt is four feet in width and runs four ounces gold to the cord. David Kennedy had ten tons of ore from his Adriadne mine treated at the Idaho Custom Mill this week. The lot yielded ten ounces of gold on the plates, and tailings worth $220 per ton. The Oneida sampled 44 tons of concentrates and 12 tons of crude ore sampled at Mathews & Co.'s last Monday. Levels have been started east and west at a depth of 90 feet in the shaft. The mineral is in fair quantities and prospects are good.

DAKOTA.

UNCLE SAM BULLION.—Deadwood *Pioneer*, June 5: Supt. J. A. Harding came in from the Sam yesterday afternoon with the bullion cleanup for the last half of May. Its approximate value was $7800, or nearly as much as that brought over on the 16th of last month, and representing a 20 days' run. That brought in yesterday was the result of operations for only 15 days, and the amount should be extremely gratifying to stockholders, as it brings the product for May nearly, if not quite, up to $16,000. This is more than sufficient to pay all operating expenses, including a large amount of dead-work in the mine for the last two months, and to leave a neat surplus besides. It is probable that before final cleanup for June, 10 and perhaps 20 more stamps will be dropping, while it is anticipated all the 60 at the mill will be employed by the middle of July. The quality of the ore is established, and as a monthly output of $16,000 can be produced with 30 stamps, the product from 60 will not be less than $32,000. As operating expenses are comparatively light, good dividends can be reasonably expected from such an output.

KEYSTONE CHLORINATION WORKS.—The works have now been in operation two days, and are giving entire satisfaction. Roasters work to a charm, the cost per ton for roasting being now estimated at only $2. This will materially reduce cost for treatment. The works are now treating about 12 tons per day. A fair estimate of the percentage of the assay value of the ore saved by the process can probably be made this evening. First cleanup takes place on the 15th.

BRITISH COLUMBIA.

THE PORCUPINE CREEK PLACERS.—Donald *Truth*, June 7: Every company that worked on Porcupine last season will be on hand and at work on their claims next Monday. The Discovery and Elsie companies will probably be sluicing before a week is over, the others, being in deep ground, will begin sinking shafts to bedrock. Porcupine creek will make a record this season, one way or other.

IDAHO.

MORE RICH MINES.—*Statesman*, June 5: Mr. J. C. Brown, just down from the Boise Basin, brings the cheering intelligence of two very rich discoveries recently made by the persevering prospectors in that section. One of these is a large lode of gold-bearing quartz, with a parallel vein of rich galena ore. This lode is situated a short distance above Centerville in the hills bordering a ravine coming into Grimes' creek from the west. The walls of the lode are well defined and inclosed in granite. The other lode was found in the range of hills between Idaho City and Centerville, near the line of the old Channel ditch. This lode is very wide, and has been traced for a distance of 4500 feet along and near the crest of the hills. The vein matter of the lode is a friable porphyritic mass filled with detached pieces of quartz so rich in gold that it does not seem safe to give here the estimated value per ton. Every day's work done by the prospectors in the Basin is producing new evidence that the wealth of that mineral region has never yet been half revealed. The want of water to work the placer mines this season and last, while very much deplored, proves far from being an unmixed evil, since it has brought an era of quartz prospecting which will not stop until the world will be startled by the rich finds that will be made.

BANNER.—Idaho *World*, June 7: The ore taken from the Banner mine last winter having all been crushed, a cleanup is being made. Twenty tons of ore taken out by the lessees yielded $10,300, an average of $515 per ton. In a little less than one month over $90,000 has been produced. Such a record is enough to create a boom for Boise county.

THE ELKHORN.—The Elkhorn is employing only two men at present, but Hugh Turner informed us yesterday that a force would be put on in two or three days, when the mill will resume crushing.

YANKEE FORK.—Frank Simpson writes that the Yankee Fork country is pretty dull, owing to the temporary closing down of the Custer mill.

LOWER CALIFORNIA.

THE MINES BOOMING.—National City *Record*, June 6: Private letters received in this city from Mexican gulch and the Alamo all go to prove that the *Record's* prediction as to the stability and richness of the Santa Clara mines was correct. There is one five-stamp mill in operation and a ten-stamp mill is being set up, with others going to the ground. A sawmill is also to be erected in the timberlands near the mines. This has been a necessity from the start. Lumber has been badly needed for building purposes, and now timbers for shafts and drifts are a necessity. The expense of freighting lumber and timbers is something appalling, and with mills within a few miles of the camp, much money will be saved. The most sanguine of the Santa Clara miners are astonished by the richness of the mines developed. The richness has not cropped out in a few isolated places, but it has been found everywhere in the district. It is the richest country in gold quartz ever known. But gold is not the only mineral carried in the belt. Galena ore carrying silver in paying quantities has been found, and there is every indication that rich deposits of carbonates and chlorides of silver will be found. The camp to-day contains 2000 inhabitants, the population having increased 500 within five weeks. The place is self-supporting so far as living expenses are concerned, and yet all the gold taken out has been from the placers. The actual output of the district has not commenced, as the work done on the quartz leads has been to meet the requirements of the government and to develop the properties as much as possible. But it has been demonstrated that when the taking out of ore is commenced in earnest, the output will amount to many thousands every month. Every day outfits bound to the mines pass through National City or go down by steamer. The rush is increasing, not diminishing. At the National City Reduction Works, of which extended mention will be made next week, preparations are being made for the handling of the mineral that is beginning to come this way.

ALAMO.—Cor. San Diego *Union*, June 8: Alamo is what I call a really fine mining camp, with a population of from 1000 to 1500 people. The placers in Mexican gulch and Alamo do not amount to much now, although they are taking out a good deal of gold every week. The old gentleman with whom I am camping, and who runs a store, manages to get in a pound or two of gold every week regularly. Alamo has 52 liquor licenses out. Gambling is not allowed under any circumstances, and, mind you, the law is enforced to the letter. The boys have paid heavily for trying to run games, but have finally given it up as a bad job. Mr. Butler has a five-stamp mill running, and Heise & Co. of San Bernardino have a 10-stamp mill, which will be in a few days. Several other parties are after mills, and the prospect looks good for a permanent camp, although but little work has been done up to the present time. I think it will be safe to say that there is nothing down over 30 feet. In the Texas mine, at 20 feet, the rock is literally hung together by golden threads. There is in all about 125 ledges denounced, and if 25 turn out good, that is all that is required to make this a bonanza camp. Capital comes creeping in slowly, owing to reasons best known to Americans. The great cause is apprehension and fear, but as soon as they commence shipping bullion, as they undoubtedly will, things will boom as they have never boomed before, and substantially, too.

MONTANA.

TWIN MOUNTAIN.—Cor. Butte *Miner*, June 8: The camp is at the head of Minnesota gulch, a tributary of German gulch, and also the headwaters of Jerry creek and American gulch, the waters of the two flowing into the Big Hole, and distant from Butte 22 miles, and three from Dr. Beal's camp on German. The district is, so far as mineral locations now found, six miles by three. The country rock is lime, cut by porphyry dikes, and in some places covered with granite. The main developments, as yet, are by the American Gulch Stock Co. They are down 118 feet, have a whim, and are sinking with good ore. The Edwards Carbonate, owned by Edwards, Fletcher & Co., has a tunnel in 320 feet, and shafts, winzes and drifts to the amount of 600 feet. They have a fine body of ore and several carloads of shipping ore, and are packing out. The ore averages 63 ozs. silver and 46 per cent lead. The ore of the camp is lead and silver, with plenty of iron for fluxing, and is easily treated. It also carries from $1 to $3 in gold. The camp is not yet quite one year old, it still lacking nine days to make it a year from the day when old man Edwards and Joe Fletcher stumbled upon it in their search for the source of some exceedingly rich float which Edwards found 23 years ago. They located the Carbonate, the first claim staked off in the camp. Last fall they shipped 20 tons of ore, and it was that shipment which gave the camp its first start. Since then much development work has been done, and the showing now made by the camp, yet in its infancy, is far above the average, and demonstrates that all of the Butte cities have not yet been discovered. Twenty-five men wintered in the camp, the altitude of which is 9000 feet at its highest point, namely, Edwards' Carbonate.

NEW MEXICO.

WORK RESUMED.—Silver City *Enterprise*, June 7: Work has been resumed on the Silver Reef and Arthone mines at Lone Mountain, under the management of Antone Schwere, of St. Louis. The work on the Pacific and Aztec mills, above town, is being pushed as rapidly as possible. The mortgage on the Solid Silver mine will be foreclosed at this term of court. A new company will probably be organized and operations resumed. The recent shipments by Bragaw & Schlosser from the McNulty, of Georgetown, averaged 181 ounces per ton. The mine is now making money. E. G. Payne came in from East Camp Tuesday. He brought in a silver brick, the result of an eight days' run. Both the mine and mill are now doing nicely. A run of 10 tons of ore was recently made at the Telegraph mill, by the present leasers, which averaged 29 ounces. The recent strike in the Mountain View mine presages a new era of prosperity for the Pinos Altos district, and conclusively demonstrates that that which hitherto has been considered a mere pocket is a strong continuous vein of ore, extending the entire length of the shaft, besides improving in quantity and quality as depth is gained. The ore, besides carrying coarse native gold, contains tellurium, and by some it is thought that the rare gold-bearing mineral, ripidolite, is also associated with the ore. An average of the richest part of the vein gave in gold $1310, and silver $300, per ton, while an average of crevice material, principally quartz and talc, yielded at the rate of $95 per ton in gold and silver. The strike has caused quite a ripple of excitement in the camp.

UTAH.

PARK NOTES. — *Record*, June 8: The Alliance Mining Co. is arranging for the equipment of the old Sampson hoisting works with new and more powerful machinery so that developments can be pursued with greater advantage. A few men are now at work at the mine getting things in shape for a larger production of ore this season, and the plan is to extract and ship sufficient ore from the upper levels to pay operating expenses while the 4800-foot drain tunnel, to tap the mine at a depth of 1500 feet, is being driven. The Alliance will distinguish itself this season as one of the Park's heavy producers of ore.

THE DISAPPOINTMENT STRIKE.—The first of the week an important lead was struck in the Disappointment property, situated up Thayne's canyon on the west side opposite the Crescent. The air in the lower tunnel, which is in a distance of 470 feet, got quite bad and a tunnel higher up the hill was started. When in about 25 feet a fine-looking ledge three feet in width was encountered, and crosscutting was at once begun. The pay streak is about a foot wide and carries ore that will assay well in silver and lead. The find was made at a point about 15 feet under the surface, but the ore looks unusually well.

THE CONCENTRATOR ABOUT READY.—The new Union concentrator up Empire canyon is rapidly nearing completion and it is confidently expected that it will be started up on the 20th inst. It will do custom work, commencing on the Woodside leasers' second-class ore, of which there is on the dump and otherwise available about 10,000 tons, worth all of $15 a ton. The capacity of the concentrator is 100 tons daily, and it will not be surprising if it has to be increased to double the capacity before winter approaches.

WASHINGTON TERRITORY.

PLACER MINING.—Cor. Tacoma *Globe*, June 5: It may not be generally known that placer mining is carried on with success near Ellensburg. But such is a fact. Between here and North Yakima 25 Chinamen are constantly engaged in washing out gold in the Yakima river in primitive style. A pan is all that is used. The parties in search of the yellow dust are not new to the business, or to their present field of operations. It is not likely they would long remain in this quest without a reasonable find. You ask John how much he is making and he is dumb as an oyster.

MECHANICAL PROGRESS.

Fly-Wheels and Steel Tubes Made From Steel Wire.

MM. Mannesmann, of Remscheid, Westphalia, have been led to attempt the manufacture of fly-wheels capable of double and even treble the speed of fly-wheels made of cast iron, the resistance of which is generally limited to a speed of 40 meters for the rim of the wheel. If this speed is exceeded, there is a risk of the fly-wheel breaking to pieces under the action of the centrifugal force. They have succeeded in obtaining fly-wheels which are capable of acquiring three times the speed of ordinary fly-wheels, by constructing the nave and the spokes of iron or steel, and making a rim entirely of steel wire wound round and round itself a great many times. Thanks to these fly-wheels, to immense reheating furnaces for the steel plates, and to a somewhat complicated but very perfect apparatus, they have succeeded in obtaining surprising results, especially with long truss-girders and steel pipes of extremely remarkable perfection. They can thus manufacture pieces of exceptional length —up to 10 meters or more, which are made of steel, the proportion of carbon of which is arranged beforehand. The process is especially useful for manufacturing tubes of all diameters and thicknesses capable of sustaining a pressure of 100 atmospheres, and which are only about a quarter of the thickness of cast-iron tubes.

We may consider only the manufacture of tubes and compare them with the cast-iron tubes, the average resistance of which but little surpasses 15 or 20 atmospheres, and which are manufactured in enormous quantities in the English and especially in the Scotch foundries. MM. Mannesmann can supply tubes of steel of the same thickness capable of sustaining a much higher degree of pressure than those of cast iron, and the price of which can be reduced to the price of cast-iron tubes of the same diameter.

As far back as 1856, M. Reuleaux, when he was professor of mechanics at Zurich, was persuaded that the proposition made in 1852 to the Sardinian Government by M. Colladon, to pierce the tunnels by compressed air circulating in long pipes of cast iron, would be the best method of transmitting force to a distance. M. Reuleaux saw steel pipes in England capable of resisting much greater pressure, and which, being much lighter than those of cast iron, may be obtained at the same price.

According to experiments made at St. Gothard with tubes of cast iron 0 20 meter in diameter and 4600 meters long (which experiments were published by M. E. Stockalper), when the pressure was 5 atmospheres 60 at the entrance of the tunnel, it was 5 atmospheres 24 when it was measured 4600 meters beyond. The loss of pressure was only from 1-15th to 1-16th. The cooling may be avoided by a little tepid water mixed with the air. This was the result obtained with pipes of cast iron, but with pipes of steel manufactured according to the process of MM. Mannesmann, it is possible for the same price to transmit a much higher degree of power by employing tubes of steel of the same diameter and furnishing compressed air at 50 atmospheres or more of useful pressure. The machines will be much less costly, as they will be greatly reduced in dimensions.

A company has been recently formed in England for working with a conduit of 11 kilometers in length, and which will use MM. Mannesmann's steel tubes. This company proposes to transmit power with pressure of from 40 to 60 atmospheres, at the same time diminishing the cost of receivers for their customers. M Colladon, who is the author of the article which we have summarized from the *Bulletin de la Societe des Ingenieurs*, adds that air may be produced almost without heating by means of a small quantity of water injected into the compressors by a small injection pipe.—*La Semaine Industrielle.*

NEW TESTS FOR CAST IRON.—The advisability of ascertaining the precise nature of the various qualities of cast iron has caused the "Keep" tests for that metal to be largely adopted. The old practice in specifying the quality of cast iron was content with describing the mixture of the pig, the physical character of the product, and breaking strength. The tests now in question, however, according to the *Mechanical World*, furnish more precise indications of the quality of cast iron. In carrying them out a sample of the metal weighing 15 pounds is melted in a plumbago crucible set in a brass furnace, and from this three steel test bars run. One bar is one-half inch square, and is cast with both ends against chills 12½ inches apart. Another bar, also run between end chills, is one-half inch wide and 0.1 inch thick. When the bars are cooled, so that they and the chills are of the same temperature, the shrinkage is measured by inserting a taper gauge between the end of each bar and the chill. A third bar is run to test the fluidity; the mold being 12 inches long, 1 inch wide, and 0.06 thick. This is run from one end, and is poured first; but the strip rarely runs full to the end, and its length is taken as the index of the fluidity of the metal. The fourth bar is called the "crooked strip," and is 12 inches long, 1 inch wide, and 0.086 inch thick. On the center of one side is a rib 0.412 in. high, 0.2 in. wide at the base, and 0.1 in. wide at top. The unequal shrinkage of the thin flat strip of the taper rib causes a slight curve in the bar, and the measurement of this is called the "crook." The square bar is tested for transverse strength by means of a gradually applied weight, the deflection being measured at the same time. The second rectangular bar is tested for resistance to impact; the test being the fall of a 25-pound hammer, at first with a fall of one-half inch, increasing by one-eighth of an inch until the bar breaks.

HOW DOES IRON SOLIDIFY?—At a recent meeting of the New York Railroad Club, Mr. Whitney, a prominent car-wheel maker, stated that iron in solidifying acts like water and expands. Mr. Thomas D. West, who is considered authority on such matters, being consulted regarding the matter, replies as follows: "In answer to your question, Does molten iron expand at the moment of solidification? I would say that practically I have never seen it demonstrated. It may be that the molecules of the metal will expand at the moment of solidification; but, taking the body of the casting as a whole, there is no such state existing as 'moment of solidification,' and practically cannot be seen or shown as it can with ice. With molten or liquid iron cooling, two elements of action exist. The first takes place during the cooling of the molten metal to a solid state, and the second from the solidification point to that of its lowest point of temperature or coolness. When molten iron is permitted by form of casting and the mold to have a natural action, it will, from the moment the mold is filled or poured till it has reached as a casting its lowest point of temperature, be all the time constantly shrinking and contracting, so as to occupy less space. Liquid metal while cooling to a solid state requires on an average one pound of metal to every 100 pounds to supply its shrinkage or prevent space existing within its body, and its contraction from the solidification point to its lowest temperature will vary from one-sixteenth inch to one-eighth inch per foot. I know that some advocate that molten iron, like ice, expands at the moment of solidification, but I have failed to see it proved, and for one would be pleased to see such elements demonstrated or proven to exist."

THAT CAST-STEEL GUN, the trial and failure of which we noticed in these columns some weeks ago, has not been lost sight of. The revolution which it would introduce in the manufacture of heavy guns is too large and important a prize to be abandoned at the first trial. It is worth many trials at large costs. The bore of the gun has been regauged, bringing to light some slight defects that were not discovered on the first examination. The result of this examination has been laid before the Secretary of the Navy, and if acted upon might lead to a rejection of the gun. The Standard Steel Casting Company, by whom the gun was made, however, claim that the gun stood the test prescribed by law, and that it should be accepted and paid for. They have signified their willingness to have the gun subjected to another trial more severe than the first.

AN UNDULATING PUDDLING FURNACE.—A Pittsburg iron-worker named Anthony Barker is the inventor of what he terms an undulating puddling furnace. As its name implies, the furnace is so constructed that an undulating motion is given to the iron during the process of boiling. When a heat is to be "balled," the bottom of the new furnace adjusts itself automatically, and the process from that out differs but little from the present method of puddling. The inventor claims that the first cost will only be a little over that of the old style, while it will turn out at least double the weight of iron with one more man. A company has been formed to manufacture and introduce the furnace, one of which is nearly in readiness for a free trial at the works of H. Lloyd & Son, Pittsburg, Pa.

CHEAP IRON.—The Ironton (Ohio) *Register* says that a party in Virginia, near Clifton Forge, offers to lease for 50 years 20 acres of land on which to build a furnace, and agrees to furnish said furnace all the ore it can use at $2 to the ton of iron. That seems to be a marvelous proposition, and yet we are assured it is a fact. Pocahontas coke can be delivered there at $2.40 a ton. A ton and a half of this to the ton of iron will make $3.60 for fuel, making the cost of ore and coke at $5 60 to the ton of iron. This will bring the cost of making metal less than $9 a ton, and will beat the best record of any Southern furnace if there is nothing uncertain in the $2 part of it.

STEEL BOATS FOR SHIPS.—A new development in metallurgical work is about to be established at Leeds. Machinery has been patented for the purpose of constructing ships' boats out of single plates of steel. The boats thus produced will be of various dimensions. It is obvious that there must be great economy in this mode of manufacturing boats in assorted sizes like so many pots or kettles.

HOLLOW STEEL INGOTS.—In Sweden, hollow steel ingots are being made by casting steel to molds hung on trunnions, allowing the sides in chill to required thickness and pouring out the steel still liquid in the center. These hollow ingots go to England, where they are drawn out cold into tubing.

SCIENTIFIC PROGRESS.

The Mechanical Features of Dust Explosions.

It is only quite recently that public attention has been called to the danger attending the presence of large quantities of dry floating dust, as is always especially observable in the atmosphere of flour-mills. Such explosions as have occurred at the great flouring-mill at Minneapolis, at a large candy factory in another Western city, and numerous lesser accidents, have, of late, quite familiarized the public mind with the possibility of the great catastrophes which, under certain conditions, may happen from the contact of such accumulations of dust with flame. That a force, comparable in its effects with gunpowder, may thus be suddenly developed, is now well known, and very naturally the scientific mind of the country has been studying carefully the philosophy of this new source of danger. An Eastern journal, which we see mentioned merely as "the *Monitor*," philosophizes upon the matter as follows:

If fire comes in contact with powder, dynamite, or any other ordinary explosive, the result is certain and instantaneous. An atmosphere of dust, on the contrary, may for years be in contact with a flame. That without any apparent change in its character, it should suddenly explode after so long demonstrating its harmless qualities, seems incredible.

The enigma would be less perplexing if the mechanical properties of matter were more generally understood. The latest advances in scientific investigation prove more and more conclusively that mechanical modifications are at the bottom of all the varied forms and properties of matter; that we are, in fact, dealing with a substance whose essence is the same, whether it be gold or iron or earth or water, or any other material with which we are acquainted—that it is the building up of the atoms, their mechanical structure, which determines to which of the great classes of metals or minerals the substance shall belong. The same atoms may be gunpowder, or they may be clay; they may be water or air or lead, according to their mechanical arrangement. Chemistry in its last analysis would seem to be nothing more than the laws and principles of the mechanical arrangement of atomic quantities.

When this truth is recognized it is easier to understand how a dust-laden atmosphere may suddenly develop the most dangerous properties after years of apparent harmlessness. That dust will burn in the presence of flame and air, and that the product will be a gas much greater in volume, all will admit who have ever tossed a handful of flour dust on the fire. But the conditions under which a dust-laden atmosphere will burn are so peculiar that, experimentally, they rarely occur. Every boy who has kindled a bonfire knows how much his success will depend upon the arrangement of the sticks and the strength of the fire already started. Until sufficient volume of flame is secured, each stick must be carefully adjusted to support the slow combustion of its fellows. But once under full headway, he may toss his sticks as he pleases, and they are instantly licked in the embrace of the roaring fire.

Somewhat after the same fashion we may regard the flour dust. Until the distribution of the particles has reached a point where they will sustain each other in creating a volume of flame, no explosion will occur. The individual particles in contact with a lamp or candle may be insensibly consumed, while their fellows float harmlessly around them. But once the precise conditions are present, the flame, with ever-increasing energy, shoots through the mass and the explosion follows. Fortunately, the conditions favorable to such a disaster are so rare that skepticism still prevails.

THE LESSONS OF THE ROCKS.—The geological history of the world develops strange facts. Geological history, says Archibald Beikie, brings before us many facts well calculated to impress our minds with the great antiquity of our planet, and with the[marvelous changes by which the present order of things has been brought about. We learn from it that the mountains and valleys have not come suddenly into existence, as we now see them, but have been formed gradually by a long series of processes similar to those which are now slowly doing the same kind of work. We discover that every part of the land under our feet can yield up its story, if we only know how to question it. And strangest of all, we find that the races of plants and animals which now tenant land and sea are not the first or original races, but that they were preceded by others and these again by others still more remote. We see that there has been upon the earth a history of living things as well as of dead matter. At the beginning of this wonderful history we detect traces of merely lowly forms. At the end we are brought face to face with man, thinking, working, restless man, battling steadily with the powers of nature, overcoming them one by one by learning how to obey the laws which direct them.

THE MOST PERFECT PENDULUM.—What is supposed to be the most perfectly acting pendulum, especially in respect to simplicity, is in operation at the University of Glasgow, Scotland. According to this plan, a small shot of about 1.16 of an inch in diameter is suspended by a single silk fiber (half a cocoon fiber) two feet long in a glass tube of three-fourths inch internal diameter, exhausting the latter to about one-tenth of a millionth of an atmosphere. Starting with a vibrational range of one-fourth inch on each side of its middle portion, the vibrations can be easily counted after a lapse of as many as 14 hours, a fact not realized elsewhere.

RAPID GROWTH OF CORAL ISLANDS.—The growth of coral islands under a tropical sun is exceedingly rapid. A remarkable instance of this kind is reported by Capt. Delap of the American ship Yorktown, which touched at Boston Island in March last, while bound from Philadelphia to Hiogo, Japan. The Yorktown has just arrived at Sandy Hook, with a large cargo of general merchandise, and Capt. Delap made close and careful observation, not only of the island, but of the natives also. The first visit to the island was made by Capt. Duperry, a Boston explorer, in 1824. He named the island after his native city. While there he made an accurate survey of the island as well as the outlying reefs, over which the sea made a clean breach at times. The largest island was without vegetation or life, and has been so marked on all navigators' charts. When the Yorktown approached the islands the vessel was hove to, and in a short time was surrounded by copper-colored natives of a friendly disposition, who brought with them such fruit as was common to the islands. Instead of reefs, as had been seen by Capt. Duperry, there were 13 islands surrounding a salt-water lagoon, densely covered with vegetation, and all inhabited. The group was called Ebon Island, and was three miles long, having grown at least a mile in half a century. Three Germans were reported to have recently arrived there from New Zealand. With the exception of the latter visitors, who were probably shipwrecked sailors, and Capt. Delap, no white men are known to have visited those islands since they were first discovered.—*Philadelphia Record.*

THE NEW ACADEMY OF SCIENCES BUILDING, on Market street, is beginning to show itself above the street level. It will be an appropriate and elegant home, covering a lot with 80 feet frontage on Market street by 195 feet deep. The edifice will cost $160,000, and is being erected on a lot given to the academy before the death of that eminent philanthropist, James Lick. The money to build it with and maintain the association as an active worker in the domain of science is also derived from the residuary fund which has been accumulated under Mr. Lick's will. The structure will be an ornament to the city and a palatial monument to science, placed directly in what will soon become the business center of our great and growing city. A cotemporary has very properly said: Captious critics have raised objections to the site of the new building. It has been said that a purely scientific institution could carry on its researches just as well in a back street as on the chief thoroughfare of the city, and that had it located its new home on a spot where land was worth $300 a front foot instead of building on land which was worth $3000 a foot, it would have had more money to devote to the cause for which it was established. There is, however, this to be said in favor of the location on Market street: that portion of the building not required for the Academy of Sciences will always bring in a good rent, and if at a future date the academy should find itself in possession of a surplus of funds, it may still be able to erect another building for its own use.

DISCOVERY IN TELESCOPE LENSES.—Prof. C. S. Hastings of the Sheffield Scientific School, who has been experimenting for some time past to find a combination of glasses which would correct chromatic aberration, has recently succeeded in combining two glasses, the composition of which is a secret, so that the aberration has been reduced to one-twentieth of what it is in the old telescope. It is said that a telescope made on the principle which Prof. Hastings has discovered will be from 10 to 30 per cent more powerful than one of equal size on the old principle. This is the first time chromatic aberration has been corrected by means of only two glass lenses. This telescope, it is claimed, is about as near perfection as any telescope can ever be made, though theoretically the aberration is not entirely corrected, yet the best eye cannot possibly detect it.

A NEW ASTEROID.—The director of the Lick Observatory has been notified of the discovery at Nice, France, on the 29th ult., of an asteroid at 4h. 32m. Washington time. Its position was right ascension 14h. 21m. 7s., and its declination south 14° 22′ 32″.

WIND PRESSURES.—It is said if a hollow hemisphere is turned first with its concave and then with its convex surface toward the wind, the pressure sustained will be respectively 1.94 and 0 77 times as much as on a plane surface of equal projection.

A NEW COLOR to stain wood is a rich violet, and the stain is thus made: The wood is heated with a bath of 4½ ounces of olive oil, same of soda ash, and 2½ pints of boiling water. It is then dyed with magenta.

A NEW COMPOUND, containing aluminium in a lower state of oxidation, corresponding to ferrous iron, has been obtained.

GOOD HEALTH.

Health and Morals.

A writer in the Providence *Journal* makes the following remarks, among others, on the causes of vice and crime:

The relation of physical disease to immorality and crime is doubtless difficult to trace, but it is clear that in large degree it is that of cause and effect. We know that irritability, petulance, and many other forms of ill temper are directly due to nervous disorders, and they increase in direct proportion to the increase of their cause; perhaps it can be shown also that anger, hatred, avarice, lust, and most if not all other species of immorality are due to physical defects. It is clear that the latter stages of intemperance, resulting in debauchery that at first would have been inconceivable to the unfortunate victim, are the result of diseased conditions of body gradually produced by indulgence; perhaps it is also true that there is a subtile connection between the earlier symptoms of a love for strong drink and inherited physical conditions. * * * Doubtless it will be said that man's power of will and sense of right are strong enough to control evil tendencies, and that guilt lies in not so controlling them. But the only proof of strength lies in its use. If a man does not use it, the presumption is that it does not lie in his nature to use it; that is, he does not really possess it.

Whether all this is true or not, it is certain that it is largely true. Our physical diseases are the cause of much of our immoralities and crimes. We are not likely to be much different from what we are at present until we change our wrong methods of living and regain our lost physical health. The real sin of man lies in neglect of the laws of health, which, disobeyed, force him into a course of action which is immoral and disastrous and compel him to travel therein at an ever-accelerating rate. What we need is a physician, if one could be found, who has skill enough to discover the ancestral taints and weaknesses of our bodies, which cloud our mind, dwarf our moral sense, weaken our will and cause our sins.

So far the *Journal*. Now while the foregoing is true to some extent, it is quite as certain that an awakened consciousness of man's essentially spiritual nature and moral powers has enabled many who had been deemed "hopeless cases" to rise up out of diseased and depraved conditions into the health, mental and physical, which is Humanity's true estate.

Without undervaluing the importance of learning and obeying the "laws of health," we must insist that a cheerful courage and a hopeful trust are the most potent medicines, while doubt and fear are depressing and killing. Although a locomotive jumps the track sometimes, with fatal consequences, it must still be borne in mind that the engineer plans and builds the engine in the first place, and often puts it in repair—the engine never creates nor medicates the engineer! An understanding of this truth lies at the root of the marvelous cures effected by "metaphysical" treatment and "Christian science." Man *is* a soul and *has* a body.

COCOANUT FOR TAPEWORMS.—In this country, remarks an exchange, comparatively few people harbor that troublesome parasite the tapeworm. Americans are no lovers of raw meats—the common source of infection. There are a number of drugs held to possess qualities destructive to tapeworms, but most of them have been proved unreliable. Recently attention has been called to cocoanuts as a vermifuge. Prof. Paresi of Athens, when he was in Abyssinia, happened to discover that ordinary cocoanut possesses vermifuge qualities in a high degree. He took, one day, a quantity of the juice and pulp, and shortly afterward felt some gastric disturbance, which, however, passed off in a few hours. Subsequently he had diarrhea, and was surprised to find that there had been expelled a complete tapeworm, head and all, quite dead. After returning to Athens he made a number of observations which were most satisfactory, the tapeworm being always passed and quite dead. He orders the milk and pulp of one cocoanut to be taken early in the morning fasting, no purgative or confinement to the house being required. A correspondent writes to the *Pharmaceutical Journal* that the cocoanut has been used as a vermifuge in India for probably 40 generations by the beef-eaters of the country, and is so well known there as a means of expelling the flat worm that he cannot conceive how information of the fact has not reached England before. When properly prepared and intelligently administered, he says it is equally efficacious with male fern, kousso, pomegranate root, turpentine, etc., while it is as pleasant for the palate as they are offensive.

MEDICAL SCIENCE.—The greatest advance in the medical science of our generation is the clearer and more general recognition that the power of medicine to cure diseases is extremely limited; in other words, that the aim of the enlightened physician should be prevention rather than cure. The sanitary science has accomplished wonders, but only as the handmaid of medicine. The discoveries of the past two centuries have taught sanitary reformers where and how to work. It is the unselfish lot of mankind and a generous sense of duty that have stimulated many of those researches that are now bearing such golden fruit, and which, while limiting the work of the doctor and curtailing his income, make life longer and pleasanter.—*Edinburgh Review*.

LITTLE ONES IN SPECTACLES.—A writer in the Boston *Herald* says that the very general and growing prevalence of near sight is largely due to carelessness with children. The number of children who wear spectacles has become a serious subject of remark. That a radical wrong exists somewhere, when children only four years of age are thus hampered for life, is only too palpable, but whose the blame, and what the remedy for this evidently increasing affliction? Are future generations to be *sans* eyes as well as *sans* teeth? The defects in vision necessitating spectacles are inherited, or infants scarcely able to read would not be hurried to opticians and fitted to glasses that must bother them while they live. Oculists give many sensible reasons for this weakness of the optic nerves. But no one impresses the necessity of care in the management of eyes until the damage is done, and then it is too late. Young mothers who cover the baby's face with a veil, or who wear spotted lace against their own eyes, and who allow their children to read by insufficient light, are laying up trouble for themselves, though oculist and optician will be better off for their criminal ignorance. As to the schoolrooms, where children spend so many hours of the day, do parents ever ask or know how they are lighted, and whether the scholars face windows, and whether they are obliged to strain their eyes by blackboard exercises in half lights? A little precaution in the use of the eyes, and some knowledge on the subject of improper lighting, would be a pound of cure in this matter of spectacles.

LIQUIDS MAKE FAT.—Liquids make fat. There is no doubt of this in my mind, says a writer, though I am fully cognizant of the fact that a good many people will deny it. The character of the liquids has a good deal to do with it, but the practice of drinking invariably leads to unwieldly bulk. In Spain, where men drink little, a fat man is unknown. In Paris, where men content themselves with sipping thimblefuls of absinthe or small cups of black coffee, the French are thin to a remarkable degree. The women, on the other hand, drink great quantities of champagne, Burgundy and latterly beer, and they are as a result prone to stoutness. In England men drink ale and beer, and they are a thick-necked, pudgy and heavy race as a rule. I had observed all this many times, and when I went to Germany, where I knew the consumption of beer was very great, I had prepared to find fat men in abundance. I was not disappointed. There would seem to be absolutely no end of big, corpulent and unwieldy men in Germany. While in the army they are slim and splendid-looking warriors, but two months after they leave the ranks they become heavy, puffy and beefy to the last degree. This is even so in the ranks among the other soldiers, and the cavalry were men of such extraordinary weight that they always excited comment from strangers.

USEFUL INFORMATION.

SAND DRIFTS.—The ocean beach back of San Francisco is not the only place in the world where drifting sands impede the progress of improvements. Dry, loose sand, wherever it occurs, is constantly being shifted by the wind, and often buries cultivated lands, buildings and forests. On the shores of Lake Michigan are drifts 100 feet deep, and those of Cornwall reach 300 feet in depth, while the drifts of the Gobi desert are 40 miles long and 900 feet high in places. On the shores of the Bay of Biscay the drifting sand travels inland 16 feet a year; in parts of Denmark, 24 feet; and in southern India, 17 yards. In some places walls and barriers of vegetation have been created to stop the destroying drifts. Fine sand is taken up to a great hight in the air and deposited many miles away. In 1882 Iceland was visited by a remarkable sand-storm lasting two weeks, which hid the sun and objects a few yards off like a dense fog, and caused the death of thousands of sheep and horses.

COMPOSITION PAVING BRICKS.—What are known by the name of iron bricks have been satisfactorily introduced as paving material in some parts of Germany. These bricks are made by mixing equal parts of finely ground, red argillaceous slate and finely ground clay, with the addition of five per cent of iron ore. The ingredients thus mixed together are then moistened with a solution of 25 per cent of sulphate of iron, to which fine iron ore is added, until the mass shows a consistency of 38 degrees Beaume. After this the compound is shaped in a press, dried, dipped once more in a nearly concentrated solution of finely ground iron ore, and then baked in an oven for about 48 hours in a reducing flame.

A NEW RIFLE CARTRIDGE.—London *Invention* states that a rifle cartridge has been invented in France, and some surprising results have been obtained with it at the Vincennes ranges. The new cartridge, which is similar in appearance, weight and every other detail to the Lebel cartridge, is claimed to possess considerable advantages. In the first place, the metal jacket is entirely dispensed with, and the cartridge can be instantly adapted to all military rifles, especially the Gras, which is still borne by the French Territorial Corps. Finally, the cartridge is said to be smokeless, and does not foul or clog the barrel, while the cost is 70 per cent below the price of the ordinary cartridge.

FIRE PROOF BUILDINGS.—Iron, when heated, bends very readily under weight, so that it cannot be considered the best of material for fireproof buildings. Stone, and especially granite, is very little better to withstand the ravages of fire. There is no material, according to the best fire-insurance authorities, that can be used for construction equal to brick. It is the opinion of both insurance men and heads of fire departments that brick has stood the test better than any other material. There is no material, says the *American Builder*, that can be used for construction equal to brick. Every brick bears its own weight. Bricks have already passed the fiery ordeal before they are used in buildings, and are tempered.

GLAZED BRICKS are now largely used for both interior and exterior decoration. They are manufactured in Philadelphia and elsewhere in the United States. For this purpose an ordinary light-colored or red brick is used, and a suitable enamel is produced on the surfaces to be exposed. Some colors are very easily obtained. A simple lead glaze or a cheap buff brick makes a good yellow. A manganese and iron glaze is used for black. White and blue are the most difficult to produce, since the red color of the brick must first be hidden by an opaque layer of white before the finishing glaze is applied. Green must be made in the same way.

THE PHILOSOPHY OF COMBUSTION FROM STEAM HEAT.—In an article on "Danger of Fire from Steam Pipes," in Glaser's *Annalen*, it is said that after wood has remained a long time in contact with steam, hot-water or hot-air pipes, the surface becomes carbonized. During the warm season the charcoal absorbs moisture. When again heated, the moisture is driven off, leaving a vacuum, into which the fresh-air current, circulating around the pipes, rapidly penetrates and imparts its oxygen to the charcoal, causing a gradual heating and eventually combustion. The rusting of the pipes contributes also to this result.

NEW PROCESS FOR MAKING WHITE LEAD.—Mr. J. B. Harvay of Glasgow has just invented a new apparatus for the manufacture of white lead. It consists of three distinct parts—a furnace, a condenser, and a washing machine. The lead is untouched by hand, the whole of the process being conducted by machinery. The process is kept going by shoveling into the furnace a quantity of lead ore. This is converted into white lead, washed and dried, in three hours, as compared with the four months of the old system. It is stated that under Mr. Harvay's process sulphur of lead, which sells for $140 per ton, can be produced for $52 50 per ton.

SPANNING THE TIME SINCE THE PILGRIMS.—That was a most extraordinary reminiscence which the speaker, Judge O. W. Holmes, cited from a letter written by the late Sidney Bartlett: "Deacon Spooner died in 1818, aged 94. I saw him and talked with him. He talked with Elder Faunce, who talked with the pilgrims, and is said to have pointed out the rock." Only three lives, one of them but just passed away, between us and the men of the Mayflower!—*Boston Advertiser*.

TO CLEAN SMALL SCREWS.—Screws that are too small for separate treatment may be cleaned from rust as follows: Take a pound of screws and place them in a small box—a cigar-box will do; put a small quantity of oil on them and shake for a minute; then put a piece of cotton-waste in the box and repeat for a minute; finally, put a handful of sawdust in the box and shake for another minute or so, and remove the sawdust by sifting it from the screws in a fine sieve.

A POTATO FREAK.—The Nevada *Transcript* says: H. D. Towle has some last year's potatoes that can be classed among freaks. They were kept in a warm and dry place. They did not sprout to any great extent, but what they did do was to have a brand-new and solid potato grow inside of each of them, and when it had grown as large as the parent potato it had invariably burst its way through the side of the latter and kept on growing.

A FAST LOCOMOTIVE.—The fastest time ever made in the United States by a locomotive was recently made on the Reading road, near Woolton, Penn. The locomotive, just turned out of the Baldwin works, in an eight-mile run on the level track at full speed, averaged a mile in 39 seconds, equivalent to 92 miles an hour.

HIGH-SPEED ENGINES.—The great advantage of high-speed engines is that the steam has no time to condense, or, rather, that very little of it is condensed in comparison with the amount utilized.

AN Englishman has made a toy containing 400 animals and men. They are all put in motion by a windmill turned by the current from burning candles.

ELECTRICITY.

NEW SOURCE OF ELECTRICITY.—London *Iron* states that a new source of electricity has been discovered by Prof. Braun of Tubingen. Hitherto it was found impossible to transform mechanical work direct into electricity. The German professor says that he has succeeded in doing this. Physicists have known for some time that currents may be produced in metal wires by bending them. Prof. Braun has found that nickel wire develops the strongest currents by winding it into a spiral, and connecting its ends with a delicate measuring apparatus (multiplicator). The pointer of the multiplicator deflected considerably according as the spiral was elongated or compressed, showing that relatively strong currents were created; the current flowing during the elongation of the spiral in a direction opposite to that in which the wire had been run in its passage through the draw-plate. The interest in the phenomena observed will be enhanced as soon as there is a prospect of increasing the strength of the currents to a degree which will render them available for practical purposes. As Prof. Braun has succeeded in putting in circuit a number of spirals like galvanic elements, and thus obtaining stronger currents, there is a probability of constructing engines which will perform useful work. Yet we cannot help thinking that the currents would prove too feeble, and that they would develop but little mechanical energy on account of the great molecular friction. Should the anticipation of the discoverer be fulfilled, however, the currents would supply to the engineer the cheapest means of transforming work into electricity direct. Prof. Braun's experiments also confirm the well-known law of reciprocation. In passing through a spiral the current of Bunsen's elements, he could prove an elongation or compression of the spiral, according to the direction of the current.

ELECTRIC-POWER TRANSMISSION IN EUROPE. The success attending the several electric-power transmission systems put down by the Oerliken Works, Switzerland, has more recently had the effect of directing attention to means of utilizing the water-power of the river Rhine near Rheinfelden. Three prominent Swiss establishments, Zschokke & Co. of Aaron; Escher, Wyss & Co. of Zurich, and the already mentioned Oerliken Works, have taken up the matter, and have commenced the preliminary work in connection with laying out plans for a plant. It is estimated that the Rhine can furnish about 15,000-horse power, and this is to be distributed among the several industrial centers located within a radius of about 15 miles. To utilize the water-power, 20 turbines, each rated at 750-horse power, are to be coupled directly to as many dynamos. Permission has already been sought for the erection of the primary station at Rheinfelden. The financial side of the undertaking having been disposed of satisfactorily, everything now depends upon the grant of this permission by the Government.

ELECTRICITY FOR TEMPERING STEEL.—Among the more recent new uses to which electricity has been applied is that for tempering watch springs and other forms of spring steel, whether in the form of ribbon or wire. The steel is wound on a spool, whence it passes down through a bath of oil. An electric current is sent through the wire of such strength as to keep it at the proper redness to answer the desired requirements of temper. As the heating is not done in contact with the air, but is entirely beneath the surface of the oil, there is no trouble from blistering, as in the ordinary methods. The final temper is drawn in the same manner, and the wire or ribbon is finished by means of rolls. The process is also applied to a number of springs besides those for watches, including piano wires. In all cases the process can be controlled to a nicety, both as to the exact temper and its uniformity through the wire.

THE FUTURE OF ELECTRICITY.—It would be quite impossible to forecast the future, even for a single decade, with reference to the applications of electricity, even though discovery were ended, writes C. F. Brackett in the June number of *Scribner*. The mere expansion of industries already in some degree established will give them an importance which we cannot now estimate. But discovery is not ended, and it is more than probable that results will yet be reached which, although they cannot be at variance with the general doctrine of energy as now understood, may, to some extent, revolutionize methods, with corresponding advantages.

SIMPLICITY IN DYNAMOS.—One of the latest discoveries in dynamos and motors is that the simpler they are made the better they work. This is a happy discovery, for the earlier forms of these machines suggested a maze of parts and details which promised to rival the modern printing press in complexity.

DANGER OF GRADE CROSSINGS.—Though in Germany there are nearly twice as many grade crossings as in Massachusetts, there are 12 times as many people killed in Massachusetts, making the crossings about 24 times as destructive to life.

TABLE OF CONTENTS.

EDITORIALS.—An Open-Hearth Furnace Plant, 433. Passing Events; Reservoir Dams; Mineral Products of the United States; Chinese Miners for Lower California; Amalgam on Plates; The Idaho Mine Fire, 440.

ILLUSTRATIONS.—Lash Open-Hearth Furnace, 433. Retort and Melting Furnace for Gold Amalgam; Section of the Neuchaum Mine; Barrel for Use in Cleaning-Up at Quartz-Mills, 441.

CORRESPONDENCE.—The Oro Bella Mines, 434.

MISCELLANEOUS.—Old Mines in Honduras; A Refinery for Butte; No Rail North of Ukiah; State Railroad Statistics; Mining Experts Not Discoverers; The Slickens Question, 434. White Labor; Durability of Timber: The Seattle Fire; Gold in Guthrie; Gold in Utah; Silver in Alaska, 435;

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 436-7.

MECHANICAL PROGRESS.—Fly-Wheels and Steel Tubes Made From Steel Wire; New Tests for Cast Iron; How Does Iron Solidify; An Undulating Puddling Furnace; Cheap Iron; Steel Boats for Ships; Hollow Steel Ingots, 438.

SCIENTIFIC PROGRESS.—The Mechanical Features of Dust Explosions; The Lessons of the Rocks; The Most Perfect Pendulum; Rapid Growth of Coral Islands; Discovery in Telescope Lenses; A New Asteroid; Wind Pressures, 438.

GOOD HEALTH.—Health and Morals; Cocoanut for Tapeworms; Medical Science; Little Ones in Spectacles; Liquids Make Fat, 438.

USEFUL INFORMATION.—Sand Drifts; Composition Paving Bricks; A New Rifle Cartridge; Fire-Proof Buildings, The Philosophy of Combustion from Steam Heat; New Process for Making White Lead; Spanning the Time Since the Pilgrims; To Clean Small Screws; A Potato Freak; A Fast Locomotive; High-Speed Engines, 439.

ELECTRICITY.—New Source of Electricity; Electric Power Transmission in Europe; Electricity for Tempering Steel; The Future of Electricity; Simplicity in Dynamos; Danger of Grade Crossings, 439.

WHEAT AND FLOUR.—The English Wheat Markets; Flour-Milling and Grain Gambling; An Improved Cloth-Cleaner for Mills; The English Flour Market; What is Patent Flour; A Million Bushels; A Competitive Exhibition; Cornmeal vs. Wheat Flour, 442.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 448.

Passing Events.

The men encased in submarine armor were unable to accomplish anything in the Idaho mine, owing to causes given in another column. The mine is now to be filled with carbonic acid gas to extinguish the fire. The bodies of the two miners who were suffocated were not recovered.

The strike in the Haas gas well at Stockton is most important, the flow being now from 80,000 to 90,000 cubic feet per day. A receiver has been built and filled with 22,000 cubic feet in six hours. This well alone can supply enough gas for the city of Stockton for some time. Other borings are now being made.

It is now estimated that the loss at the Seattle fire was at least $10,000,000, with an insurance of $2,500,000. This was the largest fire which ever took place west of Chicago.

The purchase of mining ground of large extent in Lower California will take 1000 or more Chinese from this city across the border, whence they cannot return. Doubtless if the mines pay at all, still more Chinamen will follow those now engaged.

Reservoir Dams

The dreadful result arising from the breakage of the Conemaugh dam, above Johnstown, Penn., has called attention to the condition of other dams throughout the country. It seems that the Conemaugh dam has not been in good condition for years. A. M. Wellington, with F. P. Burt, associate editor of the *Engineering News* of New York, have completed an examination of the dam which caused the disaster. Wellington states that the dam was in every respect of very inferior construction and of a kind wholly unwarranted by the good engineering practices of 30 years ago. Both the original and reconstructed dams were of earth only, with no heart wall, but only riprapped on the slopes. The original dam, however, was made in rammed and watered layers, which still show very distinctly in the wrecked dam. The new end merely added to its stability, but it was to all appearances simply dumped in like an ordinary railroad fill; or, if rammed, shows no evidence of the good effect from it. Much of the old part is standing intact, while the adjacent parts of the new work are wholly carried off. There was no central wall of puddle or masonry either in the new or old dam.

The riprapping was merely a skin on each face, with more or less loose spauls mixed with the earth. The dam was 72 feet above the water, 2 to 1 inside slope, 1½ to 1 outside slope and 20 feet wide on the top. The rock throughout was about one foot below the surface. The earth was pretty good material for such a dam, if it were to be built at all, being of a clayey nature, making a good puddle. To this the fact of its standing intact since 1881 must be ascribed.

Resident Engineer Park made every effort to save the dam a day before it broke. To strengthen the dam a plow was run along the top of it, and earth was then thrown into the furrows. On the west side a channel was dug and sluice constructed. Once they got the channel open, the water leaped down to the bedrock, and a stream fully 20 feet wide and 3 feet deep rushed out on that end of the dam, while great quantities of water were coming in by the pier at the other end. And then in the face of this great escape of water from the dam, it kept raising at the rate of ten inches an hour.

Mr. Park says that he sent warnings by telegraph three hours before the break. At 1 P. M. he walked over the dam, and then the water was about three inches above it and was gradually gnawing away its face. He thinks there was fully a million tons of water in the reservoir. Mr. Park says: "The big break took place at just three o'clock, and it was about ten feet wide at first and shallow; but when the opening was made, the fearful rushing waters opened the gap with such increasing rapidity that soon after the entire lake leaped out and started on its fearful march of death down the Valley of the Conemaugh. It took but 40 minutes to drain that three miles of water, and the downpour of millions of tons of water was irresistible. The big bowlders and great rafters and logs that were in the bed of the river were picked up like so much chaff and carried down the river for miles. Trees that stood fully 75 feet in hight and 4 feet through were snapped off like pipestems."

The loss of life as the result of this breakage is now estimated at 5000. There have been frequent failures of large dams, but no such damage as this has ever occurred before.

The dam of Estrecho de Rientes, Spain, which was 164 feet high, broke April 30, 1802, destroying 600 lives and $7,000,000 worth of property.

The Habra dam in Algiers, when it broke, caused a loss of 207 lives and several villages. The dam was 1066 feet long and held back 26,414,000,000 gallons of water, all of which poured out with a rush similar to the catastrophe at Johnstown. The water started over the *top* of the dam, as was the case at Johnstown.

The Dale Dyke reservoir, Sheffield, England, was emptied suddenly by the breakage of the dam in March, 1864, and 300 lives were lost, with an immense amount of property.

The breakage of the Williamsburg, Hampshire county, Mass., dam, May 17, 1874, caused a loss of 150 lives and much property.

We had in California when the English dam of the Milton Mining and Water Co. broke in June, 1873, the largest quantity of water ever set free at once from an artificial reservoir in the history of the world, with the exception of the instance of the Habra dam. In the space of one hour 600,000,000 cubic feet of water rushed into the canyon below, and in 1½ hours the whole quantity of 650,000,000 cubic feet was discharged. There was no loss of life, and not very much in property, owing to the topography of the country through which the wave flowed. In some places in the canyons of the middle Yuba the flood reached a hight of from 75 to 80 feet, but by the time it reached Marysville, 85 miles from the dam, it was moving 8½ miles an hour and was only 2 feet 8 inches high.

Mineral Products of the United States.

Statistics prepared by the U. S. Geological Survey show that the total value of the minerals produced in 1888 was $591,659,931. It is recognized that this is the sum of the values of substances taken in various stages of manufacture and hence not strictly comparable with each other; still, it is the most valuable means for comparing the total products of different years. The result is an increase of nearly $50,000,000 beyond the value of the product in 1887. In that year nearly every mineral industry showed an increase, and hence an increased total was evident. But the fact that the increase was so very large was due to rather exceptional conditions in a few important industries, and it could not reasonably be expected that a similar combination of circumstances would result in even a larger total value for 1888. Nevertheless the unprecedented stimulus given to the production of copper by an artificial price increased the total value of that product nearly $13,000,000, or nearly enough to offset the decline in the total value of pig iron. The other important factors in the increase were coal and the other fuels which followed the increased quantity of metals. With the anticipated decline of copper to the normal demand, a decline in the total value of the product in 1889 will not be inconsistent with the natural development of our mineral resources.

The value of the metals produced was $256,245,403, and of mineral substances and products, $335,414,528, making the total given above.

It is curious to note how the discovery and utilization of one product displaces another. For instance, the natural gas consumed has displaced large quantities of coal. It is estimated that the amount of coal displaced by natural gas in the United States in 1888 was 14,163,830 tons, valued at $22,662,128. Of this amount, 12,543,830 tons were displaced in Pennsylvania, 750,000 tons in Ohio, and 660,000 tons in Indiana.

Chinese Miners for Lower California.

Some time since mention was made in the PRESS of pending negotiations between the Chinese Six Companies in this city and the Lower California Mining Co., which, if concluded, would result in the Chinese mining there on their own account. This week the contracts were signed with the Chinese syndicate, by which they purchased two-fifths of the Masac concession of 115 square miles in Lower California for $328,000. The Chinese merchants will have a voice in the management of the company, with Theophilus Masac as president. The contracts as signed provide that the Chinese shall invest $60,000 in improvements within the next six months. They are also to assume all outstanding obligations and to pay all taxes on the property. Within two years they must erect reduction works, and two-thirds of the product of the mines must be reduced on Mexican soil. By July 1st from 150 to 200 Chinese laborers from this city will be taken to the mines. A second installment of from 500 to 1000 coolies will follow in the fall. These laborers go into Lower California with the understanding that they can never return to the United States. In other words, they have burned their bridges behind them, and will leave San Francisco permanently. Of course the merchants and stockholders can go and come at pleasure. The first work to be done at the mines will be the construction of a water flume six miles in length, at a cost of about $225,000.

PATTERN-MAKERS' work is dull in the city just now.

Amalgam on Plates.

The practice of using cyanide of potassium to promote amalgamation with plates is less common than formerly, but even when used a few pounds will be enough to clean the plates of a 40-stamp mill for a year. Silver-plated copper has almost everywhere superseded the ordinary amalgamated copper plates. These are not generally resilvered, as a coating of amalgam forms upon them which is very effective in saving gold. This layer of amalgam should not be allowed to accumulate to too great a thickness, but should be removed occasionally by "sweating" the plates. An improved method in use at the North Star mill, Nevada county, is to immerse the plates in boiling water until the amalgam is sufficiently softened to be easily scraped off. Where the pulp carries but little amalgam or silver, the silver plating is soon worn out.

There is a constant absorption of amalgam by the plates. The amalgam replaces copper or forms a layer upon it too hard to be rubbed off. At Grass Valley, after a run of a year or two, the outside battery plates and apron are sweated. Notwithstanding the fact that the plates were quite well cleaned every day, the sweating of the outside battery plates and the aprons from four batteries of the Empire mill yielded $19,000 worth of amalgam. This was the result of the absorbed amalgam after 1 years' run. The ore during this period averaged about $18 per ton in free gold.

The Idaho Mine Fire.

The attempt of the men in divers' armor to extinguish the fire in the Idaho mine was unsuccessful. They went down the shaft twice. At the 900 level the candle went out and the electric light showed a thick smoke, but they found no difficulty in breathing, the supply of air through the hose and into the helmets being good. Near the 1000-foot level the cage was stopped. The heat was very great and the helmets became very hot. The rubber around the wrists softened. The signal to hoist was given and the men were taken to the surface.

Several reasons are assigned by the men for their failure to accomplish anything. The pump which supplied them with fresh air was, unfortunately, situated at the mouth of the 700-foot level, and consequently the air was vitiated and impure to such a degree as to be absolutely poisonous. Again, the provisions made in a diver's submarine suit for disposing of the air after it has been deprived of its life-sustaining properties are altogether regulated by the pressure of the water upon the rubber suit. As the surplus air expands the rubber the water pressure releases a spring, which opens a valve and allows the foul air to escape without admitting any water. In the Idaho mine the clothing of both Page and Tucker became bulged out with the impure air, the atmospheric pressure being inadequate to release the spring, and consequently both men were compelled to open the valve themselves and take chances on the poisonous gases which surrounded them effecting an entrance. Some idea of the heat experienced may be formed when it is known that one of the eye-glasses of Page's helmet was cracked. Had it broken, his life would have paid for the forfeit. They are satisfied that their experiment will be of value, as it will cause scientists to endeavor to discover some material from which diving suits for mine fires may be manufactured.

As far as possible air has been excluded from the lower levels. The stove plan for burning charcoal and generating carbonic gas has been abandoned and a furnace for the same purpose has been built. This comprises an iron shell six feet in diameter and lined with brick eight inches deep. At least a week will be required for surcharging the mine with carbonic gas. Then the gas will have to be expelled before workmen can go down into the depths. If bad caves have occurred, many weeks will elapse before the 200 employes will again be at work.

CLEANUP.—A correspondent informs us that "a gold mine some 20 miles from Beckworth and about seven miles from Johnsville, Plumas county, owned by residents of Beckworth and vicinity, recently had its season's cleaning up after a run of about two months. The amount taken out was 80 pounds of gold, of which one nugget weighed 14 pounds."

The Neuebaumer Mine.

(Written for the PRESS by ARGUS.)

This mine is situated on the south fork of the Stanislaus river, on the "mother lode" series, Tuolumne county. The vein shows in places from three to four feet wide. The rich ore certainly will average two feet. It mills in arastra $55 per ton in free gold, exclusive of sulphurets, which latter assay from $1500 to $5500 per ton. The formation is metallic slate, black in color, carrying also rich sulphurets. The vein is a segregated lode, with interpolations of slate between the quartz, all constituting vein matter. The mine is opened and developed by two tunnels, entered from the mountain-side or face, one 350 feet and the other 250 feet in length. The two tunnels are nearly connected by a winze and raise; that is to say, the winze is sunk 54 feet.

They are now raising to connect with winze so as to tap the water that has accumulated during the last heavy rains, and to further develop and ventilate the mine; also, to facilitate stoping. This connection will afford backs to stope out of about 80 feet.

I here show a rough sketch of the works. The shaded portions show the parts stoped out. The vein's course is 45° west of north. The property comprises 2900 feet (linear) with mill-site on river, and any amount of free water all the year round. A ditch is constructed 1¼ miles long, by which water is brought to the arastra on top tunnel level.

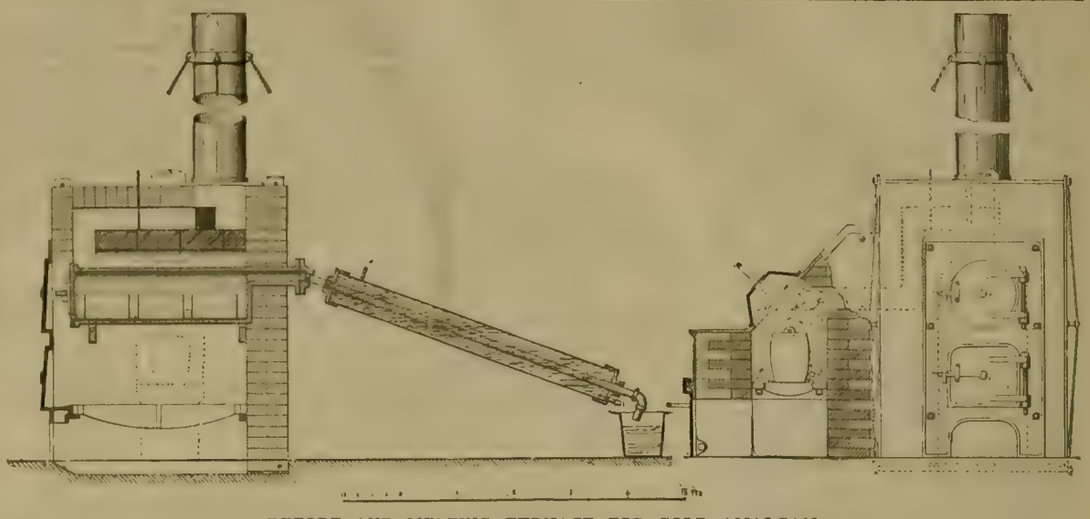
The river water is not being used at present; flows at the base of mine. The water in the ditch drives an overshot wheel that gives power to the arastra, the water being purchased and costing $30 per month. Half of the present water now used would drive a 10 stamp mill with concentrator at the proper millsite, having a vertical fall of over 1000 feet, a Pelton or Knight wheel being used. This mine requires no pump or hoisting works for very many years, as the vein can be tapped by tunnel from mountain-side on the vein all the distance. The sulphurets are of very high grade, having been worked to $300 per ton. Further, there is considerable free gold, averaging $50 to $60 per ton. I have seen some exceedingly rich rock, giving a value of a dollar to pound. There is a heavy percentage of bases—from 5 to 15 per cent. The mine topographically is splendidly situated, easy of access, there being a good road to the hillside.

BULLION RATES.—The Executive Board of the Interstate Railway Association has rendered a decision in regard to the demand for the readjustment of bullion rates from Colorado and Utah points to the Missouri river. It was held by the board that sufficient reasons exist for the proposed reduction from $15 to $13 per ton, on the rate on bullion from Utah common points to the Missouri river not exceeding $100 per ton in valuation, and the latter rate therefore is authorized. It was further found that sufficient reasons did not exist for any change in the present rate of $7 per ton from Denver, Pueblo and Colorado common points to the Missouri river, and no change in this rate is authorized.

DUMMY GUARD.—To prove the efficiency of a cable-car dummy guard invented by him, Herman Montag has several times thrown himself in front of moving dummies, when the guard has pushed him aside unhurt. The Sutter-Street Company's representatives, Messrs. Morrow, McCord and Swett, did not think the device any better than the ones they are now putting on the cars. Supervisors Barry, Becker and Pilster of the Health and Police Committee thought the guard superior to any in use in the city, and far preferable to any thus far exhibited by the Sutter-Street Company.

A LETTER from Ensenada to a San Diego paper states that a very rich strike has been made in the Santa Clara mining country, and it is believed that the mother ledge has been discovered. Two feet below the surface the ledge had been uncovered to the width of seven feet, and neither wall had been reached yet. The rock assayed from $40 to $60 to the ton.

THE *Evening Wisconsin's* Hurley special says: The Iron King mine, one of the best shippers on the Gogebic range, closed down to-day owing to trouble between the stockholders. All of the Bessemer consolidated companies' mines have also closed down, owing, as the superintendent states, to lack of ready cash. A large number of men are made idle along the Gogebic range by the above suspensions.

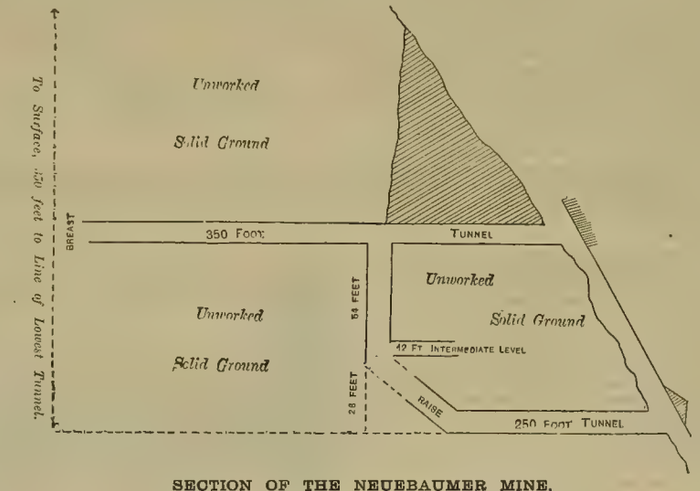


RETORT AND MELTING FURNACE FOR GOLD AMALGAM.

Cleaning Up a Gold-Mill.

In a chapter on "The Milling of Gold Ores in California," by John Hays Hammond, E. M., in the last report of the State Mineralogist, the details of construction and operation of a mill are given, with the methods employed for saving the gold. Concerning the cleanup, Mr. Hammond says:

The frequency of the cleanup depends upon the richness of the ore and upon the local practice in this respect. The outside plates, *i. e.*, the outside battery plates, the apron plates and the sluice plates are usually cleaned up every 24 hours. The amalgam and the "skimmings" are ground with the addition of quicksilver in the cleanup pan, in order to soften and clean the amalgam. The redundant quicksilver is expressed and the amalgam retorted in conjunction with the amalgam from the general cleanup. The cleanup of the outside plates requires from 10 to 15 minutes for each battery. The general cleanup of the mill is usually once or twice a month. Two batteries are hung up, the outside battery plates and the screens removed, and the inside plates and the dies taken out. These plates are laid over the sluice-plates and the amalgam scraped off. Care must be observed to prevent the plates being scratched. Amalgam will sometimes be found adhering firmly to the linings of the mortar and to the dies. All the amalgam obtained is cleaned in the cleanup pan. In large mills the use of the barrel and cleanup batea is to be recommended. A cut of a cleanup barrel is given herewith.



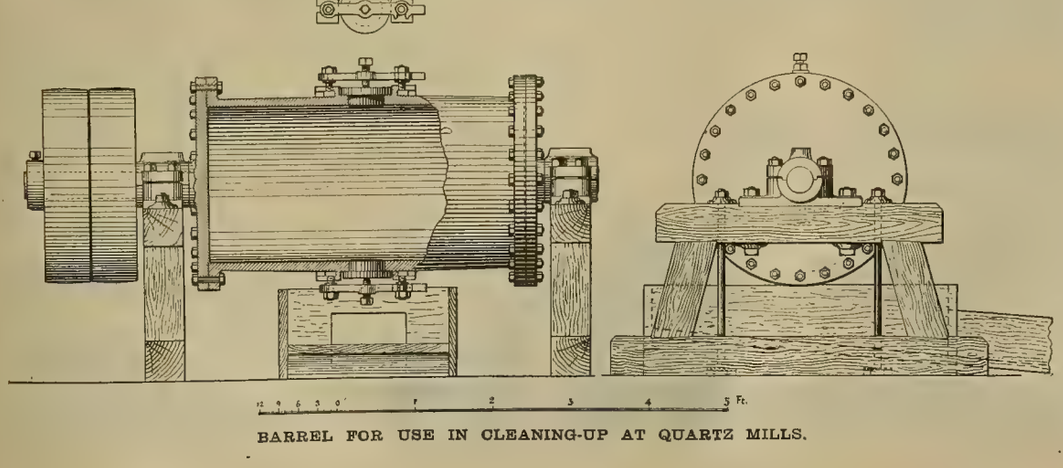
SECTION OF THE NEUEBAUMER MINE.

The "headings," composed of pulp and uncrushed ore, quicksilver, sulphurets, pieces of iron, steel, etc. (the steel and iron are taken out with a magnet), amounting to two or three pailfuls, are run through one of the batteries, through which the headings from the other batteries are likewise passed. This battery is cleaned up in the manner above described, a part of the worthless material removed by panning with a miner's common gold-pan, and the remaining material is then run through the cleanup pan. After one or two hours' grinding, with the addition of quicksilver, in the cleanup pan, the refuse matter is run off and the amalgam and the quicksilver collected. Three men can clean up a 40-stamp mill in from five to seven hours. The loss of from five to seven hours for two batteries is consequently incurred by a general cleanup. At this time advantage is taken of the stoppage of the battery to make needed repairs and to change the shoes, dies, screens, etc., if required.

It takes from two to four hours to retort the amalgam in the silver retorts which are used in large mills. Small mills use the cup-shaped retort. It takes about one to two hours to melt the gold from the retorted amalgam. A cut of a retort and melting furnace is given on this page. The melted gold is poured into molds of the suitable dimensions. Bullion assays should be made to ascertain the fineness of the gold bar.

The cleanup room should be as near as possible to the battery. The floor should be of cement to prevent loss of amalgam and quicksilver. There should be two cast-iron tanks four feet long, three feet wide, and three feet deep, to prevent loss of material and leakage in panning out. In one corner of the room there is placed a small cleanup pan 2½ feet in diameter. This pan is provided with drags of iron or hard rock.

THE WHITE-LEAD TRUST.—It is authoritatively stated that the stockholders of the Southern White-Lead Company of St. Louis and Chicago sold their stock to the National Lead Trust. This company has very large works, and the output of white and red lead for several years past has been much the largest in the United States, in fact in the world. The Eckstein Co. of Cincinnati also signed a contract to sell to the trust, and negotiations looking to the absorption of the Atlantic mills of Brooklyn are on foot. By these acquisitions the trust gains control of over 90 per cent of the output of the United States.



BARREL FOR USE IN CLEANING-UP AT QUARTZ MILLS.

WHEAT AND FLOUR

The English Wheat Markets.

The price of American wheat being materially affected at times by the crop in India gives interest to facts concerning the agricultural progress of India. Efforts which are making through an agricultural department established at Bengal to improve the quality of wheat indicate the probability of increasing competition from that quarter. In 1872 India rose to the second place as a feeder of Great Britain, and in 1877 the relative positions as concerns the United States were maintained, but trade returns for 1888 show a startling revolution in the figures. Russia has now taken first place, sending 21,396,000 cwt. as against 5,523,000 cwt. during 1886, this increase being almost entirely at the expense of America, the falling off in the imports from the United States amounting to 15,857,000 cwt., while India has exported within 325,000 cwt. of the preceding year; and it is worth noting, as pointed out by Sir James Caird in the London *Times*, that this change of basis in supply has been accomplished without in any material degree advancing the price of bread in England.

The *Mark Lane Express* of London, in commenting on the increase of Russian shipments to England, says: Russia's grain shipments in 1888 having been the largest on record, it is somewhat surprising to learn that Russian official opinion, as embodied in the report of a recent Agricultural Commission, is of a very pessimistic character concerning the future of the vast corn-growing lands of the Empire. The big yield of 1888 following the good crop of 1887, is an event which must be regarded as very exceptional, while the decrease in the average fertility of the soil on the returns of every 10 years appears to be continuous. The destruction of forests and the embarrassed state of the farmers, whose crops as well as holdings are mortgaged at a higher rate of interest than agricultural profits allow, are two other causes of what appears to be well-grounded alarm.

Flour-Milling and Grain Gambling.

The *Northwestern Miller* speaks as follows in regard to the influence which grain gambling exerts on legitimate milling industry: "Milling is no longer milling. It is simply speculation. No matter how anxious a miller may be to do a legitimate business, he finds himself forced to regard the Chicago wheat market with more concern than anything else. * * * All the immense sums invested in flour-mill buildings, in costly machinery and expensive processes, have ceased to fulfill the destiny for which they were intended, and have become the football for the amusement of a lot of wheat speculators, who employ no labor, invest no money and do not care a particle whether the American flour trade is ruined or not."

Upon the above the *Milling Engineer* comments as follows: "All of which is true so far as the great majority of millers are concerned. When a miller becomes a speculator, and runs his mill as a sideshow to his gambling operations, he is just as bad, or worse, than the grain gambler who is minus mill and capital invested. It remains to be seen whether the millers who are desirous of doing a legitimate milling business are numerous enough, united enough and have nerve enough to take the bull by the horns. If not, all the immense capital invested in milling property might just as well be sunk at the bottom of the sea."

It is no doubt a fact that a great number of the large millers, especially in the great wheat-growing States of the Northwest, are engaged in wheat speculations, and that they are now reaping the natural results of their folly. It is to be hoped that since they have learned the lesson of experience, and paid a good price therefor, they will now give their exclusive attention to the legitimate industry of milling and have nerve enough to unite firmly with their brethren who have not sinned the sin of speculation, take the bull by the horns, and wipe out, forever, this incubus on the great leading industry of the country.

AN IMPROVED CLOTH-CLEANER FOR MILLS.—Mr. W. C. L. Meyer of Starr's Mills, at Vallejo, is the inventor of an ingenious cloth-cleaner for use in mills. There is a necessity for the cleaning of flannel cloths used in the milling process, and this has heretofore been done in a crude and imperfect manner. After many years of study, Mr. Meyer has perfected and patented a machine which has been introduced into Starr's Mills and is particularly recommended by the owners to other mills. Mr. Meyer's invention supplies a need and is bound to have a successful run.

THE ENGLISH FLOUR MARKET.—Western millers have been so long shut out from the British flour market by high prices of wheat in the United States that they are fearful of losing the export trade altogether. To learn the prospects, numerous inquiries were recently addressed to correspondents in England, from whom replies have been received agreeing in all the main particulars. The general conclusion reached is that at the present time Great Britain is almost wholly independent of American supplies. Not only has the British product improved in quality, but Hungarian brands so closely resemble the best Minnesota products that the two qualities are scarcely distinguishable. Hungarian flour, therefore, is a formidable rival. Prices have undergone no material change. With reference to trade prospects, the present condition is regarded as temporary, correspondents abroad being of the opinion that with a return of abundant crops and prices on an export level the American trade would speedily revive.

WHAT IS PATENT FLOUR?—Patent flour is not any particular part of the wheat berry. It is not as strong as the bakers' or clear flour, and stronger than the low grade. We frequently hear it said that the patent flour is only made up of the harder and more glutinous portions of the wheat. The low grade, or the flour from next the bran, would come as near meeting this definition as does the flour from the middlings in the present system of manufacture. In the old system of grinding with the millstone, and especially the low grinding system, the middlings were that portion of the wheat which was best calculated to resist the action of the millstone—the hardest part. The present system of making middlings by corrugated rolls does not depend upon the varying hardness of the different portions of the wheat to make middlings. Where the wheat is harder it will be more brittle, but this is merely an incident. Middlings making is the principal object in reducing wheat by corrugated rolls, and by this method the wheat is broken into middlings, not ground into flour, with a portion remaining as middlings because of its hardness. For this reason patent flour, made according to the present methods, does not necessarily mean flour from any particular part of the wheat berry, as ordinarily understood.—*The Millstone.*

A MILLION BUSHELS.—People talk glibly about a million bushels of wheat, but very few of them realize what a vast amount that is. A wheat broker says that if a million bushels were loaded on freight cars, 500 bushels to a car, it would fill a train over 15 miles long; if transported by wagon, 44 bushels per wagon, it would make a line of teams 142 miles long. If made into bread, reckoning a bushel to every 60 pounds of flour, it would give each man, woman and child in the United States a two-pound loaf of bread. With the above in mind, the reader can better appreciate the following paragraph: There are used annually in the United States about 15,000,000 bushels of wheat in various manufactures, such as starch, food preparations, sizing for cloth and paper; 50,000,000 bushels are required for seeding and 285,000,000 for food consumption, which leaves only about 50,000,000 bushels for export. If these averages are all kept up, an increase in the wheat area of the country is imperatively demanded.

IMPROVED MILLING gives much more nutriment in flour than formerly. In the old process, a nutritious layer, called the perisperm, was, on account of its close attachment to the inner husk, largely carried away. Hence the vegetarian, Sylvester Graham, whose name is applied to bread made from unbolted flour, was correct in his time in saying that such bread contained the most nutriment. The "gradual reduction" process saves this portion of the wheat. The wheat loaf of white flour now contains a much larger percentage of nutriment than the graham loaf of unbolted flour mingled with the woody husk or bran.—*Dr. George Hays.*

A COMPETITIVE EXHIBITION.—The Congress of Chili has made an appropriation for a competitive exhibition of flour-mill machinery which is to be opened at Santiago, Chili, next November, under the auspices of the Chilian Society for the Promotion of Manufactures. The prize of $4000 will be awarded the successful competitor, whatever his country, by a jury of experts. Full particulars can be obtained by addressing Secretary Chilian Legation, Washington, D. C.

CORNMEAL VS. WHEAT FLOUR.—The *United States Miller* says: We have recently had some correspondence with cornmeal millers, and they almost unanimously report trade to be unusually good. Johnny-cake, mush and milk, hog and hominy, and potatoes and meat are being used to a greater extent than usual, while the consumption of flour is falling off. Verily, man does not live by bread alone.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

THE Napa Consolidated Quicksilver Mining Company has declared a dividend of 10 cents per share, payable July 1st to stockholders of record June 15th.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California.

Location of works, Placer County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 15th day of May, 1889, an assessment, No 13, of Five Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 327 Pine St., Room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 16th day of July, 1889, to pay the delinquent assessment, together with the costs of advertising and exponses of sale.

By order of the Board of Directors.

O. H. BOGART, Secretary.

OFFICE—327 Pine St, Room 9, San Francisco, California.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Lefler, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.

Ships under advances to smelting works in Boston, New York, Baltimore and Liverpool.
Twenty-one years' experience in Shipping Ores and Managing Mines.
Solicits Consignments of Copper Produce and Management of Min'ng Matters.
All business conducted on Cash Basis.
Purchase and shipment of Mining Supplies A SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

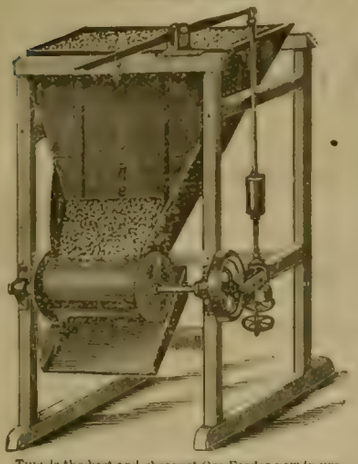
H. D. MORRIS.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

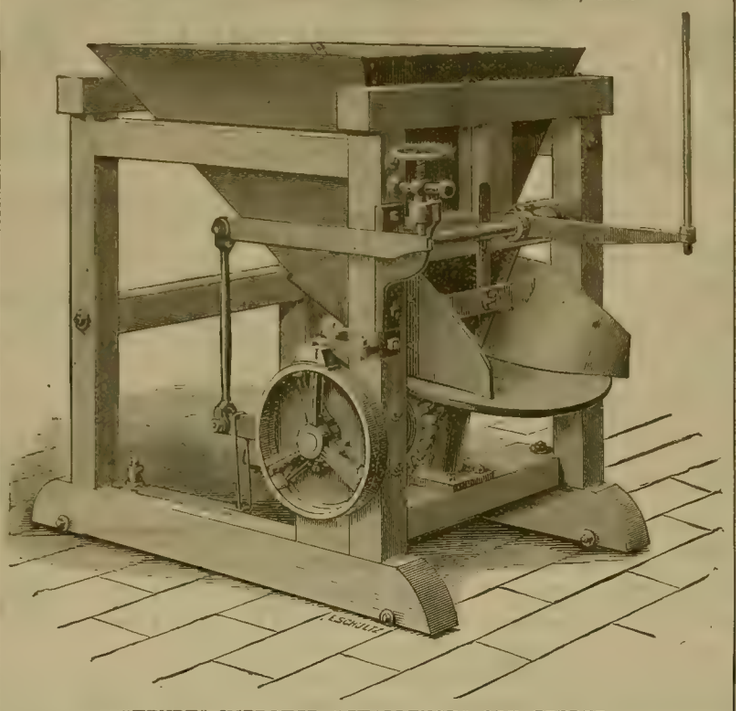
127 FIRST STREET, SAN FRANCISCO.

FOR SALE.
Two Patents—U. S. and Canada,
DOOR AND WINDOW SCREEN.
The Screen is fastened into a frame without nails and can be replaced. The Screen will last as long again as a Screen fastened by nails. Will sell separate States or as a whole or have them manufactured on royalty.
Further information can be had by addressing
JOHN J. JONES,
P. O. Box 502, Los Angeles, Cal.

WANTED.
FIVE OR SIX THOUSAND DOLLARS
Are required by the Owners of a
Well Developed and Very Valuable Gold Mine
To complete its mill and means of output of ore, etc. For this advance of capital a valuable interest will be given at a very low price. The mine is remarkably well located, with abundance of wood and water and every facility for mining, and can soon become one of the notable gold properties of the State. The owners are responsible men and practical miners.
G. M., Box 2517, San Francisco, Cal.

Situation Wanted.
A reliable and competent Stationary and Electrical Engineer desires a good, steady position in a mining district or elsewhere. Address, C. F. B., Box 2517, San Francisco, Cal.

—THE—
JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.
The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE
"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

"ORIGINAL GANDY" BELTING,
Unequaled for any Class of Work.
SPECIALLY SUITED FOR
MAIN DRIVING BELTS.
A Substantial Guarantee given with every Main Driver.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JUNE 4, 1889.

404,461.—VEHICLE—H. Arenberg, Edgewood, Cal.

404,517.—FRUIT-STONER—Briggs & Leach, San Buenaventura, Cal.

404,481.—DEVICE FOR OILING WHEELS—F. W. Harris, Napa, Cal.

404,023.—SAW-SWAGING MACHINE—T. B. Hite, Seattle, W. T.

404,494.—FOLDING VEHICLE—Jos. McBoyle, Oakland, Cal.

404,403.—CHECK-REIN HOOK—G. W. Moliere, Ocean View, Cal.

404,727.—FLY-TRAP—J. E. Packard, Mendocino, Cal.

404,496.—VEHICLE—Wilfred Page, Penn's Grove, Cal.

404,554.—CHISEL—T. H. Palmer, San Bernardino, Cal.

404,436.—NECKTIE FASTENER—J. Reidl, Lewiston, I. T.

404,573.—STEAM ENGINE—A. H. Straub, Los Angeles, Cal.

404,509.—VALVE GEAR FOR COMPOUND ENGINE—J. C. H. Stut, S. F.

404,511.—FIRE-LADDER EXTENSION—Jas. W. Tully, S. F.

404,580.—SLOT-MAKING ATTACHMENT FOR BOLT-HEADING MACHINES—S. Uren, Sacramento, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TWO-WHEELED VEHICLES.—Wilfred Page, Penn's Grove, Sonoma county. No. 404,496. Dated June 4, 1889. This patent covers novel shaft-connections in the class of two-wheeled vehicles known as "carts," by which to overcome the unpleasant jogging motion imparted to it by the action of the horse. There is no rigid connection of the shafts with the axle, but the axle remains steady, and no back or forward motion is imparted to the body.

SLOT-MAKING ATTACHMENT FOR BOLT-HEADING MACHINES.—Stephen Uren, Sacramento. No. 404,580. Dated June 4, 1889. The invention relates to that class of bolt-heading machines in which the bolt is confined and gripped between opposing dies, while a reciprocating plunger operates against the end of the bar and upsets it so as to form the head of the bolt. The attachment to this machine, covered by this patent, is so operated that it cuts a slot in the bolt at the same time that the bolt is being formed.

FOLDING VEHICLE.—Joseph McBoyle, Oakland. No. 404,494. Dated June 4, 1889. This is one of that class of vehicles in which the several parts are so arranged and connected as to adapt them to be folded, thereby reducing the vehicle to a smaller compass and rendering it portable. The object is to provide a vehicle for a child's use, which can be packed in a small compass and carried about, and when required for use can be unfolded and be developed into a perfect and practical vehicle in which the child may be drawn. The invention consists in the folding wheels, the folding tongue, the folding body or seat and folding back and a folding foot-rest, all so combined and arranged as to be well adapted for the purpose named.

ADJUSTABLE ATTACHMENT AND EXTENSION FOR FIRE-LADDERS.—James W. Tully, S. F. No. 404,511. Dated June 4, 1889. The invention consists in an auxiliary or supplementary ladder adapted to be readily applied to and connected with the main ladder, and in suitable ropes attached to said auxiliary ladder whereby the former may be extended from the latter at any suitable inclination. The object of the invention is to provide an attachment for a fire-ladder, and especially for that extensible ladder known as the "Hayes," whereby the windows or wall of a building may be readily reached by means of the extension or attachment, notwithstanding that the main body of the ladder is unable because of obstructions such as telegraph wires, etc., to reach the walls or near enough to the building to render it of service.

VEHICLE.—Herman Arenberg, Edgwood, Siskiyou Co., assignor one-half to Geo. J. Clark. No. 404,461. Dated June 4, 1889. This patent covers a means for mounting the body of the vehicle upon its running gear. The invention, though applicable to all kinds of vehicles, is specially applicable to two-wheeled carts, and its object is to overcome and ease up the several unpleasant motions of the vehicle by allowing the body an independence sufficient to counteract the tendency to undue motion, which tendency is obviously greater in two-wheeled vehicles than in other forms. The body has a movement from side to side upon its pivoted hangers, while it has a movement forward and back by means of rock-bolts on top of the shafts and rock-bars underneath the body; while between the side and forward and back movements intermediate or modified movements in diagonal lines are permitted by the rocking of the bolts and bars.

DEVICE FOR OILING WHEELS.—Frank W. Harris, Napa. No. 404,481. Dated June 4, 1889. This is a device for heating and applying oil to the fellies of wooden wheels. It consists of a segmental trough adjustably supported upon standards, a lamp or heater fixed with relation to said trough so as to heat its contents, and standards upon each side for the support of the shaft upon which the wheel is mounted. In those countries which have a rainless summer, as in California, the wooden portion of vehicle wheels becomes so dry and contracted that the tires will be loose upon the wheels, and if they are shrunk so as to fit the wheels in that condition, the wheels will, when they are again swollen by the wet weather, be greatly dished and the spokes bent out of shape, the wheel being ultimately soon destroyed. By this apparatus this inventor is enabled to apply boiling linseed oil to the fellies and spoke ends, and it will, when thus applied, penetrate the wood and swell it, so that the tires will remain tight throughout the dry season, the expansion and contraction of the wood being reduced by this means to a minimum.

VALVE GEAR FOR COMPOUND ENGINES.—John Ch. Henry Stut, S. F. No. 404,509. Dated June 4, 1889. This invention relates to improvements in cut-off mechanism for compound engines having cranks at right angles and an intermediate receiver or reservoir into which the steam is exhausted from the primary or high-pressure cylinder, and from which it is admitted to the low-pressure cylinder by suitable valve gear. The object of the invention is to provide a means by which the cut-off mechanism of the expansion cylinder is regulated by a governor or governors of the initial and expansion cylinders, which are coupled together in such a manner that they act in unison. It also consists in an adjustable mechanism whereby the cut-off or expansion cylinder may be changed with relation to that of the initial cylinder. Most of the modern compound-receiver engines have a variable automatic cut-off on the initial cylinder, but the cut-off for the steam of the expansion cylinder is set by hand at a fixed point, and this point is determined when the engine is running, so as to give the best general results. After being set, there is no variation from it, whether the engine is working with high or low pressure steam or a light or heavy load. In some cases a governor for the initial cylinder and a governor for the expansion cylinder have been employed, working independent of each other; but the results obtained from this construction are not found so satisfactory as those from the variable cut-off for the initial cylinder and fixed cut off for the expansion cylinder. The great disadvantage of this kind of cut-off is that a drop in the pressure of the steam from the initial cylinder to the receiver very often occurs, and at other times a compression takes place, while the expansion cylinder can take out only a constant quantity of steam from the receiver for each stroke. This result is produced by reason of the variable cut-off of the initial cylinder, which gives steam at different pressures when leaving the initial cylinder. This invention is designed to overcome this difficulty by so arranging the cut-offs of the initial and expansion cylinders and connecting the governors of the two cylinders that the steam will be cut off in the expansion cylinder earlier or later with reference to the cut-off in the initial cylinder, and thus retain the pressure in the receiver, so that there will be no drop in the exhaust from the initial cylinder into the receiver, and consequently no loss of power. This invention is applicable to any automatic cut-off, with only such changes in form or construction as will adapt it mechanically to the particular style of cut-off employed.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

IRRIGATION IN NEW MEXICO.—The Senate Committee on Reclamation of Arid Lands is to hold sessions in September at Santa Fe, Las Cruces, Las Vegas and possibly Albuquerque. In preparation for their visit, Gov. Prince has just issued an open letter to the people of New Mexico, urging county commissioners, mayors, boards of trade, agricultural societies and similar officials and representative bodies, as well as individuals, to collect facts, prepare opinions and make suggestions regarding irrigation, water storage, etc., and forward them to the committee at Washington prior to July 20th. The Governor says: "Nothing is of more importance to the future prosperity of New Mexico, and we should not fail to avail ourselves of this opportunity to aid in obtaining such intelligent legislative and national aid as will be of the greatest benefit to the Territory."

An Open-Hearth Furnace Plant.

(Continued from page 433.)

the flues, but also to increase the heating surfaces. The uptakes (7) are extended down below the points of entrance of the chimney flues, in this manner forming pockets (32) for the reception of any cinder, dust, or other matter that may be drawn over from the furnace chamber, and preventing this material from going forward toward the stack and clogging the checker-work (31) in the chimney flues (22-23). Suitable openings are provided in the brick-work, so that by taking down the brick bulk-heads these cinder pockets may be easily opened and cleaned out.

The four-way chamber (25) has the air duct (26) leading into it permanently open, and is fitted with a three-way valve (33) alternately connecting with flues (22-23) leading to each end of the furnace with the chimney (21), and with this air-chamber (25), in this way reversing the furnace on the well-known Siemens principle. This three-way valve (33) is hollow and is kept cold by a stream of water running through it, preventing the warping or burning out of the valve, or with Siemens gas-furnace, the direct loss of fuel by leakage to the chimney.

The tap-hole of the melting-furnace (34) is at about the ground level, and the metal is conducted, through an inclined spout (35) some 10 feet in length, to the ladle-pit (27). The ladle, after being filled, is lifted by a crane and transported to an auxiliary semi-circular casting-pit, only about four feet lower than the ground level in which the ingot molds are set. The front of the furnace is provided with three cranes, so located that they cover the entire pit-space, the ladle and ladle-pit and the furnace melting-chamber, so that, if a movable roof be put on the furnaces, large pieces may be swung into the furnace-hearth.

RECEPTION TO MR. SCOTT.—On Monday last a formal public reception was tendered to Irving M. Scott of the Union Iron Works by the employes of the works. A number of merchants and manufacturers were also present. A handsomely engraved memorial was presented to Mr. Scott expressive of appreciation of his efforts in obtaining contracts for building Government vessels here and the successes which he has accomplished. An eloquent response was made by Mr. Scott. He thanked those present for the reception and memorial in a touching manner, and congratulated the people of California on the success of their united efforts to lift the State a little higher on the plane of civilization. Some have said that San Francisco could never be a manufacturing center. He believed that he could soon reverse this verdict. The time would soon come when the industries of the Pacific Coast would surpass those of other sections of the United States. The feat of the Charleston in running 18 knots an hour during the first trip had never before been accomplished by any other vessel. It was the duty of capitalists to keep labor and money at home. They should not fill their pockets with money earned here and spend or invest it in foreign ports. In conclusion, Mr. Scott predicted a grand future for the Pacific Coast and its industries.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

THE RUSSELL PROCESS COMP'Y.

TALCOTT H. RUSSELL, Secretary.

NEW HAVEN, CONN.

P. O. Box 486.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first instalment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds $40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & CO. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 28 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications intrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

STEEL BOILERS IN TWO PLATES.

Steam Users, Attention!

The engraving represents our standard Boilers. These boilers are made of STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are bought which have a small hand-hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 1 Steam Drum, 1 Breeching, 1 Smokestack, 300 Feet Galvanized Strand for Guys, 1 C. I. Front Complete, 1 Foundation Plate for Front, 1 Set Grate Bars for Coal or Wood, 1 Back Bar Bearer, 1 Ash Cleaning Door and Frame, 1 Back Arch Plate, 1 Set Binder Braces and Bolts for Brickwork, 1 Stand for Back End of Boiler, 1 Steam Gauge for Syphon, 1 Glass Water Gauge Complete with Column and 3 Gauge Cocks, 1 Safty Valve, 1 Feed Valve, 1 Blow-off Valve, 1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds.

Boilers of the following Sizes in Two Sheets kept Constantly on Hand ready for Shipment: 60 Inches Diameter x 16 Feet Long; 54 Inches Diameter x 16 Feet Long; 48 Inches Diameter x 16 Feet Long; 42 Inches Diameter x 16 Feet Long.

SEND FOR CIRCULARS.

PACIFIC IRON WORKS

1850. 1888.

—BUILDERS OF—

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER, in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 13, 1889.

Trade the past week has been fairly active; the call appears to be increasing from the agricultural districts. Heavy shipments were made to Seattle immediately following the fire in that city. Among machinists, foundrymen and iron-workers in general there is a more hopeful feeling, with orders coming in. It now looks as if the summer and fall months will prove very active for all engaged in the above branches.

For the month of May the imports of foreign goods show a valuation of $4,880,000, and for the first five months of the year the imports aggregate in value $23,865,562. The treasure imports by sea from foreign ports in the month of May aggregated in bullion as follows: Gold, $35,818, and silver, $126,330; and in coin as follows: Gold, $16,818, and silver, $89 924.

The local money market continues easy notwithstanding the near approach of the time for a free call for crop purposes. The fire in Seattle, destroying about $12,000,000 of property, had a temporary effect on our market, but which is now passing away. The heavy losses, about $3,000,000, met by the insurance companies, cause some derangement in exchanges and a passing effect on the money market, but as much of their wants will be met by drafts on home offices, transfers through the Sub-Treasury will be in order within a few days, so that the money withdrawn by the insurance companies here will be replaced by coin through these transfers. The imports by sea of treasure the past week were as follows: Coin, $15,046; bullion, $62,868. The latter came from Alaska. The exports of treasury by sea the past week were as follows: To Hongkong, Mexican dollars, $196,915; gold coin, $5435. To Japan, Mexican dollars, $72,000; silver bullion, $155,500.

In the speculative market there was more activity in cereal futures, with a stronger tone noted. In mining stocks the strong depression and gradual shrinkage of the past four weeks brought in large quantities of stock and created more activity at the close. In local securities, trading continues only fair; the very high prices restrict general business.

SILVER—The market held fairly strong at from 92½@92⅝c for shipment by last outgoing steamer; but after its sailing, buyers dropped bids to 92¼c. The drop in exchange is against the market, but this is expected to be only temporary. The drop in exchange is due to heavy offerings by the insurance companies who lost by the recent fire at Seattle. They are drawing funds to this coast so as to keep their surplus up to legal requirements. The production of the mines is reported to be unchanged.

The silver market to-day closed as follows: London, 42d; New York, 91⅞ to 92c; and San Francisco, 92¾c bid.

MEXICAN DOLLARS—The market has held fairly firm at quotations. The demand, although not active, is fair for the season of the year. The market is under good control, owing to supplies being well concentrated.

The market for Mexican dollars closed to-day at 74c for new.

QUICKSILVER—Receipts the past week aggregate 429 flasks. The market is easier at lower quotations. Receipts are larger, while the demand is reported to be slower.

BORAX—Receipts the past week aggregate 1235 centals. The market holds strong, with a good demand reported at the East.

LIME—Receipts the past week aggregate 4100 barrels.

TIN—Imports the past week were 3193 ingots from Australia, 5942 boxes tinplate by overland railroad, and 302 boxes from Port Townsend. The tinplate received by overland railroad is for the Pacific can manufacturing company, who, some time ago, bought 10,000 boxes in the East for fear of running short of supplies. The market for both spot and loading is dull and lower. Many vessels abroad are heading this way, and take freight at lower rates. The exports the past week by sea were 1112 boxes tinplate, and 3000 lbs. pig to Victoria, B. C.

COPPER — The market is without essential change. The tone appears to be stronger and healthier, under a freer consumptive demand.

LEAD—The market holds quite strong. The consumption both on this coast and at the East is large, larger than at this time in 1888.

IRON—The only importation the past week was 40 tons from Yaquina bay, Oregon. The market is without change. Foundrymen and iron-workers in general report a freer consumption with their holdings being reduced. Iron abroad is reported firm, as it is in the Eastern States, although at the East, active competition is still reported. Freight room from abroad is in shippers' favor, with some ships reported taking in iron for ballast.

COAL—Importations the past week were light; they aggregate as follows: From Australia, 2450 tons; Utsalady, 622; Departure bay, 5350; Seattle, 2064; Coos bay, 700. Total, 11,120 tons. The fire at Seattle, it is claimed, will temporarily interfere with receipts from that quarter, although the Black Diamond Coal Co. received some the past week shipped from Utsalady. There is an increased tonnage on berth at and on the way from New Castle, N. S. W., and Sydney for this port, San Diego and San Pedro, but of which very little is due in this month. Freights favor shipments from England, but the quantity on the way is light. Our advices from Australia report heavy rainfalls and the prospects favorable for a large wheat crop, which, if realized, will cause freights from Australia, after October next, to rule higher to this coast.

Eastern Metal Markets.

By Telegraph.

NEW YORK, June 12.—The supply of borax is running low; firm at 8⅛@8¾c. California and powdered, 7¾@8½c. In quicksilver, there is an easier feeling. A rather more animated tone attends copper. One hundred and fifty tons Santa Fe casting sold at 16c, and consumers are using lake ingot more freely at 12c. In pig lead a very fair business transpired at $3.95@4, spot and near future. Considerable is offered at $4 for July and August.

NEW YORK, June 12, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 3-16	92¼	$12 00	$4 02½	$20 35
Friday	42⅛	92¼	12 00	4 02½	20 40
Saturday	42⅛	92¼	12 20	4 00	20 40

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

PACIFIC BELT AND TRUSS CO., June 7. Capital stock, $50,000. Directors—A. T. Sherwood, Martin Armstrong, J. L. Boone, M. G. Loefler and J. A. Vaughan.

HONEY LAKE WATER CO., June 7. Capital stock, $50,000. Directors—W. A. Clark, S. W. Fuller, G. D. Cooper, J. B. Jardine and D. E. Hayes.

HARTMANN G. M. CO., June 7. Capital stock, $500,000. Directors—W. B. Miller, F. S. Zimmerman, W. J. Bevans, N. L. Lenham and C. F. Filer.

PACIFIC TILE AND BRICK CO., June 12. Capital stock, $100,000. Directors—John T. Davis, M. H. Turrill, M. C. Jewell, C. B. Turrill and J. French Davis.

TIOGA DISTRICT M. CO., June 12. Location, Tuolumne county. Capital stock, $500,000. Directors—Wm. B. Wightman, Frank G. Drum, Leon D. Smith and E. B. Clement of Oakland, and Wm. H. V. Cronise of San Francisco.

CALIFORNIA LEAD BATH AMALGAMATING CO., June 11. The company has purchased the Shields patent lead bath amalgamating apparatus and propose to put it in operation in this State. Capital stock, $100,000. Directors—A. M. Shields, Chas. J. Shields, Walter Morosco, Chas. H. Bacon and George W. Van Ness.

Mining Share Market.

The market the past week for the leading Comstocks shaded off up to Monday, when a drop of about 10 per cent set in, after which values steadied, followed by a very slight reaction on yesterday and to-day (Thursday). There is no doubt, outside of chronic bulls, outside operators are disgusted at the action of the market, many of whom have sold out, while others again are letting go at every favorable opportunity. The drop this week threw considerable margined stock on the market, and necessitated others on a margin to put up more money. Since about April 20th the shrinkage in the price of the Comstock stocks has been from 60 to 80 per cent, with apparently the end not yet, although before going lower there may be more reactions than is now looked for by the trading public. In outside stocks the Quijotoas have held firm, the Tuscaroras have acted "groggy," and the Bodies—well, they are a puzzle. From a thorough canvass of the market, we are convinced that a quiet but thoroughly active, if not hot, contest is going on to get control of Bodie at the annual election to be held on next Monday. On the surface it would look as if the contest for control is for office and attending revenue, but yet there may be a deeper significance, for both Capt. Kelly and Archie Borland have high reputations for being experienced and practical miners, and therefore there may possibly be something else at the bottom of the contest. Who knows but there may be every indication on the lower levels in the mine of the finding of the rich gold ledge they have been searching for? Reliable, authentic news from the Bodie mines is hard to get, yet we are in the hope of having arrangements so perfected as to secure such advices at an early day.

The news from the Comstock mines is of an encouraging character. In the Mexican crosscut an important improvement is reported, as there is in Best and Belcher on the 625-foot level, in Gould and Curry on the 490-foot level, and in Belcher on the 1100-foot level. A decided change for the better is also reported in Yellow Jacket and Crown Point. Heretofore all reported improvements in the mines have, after a small spurt, caused stocks to sink lower in value than before the strike or improvement. It is the crawfishing of stock before favorable reports that disgusts outside operators. The work going on in the other mines is said to be deserving of careful watching as the work goes west. The Cal. Pan-Mill will probably start up by July 1st. The Eureka mill will, so says report, be run by steam after the water gives out, provided the ore in the Con. Virginia does not give out. From the Bodies there are conflicting reports, while the official reports are only "driving ahead" the crosscuts, drifts, raises, etc., all of which is very entertaining to the searcher after information. It is about as enticing as fish bones with the meat off. From the Tuscaroras continued reports of the most favorable character are received, all of which outside shareholders get, while others appear to get the benefit of the money raised from assessments and bullion turned out. From the Quijotoas all advices are of a very favorable character. The Eureka Consolidated Mill is to start up next week, while stockholders are favored with an assessment on the stock, probably for the sake of variety.

The May bullion returns from the Con. Virginia give the yield at nearly 83 per cent of amalgam assay, and that of the Hale and Norcross at 79.9 per cent. This is marked and gratifying change for the better, and is evidence that bullion production is being watched more closely by the mine managers. The latter can go still further and with deserving praise from long-suffering stockholders by making public the assay value of the ore at the mine; that is, the assay by carload as it is shipped to the mill.

BRIDGE AT KNIGHT'S LANDING.—The Yolo county supervisors will join the S. P. Co. and Sutter county in building a free bridge across the Sacramento river at Knight's Landing, and have appropriated $5000 for that purpose.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Chollar, June 8, $18,000; Commonwealth, 8, $12,000; Con. Cal. and Virginia (for May) $109,865; Hanauer, 5, $2000; Hanauer, 6, $2900; 7, $2200. Last week's bullion shipments from Salt Lake were 11 cars bullion, 289,410 pounds; 59 cars silver and lead ore, 1,745,570 pounds; 1 car copper ore, 37,100 pounds; total, 71 cars, 2,072,080 pounds.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore ithout quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY & CO., Publishers, 230 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY & CO., S. F.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

MINERS ATTENTION!

SPRAGUE ELECTRIC RAILWAY AND MOTOR CO., OF NEW YORK.

LOW-GRADE ORES CAN BE PROFITABLY WORKED BY ELECTRIC TRANSMISSION OF POWER FROM DISTANT WATERFALLS.

lants will, in many cases, pay for themselves in from 1 to 5 years by the saving produced by Electric Transmission compared with other systems

Suspension and Surface Tramways, Hoists, Pumps, Drills, Stamp-mills, etc., operated by Electric Motors.

W. T. GARRATT & CO.,

CORNER FREMONT AND NATOMA STS., SAN FRANCISCO.

CHAS. F. BLACKBURN,

Practical Mining Geologist,

SALMON CITY, IDAHO.

(Formerly of the United States Geological Survey; 15 years practical experience on the Rocky Mountains and adjacent ranges.)

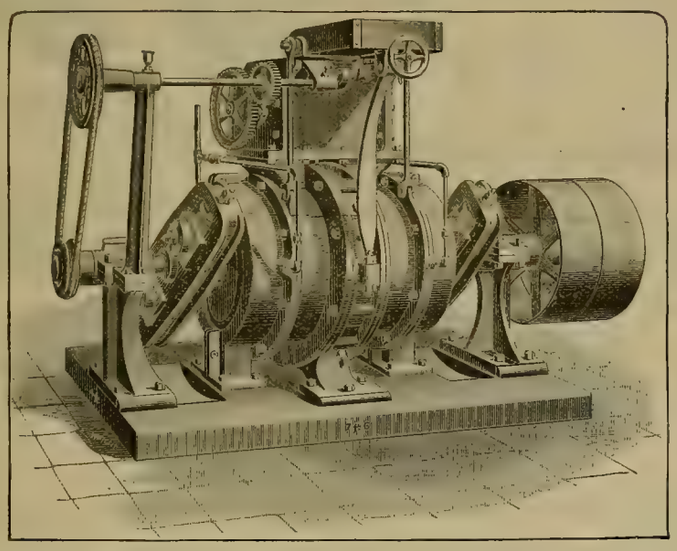
WILL REPORT ON THE CONDITION and value of any Mining property in Idaho or Montana. Topographic and Geological maps furnished. All work strictly scientific.

RICH GOLD AND SILVER LODES for sale. Bargains guaranteed. Correspondence solicited, especially with capitalists seeking good paying mines.

This region is the most extensive solid mountain country in the United States, and its metallic wealth is practically inexhaustible.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

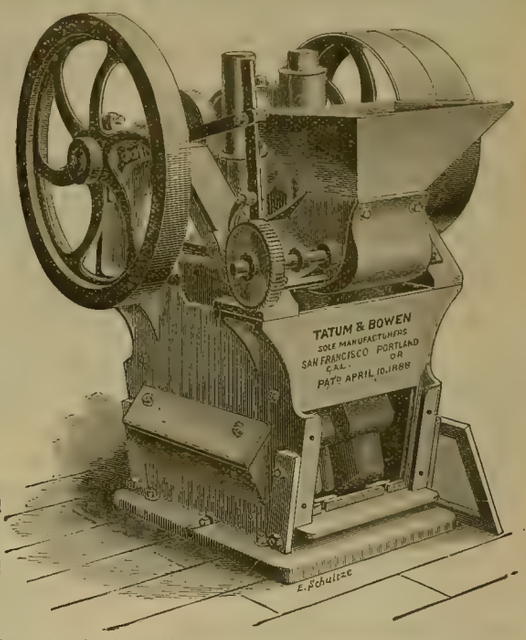
FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

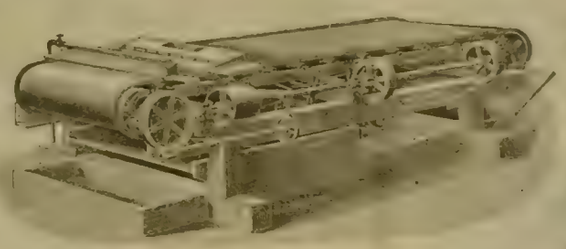
IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS: Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 41 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

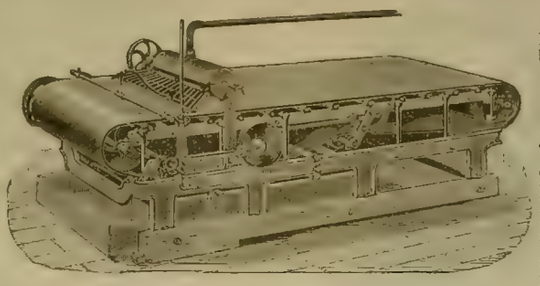
The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 51 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

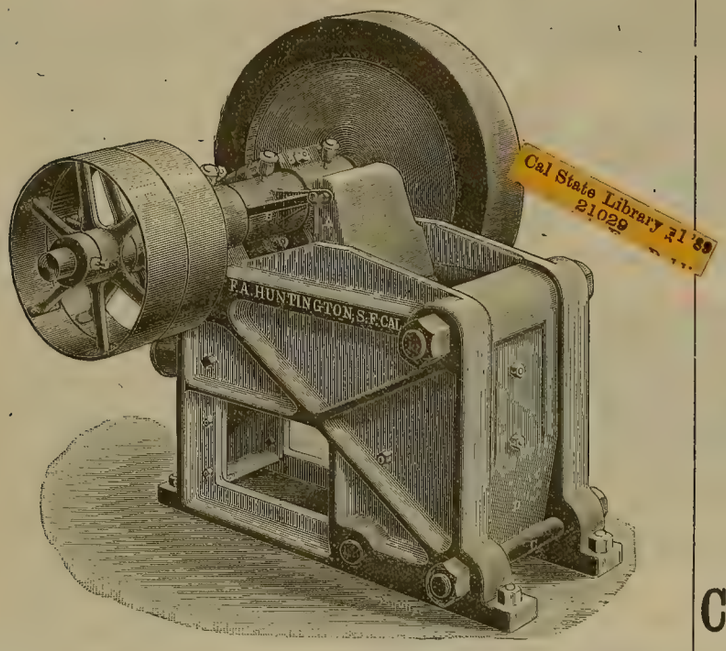
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

MINING MACHINERY.

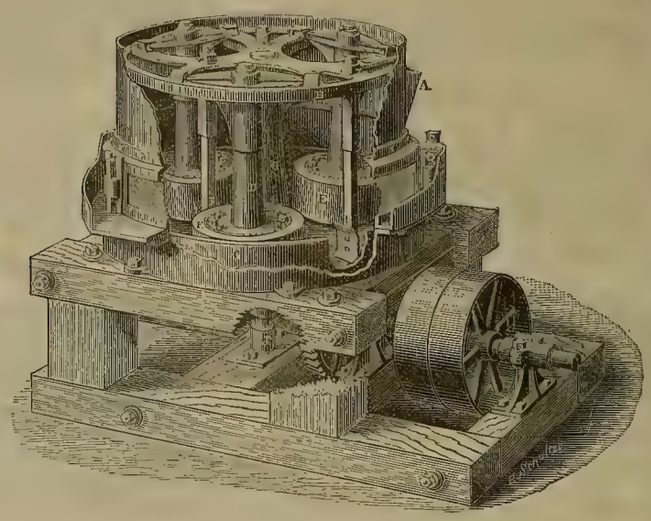


Cal State Library 31 '88
21022

Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

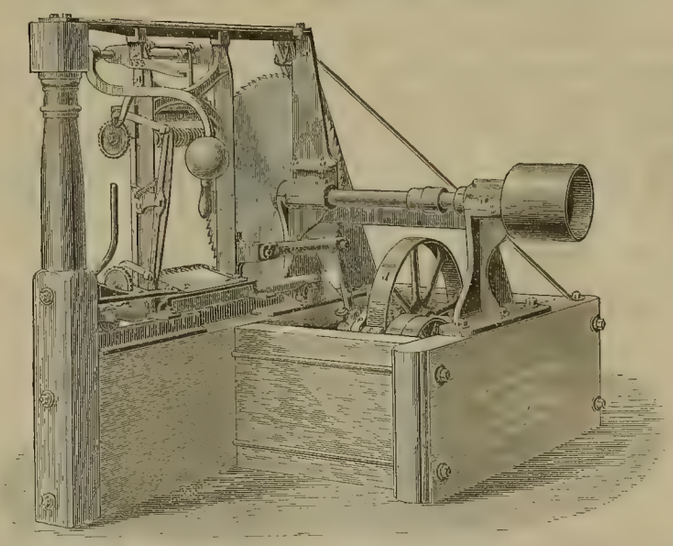
The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S
PATENT SHINGLE MACHINE.

This Machine is so well and favorably known by all the principal Lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. This feed-works is positive and uniform in its action and obviates all the jar or tremor formerly given to the machine by the weight used in the old style feed.



For simplicity, durability and rapidity of action, these machines have no equal, cutting from 50,000 to 75,500 shingles per day.

Price, complete with Jointer and one 38-inch Saw, $475.00.

The new feed-works can be applied to any of the old machines.

Price $100.

TWENTY-PAGE EDITION.

VOL. LVIII. Number 25.
DEWEY & CO., PUBLISHERS.

SAN FRANCISCO, SATURDAY, JUNE 22, 1889.

Three Dollars per Annum
Single Copies, 10 Cts.

Bimetallism in England.

Three thousand copies of the final report of the British Royal Commission appointed to inquire into the recent changes in the relative values of the precious metals, authorized to be issued by the United States Government, are now ready or distribution. The publication of this report will enable a large class of readers to arrive at a more correct understanding of the subject than through any other source of information, owing to the thoroughness with which the inquiry was made.

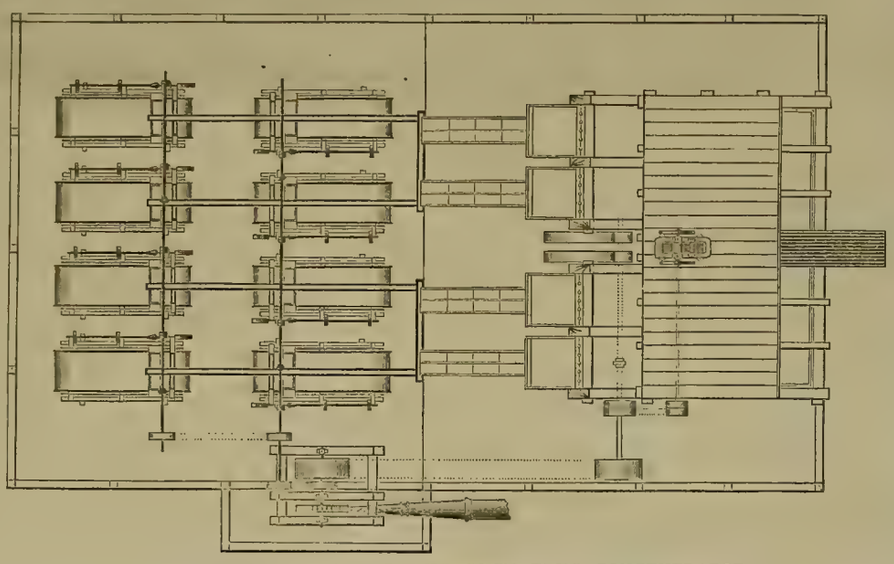
It appears by the report that six of the commissioners are outspoken in favor of bimetallism, while the other six are more conservative in their views. The only positive recommendation by the latter is abolition of the duty of 1s. 6d. per ounce on silver plate manufactured in Great Britain or imported from abroad. Four of them, Herschel, Freemantle, Farrer and Courtney, recommend the issue of silver certificates of the denomination of 10 shillings and £1 as a means of checking the decline in price of the metal, besides producing an economy in the use of gold.

The other six commissioners, namely, Messrs. Mallet, Balfour, Chaplin, Barbour, Houldsworth and Montagu, not only concur in the recommendation for the repeal of the duty upon silver plate and for the issue of silver certificates, but declare emphatically in favor of an international conference between the United Kingdom, India, and other British colonies and the United States, Germany, and the States forming the Latin Union, to arrive at a common agreement for the free coinage of both metals into legal-tender money at a ratio to be hereafter agreed upon.

The commission, as a whole, toward the close of their report, says: "Failing any attempt to re-establish the connecting link between the two metals, it seems probable that the general tendency of the commercial nations of the world will be toward a single gold standard. Any step in that direction would, of course, aggravate all the evils of the existing situation, and could not fail to have a most injurious effect upon the progress of the world. A further fall in the value of silver might at any moment give rise to further evils of great and indefinite magnitude in India, while a further rise in the value of gold might produce the most serious consequences at home."

COPPER ORE BY SEA.—A New York telegram says: Among the curiosities of commerce is the unloading of a lot of copper ore from the bark Iceberg at the stores of George A. Lawrence. The ore has been transported from the copper mines in Montana, this side of the Rocky mountains, to San Francisco, thence by the Iceberg hither. It will be taken to France.

MECHANICS' INSTITUTE.—At the last meeting of the directors of the Mechanics' Institute, the Committee on Resolutions of Respect and Regret presented their reports on the retirement of George Spaulding, who has served for 16 years, James Spiers, who served as trustee in 1866, and has served continuously for the past 12 years, and Columbus Waterhouse, who has served since 1877. The resolutions set forth their valuable services to the Institute and the regret of the Board of Managers at their loss.



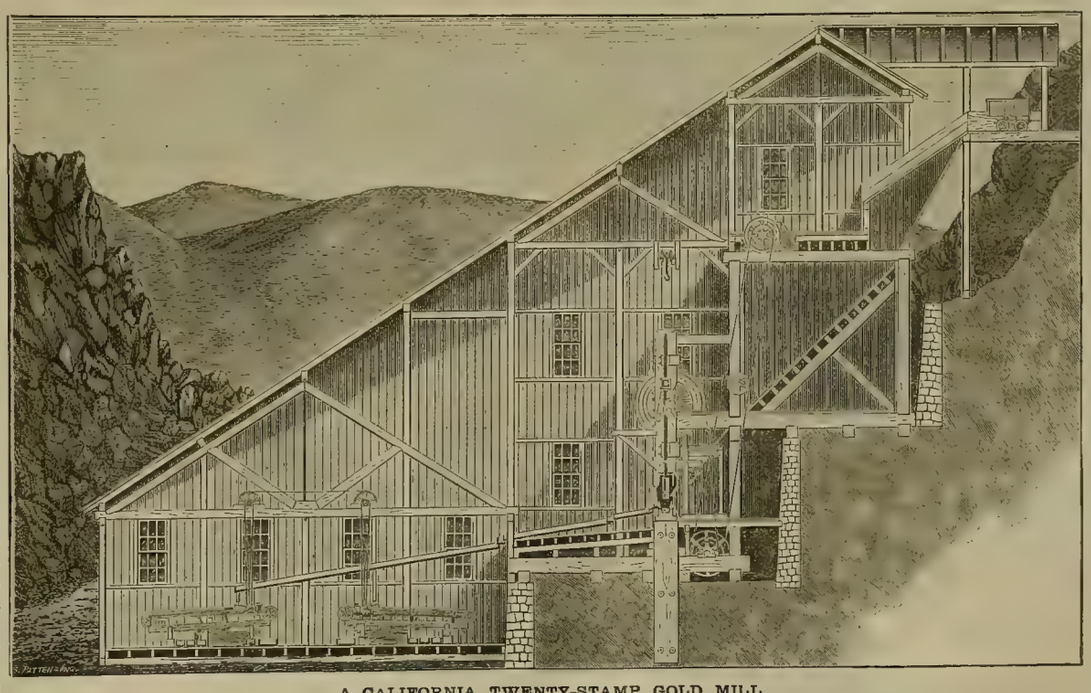
PLAN OF TWENTY-STAMP MILL WITH FRUE CONCENTRATOR.

Gold-Mills.

The cuts on this page will give a good idea of the general plan of a modern 20-stamp gold-mill with Frue concentrators. The ore, upon coming from the mine, is dumped over an inclined grizzly or ore screen at the top of mill, that portion of the ore which is fine enough passing through and falling into ore bin behind batteries; while the larger pieces are crushed by the rock-breaker to the requisite size. The ore is then drawn from bins into the feeders which supply the batteries automatically. Inside of the mortars are placed one or more copper plates covered with quicksilver; the table in front of mortar has also silver-plated copper plates over which the crushed ore and water flow after being discharged through battery screens. The free gold in the ore is caught on both inside and outside copper plates by means of the quicksilver, forming gold amalgam, which at intervals is scraped off and retorted. In retorting, the quicksilver is vaporized and afterward condensed, the gold thus left being melted and run into ingot molds.

Most gold ores will yield only a portion of their contents to the simple milling process, because some of the precious metal is in combination with sulphur and baser metals. It is for the purpose of saving these "sulphurets," as they are generally called, that Frue concentrators are placed below the copper plates. The concentrates are subsequently treated by the chlorination process or are sold to smelting works.

It is often the case that gold ores do not carry sufficient, if any, sulphurets to warrant the use of concentrators; in which case the portion of mill covering concentrators is omitted, and, as will be seen, can be easily added should subsequent developments in the mine require them. We take these cuts from the recently published mining machinery catalogue of the Fulton Iron Works. They also give a table of specifications for gold-mills of various sizes.



A CALIFORNIA TWENTY-STAMP GOLD MILL

A SHORT time ago, miners working in the Sunnyside claim near Downieville, Sierra county, took out four large gold nuggets. The largest weighs 181 ounces, and is worth $3200. In shape and size it resembles a small cobblestone.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Northern Counties of California—No. 4.

Gravel Mines of Siskiyou County.

[Written for the Press by JAMES H. CROSSMAN.]

Though mining is yet in its infancy in Siskiyou county, and agriculture the leading feature, the day is not far distant when the product from its mines will largely exceed that from its agricultural fields. Gold is the predominating metal, and not only found in place in well-defined veins of quartz and auriferous slate, but large areas of placer ground as yet remain intact in the deep beds of rivers, high bars, benches and terraces that line the banks for hundreds of feet above the present river-bed, and which will yield an abundant harvest of the precious metal for many years to come. The eighth annual report of the California State Mining Bureau has devoted much space to this subject (pages 581 to 631), to which we refer our readers for more particular information. Here, as elsewhere in California, there have been several systems (six in all) introduced for working the placers, each adapted to the condition in which the gravel occurs.

The Sluicing System.

The ordinary riffled sluice, pick and shovel have been used in the shoal and now nearly exhausted placers of beds of streams and bars. These grounds are still each successive year reworked by Chinamen, who are content with a small per diem for their labor.

The head and wing dam system is used in the beds of rivers and running streams.

This system either requires capital or organized labor. A company of from four to eight men is formed, and a favorable locality selected. Virgin ground on bars or in eddies is considered essential to success. If without funds, an accommodating storekeeper is secured, who is willing to take the chances on the outcome for the material and lumber, rope, provisions, etc., that he may furnish while the claim is being opened, operated, and ground tested. This class of mining is considered "extra" hazardous, and corresponding prices are asked for the equipment of the claim which in the aggregate varies from $2000 to $5000 before any results can be realized, and a dead loss should the bedrock when reached not prove productive or an unexpected and sudden rise in the river sweep everything away. A rise invariably occurs in the fall and the loss is usually total. Work is commenced in the spring—usually in June—when the river has reached a sufficiently low stage. The season, if propitious, lasts four months. The work is inaugurated by first building cribs of poles and timber which are placed in position in the swift-running current of these torrential streams. Guyed by ropes and weighted by rock, the cribs are sunk to the gravelly bed, often reaching a depth of from 12 to 15 feet, using double cribs.

Single cribs suffice for a depth from five to eight feet. During process of construction the crib-builders are often either swimming or wading in the icy-cold stream and powerful current and often losing their lives. These cribs serve as a support for the wing-dam proper and foundation for the powerful pumping and hoisting machinery that it is necessary to use to free the water and hoist the gravel. In the construction of both crib and dams they are lined with boards and plank held in position by the filling of clay and earth wheeled in from the river banks, together with the hydrostatic pressure of the river water, as the water in the crib space is removed. On the completion of the side dam the head and foot dam are placed in position and pumps put in place, the motor being the current of the river as it impinges on large breast-wheels. The water once pumped out, sinking commences often to a depth of from 40 to 60 feet through sand, rock and gravel. The powerful "Bull" or hoisting-wheel raises enormous bowlders of tons in weight which are swung shoreward by the long arm of the derrick. By the shorter arm the gravel is dumped on to a platform which discharges from an inclined plane into the sluices. The gold is saved in the riffles and the debris is dumped into the channel's current below the foot dam or opposite, the sluice being supplied with water from a large bucket-wheel that is also propelled by the river's current.

The Back-Channel System

Is either worked by the last-described system or by open pits cut longitudinally with the river course. The latter deposits antedate the more modern river channel, and originated from comparatively recent slides from the river banks or mountain slopes, filling the river bed and turning its course, the running water eroding the opposite banks and forming new troughs or channels in the bedded rocks. These back channels as a rule are richer than those of more recent origin. The next in order is the

Drifting System,

Which is in use in the high bars above the channel proper. These bars are also formed by the same causes, viz., slips or slides of earth changing the course of the river. The superincumbent mass being non-auriferous and often of great depth, these deposits are worked from tunnels driven from the lowest possible level attainable through the rim rock, crossing the inner channel at a right angle. On reaching its center, longitudinal drifts are driven to the boundary line of the claim, from which gangways are driven at right angles every 100 feet on either side to the raising rim rock. At the terminal point of these gangways longitudinal levels are driven, corresponding with the central and equi-distant, thus blocking out the ground into squares or parallelograms, establishing a system of thorough communication and ventilation. The claim is now opened and ready for the extraction of the auriferous gravels. Breasting is commenced from back to the central tunnel, using single posts and caps. The boulders and worthless top gravel are thrown back, forming false pillars, which serve to support the roof of the undermined and excavated ground. As the stope advances both post and caps are withdrawn and used on the next set. It is usual to carry in the breast with the bottom gravel from six to eight inches of bedrock, which often contains pockets and crevices rich in gold. Should these back channels be below the modern river bed, pumps propelled by river-water are used during the winter months and at a high stage of water the work is suspended. The same system has been adopted in working the channels of the ancient or Pliocene rivers.

The Hydraulic Elevator System

Is in use where the natural grade is not sufficient to carry off the debris without artificial elevation. This is accomplished by the assistance of the hydraulic gravel elevator, which, by the force of water under a sufficient pressure head raises the auriferous gravel to any hight that may be required to secure grade. This system has been thoroughly tested and successfully worked by the North Bloomfield Gravel Mining Co. in Nevada county, and at Quartz valley in Siskiyou county, and at the placer grounds of the Yreka Canal Gold Mining Co., same county. In the latter place a No. 2.16 inch elevator was placed in position and operated during a period of nearly three years. It was found that a volume of 650 miner's inches of water under 266 feet of pressure supplied two hydraulic giants for bank washings and bedrock sluicing. It also supplied the elevator and its accessory water-lifter with water for raising earth, sand and gravel piped to a hight of 39 feet.

Siskiyou county contains large areas of valley lands that are rich in auriferous earth and gravel that cannot be successfully worked by any other process.

For instance, on Yreka creek, from Greenhorn gulch to its junction with the Shasta river, a distance of 4½ miles, there is about 1000 acres of gravel known and proved to be rich. It has a grade of only 80 feet to the mile—too light for sluices. On Cotton Wood creek, near its junction with the Klamath river, we find 320 acres of valley land proved to be rich in gold, but grade too light to work it by any other process. The same with Quartz valley, 6 miles long by 2 miles in width, comprising 2000 acres; also on Oro Fino we find 400 acres. On McAdams creek, a tributary of Scott river, the bed is virgin for four miles up from its mouth. The ground being from 60 to 110 feet deep, can be better worked by the "drift" system, as the pay is largely on the bedrock and grade said to be sufficient.

The Hydraulic System.

The gravel deposits previously described, however, are of minor importance in comparison with the immense quantities of auriferous material that has been deposited in older channels of the modern river system lying parallel with but elevated from 100 to 400 feet above the present river-bed. These channels are usually three in number, trough-shaped, with their rims intact, of considerable width and filled with rich auriferous gravel. It is this class of mining that gives pith and moment to hydraulic mining on the Klamath river and its tributaries from Scott Bar to the Pacific ocean.

Ruby City Mines, W. T.

EDITORS PRESS:—A few lines from this new and progressive mining camp will be read by many of your California readers. As this is so far in the interior, but little is known as yet of its immense wealth. The mines in the Ruby district are opening up rich and satisfactory to the owners. The Arlington has recently made an extensive opening in their mine by cutting through the entire thickness of the ledge for the satisfaction of finding the hanging-wall, which proved to be 14 feet wide exclusive of the width of tunnel run on footwall, making the full width of ledge 20 feet between walls. About 50 pounds of the rock was shipped to Portland, taken as an average of the entire ledge. Various assays made showed silver, $340 per ton. As soon as the result was made known on the streets in Portland, stock began to raise and a boom was the result. The Arlington Co. can boast to-day of having 50,000 tons of ore opened ready for stoping. The ledge varies from 6 to 20 feet wide, with black sulphides of silver regularly disseminated through it; it also produces a small percentage of copper, zinc blende, antimonial silver and galena. One point of good character about the ledge is that wherever a large swell of an unusual size occurs, it is by far richer than the small portions of the ledge. A great many mining men will naturally ask the question why the owners of such a wonderful mine do not put up machinery and turn out silver bars. It is for this reason: the camp is situated about 160 miles from a railroad, which makes hauling of machinery and supplies rather expensive at the present time. In the meantime the N. P. R. R. Co. are building a road toward this camp as fast as possible. They completed 45 miles last winter, and by this fall of 1889 expect to have it within 60 miles of Ruby. Then freights of all kinds can be delivered so as to make mining profitable. During this time several of the mines will be extensively developed ready for machinery of large capacity, when silver bars can be shipped through the country with safety.

Montana capitalists are operating day and night on the famous Fourth of July claim recently purchased by them with good results. Steam hoisting works are now on the way for more extensive operations. The Modoc Chief is also working four men. The owners, Messrs. Murray & McPherson, have a splendid prospect, and one that will yet yield to them handsome sums of money, as the mineral obtained is of the highest grade. I can say that none are more deserving than the two enterprising and energetic miners above mentioned. Little has been done in the War Eagle or Idaho, owing to a deal of stock. These properties are owned by St. Paul and Spokane Falls capitalists. These mines are developed to an extent to prove them to be good properties. The mines of Conconully are opening up rich. The Lone Star is working about 17 men, sinking with a small steam hoisting engine and with a Cameron pump. They crosscut the ledge about every 25 feet with satisfactory results. The Wannacut Lake district is furnishing good gold sulphurets containing average assays of from $50 to $300 per ton. Work will not be extensively carried on until the railroad gets nearer; then several claims will be developed in a way to justify the owners to invest in machinery. The construction of buildings is steadily going on in the city of Loup Loup, which is the business center of all the principal mines. A MINER.

Economical Mining.

We take the following description of the admirable work in the Terrible mine at Ilse, Custer county, Colorado, from the *Mining Industry*. When the amount of timbering that has to be done is taken into account, it is a wonderful record. It is probably the largest mine in Colorado and was closed down owing to the low price of lead.

It is purely a lead mine, and the only one in the State that has been worked exclusively for that metal. It is owned by the Omaha and Grant smelting people, and its ore is used by them to supply the lack of lead that is sometimes experienced. The ore is exclusively a lead carbonate, entirely free from sulphur, and carrying very little silver. The mine is a vein, dipping about 70° from the horizontal, and measuring 119 feet from wall to wall. Its walls are rhyolite, there being no lime found in the country. The ore body, as it is mined, is 87 feet in width, and it is timbered with square sets. An average of 57,000 feet of timber has been used monthly during the past year. The ore is concentrated without any hand sorting, 10 tons being put into one, which averages 68 per cent lead. For concentration, Cornish rolls and Hartz jigs only are used. The average daily product of the mine during the past year has been 150 tons, but 1000 tons could be easily produced with the present opening and hoisting facilities. It is now 300 feet deep. It was expected that the character of the ore would change below water-level, which was at a depth of 100 feet, but it has not changed; no galena, zinc, or sulphides have been found. The shaft is vertical, 5x15 feet in the clear, fitted with a single deck-cage that carries two cars. Sinking the shaft, including timbering, cost $16 per foot. The entire cost of hoisting the ore during the past year, including fuel, engineers, pumping, etc., it is reported, has amounted to but 13 cents per ton; and the entire cost of putting the ore on the cars, including mining, timbering, hoisting, manager's salary, and hauling nine miles to the railway, has been but $1.46 per ton. This is the cheapest mining ever reported in Colorado. No man has yet been killed or injured in the mine, and it is said to be the best sample of good work and timbering in the State.

Allanite.

[Read before the Santa Barbara Society of Natural History by DR. LORENZO G. YATES, F. L. S.]

This mineral was named after Mr. T. Allan, who discovered it among mineral specimens taken from East Greenland to Scotland by Mr. C. Giesecke. It has since been reported from one locality in Norway, two localities in Pennsylvania, East Bradford and Bethlehem; from Franklin, N. J., and some few other localities furnish varieties of the species. Now Santa Barbara claims the distinction of furnishing a new locality.

This mineral is a peculiar combination of some of the rarer metals cerium, lanthanum, didymium, and sometimes yttrium and traces of glucinum, silica, alumina, lime and iron being always present; magnesium and water in nearly all of the reported analyses, and occasionally manganese, soda and copper. It is quite varied in its composition and appearance, and although neither beautiful to the eye nor of commercial value, it is very interesting to mineralogists, and adds one more species to the list of the minerals of California.

Riverside.

Our Correspondent in San Bernardino County.

Riverside is the name of a thriving and beautiful city, and the title of a colony or settlement which embraces 56 square miles. All of this region is incorporated, and the city proper is merely the nucleus of the large colony. There is no similar area on the Pacific Coast, if indeed in the United States, so beautifully planned, so thoroughly tilled, and so productive of the luscious fruits of earth. We append below an interesting description of Riverside, lately issued by the Board of Trade of that place, and the engravings used herewith are from the same source. As the pioneer and most remarkable colony in California, the sketch deserves to be read carefully, and few will read it without interest and admiration:

It is but 18 years since a small band of hopeful men, wearied with the cyclones, blizzards, and other inclemencies of the Northwestern States, east of the Mississippi, sought a place upon the Pacific Coast for a more congenial home. After much investigation they decided upon Southern California, and finally selected a few thousand acres of land upon the south bank of the Santa Ana river, in San Bernardino county, including that portion of the elevated plain upon which the city of Riverside is located.

When a retrospective view is taken of the times in which this settlement was made, the condition of the country, financially and politically, and the discouraging nature of their surroundings, it must be admitted that these pioneers "builded wiser than they knew," and that to most persons their venture seemed a visionary one.

Irrigation Necessary.

Southern California was an arid section, subject to long periods of excessive drouth, with an occasional wet season. No crop of any kind could be relied upon with any certainty without irrigation, and irrigation as introduced by the Padres and their successors was of a very primitive character—requiring no expensive structures to turn the water from its natural channel and conduct it along the lowlands bordering the stream.

These settlers were, however, more ambitious; they were not satisfied to locate upon the low flat lands bordering the river, but selected the high mesas where unobstructed views could be had of the magnificent horizon around them, and where health and strength were to be inspired from every breeze that crossed the plains from mountain or sea.

This required comparatively a new departure for Southern California. The water for irrigation (which was the life of the enterprise) must be conducted out upon the mesas miles away from the channel of the river, and hundreds of feet above it—through rocky hillsides and across deep arroyos, requiring a higher order of engineering skill than had heretofore been given to it, and a far greater expenditure of money. Therefore, instead of receiving encouragement and cordial support from the settlers upon the adjoining well-watered territory of the San Bernardino rancho, they were frequently ridiculed and discouraged by the statement that they would be compelled to abandon their project, and that "their structures would ultimately be hauled away for fuel."

It must also be remembered that they came among a people largely composed of descendants of the Spanish, and a mixed Spanish and Indian race, speaking a foreign language and naturally suspicious and jealous of Americans. They were of totally different habits and customs, with whom it was difficult to communicate, and from whom no information was to be had in regard to fruit-growing by irrigation (the principal occupation in which the new-comers proposed to engage (or the varieties of fruit best adapted to this soil and climate. The plains upon which they located were simply pasture-lands, destitute of water even for domestic use, and, owing to the deficiency of the annual rainfall, had for centuries yielded but a scanty supply of feed for a few months each year to roving bands of cattle and sheep, and from June to November were dry and barren as a desert.

Construction of Flumes and Ditches.

Cut off from all associations with their kindred, and with exceedingly limited and irregular means of communication with them, and subject to the difficulties above named, it must be evident that there was not a place upon the Pacific Coast whose foundations were laid more upon the "evidence of things unseen and the substance of things hoped for" than this colony of Riverside. Yet, with probably more of the disappointments

VIEW OF NORTHERN PORTION OF THE CITY OF RIVERSIDE.

and discouragements allotted to the average settler in new places, they persevered; and with limited means and experience in such matters, constructed dams, flumes and ditches to control and lead the waters of the Santa Ana river out upon the thirsty and apparently barren lands.

Unlike non-irrigated sections of the State, it required nearly a year's time and the expenditure of some $50,000 before the waters of the Santa Ana were flowing through the new channels to the original town plat of Riverside; and no planting of trees or vines could be safely done until the water was available in quantity and permanency. Several years more elapsed before its distribution gave even a slight promise of the rich fruitage that would result to the settlers from this large expenditure of time and money. The first plantings were made in the northern portion of the city as now incorporated. This is the principal business center of the city, in which the hotels, churches, schools, postoffice, and business houses are grouped, and the additions to these are fast displacing the beautiful blocks of orange trees that surrounded the earlier homes of the pioneers.

The Experimental Period.

The building of a home and the securing of profitable returns from horticultural investments is not accomplished in a year or two by even those familiar with all the necessities or advantages of even a favored land like Southern California. It was especially more difficult and discouraging for those who were only accustomed to the soils, climate, methods of cultivation, and productions of a semi-frigid country.

Up to and including the year 1874 the growth of the settlement was quite limited, only some 1500 acres having been brought under cultivation to that time; but sufficient had been accomplished to encourage others to locate around and unite with them.

During the years 1875 and 1876, the Riverside Land and Irrigating Company was organized. It purchased all the lands and water rights of the original corporation, the Southern California Colony Association. It also purchased some 3500 acres from Messrs. W. T. Sayward and S. C. Evans and the same number of acres from the Tin Company tract, and by these purchases consolidated all the contiguous landed interests in a territory nearly fifteen miles long and three miles wide, including all the water rights that had been appropriated from the Santa Ana river for these lands, for domestic use, irrigation and manufacturing purposes. It expended during these and succeeding years some $200,000 in enlarging and extending the first canal, in constructing the lower canal and the distributing ditches and structures required for such an extended system of irrigation—the largest and most comprehensive at that time in California.

The new territory was subdivided into ten-acre lots conveniently located upon broad avenues, with cross-streets intersecting these every half mile. Magnolia avenue with its northern extension, Brockton avenue, is 20 miles long, extending from the business center of Riverside in a southwesterly direction to the base of the Coast Range of mountains, and through South Riverside. Seventeen miles of this distance is an air line; and the avenue through this portion is 132 feet wide, divided by rows of handsome evergreen trees into two roadways and two sidewalks.

Riverside's Growth.

The growth of the settlement steadily increasing, constant additions to the systems of water supply were required; and during the years 1885, 1886, 1887 and 1888, large expenditures were made for water, both for irrigating and domestic use.

The growth of the colony from its foundation to the present time is best shown by the following summary of the population and wealth of the place: Population, 6000; acreage under cultivation, 10,000; number of citrus fruit trees, 650,000; number of raisin grapevines, 1,350,000; number of acres of alfalfa, 600; number of deciduous fruit trees, 200,000; assessed value of property for taxation, $4,000,000; annual value of products of farm and orchard, $1,100,750; length of main canals, 50 miles; length of distributing canals, 125 miles; length of pipe lines of all sizes, 42 miles; length of streets and avenues, 175 miles; length of street railways, 15 miles; cost of water system, over $1,000,000; cost of street railways, $73,000; cost of gas works, $30,000; cost of church property, $100,000; cost of school property, $125,000. Incomes from fruit farms for past year: Citrus fruits, $630,000; raisins, $357,000; deciduous fruits, dried, $80,000; hay, nursery stock, etc., $33,750.

The number of acres of land in the immediate vicinity of Riverside's business center adapted to the growth of citrus fruits and the raisin grape and supplied with water for irrigation under the different systems, are as follows, viz.: Riverside Land and Irrigating Co., and Riverside Land Co., 12,000 acres; Gage system, 12,000; Vivienda Water Co., 3500; North Riverside Water Co., 2000; Jurupa Land and Water Co., 10,000 acres. In addition to these there is within the same territory an area adapted to alfalfa, corn and vegetables, mostly river-bottom lands, equal to 5000 acres, making a total now supplied with water and ready for cultivation 44,500 acres. These lands are capable of sustaining in a bountiful manner a population of 50,000 people. We have therefore room at Riverside and its immediate vicinity for 44,000 more people than we now have.

Oranges and Raisins.

The fame of Riverside as an orange-producer is almost world-wide. It was here that the first trees of the celebrated Washington Navel orange (which took the first prize at the World's Exposition at New Orleans) were planted, and to-day the orange products of the place consist mostly of that variety. They bring the highest price in the markets of the East, and practically rule the orange markets of the United States. Riverside raisins are also becoming equally famous and valuable. About 4000 boxes of these raisins were sent to London last year, and they brought better prices than the celebrated layers from Malaga. During the season the several packing companies at Riverside give employment to more than 2000 people.

Riverside is located on the new main line of the Atchison, Topeka & Santa Fe railroad, completed and in operation to San Diego via Santa Ana and Oceanside, and seven miles southeast of the Southern Pacific railroad at Colton, and connected with it by the Motor railroad. It is 53 miles in a direct line southeast of Los Angeles, and some nine miles southwest of San Bernardino, and ninety miles due north of San Diego, all county seats of their respective counties.

Thirty-three square miles of the colony tract are divided into 5, 10, 20 and 40 acre tracts for small fruit farms. Twenty-one square miles are yet used for grazing purposes, being at present above any system of irrigation. It can, however, all be irrigated from the upper tributaries of the Santa Ana, and will be, as soon as the increase of population demands it.

The Business Portion of the City of Riverside.

The business part of Riverside is well constructed, and contains several fine brick blocks. The Rowell hotel and the Arlington House are the two largest structures in the city at present, though these will soon be eclipsed by a fine opera-house now in process of construction. The Rowell is an excellent hotel for tourists and commercial travelers and is largely patronized. The Glenwood is a splendid family hotel, with the most comfortable arrangements possible for the accommodation of sojourning visitors. As indicated in the foregoing description, the city has a splendid water supply, has a gas company, and is moving for an electric-light plant. The business streets are well graded and macadamized and lined with sidewalks of artificial stone. The residence streets are beautifully shaded. There is a fresh, inviting look to the place, and one is loth to leave a city so highly favored and so well kept. The traveler who wishes to see California thoroughly, should by all means visit Riverside. H. G. P.

THE WATER GAS "BOOM."—No invention has made more noise in metallurgical circles of late, says an English writer, than that of water gas. There are now three companies formed for the exploitation of the idea in different parts of England, and it is stated that a fourth to introduce it into the Birmingham and Wolverhampton district is now in the course of promotion. In the case both of the Yorkshire Water Gas Company and the Derbyshire and Nottingham Water Gas Company the directors have closed the lists of shareholders some days before the date originally fixed.

THE Barnes Sulphur Company of Utah have struck an eight-foot vein, 98 per cent pure, 60 feet down from the apex.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

CHROME DIGGING.—Livermore *Herald*, June 15: Messrs. Pitcher and Knight put L. Diteman to work last week in the Ab. Mendenhall chrome diggings on Cedar mountain, and he struck the metal at once and began taking out ore. By Monday night of this week he had out 200 sacks, getting 22 bags that day. There seems to be plenty of ore, and it is probable that the force will soon be increased. Ab. Mendenhall will do the hauling for the present. No industry ever inaugurated in this section ever put so large a proportion of money invested into circulation as that of chrome mining.

Amador.

ALPI.—Amador *Ledger*, June 15: At the meeting of the directors last week, a modification of the agreement with the owners was made, whereby the monthly installments of $500 for the purchase of the property are suspended until July, 1890. Whatever money is derived from assessments in the meantime is to be expended in putting up a mill and developing the property. A five-stamp mill is to be put up as soon as possible. The purchase price will remain at $10,000. With one year to develop the mine and test the quality of the ledge, the company ought to know by the expiration of that time whether or not it is a desirable investment. At the mine the tunnel has been driven 80 feet beyond the shaft, making about 150 feet in all. At the face a crosscut is being driven across the ledge. The ore at this point looks better than any heretofore encountered.

MISCELLANEOUS.—We last week stated that W. Petrie had offered to move the machinery of the Ilex to Bright claim east of Jackson, and spend $2000 in prospecting. The negotiations have not assumed so definite a shape as stated. There has been some idea of moving the works either to Bright's claim or to the Gwinn mine, Calaveras county, but it is uncertain as yet. The pipe for the Amador gold mine hoisting works passed through Jackson Tuesday. It comes from the Risdon Iron Works, San Francisco. There are two parties negotiating for the purchase of the Mahoney mine at Sutter Creek. Reports say that some very fine ore was struck in the 700-foot level of the Wildman this week. It showed plentifully of free gold.

DRYTOWN CON.—The shaft, 300 feet deep, is free from water. Sinking will be commenced this week. It is proposed to go at least 200 feet deeper before any drifting is done. The ground is soft, and it is expected to complete the sinking inside of four months. The 280-foot level shows a fine-looking ore body, six feet wide. It is soft, free-milling rock, and carries considerable sulphurets. Competent judges estimate at it from $5 to $9 per ton.

Butte.

FORBESTOWN MINES.—Oroville *Register*, June 13: The Golden Queen mine is about one-half a mile down the gulch from the little village of Forbestown. The Stow mine immediately adjoins the works of the Golden Queen, being on the east side. The Stow people claim that their sulphurets will yield about 40 per cent gold, but that their process will only save half of the gold or even less. The owners of the Stow mine use the Huntington mills and have also erected chlorination works which will treat three tons of sulphurets every 24 hours. The Golden Queen has about 1500 feet of tunnels, all timbered. The vein has a thickness of about eight feet running northeast and southwest and lays almost flat. The ore contains about ten per cent of silver, no lead or zinc, very slight traces of copper and a percentage of tellurium. The Golden Queen has ten stamps in operation, the mill being run by a six-foot Pelton wheel under a pressure of 250 feet. The crusher is a "Gates ore-breaker," driven by a small Pelton. Mr. Geo. C. Hunter is superintendent, a gentleman who has had large experience in quartz mining in Australia and New Zealand as well as in California, and is very justly proud in that he saves all his free gold and clears the sulphurets from the quartz. We examined the refuse and it was almost impossible to detect any sulphurets in it. This system of running the pulp through the pans and over the blankets and timing it just right to get the best results, enables him to save the free gold, and then by continuing the process of thinning with water and by the action of gravity, he clears the sulphurets from the debris. In erecting the works he had left a space for the erection of another building to contain machinery to aid in cleaning the sulphurets, but he has not found it necessary to put them in. They send their sulphurets to San Francisco to be worked.

El Dorado.

MUD SPRINGS DISTRICT.—Placerville *Observer*, June 19: The new hoisting works, manufactured at Placerville by H. S. Morey, for the Church mine, is the finest plant of its kind in the county, and works to perfection. The work of enlarging the main shaft at this mine is progressing as rapidly as possible and a fine job is being made of it. We have heard it reported that new hoisting works are to be erected at the old Springfield mine.

DIAMOND SPRINGS DISTRICT. — The Equator mine, north of the Springfield and Church mines, on the same line, is promising most favorable results. The east tunnel is in about 1100 feet, crossing in its line three distinct ledges of gold-bearing ore. The first, No. 1, is about 600 feet from the mouth of the tunnel, and is over seven feet between walls. One hundred feet farther is No. 2, nearly 15 feet wide, and about the same distance still farther on is ledge No. 3, about twenty feet wide. According to samples taken, these ledges all contain ore of fair grade. The amount of water coming in at the face of the tunnel would seem to indicate its near approach to a larger vein of ore. The ore taken out in crossing the ledges, Nos. 1, 2 and 3, is the same in character as that taken from the famous old Keystone mine at Amador City, which has yielded its millions. These ledges are now in condition to admit of ore being taken out at a very low rate per ton. D. C. Morgan is opening up the old Bond mine, south of Diamond Springs and near the Equator mine. Blair Bros. are delivering a large lot of lumber on the ground, and Philias Cote of this city is erecting hoisting works. It is reported that a mill will be put up as soon as the hoisting works have been completed. The Griffith Consoiidated mine has temporarily suspended operations.

NOTES.—The so-called Rudd Pulverizer, placed on the Steuart cement gravel mine a few months ago, has proven to be a complete failure. It will not pulverize the gravel or save the gold. The gravel in this mine is very good. At the Gignac mine development work is being pushed with vigor.

Fresno.

KING'S RIVER DISTRICT.—Fresno *Republican*, June 15: E. H. Barton, Civil Engineer and United States Mineral Deputy, has returned from the Minarets in the King's River mining district, about 90 miles northeast of this city. The mines are at an elevation of 11,000 feet above the sea level and received their name by reason of the resemblance of the peaks to minarets. The district is of a volcanic formation of green porphyry and slate mixed with gray hornblende. It abounds in silver ore, carrying a large percentage of bismuth and gold. The ore is easily worked by the smelting process. One of the mines known as the Sierra has been bonded to Mr. Selby of the Selby Smelting Works in San Francisco, and the Wheat mine has been bonded by C. D. Wheat. A bonus of $10,000 has been placed on the bonds. The remaining in the group have been bonded to an English syndicate for $2,500,000. The syndicate has now a carload of provisions and material at Madera to forward to the mines. S. E. Holcomb is at Madera, and will go to the district as the superintendent for the syndicate. Mr. Barton says that the quartz is of a permanent formation, and that the ledges in extent and in promise surpass anything that he has ever seen in Nevada or California.

Inyo.

MINING REPORTS.—Inyo *Index*, June 15: From several directions come encouraging mining reports, and it is not improbable that Inyo county is even now on the eve of a mining boom of no small proportions. No section of the Pacific Coast offers as much inducement to prospectors as can here be found. There are now a number of excellent openings for mining investment in this county, certain to pay handsome dividends for a great many years, but which lie idle because their merits are unknown to mining capitalists and investors. Could any one of these properties be taken hold of and developed by a big company, the result would insure the speedy sale and working of others. The only present difficulty is the financial inability of the holders to develop these future bonanzas and erect the expensive machinery necessary for their profitable working.

GOLD ORE.—Inyo *Independent*, June 15: Kehoe & Barnes are taking out some very rich gold ore at the White Hill. The ore is from a blind ledge found in prospecting for silver-lead ore. An incline is now sunk on the ledge to a depth of about 50 feet; it is getting wider as it goes down and dips to the east at a very steep incline; in fact the vein is nearly vertical. Samples of the ore brought into town would go far up in the hundreds of dollars per ton, if not thousands. At present the vein is about 20 inches wide. It is intended to send a lot of the ore to the Maxim mill soon for working.

CASEY.—The mill at the Casey mine, north of Laws, is running about 16 hours each day. Fourteen men are employed in the mine.

Napa.

AT THE PALISADE MINE.—*Calistogian*, June 12: Preparations are being made at the Palisade mine to more than double the output of bullion there. The reduction works were constructed with the intention finally of increasing the number of stamps to 20, ten now being used. But for certain reasons Mr. Grigsby concluded that a pulverizer used in connection with the stamps now employed would answer his purpose better, and a machine of this kind has therefore been purchased. It will do about as much pulverizing as can be done with ten stamps. A new rock-breaker, having important improvements designed by Mr. Grigsby, has been procured, and is in operation. Its capacity is much greater than is at present required at the works. It breaks the rock or ore nicely and easily, and is a great improvement on the one previously used. The hoisting works in King canyon are not yet in working order. When they are completed the 300-foot level of the Palisade vein will be worked. High-grade ore is found there, and will now be mined. This mixed with lower grade, an average value will be obtained much greater than that of the ore heretofore worked. With this increase, and the crushing capacity of the works doubled, it will be seen that the amount of bullion produced must necessarily be far greater than is now obtained.

Nevada.

THE COE.—*Tidings*, June 12: Superintendent White informs us that the water in this mine has been lowered to a point below the 400-foot level and that now the shaft and drifts are being placed in repair. It is probable that pumping will be continued until the mine (550 feet in depth) is entirely clear of water.

Placer.

WEST POINT.—*Herald*, June 15: G. W. Snyder, foreman of the West Point mine, was in town Monday. Mr. Snyder says that gravel of wonderful richness was struck last week. From one panful gathered from the richest part of the lead, 18 ounces were taken. The channel is 300 feet wide and the gravel rolls out an average of $11 to the carload. This mine has paid regular dividends right along since it was opened, and from present prospects seems destined to rival the most famous mines on the divide in richness.

FOREST HILL.—J. C. Scott of Forest Hill reports everybody is encouraged by the good news from the Red Point mine. At the Dardanelles the water has been got under control, and sinking to find the bedrock is going on uninterruptedly. The Baker Divide Co. will begin to run their main tunnel ahead right away. Breece & Wheeler are taking out good pay. The channel has taken a turn to the eastward.

Plumas.

RICH STRIKE AT INSKIP.—Greenville *Bulletin*, June 12: In a note from Charles H. Stokes we learn that a rich strike was made about a mile from Inskip last Saturday by R. E. Calloway and P. H. Riffe, in head of Dutch Gulch, yielding $10 to the pan in a small quartz vein. There are numerous quartz claims in the vicinity of Inskip which only require capital to develop them.

Shasta.

QUARTZ DISCOVERY.—Shasta County *Democrat*, June 8: A new gold quartz discovery was made by an old prospector named Brown, about two weeks ago, on the old Gage place on the divide between Shasta and Centerville, that promises to make a rich mine. Two claims were located, one on the Gage place and the other just off and adjoining. The Gage place is deeded land and belongs to Mr. Walden, who is at present farming in Happy Valley. Brown sold the outside location to Jim Beecher of Anderson, and a Hayden Hill miner named Hall, for $1000, and last week they were offered $5000 profit on their bargain. Beecher & Hall are sinking on their claim, and we are told they take out as high as $4 to the pan. This discovery has caused quite an excitement in that vicinity.

REDUCTION WORKS.—Redding *Free Press*, June 15: The Ottawa Reduction Works will be ready to reduce ore on Monday. There is plenty of ore ready to be roasted and submitted to the patent bath. The projectors of this enterprise have abundant faith in the result of this new process for extracting gold. Whether that faith is well founded or not will soon be determined.

Sierra.

THE COLOMBO MINE.—*Tribune*, June 14: Messrs. John Mooney, Wm. Petaluma, Mort Mooney, Jake Moss and J. W. Conely are the ones who have the Colombo mine leased. They commenced last week to fix up and get things ready around the mill and mine. A dispatch was received from San Francisco Wednesday, stating that the pipes and plates sent for had been shipped. As soon as they arrive, and the company can get them rigged up, they will be ready to start the mill going. The above parties have leased the mine for two years.

FIVE-STAMP MILL.—*Mountain Messenger*, June 15: The Garibaldi Mining Company is about to build a five-stamp mill in Gold Valley, just opposite the site of the old Gold Valley sawmill. Water for power will be taken out of Gold Valley creek at the bridge above. There will be sufficient water the year round.

GOLD BLUFF.—J. S. Jaquith was here last week to look at the Gold Bluff mine, with a view to erecting pumping machinery on the same. We understand that he reported favorably upon the project, and that work will soon be commenced. It is proposed to take the water from Costa's ditch in through the upper tunnel and down the shaft to the lower tunnel, and use it upon a Pelton wheel under something over 200-feet pressure. There is also some talk of putting a new mill upon the property.

FIR CAP.—Work has been commenced again in the Consolidated Fir Cap tunnel. This mine comprises some 340 acres, and is situated on the ridge between the rich old mining camps of Fir Cap and Monte Cristo in this county.

THE FRENCH COMPANY, at Barnes' Ravine, are running their hard bedrock tunnel; with seven men employed are making good progress and expect to reach gravel every day.

THE WIDE-AWAKE new tunnel is in over 60 feet, 40 of which were made last week. They will have to go 600 feet to the front channel and 200 feet farther to the back channel.

A HUNTINGTON MILL is being erected upon the Montpelier claim, just above this place on the North Fork, to be run by water from the Montpelier flume.

Siskiyou.

QUARTZ AND PLACER.—Yreka *Journal*, June 19: The Good Enough quartz ledge at Humbug is certainly a good enough claim for anybody, paying over $120 to the ton at the last crushing. From 21 tons of ore crushed in the McCook mill at Forks of Humbug, last week, the yield was over 150 ounces. It is owned by Charley Humphrey and Thornton Thomas, and located in the gulch close to the site of the old Eliza mill, averaging about two feet in width. There seems to be plenty more of just as rich quartz in sight, and it is believed to be the richest quartz mine yet discovered in Siskiyou. Work has been resumed at the Montezuma placer claim at the south fork of Scott river, with prospects of a good yield this summer as long as the water supply is sufficient to furnish the immense flume. F. Hellmuth has started up the old Cummings quartz-mill on Boulder creek, south fork of Scott river, and is now crushing some very fine-looking quartz. Crowley, who owns a good placer mine at south fork of Scott river, has bonded to a San Francisco company, who are now testing it with a likelihood of taking the claim and working it on an extensive scale. The men employed by the Odd Fellows in sinking a well at the cemetery for water, struck a quartz ledge at 27 feet down, the ledge being 18 inches thick, but they have found no water. The work will be continued with prospect of finding both gold and water. The Schroeder & Werner quartz mines at head of Deadwood creek are paying well, and the mill is kept going steadily, with a large force of men employed. This mine is destined to be one of the most extensive and permanent in the State, and by next season there will probably be twice as many men employed as at present.

Tuolumne.

NOTES.—*Democratic Banner*, June 14: It is reported that the Kanaka mine near Groveland will soon be sold to San Francisco parties. E. J. Richards, A. Colby, Wm. Suttle and Robt. Watson are about ready to put up hoisting works on their mine at the St. Cyr ranch. Everything is looking well for a bonanza. The Golden Gate mine, under the supervision of Mr. W. G. Long, is proving itself to be one of the best mines in the county. The ore taken out is of such grade as to warrant the expenditure of considerable money by the company, and arrangements are now perfected for the building at once of a ten-stamp mill and chlorination works. The material necessary for the construction of the works has been ordered and work will be commenced in a few days. It is said that a new system of operations will soon be inaugurated at the Buchanan mine, through the introduction of electricity. A survey and estimate for an electric plant of sufficient capacity to run all the machinery at the mine has been made and forwarded to the owners of the property in San Francisco, and it is believed that the company will make the change, as the expense of running by electricity as compared with the present mode of operations will be a mere nothing. Dr. Tibbets, of Columbia, was in Sonora Saturday and reports that his mine on the Stanislaus river, fourteen miles from Columbia, is looking well, and that a ten-stamp mill with all the modern improvements is being rapidly constructed. This mine is well prospected, and bids fair to become a substantial and valuable adjunct to the many paying industries of Tuolumne. It is in a district heretofore but little prospected but which has always been looked upon as good ground by mining men. The Mary Ellen mine, owned by Mr. Cruikshank, near Groveland, is in splendid condition, and from Mr. Louis Blanding, who is getting up a concentrator for the mill of his own design, we learn that the vein is about four feet in width, and will pay about $40 per ton in free gold and that the sulphurets assay as high as $1800 per ton. The new ten-stamp mill is about to start up, and under most favorable circumstances. The operating power will be steam.

Trinity.

NEW RIVER.—*Journal*, June 15: Messrs. Colgrove and Mullane were in town this week from New River. We are indebted to Mr. Colgrove for the following items: Ladd & Clements are running their mill night and day with plenty of good ore in sight. Mr. Colgrove is working 12 men in the Excelsior. The stamp-mill is running steadily and the mine is looking well. The tunnel on the Ridgeway is in 430 feet, and they have 300 feet more to run to strike the ledge. A sawmill, belonging to the mine, is already built, and a stamp-mill will soon be constructed. The Sherwood mine is looking well and has some good ore in sight. The Toughnut, leased by Fairburn & Fulmorn, is paying well. Nicholson & Miller are working a small crew of men and are doing well. The prospects of the camp for a successful season are very bright. W. S. Lowden, who has just returned from the New River country, informs us that the parties who leased the Hardtack last fall have struck a very rich vein of ore in that mine. The extent of it is not yet known, but at last accounts the indications were favorable for a large body of ore. A Mr. Irvin has made a new discovery that prospects very well, and he is confident that it will develop into a good mine with a reasonable amount of work.

NEVADA.

Washoe District.

BALTIMORE.—Virginia *Enterprise*, June 15: Are extracting ore of good grade from the crosscuts on the 225 and 338 levels. Both places are quite wet.

SAVAGE.—On the 400 level the joint west crosscut was extended 15 feet. There is considerable water coming in from the face, and the ground is very heavy and requires close timbering. From No. 1 and No. 2 west crosscuts we are stoping ore of fair grade. Are also extracting ore from the old stopes in the north and south drifts. On the 500 level west crosscut No. 2 was advanced 12 feet. The face is in vein porphyry. In the south drift are extracting ore from the old stopes. During the week hoisted 461 cars of ore. Shipped to the Rock Point mill 484 tons and milled 490 tons. Average battery assays, $23.96 per ton. Bullion yield in May was $27,940.25. Ore milled, 2170 tons.

CROWN POINT.—The 500 raise is up 50 feet, having been advanced 8 feet during the week. The top is still in hard blasting ground. Have opened the 13th floor, 400 south stope, and find the pay ore narrowing rapidly and of poorer quality. No change to report on the 350, 160, 450 or 700 stopes. The 400 north stope is looking and yielding about as usual. Shipped to the mill during the week 711 tons and 570 pounds, the average battery sample of which was $18.26 per ton.

BELCHER.—The 1100 raise is up 83 feet in soft porphyry. The 1100 south drift was advanced 41 feet, making its total length 224 feet. Expect to connect with the west crosscut this week. The 1000 and 1200 south lateral drifts are out 83 and 89 feet respectively, with no change in the ground to report. Have just started a west crosscut on the 200 level from the shaft.

CONFIDENCE.—The joint Challenge, Confidence and Imperial north drift on the 500 level is in a distance of 668 feet from the Yellow Jacket shaft. The face shows porphyry. The joint Challenge and Confidence raise from the east drift on the 1250 level is up 15 feet, having been commenced during the week. The face shows quartz and porphyry.

HALE & NORCROSS.—Hoisted about 1200 cars of ore during the week, and shipped and milled nearly 1000 tons. The stopes are yielding their usual quantity of ore, and active prospecting work is going on.

CON. IMPERIAL.—The north drift on the 300 level is now in a distance of 114 feet from the south line, having been advanced 30 feet during the week. The face shows porphyry.

CHOLLAR.—Prospecting on the 550, 750 and 850 levels. Are not hoisting ore now, as there is not enough water to run the Nevada mill to its full capacity.

CHALLENGE CON.—The work, which continues to be jointly with Confidence, is described in the report from the last-named mine.

JUSTICE.—The mill and machinery are working steadily and well, and the usual amount of prospecting is being done.

EXCHEQUER.—Active prospecting work is going on on the 332 and 500 levels, though there is no change to report.

BULLION.—Drifting north in the ledge on the 760 level. There is no change to report in the formation.

ALTA.—The usual work is reported from this mine, and extracting the same quantity and quality of ore.

YELLOW JACKET.—Are shipping about 100 tons of white gold rock daily to the Brunswick mill.

SILVER HILL.—Drifting northwesterly in a promising quartz formation.

POTOSI.—About the usual prospecting work is being done.

ANDES.—Drifting west on the 175 level.

SEG. BELCHER.—The 1100 raise is now up 73 feet, having been advanced 18 feet during the week. The top shows streaks of quartz of good grade.

Have put in a blower during the week, which will enable them to advance more rapidly.

Golconda District.

SHIPPING COPPER.—*Silver State*, June 12: The Adelaide Copper Co. has 15 tons of copper ingots at Golconda, ready for shipment. Last year copper averaged producers in the United States about 14½ cents per pound, but since the disruption of the French syndicate, the price has dropped to about 11 cents a pound. The Adelaide copper will doubtless command a higher price, as it carries considerable silver.

Pioche District.

MANGANESE ORE.—*Record*, June 8: Nearly every miner who has lived long in Pioche has noticed the black croppings of a ledge which runs back from the R. & E. works in a southerly direction and shows strongly at the surface near the Divide over which passes the Bennett Springs road. It has been called the "Iron Ledge," everybody supposing that iron was the most important element in its composition. A few years ago a number of tons of ore were taken from the surface where the road crosses, but, bearing comparatively little silver, supposedly in an iron gangue, and no smelting furnace being at hand, it was left unworked where it was taken out. It remains there yet. A short time ago a sample was sent to Salt Lake for analysis, when the surprising discovery was made that the "iron" ore was manganese ore, carrying 37 per cent manganese, 10 per cent iron and 3 per cent zinc—an ore in which the silver, treated with salt and heat, chloridizes easily to 90 per cent of the assay contents, and which, thus treated, leaches freely. The croppings show plainly at intervals along the ledge, a total distance of say 1000 feet. The ledge ranges in width from 3 feet to 18 feet, runs west of north and east of south and dips westerly at an angle of about 30 degrees. Supt. S. T. Godbe's samples show the croppings at some points to contain but little silver; but in most places high assays can be had, and the average of the ledge where an incline has been sunk 30 feet, about 500 feet southerly from the R. & E. shaft, is 28 ounces in silver. At the most southerly point sampled, the average was 30 ounces. Small bits of galena, which are considered more as indications than as a factor in the ore, are occasionally found. But expert testimony is to the effect that 20-ounce ore, of the character and in the quantity now being extracted, will pay well. This being true, the Pioche Consolidated Co. will not have to depend entirely on developments below the water level for a paying property, and one which, there is a probability, may prove a bonanza.

RAYMOND SHAFT.—The work of raising the lift pump out of the sump, to the station at the 12th level of the Raymond shaft, occupied the force employed in the pump compartment most of the week, but was successfully accomplished. It was thought at first to have gone down but 30 feet, but it proved to be at the bottom with 70 feet or more of pump columns attached to it. The work of retimbering the shaft and repairing the large pump and machinery has been done under the supervision of Mr. E. A. Shear, who came here from Park City, Utah, for that purpose. The work has progressed steadily and satisfactorily since its commencement, and by the time the new boilers, now going in, are ready for use, the pump will be ready for work. The cost, too, of the repairs, though great, has been materially less than was expected. The necessary receiving and supply tanks are in place, and we may soon look for a stream of water from the mine running down Main street.

IN THE YUBA MINE, says Supt. Sam Godbe, we have crosscut from the main incline at the 12th level, 100 feet north to the middle vein. Thence we have drifted west 100 feet along the latter, which here gradually approaches the north contact vein. The middle vein is about six feet wide and now shows small streaks and spots of ore in the face of the drift. Near the face a winze has been sunk 30 feet. At the bottom there is about three feet of good ore, partly milling, but the whole carrying enough lead to make it smelt freely.

Rebel Creek District.

MINING SALE CONSUMMATED.—*Silver State*, June 12: Deeds were recorded yesterday from H. H. McColley, J. H. MacMillan and N. Levy & Co., to L. P. Brenan of Philadelphia, for the Golden Era mines, Nos. 1 and 2, and the Great West mines, in Rebel Creek district, and also the Silver Wave mill and water right in the same district. A deed from H. H. McColley to L. P. Brenan for the Flat Creek mine was also recorded. The mines have all been more or less developed, and they carry considerable gold as well as silver.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, June 11: North drift on the 200-foot level extended 12 feet. West crosscut from the 300-foot level station extended 10 feet. Total length, 20 feet. The face shows some spar seams.

COMMONWEALTH.—Stopes 100 feet east of the shaft on the 100-foot level are yielding very rich ore. North stopes, same level, are being opened so that men can soon be put to extracting ore. South stopes, same level, continue to yield about the same amount. The 150 and 225 foot level stopes are looking better than at any time since starting the mill; 245 tons of ore have been delivered at the mill. Shipped Monday, 10th inst., $12,379.13 and $12,000 on hand. The mill is running nicely and doing good work.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 15 feet; total length, 85 feet. East crosscut from the end of the south drift, 100-foot level, extended 16 feet, passing into the hanging-wall; total length, 90 feet. The face shows a little water.

GRAND PRIZE.—The stopes on 400-foot level are looking and yielding well. Construction work on the concentrator is being pushed and will be in running order about the 1st of August, by which time sufficient high-grade ore will be on hand to begin milling also.

DEL MONTE.—Joint crosscut, 225-foot level, extended 15 feet. North drift, same level, extended 12 feet. A seam of black spar continues, carrying some high-grade ore.

NEVADA QUEEN.—Winze from 450-foot level has been sunk 10 feet; total 30 feet. Cut into the ore at a depth of 20 feet—it is now about 30 inches in the bottom. Assays range from $112 to $329 per ton. The ore is solid and regular. South drift from east crosscut, 150-foot level, of Commonwealth has been advanced 17 feet. The ore is low grade.

BELLE ISLE.—Crosscut west from the end of north drift on the 250-foot level, extended 19 feet; total length, 24 feet. The face is in favorable-looking ground.

ARIZONA.

MOHAVE COUNTY.—*Miner*, June 15: A thirteen-pound bar of bullion was shipped from the express office Thursday. At the Moss mine things are getting in good working shape, and good ore is being encountered and the ore track in the mine is about finished. The Flores mill made a run last week on Tintic mine ore, and the Rogers Bros. will probably have their ore from this mine worked at the Flores mill hereafter. A strike of high-grade ore has been made in the 400-foot level of the C. O. D. which bids fair to prove of a more permanent character than any strike beretofore made. The Hudgeons Bros. this week made a shipment from the Prince George north, on which they have a lease. The ore body is reported as being six feet wide, and assays something over 120 ounces per ton. The Oliver Bros., who are working the Prosperity on a lease, are taking out large quantities of high-grade ore and will make a shipment before long. Thomas Steen, the superintendent of the Rattan mine, reports that mine as looking better than ever. Drifting has commenced on the 200-foot level, and the mine will be fully developed before more machinery is added. Miners all unite in saying that the mining outlook is better in Mohave county at present than at any time in its history. Miners are all taking out ore and capital is looking this way for investment, and the indications are that considerable Eastern capital will be invested in Mohave county mines this year.

WALKER DISTRICT.—Prescott *Courier*, June 12: D. Boaz and J. C. Brown arrived in Prescott yesterday, from Walker district. Mr. Boaz is an officer of the Dixie Co., and, we believe, the organizer of it. Mr. Brown is the head of the Kansas City firm of Brown & Faulkner, who are heavily interested in the Dixie. His business in the district was to examine the mill and mines of the company. This he has done and has stated that he is well satisfied with the property, much better than he thought he would be. His statement is that he found the mines large, the country cool, well-timbered and pretty well watered. He will go East well pleased with this part of Arizona; well satisfied with its mineral wealth, etc. E. H. Witherell, merchant of Jerome Junction and general freighter for Mr. Clark of the United Verde, informs us that his teams are kept very busy hauling coke and other supplies to mines and smelters and bringing out bullion.

WALNUT GROVE.—The *Courier*, a short time ago, spoke of the discovery, in Walnut Grove district, of small and large pieces of silver, by placer miners. Since then the discoverers of the floated treasure followed the lead in regular prospector's style and were recently rewarded for their labors by finding the ledge or vein, which is very rich in native black sulphuret and horn silver. So we are told by a gentleman who has conversed with the people who found the treasure, and who, yesterday, brought considerable of the rich stuff to Prescott. The ledge is situated near the lower dam of the Walnut Grove Water Storage Co. on Hassayampa creek.

COLORADO.

MOVED.—Idaho Springs *News*: The big hoisting plant formerly used on the main shaft of the Kitty Clyde mine has been moved over to the west shaft where a big bonanza is showing its color. Work was resumed on the Conemara mine this week for the first time in a year. A three-inch streak of rich ore is now exposed. Some enterprising miners have taken hold of the Edwards placer at the junction of Chicago and Clear creeks, and are going to clean out all the pay there is left in it. In prospecting the surface of the Blue Ridge Lode in Spring gulch, W. H. Robertson, the owner, uncovered a big streak of decomposed mineral that shows well in the pan. A large force of miners working on the Champion, are keeping their 50-stamp mill supplied with ore.

DAKOTA.

CHLORINATION WORKS. — Deadwood *Pioneer*, June 12: The success of McPherson's chlorination process has been so fully demonstrated that promoters no longer regard it as experimental. Col. Keith, who has been prime mover, and to whose energy and enterprise is due credit for the works at Garden City, is negotiating for the Gates crusher brought in for the Deadwood Sampling Works, and which never used, has lain idle opposite the court-house for years. This, and an outfit of heavy rolls, put up instead of stamps at the plant, will reduce cost of reducing the ores to $4.50 or less per ton. So far the plant has been operated under many and great disadvantages, and yet has proved a thorough success.

IDAHO.

CŒUR D'ALENE MINES.—Wardner *News*, June 12: The mining regions of America have but one way to grow and from present appearances that is in the direction of the great Northwest. Here there is mineral land enough to accommodate the rapidly increasing population and wealth enough contained therein to amply reward their labor. There is no necessity for people to travel farther and fare worse, when all they can in reason desire is to be found right here in Cœur d'Alene. The prospector versed in his calling is satisfied of the fact and never fails to exclaim "This is good enough for me." The far-seeing capitalists are fast turning their attention to the unequaled field afforded them for investment here and the result of sales already made offer great encouragement to future ventures.

EVOLUTION DISTRICT.—Manager Clement has suspended all operations for the present on the Argentine mine. Several carloads of high-grade ore are lying on the dump and in the ore-houses, and the lode from all appearances contains an inexhaustible supply of mineral.

ELK CREEK.—The work done on the Alma & Nellie property during the last month proves conclusively the great value of the gold mines owned by this company; vast piles of ore have been extracted and the future of Elk Creek looks more promising than ever. Work was resumed this morning in the mill and the 20 stamps will henceforth be kept dropping day and night. J. Cronin is general manager. J. A. Mayer is in charge of the mill, and 30 men are on the company's payroll.

BUNKER HILL & SULLIVAN.—Development work continues on both these mines, keeping a force of men piling up ore in huge masses, showing an accumulation of wealth that cannot be surpassed in the product of any mineral belt in the world. Work is progressing in the lower tunnel to strike the vein, and in the Small Hopes tunnel drifting is to be done on the vein. The air compressor is meeting all expectations and is running two air drills at present.

POLARIS GULCH.—The result of the steady development work on the Polaris mine is gratifying to the owners. Shaft No. 2 is down 115 feet and sinking is continued on the ledge, which is widening as depth is attained.

ROSEBUD GULCH.—T. St. Germain is working on an extension of the Nellie, owned by Horton, Alger & Co. The shaft will be sunk to a depth of 100 feet.

LOWER CALIFORNIA.

THE ALAMO DISTRICT. — *Lower Californian*, June 13: Each day's work in the Alamo district only goes to show the permanency of the mines. At first it was believed that the gold belt was narrow and confined to the immediate vicinity of the Princesa and Ulises, but subsequent developments in the camp show that the mineral belt extends in length and breadth over a greater area than the most sanguine persons at first supposed. The developments in the Sunrise, Rattlesnake and Placer, on the west, in the Buena Vista and Elsinore on the south, in the San Vicente, Scorpion and Moran on the east, and in the Buster, Red Cloud and Chispa on the north, prove that the mineral belt is a large one. Even to the southwest, the Rainbow and others prove that the belt runs into and extends west of Mt. Alamo. Every week new ledges are discovered and the richness of the mines is beyond all doubt. It is a permanent camp.

QUARTZ.—McGrath & Joseph had the work done on the Elephant mine, 17 feet of shaft 5 feet square and 17 feet of drift, for $80 Mexican money. The regular price paid for this work in other mines was $250 to $288. As a rule the rock is quite hard. They take out some rock occasionally from the Texas which fairly makes one delirious. A little wedge-shaped piece taken out a day or two ago, weighed about three pounds and was at least one-third gold. The vein is very small, only two to six inches, and while it may prove to be a pockety vein, many believe it will be a permanent one.

THE SCORPION shows rich ore at 20 feet in the west drift. A new vein has been struck in the Moran at 20 feet. This mine, which is proving to be so rich in the Princesa vein, now has another value added to it in the fact that the Quinota vein is also found in it.

MEN are taking out the usual quantity of gold from the placers. On a careful estimate they will average $1200 a day altogether. Messrs. Wade and Curry struck a pocket of thirty ounces the other day.

THE timber and light machinery of the Torres Co.'s ten-stamp mill has arrived. The boiler, engine and mill were in San Rafael valley Saturday and should be here by the time this is printed.

TONS of giant powder are now here and several mines besides those of the International Company are being worked night and day. Good miners are getting $4 a day on the ledges.

GOOD ROCK was struck in the Chispa mine at the depth of 18 feet. This vein, while not so rich on top, is well defined and regular.

MONTANA.

THE LANDOWNER.—*Inter-Mountain*, June 10: Donald Mitchell, president of the Landowner Consolidated Mining Co., arrived in Butte this morning and gave a reporter some facts in relation to that company. The properties owned by it are the Landowner, Sunday and Hortense claims, and they are situated about 12 miles south of the postoffice of Quartz, in Missoula county. The nearest railroad point is Missoula. The company was organized altogether by Missoula men, and they have six men engaged on development work. The main discovery is on the Landowner, where a tunnel has been driven in to a depth of 35 feet. A vein has been encountered at that depth, and eight feet of quartz has been cut through. The rock is free-milling gold, and the assays, according to Mr. Mitchell's statement, will average about $30. Development work will be systematically prosecuted.

A SHIPMENT FROM VIRGINIA CITY.—Butte *Inter-Mountain*, June 15: R. T. Cooke of Virginia City was in town during the week with a sample shipment from some mines he is an owner in near that place. While his ore will probably not pay very handsomely to ship to Butte, yet with a reduction works on the mine it would be a dividend-payer. Virginia people are anxiously waiting the completion of the Butte and Gallatin line of the N. P. R. R., when they think their time will come, and the probabilities are strongly in favor of their realizing on this.

MINOR NOTES ABOUT BUTTE MINES.—The Germania still continues to improve, the last mill returns going 250 ounces per ton, though the rock assays up in the thousands. Mr. Frudenstein asserts the mine has actually improved 60 per cent in sinking the last 50 feet. Mr. Cal Gates of the Prospector has the station completed on the 100, and will shortly commence sinking again to another 100 feet. The flags of all the prominent mines threw to the breeze the star-spangled banner on the 13th of June in honor of the Miners' Union anniversary. On the 800 of the Mountain View, the leads, both north and south, continue to improve both in quantity and quality as they are extended.

THE FLINT CREEK MINE.—Clint Freyschlag will probably succeed in starting work again in a few weeks on the at one time famous Flint Creek mine in the Georgetown district. Several thousand dollars were spent in impractical prospecting on the property two years ago, but no regular body was found of the wonderful gold rock that set so many people almost wild with excitement at the time. Mr. Freyschlag, however, believes it is there somewhere, and is determined to look further for it.

THE SOUTHERN CROSS.—The 150-foot level, west, in the Southern Cross, has now been driven 108 feet from the shaft all the way in ore. For the last 40 feet they have been in a body of as good ore as has been found in the mine, and prospecting in the pan is "away up." The gold is much coarser than in other portions of the mine.

THE RED LION.—The five-stamp mill at the Red Lion mine has been running now for over two weeks, but owing to the remoteness of its location, nothing definite is known as to the result. The ore is quite low grade, but not so low as to render its treatment unprofitable with proper management.

GOLDEN GATE.—A representative of the Golden Gate Co. went to Cable to-day to start up work on that property. A shaft will be sunk near the line of the Cable mine and the ground will be prospected from the bottom of it with a diamond drill. Work will be actively commenced on Monday.

BROWN'S SMELTER.—Construction work on the Blue-Eyed Nellie smelter on Warm Spring creek is being pushed, about a dozen men being employed. There will be but one furnace for the present. The stack of that is now in place and the smelter building is well under way.

THE CABLE MINE.—The 30 stamps of the Cable mill at last accounts were still dropping on high-grade ore. As there is a three years' supply of ore in sight in the mine, it is probable that the mill will run continuously from this on.

NEW MEXICO.

FROM VARIOUS CAMPS.—Rio Grande *Republican*, June 15: The Toughnut still continues to produce high-grade ore, and "Little Mac" is happy. Ore wagons brought in a shipment from the Comstock this week. A carload goes to Pueblo. A shipment of high-grade ore from the Toughnut was made yesterday by Burt & McLaughlin. It went to El Paso. Lew Cowan has taken a lease on the three claims owned by the Philadelphia Co. He has opened up a good vein of ore on the Girard. Joe and Will Herd, who have been at work for some time driving a tunnel on the Modoc, cut the contact this week at 90 feet. They found ore, but the quality or size of the body has not yet been determined. Bob Gamble and Mart Bergeret were given a claim by Billy Hayden and Jim Robertson, which lies near San Augustin peak. They have found a streak of very high-grade ore, assaying from $800 to $1300 per ton. A. Cowan is going to do some work on the Trump, a claim in the Hawkeye group at Organ. Some good mineral has been shipped from this ledge and Mr. Cowan thinks he has found a blow-out which will show a good body of ore. The Dos Amigos, which has been worked by Sam Barlen, Jack Younger and the Foy Bros., now has a four-inch streak of high-grade ore. The boys started in to do the assessment work, but the ore is good enough to pay them to continue working the claim. Captain Crawford has returned from London to Kingston, and immediately on his arrival in the silver camp put a force of 30 men to work on the different claims which he represented. It is reported that he secured $180,000 with which to develop mines at Kingston. Dr. J. V. Cowan is interested with him in one group of mines.

OREGON.

POWDER RIVER F. & M. CO.—Bedrock *Democrat*, June 10: The Powder River Flume and Mining Co. are getting everything in readiness for extensive mining operations, and are only waiting for the waters, which are unusually high for this season of year, to fall, when they will at once put on foot this gigantic enterprise which has already been proven, by the construction of wingdams, the best and richest diggings now in the West. The gentlemen composing the company are W. A. Cowles, of Battle Creek, Michigan, Messrs. Sicord and Irwin, of Chicago, Major Wilkerson and O. S. Buckland of Sparta. The property is situated about five miles southwest of Sparta and embraces five miles of river where many gulches that have paid largely empty their golden sands, and where Powder river has cut the gold belt and is intersected by a series of gold-bearing quartz ledges, several of which are now being successfully worked. The tributary gulches and intersecting ledges have been the natural gold-feeders of Powder river, and the many hundreds of dollars taken out last season by the ordinary rocker prove the richness of this company's ground, and by honest, capable and economical management (which the reputation of the gentlemen owning the property warrants) dividends can be made to pile up equal to the best days of the "Granite Mountain" for the next quarter of a century.

UTAH.

PARK CITY.—Salt Lake *Tribune*, June 16: Bullion shipments: June 9th, 17 bars Ontario, 8510 ounces; June 10th, 18 bars Ontario, 9120 ounces. The Crescent Co. shipped, during the week ending June 14th, 167,825 pounds of first-class ore; 67,300 pounds of concentrates. Received at Mackintosh sampler for the week ending June 15th, 615,820 pounds Ontario ore; 211,120 pounds Daly ore; 337,530 pounds Woodside ore; 19,320 pounds Apex ore. The Union concentrator expects to commence operations within the next ten days on second-class Woodside ore. The Alliance Company has on hand about 1500 tons of second-class, which will be hauled to the concentrator as soon as it is in readiness to receive it. The Mayflower leasers are doing considerable development work preparatory to putting the mine in first-class shape for taking out the ore. The management of the Anchor Co. have let a contract to bore the shaft to make connections with the tunnel. The works will be completed within 30 days. Mr. Morris Dusseldorf, manager of the Comstock Co., arrived here on Thursday night, and on Friday, in company with Mr. Wm. M. Curtis, made a general inspection of the company's claims. They found everything in good shape, and work will be immediately commenced. A contract has been let to drive a tunnel to the ledge, the work to be under the supervision of Mr. Curtis.

MECHANICAL PROGRESS.

Iron-Workers

Blacksmiths and other iron-workers should be very proud of their calling. Gold has been called the most precious of metals, and so admitted; but as between gold and iron, the world could better dispense with the yellow metal than with iron. Of course we could exist without either; but to be without iron would carry us back centuries and paralyze thousands upon thousands of industries, and take away nearly all the great inventions of modern civilization. This can readily be comprehended when once attention is called to the fact.

The antiquity of iron is an unsettled question, but we have mention of it in the earliest records, and from all times the workers in iron have been held in high esteem, and ofttimes considered chief among the many. The Greeks had their Vulcan and the Hebrews their Tubal Cain. Even in the wilds of Africa, Dr. Livingstone discovered workers in iron, and the novel method they had of working it was surprising. The modern forge is an improvement over the bellows, but the latter, of course, should not be mentioned in the same breath with the rude contrivance of the Africans—an earthen forge, covered with two blow-pipes, acting without any tuyeres, but attached to two upright boxes or valves. In these valves the operator places pistons, which he works up and down alternately with either hand, and thus forces a continuous blast. It is rude but ingenious, and works reasonably well. How would you like to turn a hundred shoes by such a forge? A stone near by answers the purpose of an anvil. In early times the glory of the iron-worker lay in the fact that he was the maker of swords, spears and other implements of war. War was the principal occupation of people then; might was right, and woe to the captives.

Now the scene is changed. The world is peaceful. Agriculture, commerce and the mechanical arts furnish the chief sources of livelihood, and in all these the iron-worker lends a helping hand. The farmers' implements are made by the iron-worker, his horses are shod (occasionally) by the iron-worker, the wheels of commerce are accelerated by his efforts. Without him, it would be the slow ox-team of yore, while he almost, if not actually, personifies machinery. Verily, the legend attributing to the iron-worker the seat at the right of King Solomon, at the dedication of the great temple, is but further proof of that wise monarch's wonderful wisdom.

Some Defects in Axles.

It seems strange that in all of the reported discussions on the subject of a suitable axle for a 60,000-pound car, little or nothing has been said regarding the material and manipulation during the process of manufacture, while the whole stress has been laid upon the suitable dimensions and proportions. It is, of course, taken for granted in these discussions that hammered wrought iron is the material in question, except in a few instances where steel is brought forward. But every car-builder who has had to do with axles knows that there are as great differences existing between makes of wrought axles as between cast-iron car-wheels.

Some short time since, having occasion to use some finished wrought iron, slightly smaller and about the same length as a M. C. B. axle, we conceived the idea of rehammering some old axles and finishing them to our purpose. Before purchasing the old stock, however, we were assured that they were of first-class quality. They had never given any trouble, had never broken, and had been made of carefully selected scrap by a thoroughly reliable maker.

These axles were then drawn out and finished. Of the whole lot, there was not one that did not develop old sand-seams and coal-shuts on being cut into, and 20 per cent had to be discarded on account of the larger size of the defects. Under these unexpected developments, and as we were in a hurry, we decided to take some of the old axles and turn them down to size without rehammering. Here, worse defects were found, and one-half of all the axles tried were discarded. It may be added that nothing was discarded except for defects such as would secure the condemnation of any axle in any shop where the slightest attempt was made to select good clean stock for journals.

This experience merely goes to show that while the outside of the original axle had been worked sufficiently to give a clean surface at the wheel-seat and journal, the core was in a decidedly seamy condition. The hammering had been concentrated where it would tell, and the rest left in an unworked condition. Every mechanic knows the value of the working metals, and it is nowhere more desirable than in the manufacture of axles, especially if steel used.—*National Car-Builder.*

TWO HUNDRED MILES AN HOUR.—The latest invention for rapid transit and the transportation of mails is being introduced by the Portelectric Co. of New York and Boston. It is the invention of John G. Williams of New York, and consists of an elevated railway track of a new design, for a car made of magnetized steel, and running upon a single rail. It has been exhibited in Boston and explained by Prof. A. E. Dolbear of Tufts College, who announced that, after a very thorough examination and testing of the discovery, he was certain that a car could be run from New York to Boston, a distance of some 230 miles, in one hour. He explained that while the new plan will at first be devoted to letter-carrying—and by it there can be a mail from city to city several times every forenoon, afternoon, and evening—it will be entirely possible to carry people as well as the mails, and that this will before very long be done. The working model of Mr. Williams' system of rapid transit has been carefully examined by many electricians and practical business men, and all who have seen it pronounce it the solution of fast transmission for small packages and the mails.

THE MANUFACTURE OF AUGERS.—Although every one is perfectly familiar with this commonplace tool, but comparatively few know the process of its manufacture. In making augers the iron which forms the main or spiral part is welded into the steel of which the tip is made before forging. The bar is then put under hammers and forged into shape. It is then put into what is called a "wringing machine" and twisted up in a rough state into the spiral form, after which it is passed through "crimpers," giving a uniformity of twist. The augers are next put through "straighteners" and revolved, making them perfectly straight, when they are ready for putting on the head, which is the most delicate operation in their manufacture, and requires the work of a skilled artisan. They are then subjected to a "grinding-out" process, which consists of putting them through two rubber wheels to rough-polish the twist. The "fitter-up" then takes hold of them and "lightens" or fits the head; then the filers file down and sharpen the heads, after which they pass through the hands of the polishers, where they are polished and hardened ready for market.

MALLEABLE BRONZE.—A patent has been taken out both in England and France, by Mr. A. Sentex, Mr. C. Marechal and Mr. A. Saunier, establishing a process for producing malleable and ductile bronze bars or plates which are free from cracks and blowholes, are "inoxidizable," and which may be "rolled and drawn with the greatest ease." Moreover, the metal has the appearance and "sonorosity of gold." One and a half kilos of tin are purified by melting under niter. Ten kilos of copper are melted and 50 grammes of equal parts of nitrate and cyanide of potassium are added for the double purpose of reducing the oxides and "fattening" the metal. Then 25 grammes of bitartrate of potassium, with the same quantity of cyanide, are added, and, after poling, the tin is introduced; 25 grammes each of sal-ammoniac and cyanide are thrown on, 1 gramme of "phosphuret of copper" introduced to "impart mildness," and 20 grammes of "Marseilles soap" added, which still further "fattens" the metal. Finally, one gramme of sodium is added at the moment of casting. The metal, if cast in sand, may contain more tin, and if the proportion of tin be reduced, the quantity of phosphorus and sodium may be increased.

NEW DEVICE FOR WIRE-MAKING.—Wire is now being manufactured—whether iron, copper or brass—by a new and greatly improved process, and at a considerably reduced cost. The machine devised for this purpose consists of a series of rolls in a continuous train, geared with a common driver, each pair of rolls having a greater speed than the pair preceding it, with an intervening friction clutch adapted to graduate the speed of the rolls to the speed of the wire in process of rolling. The entire operation of producing the smallest sized wires from rods of one-half inch is done cold. It is alleged that this method obviates the danger of unequal annealing and of burning in the furnaces—in addition to this the wire being more flexible and homogeneous than that made by any ordinary method, and capable of sustaining greater longitudinal strain; in the case of copper wire there is said to be a greatly increased electrical conductivity.

NEW PROCESS OF MAKING COPPER CASTINGS. Messrs. Schneider & Co., Creusot, France, have patented a process, which consists in making, in a blast-furnace, a cupola or a reverberatory furnace, castings having a variable proportion of copper, with a proportion likewise variable, of the ordinary constituents of cast iron. These copper castings are used for the manufacture of the copper steels which serve for the preparation of articles such as sheathing and armor for vessels, cannons, projectiles, bed-plates, steam-cylinders, roll, etc., the articles when desired being case-hardened or hardened in oil. Copper ore is mixed with the charge in the blast furnace, or copper alloys with the charge in the cupola. Also copper filings can be mixed with coal to form a copper-coke, which is used for heating the blast furnace or cupola; or copper compounds can be melted in a reverberatory furnace, with a mixture of steel or iron, under a layer of anthracite to prevent oxidation.

A HYDRAULIC RAILROAD.—At the Paris Exposition there is a hydraulic railroad, which is not very clearly described. The car rests upon a species of skates which rest upon compressed water, but they do not touch the rail. The motive-power is a column of water, but how it works is not given. It is said to be one of the most curious inventions at the Exposition.

SCIENTIFIC PROGRESS.

The Super-Sense of Animals.

The physical expressions which the animals employ to manifest their passions, requirements, distresses and emotions, are precisely similar to man's. They caress with their lips and limbs, show resentment by facial distortion, bites and kicks, and fear by a tremor; they leap with joy, loll with thirst, lag with fatigue, and attack for revenge or reprisal. Even fishes, with their poor, deficient bodies, are able to manifest many mental operations in a manner intelligible to man, as well as to each other. There is no end to authenticated instances of animal sagacity, indicating premeditation, plan, purpose, sense of duty, prudence, gratitude, method, judgment. Animals memorize. They cherish malice, they dream in their sleep, they can count, they have a sense of injustice, a consciousness of error, and notions of forgiveness and reparation. I have seen a brute of a man requite the clumsy caresses of his horse by a thumping blow on the nose. His supreme intelligence did not comprehend the animal's action, forsooth. Now some men get vexed if they are not readily understood. Did the horse show temper—this noble animal whom Job represents as endued with the spirit of the tempest? Did he even resent the outrage? Not by retaliation, although he plainly indicated his keen sense of the indignity. What may we suppose his emotions to have been at treatment so regardless and unprovoked? Yet he presently forgave all. Do not say that he forgot, for at all times afterward he shrank with apprehension when his master approached. Oh! the gentleness, forbearance and long-suffering of the brutes, who oft-times grieve in silence—speechless and unable to utter protest or complaint.

Animals meditate. Dogs have been seen to sit in a fit of abstraction, so that no one could engage their attention, and presently start off with an impetus which showed there was a mental impulse behind it. That was a keen sense of *finesse* displayed by the Newfoundland dog at a seaside resort when he pushed little girls off the pier so that he could jump in magnanimously to the rescue, and thereby obtain the reward of a handful of candy which he anticipated the grateful parents would bestow. He repeated the trick so often that he fell into suspicion and disgrace, but his method showed not only a conception of the efficacy of a virtuous act and its logical recompense, but the advantage of deception when successfully practiced.

A crow which I knew of shammed hunger habitually so as to obtain more food, which he invariably carried off and hid in a wall, and then came back for more. In this way he accumulated large hoards of provender. A certain Java sparrow was able to distinguish the click of its master's latch-key in the hall door from any other person's, and flew to meet him with demonstrations of joy as soon as he entered the house. He never made a mistake. A sagacious mastiff always pulled the door-bell when he desired to enter. A parrot in New Orleans seemed to answer questions categorically, and recognized different persons, calling them by name. The intelligence of insects is perhaps even more wonderful. Fishes exhibit remarkable sagacity, which has been made the theme of writers for 2000 years.—*Forest and Stream.*

The Bottom of the Sea.

Notwithstanding the fanciful pictures which some writers have drawn of the ocean-bed, its desolation, at least in its deepest parts, must be extreme. Beyond the first mile it is a vast desert of slime and ooze, upon which is constantly dripping a rain of dead carcasses from the surface, which carcasses supply the nourishment for the scanty fauna inhabiting the abyssal region—in some places more than five miles from the sunshine, and the microscope reveals that the slimy matter covering this deepest ocean-bed is very similar in composition to the ancient chalk of the cretaceous period, while mixed with it here and there are minute metallic and magnetic bodies, which have been proved to be dust from the meteorites.

At long intervals a phosphorescent light gleams from the head of some passing fish, which has strayed hither from a higher zone. But it is not until we have mounted a good deal nearer the surface that the scene changes for the better. We now meet with forests of brilliantly colored sponges, while the phosphorescent animals swimming about are much more numerous, and the nearer we get to the littoral zone more and more phosphorescent lights appear, till at length the scene becomes truly animated. When only 1200 feet separate us from the sunshine, we come upon the first seaweed and kelp (1200 feet is the deepest limit of plant life in the water), but we must rise still another thousand feet and more and get as near the top as 120 feet before we find any reef-building corals.

As plants do not live in the deep sea, the deep-sea animals either prey on one another or get their food from dead organism and plants which sink down to them. Thus Maury says: "The sea, like the snowcloud with its flakes in a calm, is always letting fall upon its bed showers of microscopic shells." And experiment proves that a tiny shell would take about a week to fall from the surface to the deepest depths. Since sunlight does not penetrate much farther than the littoral zone, there would be beyond this perpetual darkness, except for phosphorescence. Many of the animals inhabiting the continental and abyssal zones have merely rudimentary eyes. But these blind creatures have very long feelers, which help them to grope their way along the bottom. Other deep-sea animals, on the contrary, have enormous eyes, and these very likely congregate around such of their number as are phosphorescent, and may perhaps follow the moving lamps about wherever they go. And so bright is this light on many of the fish brought up by the dredge that during the brief space the animals survive it is not difficult to read by it.

The reason why fishes and mollusks living more than three miles under water are able to bear a pressure of several tons is that they have exceedingly loose tissues, which allow the water to flow equally through every interstice and thus to equalize the weight. When the pressure is removed, they perish. In the Challenger expeditions sent out by the British Government, all the sharks brought up from a depth of a little less than three-quarters of a mile were dead when they got to the surface.

The Speed of Thought.

Some readers have no doubt frequently made use of the expression "quick as thought," but have any of them ever stopped to consider how quick thought is? A writer has made some interesting calculations regarding the comparative length of time it takes to call to mind various every-day facts.

It takes about two-fifths of a second to call to mind the country in which a well-known town is situated, or the language in which a familiar author wrote. We can think of the name of next month in half the time we need to think of the name of the last month. It takes on an average one-third of a second to add numbers consisting of one digit, and half a second to multiply them. Such experiments give us considerable insight into the mind.

Those used to reckoning can add two to three in less time than others; those familiar with literature can remember more quickly than others that Shakespeare wrote "Hamlet." It takes longer to mention a month when a season has been given than to say to what month a season belongs.

The time taken up in choosing a motion, the "will time," can be measured as well as the time taken up in perceiving. If I do not know which of two colored lights is to be presented, and must lift my right hand if it be red, and my left if it be blue, I need about one-thirteenth of a second to initiate the correct motion. I have also been able to register the sound waves made in the air by speaking, and thus have determined that in order to call up the name belonging to a printed word, I need about one-ninth of a second; to a letter one-sixth of a second, and to a color one-third of a second.

A letter can be seen more quickly than a word, but we are so used to reading aloud that the process has become quite automatic, and a word can be read with greater ease and in less time than a letter can be named. The same experiments made on other persons give times differing but little from my own. Mental processes, however, take place more slowly in children, in the aged and in the uneducated.

METEORITES.—From an exhaustive study of the large collection of meteorites at Harvard college, the conclusion has been arrived at that many of the masses of meteoric iron now known are cleavage crystals, broken off, probably, by the impact of the mass against the atmosphere. It is found that these masses show cleavings parallel to the planes of all the three fundamental forms of the isometric or regular system. From all that appears, the theory has come to be entertained that the masses of meteorites were thrown off from a sun among the fixed stars, and that they were slowly cooled while revolving in a zone of intense heat.

SOME CURIOUS COMPUTATIONS.—The energy set free on firing a small pistol is about 600 foot-pounds, the pressure being about 40 tons per square inch. A watch consumes about one fifty-fourth millionth of a horse-power, so that the energy of the bullet would serve it for two years. An Edison telephone transmitter requires about one-thousandth of the energy in a watch; it would therefore be worked for 2000 years on the energy exerted in the pistol. A lightning flash of 3,500,000 volts and 14,000,000 amperes, and lasting one twenty-thousandth part of a second, would run a 100-horse power engine for ten hours.—*Electrical World.*

MICROBES DESTROYED BY STEAM.—The experiments of steam disinfection tried in Jacksonville, Fla., have proved that the steaming process is thoroughly efficacious in destroying microbes in general, and also the yellow-fever microbes. Active germs placed by Dr. Gibier in a gelatine-filled glass tube germinated, showing unmistakable life and activity. Microbes subjected to the steaming process, though for only ten minutes, and under very imperfect conditions, were afterward subjected to the same cultivation, but remained entirely inert.

THE STOMACH AN INHABITED WORLD.—A French scientist claims to have found nine forms of microbes in the juices of a healthy stomach, and concludes that they play an important part in digestion. Every stomach seems to be a little inhabited world in itself.

GOOD HEALTH.

Health of the State.

The State Board of Health reports for the month of May that from 78 towns, with an estimated population of 725,450, there was a total mortality of 885, a percentage of 1.22 per thousand for the month, or an annual percentage of 14.64. There are at present no epidemics of any kind existing in the State, and a light rate of mortality has prevailed during the past month.

The excess of humidity that prevailed during the earlier part of the month, and the increased temperature during the latter half, had the effect of developing malarial and other fevers in quite a large number of localities that, up to this time, had been completely free from them.

The report adds that whooping-cough seems to progress hand in hand with measles, and is apparently influenced by the temperature. As the disease is highly infectious, children suffering from it should not be admitted into schools or crowded assemblies, or wherever other children are congregated.

Measles is quite prevalent; but it is thought that, like scarlet fever, it is the result of a germ and can be prevented. It is intensely contagious, however, and this fact makes the difficulty of prevention proportionately great. So it is recommended that unprotected persons be placed beyond its influence. Scarlet fever nowhere assumes an epidemic or malignant form. Diphtheria and croup were severe only in scattered localities. In Gold Run there were 21 cases in four months.

Three cases of small-pox appeared in San Francisco, one case in Lodi and one case in Stockton during the month. All are now convalescent, without any cases being reported. Typhoid fever is mentioned by very few observers. Cholera infantum is reported from a number of towns.

Dysentery is quite prevalent in many parts of the State. The opinion is daily gaining credence that the excretions in dysenteric attacks should be immediately disinfected and buried, as it is generally believed that the disease depends upon a living germ taken into the stomach, either with the food or through the impurity of the water imbibed. Indeed, so many diseases can be produced from impure water that for prudential reasons all water should be boiled before being used for drinking purposes, especially during the summer months.

The chief causes of death were as follows: Consumption, 146; heart diseases, 80; acute pneumonia, 52; diarrhea and dysentery, 33; cancer, 25.

A REMARKABLE case of injury which occurred a few days since in this city is attracting much attention. Mr. J. B. Hill had the vertebræ of his neck dislocated by the fall upon him of a bale of hay. Three of the vertebræ were shattered and he was otherwise injured. He has been attended with the utmost care and skill, and up to this present time of writing, about six days, he still survives and is nourished with liquids. An egg has now been added to his diet. He still retains his mental faculties, and even in delirium knows the members of his household, and often makes suggestions concerning his treatment. Regularly at 10 o'clock every morning he begins to sink into a semi-comatose state, and remains in that condition until 3 P. M., when he commences to rally. The most serious thing that the physicians have to contend with is the patient's throat, which fills up and nearly strangles him at times. Every attention that one could have is given, and Mrs. Hill says that if good treatment is of any avail, he will certainly get well.

INOCULATION FOR YELLOW FEVER is creating considerable interest at this time among the medical fraternity and others. Dr. Nelson, a member of the College of Physicians and Surgeons of the Province of Quebec, and a late member of the State Board of Health of Panama, read a paper at the recent fourteenth annual meeting of the State Medical Society of Arkansas on the subject of "Yellow Fever," in the course of which mention was made of the work of Dr. K. Girard, late Surgeon-in-Chief of the Panama Canal Company, whose profound faith in the protective power of inoculation was fully shown by his inoculating himself and having a mild form of yellow fever, which was followed by perfect immunity from the disease, and finally the crucial work of Dr. Carlos Findlay and Dr. Delgrado of Havana. Dr. Nelson being perfectly familiar with the work of these gentlemen, he boldly forecast the day when inoculations against yellow fever will take equal rank with the inoculations against smallpox.

PHTHISIS FROM HOUSE SWEEPINGS.—The *Munchener Medicinshe Wochenschrift*, No. 308, reports that Carnet has experimented with the dust obtained from the walls and floors of various dwellings in which tuberculous patients have been, inoculating guinea pigs with it, and carefully excluding all possibility of infection from outside sources. In this way, 21 rooms of seven Berlin hospitals were examined, and bacilli found to have been present in the dust from most of them. Positive results were also obtained with the dust from insane asylums and penitentiaries. The dwellings of 53 tubercular patients were investigated in the same way, and the dust in the neighborhood of 20 patients found to be virulent. It was the case, with absolute regularity, that the dust was always virulent when the patient had been in the habit of spitting on the floor, or in a handkerchief, while it was never so when a spit cup had been employed.

CARE OF CHILDREN'S EYES.—A very sensible decree has recently been issued by the Austrian Minister of Public Instruction, forbidding the use of books printed with small type in public schools, as shortsightedness is so prevalent among school-children in Austria. Scientific supervision might very properly be given to school-books in this country, attention being especially directed to the size of the type, length of line, and spacing of letters and lines. In the works published by the Clarendon Press no fault can be found in these respects, and speaking generally, the school-books of this country are well printed. The chief fault in German books is their adherence to the very dazzling Old English shape of the letters, which certainly severely tries the eyes by necessitating very close attention, and the evil effects of this are aided by the paper being coarse and by the light supplied being usually insufficient.

THE BEST TIME TO BATHE.—The best time to bathe is just before going to bed, as any danger of catching cold is thus avoided, and the complexion is improved by keeping warm for several hours after having the bath. A couple of pounds of bran put into a thin bag and then in the bathtub is excellent for softening the skin. It should be left to soak in a small quantity of water several hours before being used. The internal aids to a clear complexion are most of them well known. The old-fashioned remedy of sulphur and molasses is considered among the best. Charcoal powdered and taken with water is said to be excellent, but it is most difficult to take. A strictly vegetable and fruit diet is followed by many for one or two weeks. —*London Lancet*.

VACCINATE THE CHILDREN.—The State Board of Health recently issued a circular to the various Boards of Supervisors in the State in which the following is set forth: In accordance with the law requiring general vaccination prior to admission to public schools, you will immediately take the necessary steps to ascertain the number of unvaccinated children in your school district and give due notice when and where they can be vaccinated. It is recommended that this operation be performed by a competent physician who shall give a certificate when he is satisfied that the vaccination is successful and confers protection.

USEFUL INFORMATION.

Hints in Regard to Shaving.

Never fail to wash well your beard with soap and cold water, and to rub it dry, immediately before you apply the lather, of which the more you use, and the thicker it is, the easier you will shave.

Never use warm water, which makes the face (of shavers) tender.

In cold weather, place your razor (closed, of course) in your pocket or under your arm to warm it.

The moment you leave your bed (or bath) is the best time to shave.

Always wipe your razor clean, and strop it before putting it away, and always put your shaving-brush away with the lather on it.

The razor, as we have shown, being only a fine saw, should be moved in a sloping or sawing direction, and held nearly flat to your face, care being taken to draw the skin as tight as possible with the left hand, so as to present an even surface and to throw out the beard.

The practice of pressing on the edge of the razor in stropping it soon rounds it; the pressure should be directed to the back, which should never be raised from the strop. If you shave from heel to point of razor, strop it from point to heel; but if you begin with the point in shaving, then strop it from heel to point.

If you only once put away your razor without stropping it, or otherwise perfectly cleaning the edge, you must no longer expect to shave well and easy, the soap and damp so soon rusts the fine teeth and edge.

A piece of soft plate leather should always be kept with razors to wipe them with.

A SUBSTITUTE FOR INDIA-RUBBER.—For five years Mr. Henry Kellogg of New Haven, Connecticut, has been at work on a new substance to be used in manufactures, and he now claims that he has perfected the invention, or at least hit on the proper kind and proportion of ingredients. The substance is termed kelgum, and is calculated to supersede rubber in many uses to which the latter is put. Kelgum is said to be specially adapted to textile fabrics, which, when thoroughly saturated or impregnated with it, become absolutely waterproof, and will not become mildewed, and will not rot. Kelgum is produced from vegetable oils, which are treated so as to leave a residuum of a gummy character, not as elastic, however, as india-rubber gum. Being a product of oil, kelgum is not affected by oil, as is the case with rubber, nor is it changed by the action of heat or light. It can be vulcanized the same as rubber, but without the use of sulphur. Under many conditions it is said to be more durable than rubber, and especially adapted to beltings for all kinds of machinery, sail covers, awnings, tents, mail pouches, carriage coverings, overshoes, trunk covers, bags, book covers, insulation for telegraph and electric-light wires, shoe soles, gossamer waterproofs, window shades, tennis nets and seines, and many other uses. There is very little odor in the substance, and what there is is not disagreeable. When perfumed, it retains the artificial odor indefinitely.

USING AIR FOR FUEL.—Another marvelous discovery is reported at Philadelphia. Whether it is a fact or a fiction we do not pretend to say. It may be genuine, and again some excellent people may be mistaken. At any rate it is being talked about, and we give such information regarding the matter as comes to our hands from various sources. The device is called the Fales furnace. It is described as follows: It burns the air instead of coal. It is done in an ordinary stove or furnace. The device, in itself, consists of a grate 12 inches in diameter, 9 inches deep, surrounded at the upper end by prongs 4½ inches long, and an inch apart at the outer edge. It looks more like an immense hat of cast iron than anything else. This cast-iron hat is set on its head in the furnace or stove, and is filled with coal of any kind. The coal is piled up till it spreads over the top of the hat, including the brim made of cast-iron prongs as stated; on top of this coal is put a little kindling just to start the fire. It has a pipe, but this pipe is not to let the smoke out, for there is no smoke to go out. The pipe is to let in the air that is burned. It is such a wonderful device that the mere statement of what it can do will be received with incredulity and even with denunciation. The heat is intense. We have no comments to make on this astonishing statement. We would suggest, however, that the Franklin Institute could not do a better thing than to make an investigation of this matter and make a statement as to its fraudulency or the magnificence of the discovery.—*Age of Steel*.

THE NEW SUBSTITUTE FOR GLASS.—The new translucent substance intended as a substitute for glass has been satisfactorily adopted in some of the public buildings of London, and various advantages are claimed for it, among these being such a degree of pliancy that it may be bent backward and forward like leather and be subjected to very considerable tensile strain with impunity. It is also almost as translucent as glass, and of a pleasing amber color, varying in shade from very light golden to pale brown. The basis of the material is a web of fine iron wire, with warp and weft threads about one-twelfth inch apart, this being inclosed, like a fly in amber, in a sheet of translucent varnish, of which the base is linseed oil. There is no resin or gum in the varnish, and once having become dry, it is capable of standing heat and damp without undergoing any change, neither hardening nor becoming sticky. Briefly, the manufacture is accomplished by dipping the sheets edgewise into deep tanks of varnish, and then allowing the coating which they thus receive to dry in a warm atmosphere. It requires somewhat more than a dozen of these dips to bring the sheets to the required degree of thickness, and, when this has been accomplished, the material is stored for several weeks to thoroughly set.

WHY THE CAT IS NOT HARMED BY A FALL.—It is quite wonderful to see a cat jump from a hight. It never seems to hurt itself, or to get giddy with the fall. It always lands on its feet, and these are so beautifully padded that they seldom or never get broken. Why does not the animal get a headache after its jump? Why does it not receive a concussion of the brain, as a man or a dog would if he performed a similar acrobatic feat? To answer this, we must examine a cat's skull, when we shall see that it has a regular partition wall projecting from its sides, a good way inward, toward the center, so as to prevent the brain from suffering from concussion. This is indeed a beautiful contrivance, and shows an admirable internal structure, made in wonderful conformity with external form and nocturnal habits.

THE LIGHTEST SOLID KNOWN.—Cellulose is a fibrous substance produced in France, by a secret mechanical process, from cocoanut husk. When compressed, its specific gravity is far less than that of cork. It is the lightest solid known, and therefore invaluable for life-belts and life-mattresses, while in large quantities its buoyancy will make a ship non-sinkable. It is used to fill compartments in a ship's side, and serves to prevent water entering through a hole made by a projectile or rock, because the instant the water enters, the cellulose is expanded by it to an impenetrable tightness. It does not decay or emit any odor, and has been packed in a ship's compartments without undergoing any change. If a mass of cellulose be penetrated by a projectile, it will not be ignited by the friction.

NATURAL GAS was first used for fuel only about 15 years ago. Within that comparatively short time it has become so extensively employed that to-day there are required to pipe it 27,350 miles of mains. In Pittsburg alone 500 miles supply 4268 private houses, 40 iron-mills, 37 glass works, 83 foundries and machine shops and 422 miscellaneous industrial establishments. An idea of its value as fuel can best be obtained when it is realized that the value of 7,000,000 tons of coal is annually displaced by natural gas.

ENGINEERING NOTES.

Engineering Development in the New World.

The address of the president of the British Institute of Mechanical Engineers, reported to the *American Manufacturer* (Pittsburg) by its English correspondent, was chiefly notable for its calling the attention of mechanical engineers to the wide field offered for the display of engineering energy and talent in the western hemisphere, especially in connection with the Republics of North, South and Central America, and with Mexico and her federated States. "Scarcely inferior in number to those of her great neighbor, and certainly not inferior to the United States, in the wealth which was now on the eve of vigorous and practical utilization, Mexico," said the president, "is about to cover her territory with railways, harbors, piers, gigantic drainage works, bridges, viaducts, tramways, etc., and is also requiring the necessary machinery for her mining and commercial enterprises. Chili and Peru are also moving forward with new sources of wealth and in the same direction as Mexico, the nitrates being far greater revenue-producers than the famous guano deposits of Peru. What has for ages been a productive petroleum-field in Peru, considering how crude have been the means hitherto employed in working it, is now being opened with modern machinery, and is yielding large quantities of oil and gas from flowing wells. It may, indeed, probably rival both American and Russian fields, owing to the enormous advantages it possesses in distance and other respects for the Chinese, Australian and Indian trade. The Argentine Republic and other States are at this moment addressing themselves to Europe for capital and scientific assistance. Among the other States may be mentioned Venezuela."

The movement started in New York for the furthering of United States trade is attracting English attention. That during March 500 members should have joined the movement in New York alone is thought significant of the fact that while British traders are on the look-out in that direction, the traders of the United States do not intend to lose any opportunity of increasing whatever hold they at present have upon the South American markets.

THE MISSISSIPPI TO BE BRIDGED AT NEW ORLEANS.—The charter of a company organized for the purpose of building a bridge across the Mississippi a short distance above the city has been published. It is understood that the company proposes to build a suspension bridge which will span the river at or near Southport, in the parish of Jefferson. For some weeks engineers have been at work running lines through the plantations and lands on both sides of the river. The general impression is that Collis P. Huntington, the millionaire president of the Southern Pacific railway system, is the moving spirit of the bridge company, and that he will build the bridge in order to more closely connect his Chesapeake & Ohio and Southern Pacific systems, and to have an unbroken railway line from the Atlantic to the Pacific oceans.

PANAMA.—The latest advices from Panama present a picture so gloomy in its general tone that it is impossible to see anything cheerful there, even by the aid of the few half-lights introduced. Ever since the collapse of De Lesseps' company the canal has been deserted, and now the same spirit of desertion has reached the Atlantic terminus town of Colon. A telegram from Paris on the 13th instant says: "The Cabinet to-day discussed the difficulties of the Panama Canal Co. after the liquidator read his report. The result of the findings will be that the Government will shortly present a bill dealing with the matter." To look for a reinvigoration of the dead forces on the Isthmus of Panama is a forlorn hope indeed.

A RAILWAY THROUGH THE COLORADO CANYON.—The building of a railway through the Grand Canyon of Colorado, which has been suggested, would be a grand affair if it could be accomplished. The trouble, however, would be to obtain a survey of the route—a task of which the Denver *Republican* says: "No one who can neither fly like a bird nor leap like a chamois will be able to make the trip over the falls, through the rapids or along the narrow and dizzy ledges of cliff, hundreds of feet above the water. It does not look like a desirable job. Most tourists would prefer to go around the canyon."

OPENING UP SIBERIA.—It is rumored that an American syndicate, with a capital of $50,000,000, has been formed to construct a railway in Siberia, and that several former and present diplomatic and consular American agents are interested in the undertaking. It is singular how thoroughly these gentlemen share with Sir Robert Morier the view that there is money to be made by the development of Siberia.

FLOWING WATER.—The best form of aperture for giving the greatest flow of water is a conical aperture, whose greater base is the aperture, the hight or length of the section of cone being half the diameter of aperture, and the area of the small opening to the area of the large opening as 10 to 16, there will be no contraction of the vein, and consequently the greatest attainable discharge will be the result.

Passing Events.

The proposed construction of steel works at Vallejo, in this State, is an important move. English capital is to be used. It is stated that work will be commenced in two months and on quite a large scale. The machinery will be sent here from England.

The sale of a number of mines in New Mexico to New York capitalists is a good thing for that Territory, as if they are successful it will attract others. New Mexico has large areas of mineral ground not yet utilized.

The quartz mines of Lower California seem to be yielding well for the little work done on them. The placer excitement has all died out, but interest in quartz has increased. More machinery is going in and the mines are being developed with vigor.

People all over the country are just now examining reservoir dams, being nervous about them since the Johnstown disaster. We devote considerable space in this number of the PRESS to the subject of breakage of dams, and the article is one of general interest. The data relative to the speed of bodies of water suddenly set free will be of special value at this time.

The Debris Commission.

The U. S. Debris Commission have been examining the hydraulic mines in Klamath, Trinity, Siskiyou, Modoc, Nevada and Sierra counties. At the North Bloomfield they are mining on the elevator system, their elevator lifting 90 feet. From the upper end the water is received into a flume, which carries the water to an immense settling basin, about 200 feet deep and 20 acres in area. This is formed by damming a canyon in the vicinity of the mine. All the bowlders, debris, gravel, etc., that are torn down by the monitors are washed to the foot of the pipe, and by the force of the water carried upward into the flume, and by this into the settling basin. The outlet to this basin is at some distance from the inlet, and as there is no noticeable current the sediment is mostly precipitated, and when the water leaves the impounding basin it is comparatively free from slickens.

Of course all the heavier portions that were held in solution have settled. The Commissioners examined the water leaving this basin, and found that it contained one-eighth of one per cent of sediment.

The system adopted by the Spring Valley mine in the Cherokee district, Butte county, seems to be open to no objections. A canal 19 miles long has been constructed from the mine to the waste tule lands in the Sacramento valley. By means of this ditch all the debris from the mine is carried to the marshes and assists in forming valuable lands. It has been found that slickens makes a good foundation for a productive soil. In the Klamath region the commission saw alfalfa growing luxuriantly on 20 feet of debris. The tailings had been treated with a mixture of soil and fertilizers, and the result was satisfactory. In the case of the Spring Valley mine, none of the debris whatever reaches the river, or can in any way become detrimental to any other interest.

Steel-Mills.

The Anglo-Pacific Steel Company was organized some time since, but have done nothing toward building the proposed works here, until recently. The projector has now secured a location at Vallejo, opposite Mare Island, the city having given 100 lots and more having been purchased. The land is given conditional to the works being established. A tract of 350 acres has been secured, southwest of Vallejo, with a water frontage of 4000 feet. Mr. Hammond, the projector, says: "We expect to begin preparations within two months, and will probably have a portion of the plant in operation by the last of the year. The first structures erected will be four main buildings entirely of iron, 64x500 feet in area. A number of other buildings, as store-houses, offices, etc., will also be built. The total investment, including plant and material, will amount to about $1,000,000. When the works are fully in operation we will employ about 1000 men. We have already engaged a number of the principal ones in the East. We will hire what labor we can on the coast and will bring the rest from the East.

"This number of men, with their families and others who will be drawn to the place indirectly, will make quite a city on the start. The new town of Sheffield will be regularly laid out in blocks 250x500 feet, with avenues 60 and 70 feet in width. The company will build houses to rent to the workmen as fast as needed, and we intend to build school-houses, a church, a library building and other improvements for the benefit of the community. Railroad tracks, running into our works and to our wharves, will be built, connecting with the Southern Pacific road which runs through Vallejo.

"As there are no steel-mills on the Pacific coast, and as we will confine ourselves to steel, we will not compete with any other manufacturers here, but will rather give them more work. There is a very active demand for steel manufactures on the coast now and the demand will continue."

THE UNION COPPER MINING COMPANY, Copperopolis, are erecting large works for roasting and leaching the many thousand tons of low-grade copper ore lying on the surface at that mine. The ore was mined several years ago and left on the surface for future work, which time has now arrived.

The Pacific Power Co.'s New Engine.

In the Pacific Power Co.'s building on Stevenson street, near First, a large 250-horse power engine, which is among the finest in the city, has been running for some months. It is a compound condensing tandem Corliss engine with condensing apparatus similar to that of a marine engine, salt water for the purpose being brought from the bay, a distance of 3000 feet. The cylinders are 16 and 28 inch respectively, with 42-inch stroke, and the engine runs 69 revolutions per minute. The bed is what is known as the Porter-Allen; and the cross-head works in locomotive slides.

The main shaft is 12 inches in diameter and the bearings 21 inches long. The quarter-boxes in the main bearings are taken up by means of taper wedges, adjusted horizontally, so that the bearings cannot be screwed up out of line. The crank-pin is 6 inches in diameter and 7½ inches long; the cross-head pin is 5 inches in diameter and 6 inches long.

Each of the cylinders is steam jacketed, as is also the head and receiver pipe between the two cylinders. The steam for the jackets comes directly from the boilers. The condensed water from the jackets flows to a steam trap and from there it drains to a hot well.

The valve motion is of the most approved Corliss type and is operated by means of two eccentrics which operate two independent wrist-plates on each cylinder. One of the eccentrics works the four inlet and the other the four exhaust valves. This arrangement admits of an early closing of the exhaust valves to gain compression, permitting the moving parts to cushion on exhaust steam, so that the engine runs perfectly smooth and without jar.

The details of mechanism are all laid out for the greatest convenience to the engineer. The end of the valve-stems are so constructed that by moving the valve-plates on the opposite side of the cylinder, the valves can be taken out without removing the stems or disconnecting any of the valve-motion gear. The heads are so made that the back high-pressure head and the front low-pressure head come out through the low-pressure cylinder, allowing the piston-rod, with the two pistons, to come out through the back of the engine without having to disconnect any of the other parts. Each of the cylinders has automatic relief valves on each end in case the engine should lock water. The heads are covered with polished iron bonnets which are thoroughly lined with a non-conductor to prevent undue radiation. The cylinders themselves are fitted with asbestos and hair-felt. The governor is of the usual Corliss type fitted with an oil dash-pot.

In the basement, close to the engine, is set the condensing apparatus, which consists of a surface condenser and combined circulating and air pump, with steam cylinder placed between the two pumps. The condenser is of a very neat and compact construction and has 750 ⅝ brass tubes through which the salt water circulates. The condensing water comes from the bay through pipes laid down Mission street and is discharged into the sewers after passing through the surface condenser. A great saving is effected by this plan.

On the suction pipe for the circulating pump is a large air-chamber to overcome the water shock from the long suction pipe. The circulating and air-pumps are operated by fly-wheel and Scotch yoke. The pump has a Myers cut-off valve motion. The air-pump takes the condensed steam directly from the condenser and lifts it into a hot well which is so constructed as to remove the oil, and from there it is pumped by an auxiliary pump to the pair of Babcock-Wilcox boilers.

The old engine ran right up to the time when the new one was connected to the Power Co.'s shafting, which was done in the night-time, so that none of the tenants were inconvenienced in any way, some of them not even knowing that a change had been made. Since the change the Power Company has never had to shut down on account of the new engine, the work going on steadily as before, but with a saving of almost 50 per cent over their old plant.

The engine was built for the Power Co. by the San Francisco Tool Co., whose shops are in the same building.

THE output of the Gallup (N. M.) mines is now 50 carloads a day.

Dams Which Have Burst.

Some Account of Former Disasters—A California Instance.

Although the disaster caused by the overflow and breakage of the Conemaugh dam, Pennsylvania, is far beyond, both in loss of life and property, anything of the kind that ever before occurred, the instance is by no means an isolated one. Both in this and other countries there have been similar accidents, nearly always attended with large loss of life and property. It is worthy of note, too, that several of the previous disasters were due to exactly the same cause to which the Conemaugh break is attributed, viz., the overflow of the dam and its resultant collapse. This would seem to indicate that the question of possible overflow by reason of sudden freshets or cloud-bursts had not been properly considered by the engineers, waste-gates not being sufficiently large to provide for all contingencies. At the Conemaugh dam those in charge, in order to relieve the pressure, claim to have cut a waste-way and built a sluice through which rushed a body of water 20 feet wide and 3 feet deep, but even this did not prevent the flood-water passing over the top, eroding the face and destroying the dam.

The dimensions of this dam are variously given in the different accounts. One report says it was 400 feet in length at the top by 75 feet in hight, about 90 feet thick at the base and 20 at the top. Another description gives the dimensions as 930 feet in length, 90 feet thick at base, 20 feet wide at top and 110 feet high. The inside slope was 2 to 1 and the outside slope was 1½ to 1. The lake was at an altitude of 1700 feet, or 300 feet above the city of Johnstown.

The Habra Dam.

The most noted instance of the breakage of a dam before that of the Conemaugh was that of the Habra dam in Algeria, which was caused by the flow of water over the top. The topping of dams by floods is not uncommon, and if the extra strain thus induced is not allowed for, the destruction of the dam is nearly certain. There have been several examples of this in Algeria, where, although the average rainfall is only about 15 inches yearly, a depth of 6½ inches, or more than one-third of the total, has been known to fall in 24 hours.

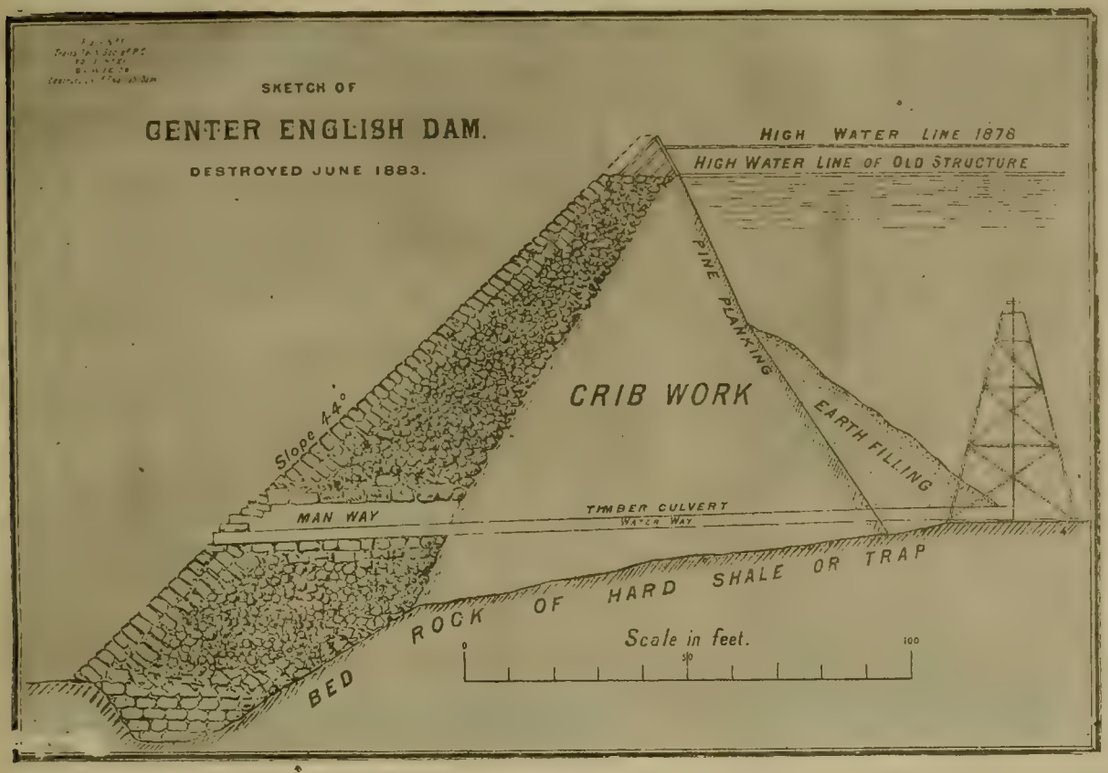
The Habra dam, a section of which is herewith shown, was destroyed by a sudden flood of this kind in 1881. This reservoir was intended for the irrigation of a cultivated district bordering on the Mediterranean and for the storage of flood-waters. The hight of the dam was 117 feet and it was provided with a by-wash of 394 feet in width, and outlets for irrigation formed by four cast-iron pipes 31½ inches in diameter through the dam. It was composed of rubble set in hydraulic mortar, the latter composed of two parts of sand to one of hydraulic lime. This dam was 1060 feet long on the crest. It retained a volume of 1050 million cubic feet of water. This immense body of water was suddenly set free by the bursting of the dam, destroying several villages and the city of Parregaux. There were 209 lives lost by the flood. This was a masonry dam.

At the Hamiz dam, also in Algeria, when the water was admitted, signs of weakness were shown and it had to be practically rebuilt. When water was admitted to the Cheurfas reservoir the water began to make its way around the permeable ground at one end. The flushing gate in the deepest part of the reservoir was jammed and 30 feet of the dam was destroyed, causing a flood in the river below. At some distance down stream was the Sig reservoir. The flood rushing down overtopped this dam and destroyed it also.

The earthwork dam of Estrecho de Rientes, near Lorca, Spain, was 150 feet high, and two months after it was filled, in February, 1802, gave way, destroying part of the town of Lorca, devastating a large tract of fertile country and causing the death of 600 people.

Dale Dyke Reservoir.

The Dale Dyke reservoir, Sheffield, England, was suddenly emptied by the breakage of the dam in March, 1864, causing the loss of 300 lives and much property. The greatest depth of this embankment from the ground level to the crest was 95 feet, the top width 12 feet, and the slopes, both on the up and down stream



THE ENGLISH DAM, SIERRA COUNTY, CALIFORNIA.

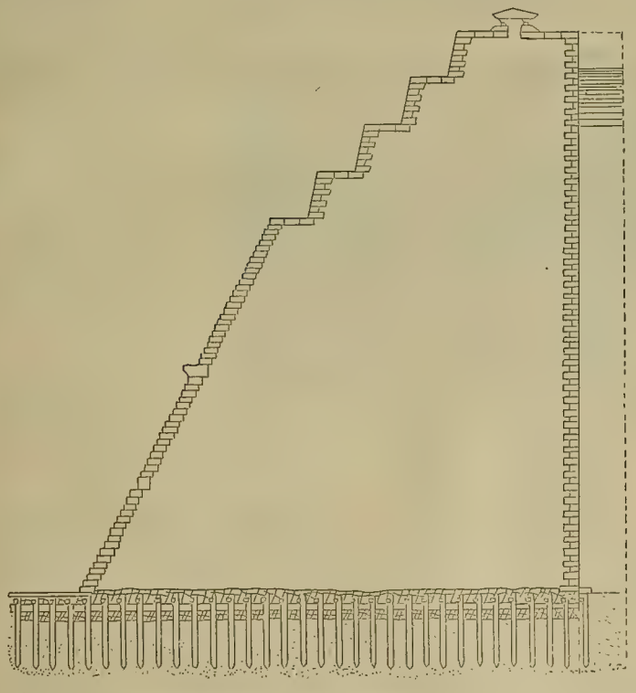
sides, was 2½ to 1. The area of the reservoir was 78 acres. A cross section of this dam is shown herewith. The discharge outlets of this dam were made by laying pipes in a trench under the dam. Those who made an official examination of the dam after the disaster were of the opinion that the mode of laying the pipes was faulty and their subsidence caused a crack and eventually the accident. This view was not agreed to by all the engineers, some of whom thought that a land-slip had caused the break.

The Worcester dam, or rather the Lynde Brook dam near Worcester, on March 30, 1876, gave way and 600,000,000 gallons of water were emptied suddenly into the river. Only one life was lost, but property was damaged to the extent of about $1,000,000.

By the Mill river disaster May 16, 1874, the village of Haydenville, Mass., was swept out of existence and 140 persons were drowned. A guard was watching the dam, and about 8 o'clock in the morning he discovered that an enormous leak had developed out of a small one. He started to give warning to the village of Leeds, just below, but the reservoir broke away before he could reach the village, and the water from a pond of 114 acres in area came down like a wall, carrying away nearly the whole village. Haydenville was swept away and several other towns on the Connecticut river were inundated. Over 300 families were rendered homeless and $1 000,000 worth of property in dams, dwellings, factories, etc., was lost. Roads and bridges were damaged to the extent of $200,000.

By the bursting of the Huron mill dam, near Houghton, Mich., on Jan. 2, 1884, six lives were lost. The money loss was not great. A similar disaster near East Lee, Mass., April 20, 1886, destroyed nine lives, and the damage to mill property, private dwellings and roads and bridges exceeded $150,000.

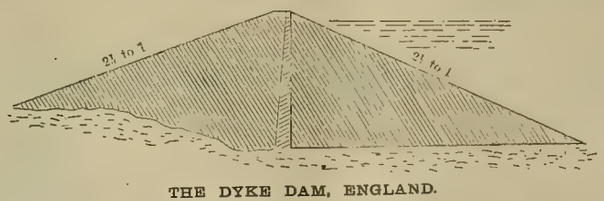
In February, 1852, the Bilberry reservoir, Yorkshire, England, burst its dam, drowning 90 people and destroying a great deal of property.



THE PUENTE DAM, SPAIN.

The Puentes.

The construction of the Puentes dam was considered one of the great achievements of the reigns of Charles III and Charles IV of Spain. It was built during the years 1785 and 1791, and was destroyed 11 years afterward. The maximum hight of this dam was 164 feet, and it was 925 feet long on the crest. The whole wall was built of rubble masonry faced with large cut stones. The dam was finished with a magnificent parapet on which the statues of the two kings were to have been placed. An engraving here shown gives an idea of the cross-section of this dam. The wall was to have been founded entirely on rock, but a deep pocket of earth was encountered and it was unfortunately decided to build the wall at this place on a pile foundation. This pile foundation was built securely and held water to a depth of 84 feet for 11 years, but the water rose to an elevation of 154 feet above the base of the dam and the foundation gave way. The accident caused the loss of 608 lives and over a million dollars in property.



THE DYKE DAM, ENGLAND.

A Dam in Sierra County.

An instance of breakage of dams occurred in California June 18, 1883, when the English dam of the Milton Mining and Water Co. was destroyed. This was on the headwaters of a tributary of the Yuba river in Sierra county, at an elevation of 6140 feet above sea-level. The structure was built in 1856–58. With the exception of the destruction of the Habra dam, this was probably the largest quantity of water ever set free at once from an artificial reservoir in the history of the world up to that time. Taking into consideration the elevation of this storage reservoir and the tremendous descent of the water, 6134 feet in 140 miles, the small amount of damage caused by the accident is unparalleled.

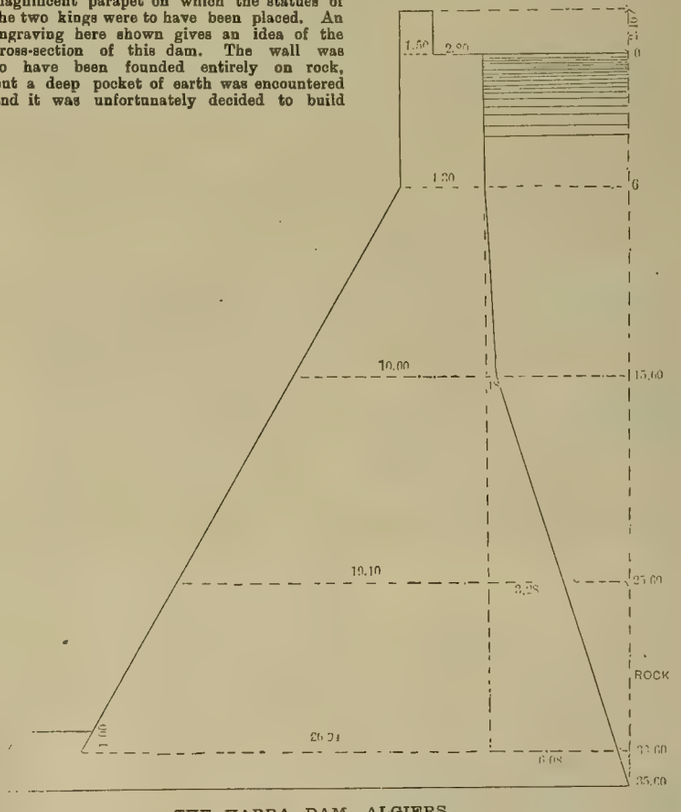
The reservoir covered 395 acres, impounding 650,000,000 cubic feet of water. The middle dam (that which burst) had a vertical hight on the interior of 100 feet, and on the exterior of 131 feet from the deepest part of its foundation. Its total length on the crest was 331 feet, with a minimum length of about 50 feet..

The original dam, which was of the ordinary timber-crib style (the cribs being built of tamarack and filled in with stone), had a total width across the base of 100 feet, measured through the culvert, with a vertical hight of 79 feet above datum line, on the inside face. This face was covered with a heavy pine planking, forming a water-tight lining to the dam.

When this reservoir was purchased by the North Bloomfield Gravel Mining Company, as it then had no immediate use for the water, the waste-way of the dam was cut down eight feet. As a small amount of water was observed flowing under the bottom of the crib of the middle dam, earth was taken from the sides and filled in on the inside of the dam to stop this leak.

In 1876–77 the outer face was overhauled, and that portion of the old crib partially decayed was torn out and replaced with new timbers.

With a view of increasing the capacity of the reservoir, which necessitated raising the crest of the dam, it was deemed advisable to strengthen the structure with a stone facing on the outside. To carry out this improvement, a tramway passing along the entire crest of the dam was built to a quarry about a mile distant. This rock was trammed to the dam, where an outer face-wall of dry rubble stone was gradually raised on a slope of 44°, and the intervening space filled in solidly with stone dumped from cars.



THE HABRA DAM, ALGIERS.

The material used was a trachytic tufa (?) of 2.4 to 2.6 specific gravity, the best there obtainable. It was estimated that in the quantity used the ratio of the dead weight to the pressure on the bottom of the dam was 19,200 pounds to 5400 pounds per square foot, which made the new dam stronger than the old structure.

In 1878, when this stonework was completed to within seven feet of the intended crest, a substantial piece of timber-work, thoroughly braced, having a greater resisting power in proportion to the pressure than any other portion of the structure, was raised on top of the dam, carrying up the inside water-face to the full projected hight. The improvements cost $70,-

000. The high-water mark was raised seven feet, or to a point 86.73 feet above bottom of inner mouth of culvert.

The dam was examined daily, and on the day of the breakage the water was within 16½ inches of the crest, so it still required 2½ inches to reach the waterway or high-water level. Early in the morning the watchman heard two violent explosions and then saw the water pouring through an opening in the upper timberwork over the crest of the stonework. In a few moments the crest in the center of the dam for a length of 175 feet was swept away and an immense opening soon cut to its very foundation. In the space of one hour fully 600,000,000 cubic feet of water were discharged into the canyon below, at the rate of over 166,000 cubic feet per second. In an hour and a half from the time when the explosion occurred the reservoir was emptied of its entire contents of 650,000,000 cubic feet of water.

This immense volume of water rushed into the canyon below the dam, which for the immediate distance of 1000 feet has an average width at the high-water level of the dam of 300 feet and a bottom width of 100 feet.

Mr. Aug. J. Bowie, the well-known mining engineer of this city, read, before the Technical Society of the Pacific Coast, a paper on the destruction of this dam, in which he brought together many new and interesting facts concerning the speed of a body of water suddenly[set free in the manner described.

Speed of Large Bodies of Water.

The canyon has a grade of 500 feet to the mile, and was entirely denuded. The first indications of any deposit from the stone in the dam are observed at a point about 1500 feet below it. Here the canyon widens, and a deposit, which is 8 or 10 feet high, composed of gravel, mud, and rock, extends along the south side some 500 or 600 feet. Stones of various dimensions, containing as much as four or five cubic feet, are observed to have lodged here.

As soon as the break occurred, the news was telephoned along the line, and every one that could be reached along the river was notified of the coming waters.

There are many places in the canyons of the middle Yuba where the flood is believed to have reached a hight of from 75 to 80 feet, and it was observed by those who saw the rush in these places, that the face of the torrent was a mass of timber and trees, no water being visible.

At Freeman's Bridge, 43 miles below the dam, which point it reached at 9:30 A. M., a rise of 40 feet was reported. The water reached the Narrows, a short distance above Smartsville, and 65 miles from the dam, having descended 5850 feet (baro. obs.) in 6 hours and 15 minutes, or at a maximum rate of 10.4 miles per hour, or 15.25 feet per second. Here the river is 285 feet wide at the water-line, and the rise due to this flood was reported to be 35 to 40 feet. This rise was due to the accumulation of timber and trees which held back the water.

At Point de Guerre, 70 miles below the dam, the river is a mile wide, and in 15 minutes it rose 2½ feet, with strong waves washing the shore. This place is 6020 feet below the dam. The average velocity of the flow of the first wave to this place was 9.65 miles per hour, or 14.16 feet per second. Below Point de Guerre a levee was broken and a large volume of water passed over some miles of farming country, destroying, however, only about $4000 worth of property.

At Marysville the indicated rise was 2 feet 8 inches at the highest. From the dam to Marysville is 85 miles, and the wave traveled to that point at an average speed of 8½ miles per hour, or 12.46 feet per second; or from Point de Guerre, 6.66 miles per hour, or 9.77 feet per second, and from Smartsville to Marysville 6.15 miles per hour, or 9.01 feet per second.

The final observation of this flood was made at Sacramento, 140 miles distant from the dam, or

	Miles.
From Smartsville	75
From Point de Guerre	70
From Marysville	55

Elevation of Sacramento above mean sea level at low-water level, 6 feet. Total grade or fall from dam, 6134 feet.

The gauge at foot of K street, on the Sacramento river, registered at 6 P. M., June 18, 1883, 14 feet 4 inches. The first indication of the arrival of the water from the dam was the appearance of muddy water at 6 A. M., June 19th. At 8 A. M. the gauge indicated 14 feet 9 inches. From 2 to 3 P. M. the water was extremely muddy. At 4 P. M. the gauge read 15 feet, at 5 P. M. it registered 15 feet and ½ inch, which was the makimum hight of the wave. At 6 P. M. the gauge stood 15 feet; at 7 P. M., 14 feet and 11½ inches; at 7:30 P. M., 14 feet 11 inches; and at 8 A. M., June 20th, it registered 14 feet 2 inches, or 2 inches below its register of June 18th.

The total time occupied by the wave in passing Sacramento was 26 hours, and assuming that the entire quantity of water from the dam was discharged by 6:15 A. M., June 18th, the mean between 5:30 and 7 A. M., when the dam was entirely emptied, the average velocity of the flow between the dam and Sacramento was 3.8 miles per hour, or 5.58 feet per second.

Water Ways of California.

The capacity of the water-ways of this State in comparison with the requirements of the drainage area is insignificant, and it is a well-established fact that the river channels without the streams overflowing their banks on the adjacent lowlands are or were always wholly insufficient to contain at high flood water, the drainage of the country.

In substantiation of these facts may be cited the report of the State Engineer, 1880, pp. seven and eight, where in speaking of the Sacramento valley, it is stated that it has an area of 4769 square miles.

The watershed with the drainage tributary of the Sacramento in combined area, is more than 2½ times the superfices of the valley itself. The Sierra Nevada side, drained by the American, Bear, Feather and Yuba rivers, Butte, Chico, Rock, Deer, Mill and Antelope creeks, has an area of 8298 square miles, with elevations from 7000 to 11,000 feet, receives annually from 24 to 102 inches of precipitation in form of rain and snow. The entire drainage basin of the Sacramento river aggregates about 25,000 square miles.

As the rise of water caused by the destruction of the English dam, occurring as it did at midsummer, raised the waters at Marysville only two feet eight inches, and at Sacramento only 8½ inches, it is evident to any engineer, from an examination of the official maps of the State of California, and of the map attached to the report of the "Debris Question," by Lieut. Col. G. H. Mendell, Corps of Engineers U. S. A., to the Secretary of War, that had this flood taken place during high water, it would never have been observed by a marked increase in the level of these streams.

This would be due to the fact that the increased water-way area over the lowlands (which are river channels during periods of high flood) is so immense when compared with the area of the river channels alone, that with this addition of 650,000,000 cubic feet spread over this vast surface, it is very questionable if it would have noticeably affected the water level of the rivers.

These facts, the result of Mr. Bowie's investigations, are given to show that the bursting of dams of the high mining or irrigation reservoirs in our mountains would cause *local* damage only. This is the first time that data as to the speed of large volumes of water suddenly set free could be obtained, but the circumstances were favorable and Mr. Bowie has contributed valuable information in obtaining it.

The Fordyce Dam.

In this connection we give the following concerning the Fordyce dam in this State: A correspondent of the Nevada City *Herald*, writing from Washington, in Nevada county, says: Reading of the terrible destruction of life and property at Johnstown by the breaking of the Conemaugh dam, it is pertinent to ask: What would be the result if the Fordyce dam should give way? It might not result in 15,000 deaths, but it would sweep all from the dam to Marysville. The lake in the Conemaugh dam was three miles in length, with a dam 100 feet high to hold it back. The Fordyce dam has a wall 170 feet high and the lake behind it extends back a distance of six miles, holding double the quantity of water the Conemaugh did. It is affirmed that there is no danger of it ever giving way, because it is built of stone and solid masonry; but circumstances may arise that would break it. An earthquake, for instance, would open it and let the flood escape. In view of possible emergencies, either there or at Bowman's, would it not be policy to have telephonic or telegraphic communication down the river, so that immediate warning could be given in case of danger?

Commenting upon the communication, the *Herald* said: The Fordyce dam is composed of solid masonry about 100 feet high. On the base it is over 100 feet thick and on the top 25 or 30 feet. The inner surface of the dam pitches down at an angle of 45 degrees; the outer surface slants at about one inch in eight. The Yuba river, when the dam was built, had a rocky island in the center. The dam was built across this prominence, after it was blasted down, so that it is braced by a solid mass of rocks. There is a gate on the bottom of the dam capable of letting out a whole flood of water and reducing the depth of the water in the lake in the heaviest freshet. Watchmen are always at the dam to regulate the flow of water, and there could be no combination of circumstances that would cause any break in the structure or raise the water above a prescribed point. The area covered by the reservoir when the dam was 75 feet high was 750 acres, giving a storage capacity of 725,000,000 cubic feet or 325,000 24 hour inches. Since the dam was raised to 100 feet the capacity has been increased. The reservoir is something over three miles in length, we are informed. Both the Fordyce and Bowman dams are so built that they will never be disturbed. They are as permanent as the Rock of Ages. They were built not for a fishing pond, but for mining, and the best engineering skill was employed in their construction. The Fordyce dam cost in the neighborhood of $175,000.

DOCTOR OF SCIENCES.—Prof. Geo. Davidson, A. M., Ph. D., of the United States Coast and Geodetic Survey, has been notified by the trustees that the University of Pennsylvania, on the 5th of the present month conferred upon him the honorary degree of Doctor of Sciences. Prof. Davidson is a graduate of the Central High school of Philadelphia, from which he was taken by Prof. Bache and placed in the Coast Survey, where he has served without a single leave of absence from June 1, 1845.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

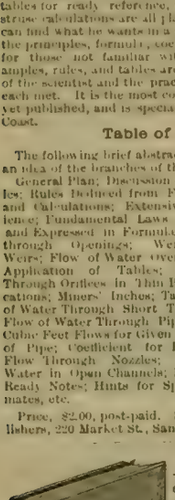
This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given, and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.



A NEW PAPER BINDER—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

Employment Wanted.

Wanted, a situation as Machinist, or to run a Stationary Engine. Address W. A. U., P. O. Box 2361, San Francisco.

YOUNG MINING ENGINEER, SPEAKING GERMAN. English and Spanish, wants position. Is acquainted with gold works in gold and silver mines, mills, concentrators and chlorination works; good assayer and surveyor. Address MINING ENGINEER, 2211 Van Ness Ave., San Francisco.

Situation Wanted.

A reliable and competent Stationary and Electrical Engineer desires a good, steady position in a mining district or elsewhere. Address, C. F. B., Box 2617, San Francisco, Cal.

Smelter For Sale or Exchange.

One 50 ton wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft.; No. 2, 94 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leiter, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

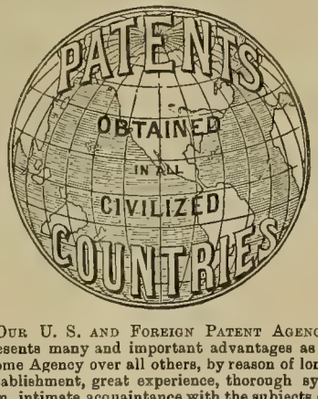
Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE WATCHMAKER.

A California Watch Factory.

A large and well-arranged watch factory is nearly ready to commence operations at Otay, San Diego county, in this State. The building, which is already completed, is a three-story brick structure 100x38 feet in ground area. The enterprise has been undertaken by an incorporated company, which will be known as the "Otay Watch Company." The officers of the company are as follows: President, R. D. Perry; general manager, J. H. Guion; general superintendent, P. H. Wheeler; secretary, J. W. McCool. Directors—M. D. Hamilton, P. H. Wheeler, Dr. H. P. Woodward, R. D. Perry, J. H. Guion, D. R. Moore, S. B. Hawes, E. H. Miller, E. Sneffer.

In addition to the factory building, there is an office building 18x30. The company are also erecting several dwelling-houses for occupancy by the working force. About 200 skilled hands will be employed at the start, many of whom, with their families, will be brought from the East.

The factory is directly on the line of the railroad, with which it is connected by a side track. The 200 skilled mechanics which the business will introduce into the beautiful valley and town of Otay will be accompanied with a much larger number of persons, which will make up the families of the bread-winners, to say nothing of the influx of many other kinds of business which must always accompany so large a number of persons.

The establishment of this new industry in the extreme southern portion of the State, especially when taken into consideration with the fact that it was started directly on the debris of the late boom there, is all the more creditable to the nerve and enterprise of the people of that section. May success attend it.

There is no country on earth where an industry of this kind will be more likely to meet with success than anywhere along the seaboard of California. The equability of our climate, where the workmen are never exposed to the extremes of heat or cold, is an important factor in our favor. The fact that there is required but a minimum amount of transportation for material is another advantage in favor of this particular industry. Let the initial work go on, and let it prove to capitalists that California is the locality of all others for the manufacture of light goods of every description. We have here no fingers benumbed by the frosts of winter, or rendered unserviceable for nimble work by the perspiration of summer heat.

That the business, if properly conducted, will be a permanent and profitable one goes without saying. In proof we append the following facts in regard to a similar institution, which has to meet the harsher conditions of our northeastern climates:

At the recent annual meeting of the Waltham Watch Co. in Boston, it was voted to increase the capital stock of the company by $1,000,000, making the total capital $3,000,000. A cash dividend of 50 per cent was also declared. The treasurer of the company, in explaining the matter, said that the company had a surplus of $2,000,000 above its capital. The capital stock had been increased to the extent of the cash dividend, and those of the stockholders who wished could take the cash they received in dividends, and purchase new stock at par in pro rata proportion to what they already held. It was not a stock dividend. The other $1,000,000 surplus would be used in carrying on the business of the company. There would be no additions to the works on the head of the increase in stock. In 1865, when the capital stock was $300,000, a dividend of 150 per cent was made, and the stock increased to $850,000. In 1880 a dividend of 100 per cent was made, and the stock increased to $1 600,000, and in 1885 the stock was increased $500,000, for which the stockholders paid.

ELECTRIC WATCHES AND CLOCKS.—M. L. Hussey, of Menlo Park, N. J., who has secured a patent for a watch to run by electricity, has just completed the formation of a company to manufacture his electric clocks and watches. Mr. Hussey has been eleven years at work on his inventions, and has secured patents on thirteen appliances necessary in the manufacture of his clocks and watches. There are four of these, including a marine clock. The peculiarity about them is the gravity movement, which, aided by a small electric current, moves the pendulums of the clocks and the large balance-wheel of the watches. The battery is inclosed in the watch case, and with it the timepiece will run for a whole year without any attention. In time it is expected that five-year watches and clocks can be manufactured. The new watches and clocks contain only one-third as many parts as the ordinary instrument. Two small cells and a small electric motor take the place of the ordinary watch movement.

A TORSION PENDULUM.—An improvement in clocks has been shown the British Association for the Advancement of Science by W. H. Douglass. The new feature is the torsion pendulum, which, with lever and escapement, may be applied to ordinary works and by its slow rate of vibration makes practicable the conversion of an eight-day clock into one requiring winding only once a year.

Gold Watches.

"Gold watches are so common nowadays that men don't take as much pride in wearing them as they did a few years ago," said a jeweler to a reporter. "The newspaper individual who could sport a gold watch and chain a dozen years ago was considered a person of wealth and property. But he isn't now."

Gold watches are so cheap now that almost everybody can afford to wear them. A few years ago, when a young man came into possession of a gold watch, he generally handled it in quite an ostentatious manner. He often carried it in a chamois leather pouch and was very careful not to breathe on it or touch the case with his fingers. He consulted it every fifteen minutes for the first month, but he soon tired of that. The demand for gold watches was never greater than it is to-day. Watch companies are kept very busy filling orders, and retail jewelers do a good business in this line.

Why is it that watches are so much cheaper now than a few years ago? has been answered as follows:

For one thing, the watch movements are a great deal cheaper. Gold is just exactly the same price per pennyweight. The reduction in price is confined to the movements. The watch movements of the standard American make are very cheap. Those in common use in gold watches of the cheapest grade are from $10 to $20 each, and some of the best movements are worth at wholesale $25 or $30. There is, however, a high-priced, fine American movement which may cost you say $75, but they are not put in ordinary cases. A watch that you paid $100 for a few years ago you can get to-day for $60, and this $60 watch will have a $10 or $15 movement in it. For $50 you should get a movement cased in solid fourteen-carat gold weighing from 45 to 50 pennyweights. The purchaser will get more service out of a fourteen-carat case than he will out of an eighteen-carat.

"How can dealers offer the public solid gold watches for $30 and $35?"

"They are not solid by any means. There are some unprincipled makers who will mark a case of 10 carat outside and 8 carat inside 14 carat, and a 10 and 14 carat would be marked 18 carat. There is no law in America to prevent this. The case is made of a composition which holds a gold-plating finely. The composition is sometimes very heavily plated, and will wear for several years without showing the base metal. There is little difficulty in disposing of them as solid gold cases, and in this way the price is surprisingly low. There is more opportunity for deception in the movement and case of a watch than in almost any other article. The amount of money invested in a watch offers much inducement to experiment. The case manufacturer is not necessarily obliged to know much about the movement of a watch. He makes his cases to fit the standard American sizes of movements, and most makers produce a uniform size."

In regard to descriptions in watch cases we may remark that the watch-case makers of New York are desirous that a law should be passed providing a good sized penalty for stamping cases as of a finer quality than they really are. This is said to be the practice of unprincipled manufacturers, and it works to the disadvantage of those who do an honest business, and tends to encourage dishonesty. It is to be hoped the honest manufacturers will not only get such a law passed, but that they will see that it is enforced. Nothing is more demoralizing to any branch of manufacture than the certainty that unprincipled manufacturers are selling goods in the same line for what they are not, without much prospect of detection and without fear of adequate punishment if detected. We wish the watch-case makers all success. But what about the dealers who consent to handle watch-cases marked 14 carats that are only in reality six or eight carats?

NON-MAGNETIC WATCHES are fast coming into use everywhere. The rapidly increasing use of electricity has long been calling for such a device, and we now have one that can be implicitly depended upon. The device is called for not only from electrical workers generally, but from the time-wearing public as a whole. The difficulty which the Non-Magnetic Company now has is in filling orders. A new-style watch containing the Paillard improvements in all respects, that can be sold for a price ranging from $12 to $18, is to be brought out at once, and will supply a demand that this company has not heretofore been able to fill. The Non-Magnetic people are well pleased over the number of gold medals they won against all competitors while in Geneva.

A NEW ALARM DEVICE.—A substitute for the old-fashioned alarm on a clock has been invented. It is so constructed as to be set to any given five minutes of an hour, the bell beginning to ring at that time and continues to ring until the switch is turned to cut off the electrical current. Instead of winding up and setting the clock in the old way, with this device one has only to turn the switch, thus allowing the circuit to be completed at the time the bell is to ring. In this arrangement the clock and battery are made in a compact form, the cell of the battery being inclosed in the clock case.

ANOTHER BENCH SHOW. — The California Kennel Club talks of holding a dog show in this city next October.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JUNE 11, 1889.

404,954.—HEADER ATTACHMENT FOR HARVESTERS—Henry Bryan, Modesto, Cal.

404,957.—DUMPING WAGON—Leopold Busse, S. F.

405,023.—COLLAR STUFFING MACHINE—Calvin Ewing, S. F.

405,037.—CORSET—Lucy J. James, Pomona, Cal.

405,215.—COIN ACTUATED RECEPTACLE—F. J. Jones, S. F.

404,988.—STRETCHER BAR—Erich Schmidt, Marysville, Cal.

404,973.—GATE—Hyde & Dotterrer, Davisville, Cal.

405,132.—PISTON FOR STEAM ENGINES—W. J. Thomas, Saucelito, Cal.

405,193.—CART SPRING—L. E. Walberg, Hollister, Cal.

404,983.—SHIP'S WINDLASS INDICATOR—David H. Rivers, * * *

The following list for June 18th, now reported in brief by telegraph, will appear more complete on receipt of advices by mail:

California—Joseph Behm, West Point, amalgamator; Louis J. Borie (assignor of a half-interest to G. F. Chevalier), S. F., machine for affixing postage-stamps, etc.; James A. Christie, Los Angeles (assignor to J. W. Moyle, S. F.), advertising device; Peter H. Jackson, S. F., support for beams, or girders; Ralph P. Waddell, Alameda, sash-holder; Emil M. Dean, Alta, staple-driver.

Oregon—John H. Wait, Junction City, automatic safety railway switch; Isaac M. Woodle, Albany, veterinary surgical instrument.

Washington Territory—Franklin W. and E. Gaines, Colfax, fruit or vegetable cooker.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GATE.—Fred W. Hyde and A. Z. Dotterrer, Davisville, Yolo county. No. 404,973. Dated June 11, 1889. The invention relates to that class of gates which are adapted to be operated by the approaching and receding traveler without his having to alight from the vehicle. The patent covers certain constructions and combinations of devices.

DUMPING-WAGON.—Leopold Busse, S. F. No. 404,957. Dated June 11, 1889. This dumping-wagon consists of a wagon having a centrally divided floor, the sections of which are hinged to the sides of the wagon-body, so as to swing outwardly and downwardly, and in combination therewith of a windlass and mechanism whereby the sections may be drawn up and closed after the load has been discharged, and a means for locking and unlocking the sections.

STRETCHER-BAR.—Erich Smith, Marysville. No. 404,988. Dated June 11, 1889. The invention relates to that class of devices used in connection with draft harness and commonly known as stretcher-bars. The object of these bars is to spread the draft connections to an extent sufficient to apply two singletrees to them so that a double team may be used. The object is to provide simple and effective end connections for the bar, which will hold it in place and prevent it from binding, said connections being readily removable to permit their use for other purposes.

HEADER ATTACHMENT FOR HARVESTERS.—Henry Bryan, Modesto, Stanislaus Co. No. 404,954. Dated June 11, 1889. This invention relates to a means for connecting the header portion of a combined harvester with the thrashing mechanism in such a manner that the header-frame may be raised and depressed with relation to the thrasher-frame and independent of the mechanism by which it is tilted, so as to raise and depress the cutter-bar. The object is to raise and lower the whole frame of the header so that it may be used in very tall or in very short grain without tilting the header to such an angle that the heads will fall off toward the front and be lost, which is the case where the adjustments depend altogether on the tilting of the frame.

SHIP'S WINDLASS INDICATOR.—David H. Rivers, Stoneham, Mass., assignor of one-half to Nicholas Smith, S. F. No. 404,983. Dated June 11, 1889. When the anchor is dropped, it is desirable to know how much cable is paid out, and when all is in readiness, the wildcat having been unlocked from the remainder of the windlass, is held temporarily by the brake-band or compressor, and when it is allowed to rotate, its contact with a frictional roller rotates a shaft, and through this shaft the gearing in the indicator-box. The index-hand will thus be caused to move over the dial, and when it indicates that a sufficient quantity of chain has been paid out, it may be stopped and held by the compressor. If for any reason it is desired to heave in a portion of the cable, or to shorten it preparatory to tripping the anchor, the index-hand, which is movable, independent of the gearing, is turned back to zero, and the amount of chain hove in will be accurately indicated on the dial and index-hand.

Excursion to Ukiah.

EDITORS PRESS:—The recent excursion to Ukiah via North Pacific Railway was one of the most enjoyable and successful events of the year. The fare was placed at $2 for the round trip, a distance of 120 miles. Eleven hundred people, made up of families and a goodly number of ladies, embarked on the steamer Tiburon at the foot of Market street. At Tiburon, two trains were made up and the excursionists sped over the road through tunnels and valleys at a high rate of speed, only stopping for water.

The Petaluma valley is 16 miles long and about 10 miles wide and one of the richest and most productive in the State. From Santa Rosa, the county seat of Sonoma county, northward through what is known as Russian River valley, there is one succession of villages, lovely homes and small farms under a high state of cultivation, surrounded by orchards, vineyards and fields planted in corn, vegetables and cereals. As you approach the attractive village of Cloverdale it appears to be walled in on the east, west, and north by great gray hills covered with bushes, stunted oaks and craggy rocks. From Cloverdale to Ukiah, a distance of 30 miles, the route is one of the most romantic, picturesque and interesting to the traveler in the United States. The railroad follows the Russian river about 10 miles of the distance, and considering the topography of the country, it may be classed as one of the triumphs of modern engineering.

The Ukiah valley in Mendocino county is walled in by high mountain ridges, the valley being from one mile to five miles broad, and the fertility of this section has become noted in the production of hops. This part of our State has been isolated from the traveling public, and the residents led a quiet and happy pastoral life, until the steam-whistle a few months since seemed to awaken them from their Rip Van Winkle slumber. Ukiah City is laid out on a plateau, and has special advantages in climate, fine water, and a rich country adjacent thereto that has the reputation of being one of the best fruit belts in the State. The Palace hotel, a large brick structure, kept by Mr. I. N. Stapp, is the headquarters for the stages that go out from this place, of which there are three lines, owned by Messrs. Force & Curtis, viz.: Ukiah and Mendocino, daily, except Sunday, fare $5; Ukiah and Hydesville, 35 hours without stopping, daily, fare, $15; Ukiah and Blue Lakes and Lakeport, daily, except Sundays, fare $2. On this occasion, as these fine turnouts swung in front of the Palace hotel, the veteran Jehus reminded the excursionists of old times in California. It was hot, 96° in the shade, and the celebrated Vichy Springs, three miles distant, were well patronized.

The management was under Mr. W. H. Menton, general traveling passenger agent for the N. P. R. R., and no accidents or hitch occurred during the day. There were general expressions of pleasure and satisfaction among the excursionists, and a desire to take another ride to the city of Ukiah. This great concourse of people was landed at the foot of Market street at 8:50 P. M.

J. C. H.

ACADEMY OF SCIENCES.—At the last meeting of the Academy the secretary reported the addition of 94 volumes to the library, and a letter from J. F. Houghton, presenting a piece of tapa cloth from the Samoan islands, was read. Walter E. Bryant, who, with T. S. Brandegee, made an exploration of Lower California under the auspices of the Academy, extending over the months of February to June, read a report on new varieties of birds discovered on the trip, together with their habits, nests and eggs. There were five varieties discovered—the horsefinch, sparrow, jay, Belding's warbler and yellow-throat. He had 11 eggs of Belding's warbler, the only eggs in any collection. These were found at Comondu, near the lower end of the peninsula.

DAKOTA TIN.—Richard D. Atkins, the English mining expert who has been examining Dakota tin mines, has left for England, whither he goes to make arrangements with capitalists largely interested in the Black Hills tin mines. The mines are exclusively owned by American capitalists, but Englishmen have loaned money to develop the property and will control the mines under contract for five years. The output in six months will be 100 tons of block tin daily, equivalent to seventy-five tons of white tin, more than enough to supply the American demand. Atkins says it is the richest deposit he ever saw, and the formation of the soil makes it much easier to work than the tin mines of Cornwall.

NORTHERN COUNTIES OF CALIFORNIA.—The series of articles now being published in the PRESS from the pen of James H. Crossman furnishes valuable data concerning a region of which little has been written. While assistant in the field for the State Mining Bureau, Mr. Crossman visited all these counties and made notes, which he has now completed, so that he writes from personal observation. There are many peculiarities in the mining regions of the section referred to, and these Mr. Crossman has noted. The articles are worthy of preservation for reference, being descriptive of a region of great future importance.

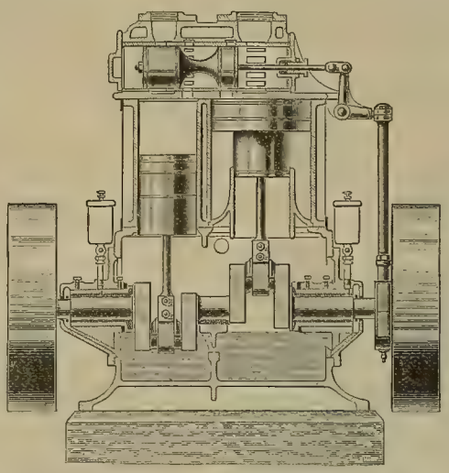
PARKE & LACY COMPANY

IMPORTERS AND MANUFACTURERS OF

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,
AIR COMPRESSORS, ROCK DRILLS,
WALL'S CRUSHING ROLLS,
CONCENTRATORS, PULVERIZERS,
TURBINE WATER WHEELS,
ROCK BREAKERS, DRY JIGS

Golden Gate Concentrators,
GREATEST CAPACITY
OF ANY CONCENTRATOR MADE,
One Machine Taking Pulp from 10 Stamps.



SAW MILLS, MACHINE TOOLS,
PLANING MILLS, INJECTORS and EJECTORS,
BELTING, PACKING, OILS, LUBRICATORS,
FIRE EXTINGUISHERS,
CENTRIFUGAL PUMPS,
ROTARY PUMPS, GANG EDGERS,
CAMPBELL'S STEAM FEEDS,
MILL and MINE SUPPLIES.

GENERAL AGENTS FOR

WESTINGHOUSE AUTOMATIC ENGINES.

SALES DURING LAST FOUR MONTHS:

COMPOUND, 44 ENGINES, 5215 HORSE POWER. STANDARD, 99 ENGINES, 4500 HORSE POWER. JUNIOR, 166 ENGINES, 4260 HORSE POWER.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W.

PACIFIC IRON WORKS

1850. 1888.

BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

SEND FOR CIRCULAR.

PACIFIC IRON WORKS,

NO. 127 FIRST STREET, - - - - SAN FRANCISCO, CAL.

I. S. VAN WINKLE & CO.,
Importers and Dealers in
IRON, STEEL, HEAVY HARDWARE, CUMBERLAND COAL, PERKINS AND BURDENS
Horse and Mule Shoes, Putnam, Globe and Northwestern Horseshoe Nails, HARDWOOD LUMBER AND WAGON MATERIALS, Blacksmith and Carriage Makers' Supplies.
SOLE AGENTS FOR THE WELLS RUSTLESS PIPE AND FITTINGS,
Specially manufactured for use in Artesian Wells, and for conveying water charged with Salts and Minerals, Acids, Gases or other substances of a corrosive nature. In building it takes the place of either black or galvanized piping or gas, water-waste, etc. Catalogues and testimonials, from large users in the United States, sent on application.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

GREAT REDUCTION!
BATTERY SCREENS.
Best and Cheapest in America.
No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.
I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL
For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass Zinc and other metals punched for all uses.
Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.
Mining Screens a specialty, from No. 1 to 15 (fine).
Orders promptly attended to.
San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 20, 1889.

General trade continues to show more activity in all lines, with a perceptible increase in the volume of goods going out on distributive orders. Traveling salesmen of leading firms in this city report that the outlook throughout the coast is of the most flattering character for a large and healthy trade.

The local money market continues easy for call and short paper, but slightly firmer, except on gilt-edged security, for long-term paper. The disbursements so far this year in this city on buildings are largely in excess of the like time in any former year since 1885. For the first five months of the calendar year they aggregated nearly $4,000,000. Other large cities report a proportionate large disbursement. These sums soon find their way back into the general reservoir for disbursing again. For the week ending last Saturday there was placed on realty in this city $419,830. One of the loans was for $140,000 at 6 per cent a year.

Exchanges on the East are in buyers' favor under freer offerings.

There was imported by sea the past week the following treasure: Coin, $7717; silver bullion, $150,000; Mexican dollars, 75,000.

SILVER—The market has held stronger throughout the week at 92⅝@92¾c. Japan has been a free buyer for two or three steamers past, with yesterday's (Wednesday's) shipment to that country, it is claimed, meeting present wants. The supply of available silver is quite light, with a still further decrease in the output looked for in the Nevada and Arizona silver mines. This opinion is based on the decreasing water supply at Virginia City, Nev., and also the managers of the leading Comstock mines driving all important work toward the west, in the direction of the gold lode.

MEXICAN DOLLARS—The market has held very strong at 74 cents for new. The demand was largely from the Chinese for shipment by this week's outgoing steamer for Hongkong. The imports are not excessive, while the bulk coming to one firm admits of better prices than if there was competitive selling.

New York telegrams came through to-day (Thursday) quoting silver at 91⅞c. In our market we are unable to obtain quotations, although 92⅜@92½c is probably about what can be obtained.

QUICKSILVER—Receipts the past week aggregate 953 flasks. The exports by sea aggregate 50 flasks to Mexico and 1 to Victoria. There was shipped overland in last month 1980 lbs. The market is steady at full prices. The demand for home use continues good.

LEAD—The local market is unchanged, although a firmer tone is reported in sympathy with the East. There was shipped by sea the past week 20,017 lbs. to Victoria, B. C.

TIN—Exports by sea the past week were as follows: To Victoria, B. C., pig, 8070 lbs.; tinplate, 159,100 lbs. The market continues in buyers' favor for both plate and pig, both on spot and for shipment.

BORAX—The exports the past week aggregated 40,619 lbs. to Chicago via Canadian Pacific railroad. The shipments last month via Southern Pacific aggregate 276,520 lbs. The market continues firm, with a good inquiry at the East.

LIME—Receipts the past week aggregate 3942 barrels. The market is steadier and firmer, with a good demand reported.

IRON—Imports the past week aggregate 145 pigs from Irondale. The market is still flat, with consumers only buying in a small way. Spot prices are below the English parity, and therefore holders are slow in selling at any further concessions. Eastern and European mail advices report strong markets, with prices strengthening. In England there are 290 iron vessels under construction, which is a larger number than for over a decade past. Besides these, the Navy Department of Great Britain will have more vessels underway soon. It is this that gives strength to the iron market abroad.

COAL—Imports the past week were as follows: Coos bay, 350 tons; Nanaimo, 4634; Tacoma, 8900; Puget Sound, 2870; Departure bay, 2400. Total, 19,154 tons. The market for household is without any change to note, but for Australian there is a firmer tone, owing to an advance in ships in Australasian waters. The rate asked there now is 14s for this port, against 12s and 13s a short time ago, which makes the cost of coal delivered here $7.00 a ton. For late August and all September loading, probably cargoes at $6.75 could be had. Large consumers continue indifferent. They do not appear disposed to anticipate their wants except at concessions, preferring to take chances on forced sales by vessels having coal as ballast, or else having coal for wheat exporters who fetch it here to help pay expenses so as to reduce the wheat freight hence.

Eastern Metal Markets.

By Telegraph.

NEW YORK, June 19, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42	91¾	$12 10	$3 92½	$20 20
Friday	42	92	12 10	3 95	20 20
Saturday	42	92	12 10	3 95	20 25
Monday	42	92	12 10	3 97½	20 25
Tuesday	42 1-16	92	12 00	4 00	20 10
Wednesday	42 1-16	92	12 00	4 00	20 00

NEW YORK, June 19.—Lake Ingot copper went to consumers to a fair extent, at 12c; casting brands, 10¾@11¼c, with sales. Pig lead closes firm, and in fair demand; spot, $3 95@4; near futures, $4@4.02½, including 'Change transactions. Borax is firm at last rates. Under a moderate supply, quicksilver advanced to 64@66c, following the recent London advance to £9.

COL. R. H. RANLETT left this week for Boston on business connected with the copper interests of this coast.

Getting Around the Alien Act.

The simple, ingenious, straightforward way that the Lady Franklin Company has adopted to get around the difficulty raised by the demagogic alien law, which tried to prevent our miners from seeking the aid of foreign capital by refusing to allow foreigners to acquire title to mining properties, will doubtless be followed by other mine-owners who want to place their mines abroad. The man wishing to dipose of his properties will, until this section of the alien law is repealed, instead of selling out right, give a lease on his property for a long term of years at a rental of $1 a year, while the real consideration will be paid him just in the same way it would have been paid if he had sold outright. This appears to be an extremely simple way of getting around this clause of the alien law, which has already proved detrimental to our mine-owners. Far better, though, than getting around the difficulty, even in this simple way, would be the repeal of this obnoxious section of the law. Calls for its repeal have been heard from all the mining regions of the West since its passage, and it is to be trusted that it may be removed from the statute-books.—*Sierra County (N. M.) Advocate.*

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Mt. Diablo, June 14, $7721; Chollar, 14, $14,322; total for May, $32,525. Hale and Norcross, 14, $6878; Commonwealth, 15, $12,000; Standard, 15, $11,149; Alice, 12, $20,946; Hanauer, 15, $24,500; Bluebird, 14, $23,104.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Mining Share Market.

The little reaction in the Comstock mining share market, outside of the Alta group, mentioned in last week's report, was of short duration, and was followed by a steady shrinkage until a decline of, on an average, 10 per cent was obtained. The setback, if made by the pool for the purpose of getting more stock, was a success, for more margins were uncovered, besides many stocks thrown on the market by disgusted holders. There can be no doubt but the pool is steadily concentrating stocks, yet there is no denying that there is more stock out on the public than is desirable for much of an upward movement. The holdings are chiefly paid for and can only be reached, if it is the pool's aim to get them, by assessments and a continued drag relieved by spurts for quite a length of time. The work going on in the mines indicates that nothing of an important character can be looked for yet awhile. In outside stocks the Tuscaroras and Quijotoas have ruled weak at lower prices, and this, too, in the face of ore reports from some of the mines. There are strong bear reports out on the latter. The Bodies have held fairly steady at firm prices under light transactions. The strength of these stocks, in the face of a strong opposition from a bear clique, causes more or less comment from outside operators.

Reliable news from the Comstock mines is hard to get, owing to those who have been giving information becoming wearied with stocks on the down grade. The work going on in the leading mines is of a very important character, yet it will take time and a large expenditure of money before the value of the work can be demonstrated. How long a distance has yet to be run by any one of the west crosscuts before reaching the west or gold lode, is not known by outside mining-men, and, therefore, everything bearing on the subject is conjectural. That streaks or stringers are liable to be run into at any time before reaching the lode is quite certain, and may prove disastrous to outsiders who buy stocks under the impression that the main lode has been cut. There is more talk of a growing scarcity of water to run the mills. From the Tuscaroras the usual "chestnut" of large bullion outturn and ore developments comes to hand. From the Quijotoas advices are conflicting. Some report that the mines are to be abandoned, while others, again, are of a glowing character and report that a 20-stamp mill will start up on Crocker ore at an early day. From the Bodies our advices, from a thoroughly reliable source, indicate that on the upper levels in Bodie an important development has been made, but the particulars were not obtainable up to the hour of writing. This, no doubt, accounts for the strength exhibited by the Bodie and Mono stocks in the face of a declining and demoralized market for other stocks.

Instantaneous Cure of a Snake-Bite.

The National City *Record* says that a few days ago Geo. Beermaker and Constable Ad. Pearson went hunting for rabbits. While pushing their way through the cactus and sagebrush, they came upon a four-foot rattler which was coiled for a spring, and with swaying head awaited their coming. Mr. Beermaker, who was in advance and did not observe the reptile, stepped squarely upon it, about six inches from the head. There was hissing and rattling, and the next instant, before the unfortunate city clerk could jump away, he felt a stinging sensation in the leg. At this moment Mr. Pearson came up and shot the head of the snake into bits.

They were miles away from the nearest drop of rattlesnake balsam, and they had no ammonia. This was a predicament indeed, and Mr. Beermaker could feel his hair rising with fright. He bared his leg and was about to cut out a huge piece of flesh where he could see a solitary drop of blood oozing out, when Mr. Pearson electrified him with, "Why, you blamed idiot, that's the wrong leg. You couldn't have been bitten there." Then it came out that the clerk had run into a cactus bush.

Beermaker sat down and in a minute was perspiring from every pore. He was relieved, for, as he admitted, a moment before he could feel the deadly poison coursing with lightning-like rapidity through his veins.

MINING SALE.—Some 800 acres of patented mineral land, 20 miles south of Santa Fe, has been sold for $2,000,000 to New York parties. The mines are in Cerillos district.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

CHINESE PHEASANTS.—The Salinas *Democrat* says that Hon. Paris Kilburn has recently turned loose a pair of Chinese pheasants upon his ranch near Chualar. These birds are plenty now in Oregon, all having sprung from two pairs turned loose there a few years ago. They are very prolific, raising three broods a year.

E. H. TAFT and O. Livermore, executors of the estate of Frederick Zeile, deceased, have applied to the Superior Court for authority to sell the Zeile mine. The estate owns 18,600 shares out of 19,867 shares of the company.

Brief Notes from San Diego.

A. H. Butler of the Alamo mines, Lower California, has lately returned from a visit to the properties of which he has charge. The mill of his company is the pioneer mill at Alamo and the only one now running. He speaks very encouragingly of the Alamo mines.

The St. Nicholas & San Francisco Gold Mining Co. of Lower California, with office and headquarters at San Diego, report frequent shipments of bullion from their property, which is located two miles from Real del Castillo, 32 miles east of Ensenada. The company has a ten-stamp mill, 40-horse power engine and other necessary machinery, and they have so thoroughly exploited their mines that they are satisfied they have valuable properties. The ore now being crushed comes from the St. Nicholas mine, where three shafts of 80, 90 and 20 feet, respectively, have been sunk, and from which a good quality of free-milling ore is taken. The San Francisco is a more pockety mine, from which $12,000 was lately taken in one pocket.

San Diego now has a good assaying office, conducted by W. S. Young, at 961 Fourth street. Mr. Young is a thorough and practical workman, and makes assays for all classes of metals. By reason of the late increased interest in mining matters at San Diego, this assay office will prove a beneficial institution, and Mr. Young will be kept busy in testing the minerals of Southern California and the lower country in Mexico.

A tray of gold nuggets and dust, displayed on the counter of the Commercial National bank, San Diego, and represented to have all come from Lower California within a short period, convinces many that there is much wealth to be found in that country as developments progress.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.

R. G. HUSTON—Montana.

THE Sonora, Sinaloa and Chihuahua railway, work on which is about to be commenced, will tap coal and iron deposits in the Sierra Madres. The mineral will be transported to the west coast of Mexico and from there shipped to San Francisco.

Books on Assaying.

BY C. H. AARON.

PART I.—**Gold and Silver Ores.—Price $1.**

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

reface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification, Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, po t-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

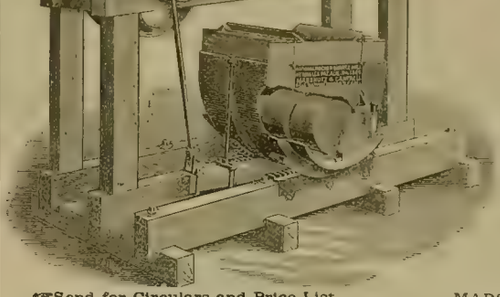
NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List.

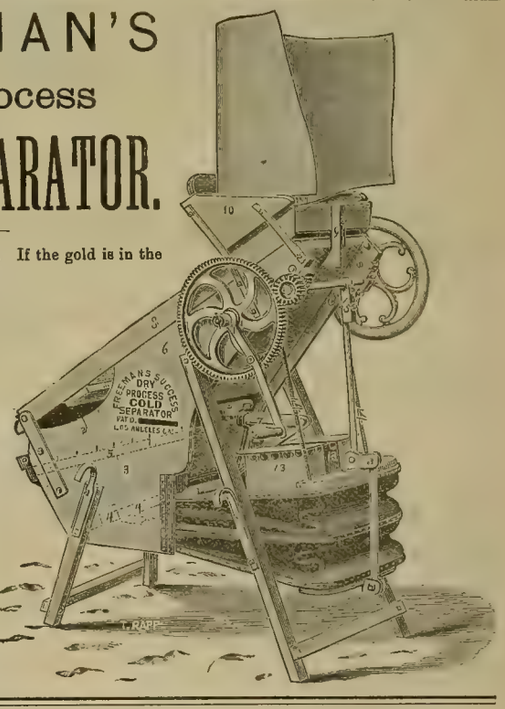
MARSHUTZ & CANTRELL.

FREEMAN'S
Dry Process
GOLD SEPARATOR.

They are good machines. If the gold is in the dirt they will save it. They will save finer gold than water will.

T. J. SCOTT,
Osceola, Nevada.

Smith & Drew took out Tuesday, in their dry wash diggings, in addition to 5 ozs. of fine gold, a nugget weighing 22 ozs. The machine used was Freeman's Dry Process Separator.—*Utah Daily Union, May 10, 1889.*



☞Send for descriptive Circular and Price List.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

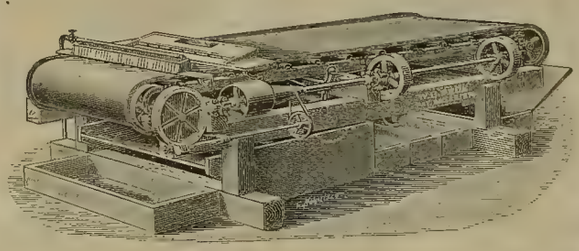
IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

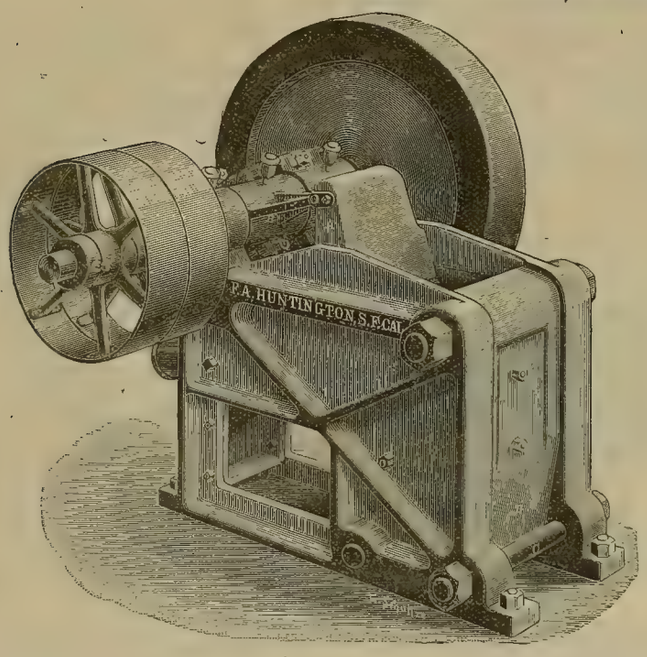
Cal State Library Jl '89

MA[illegible]ER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

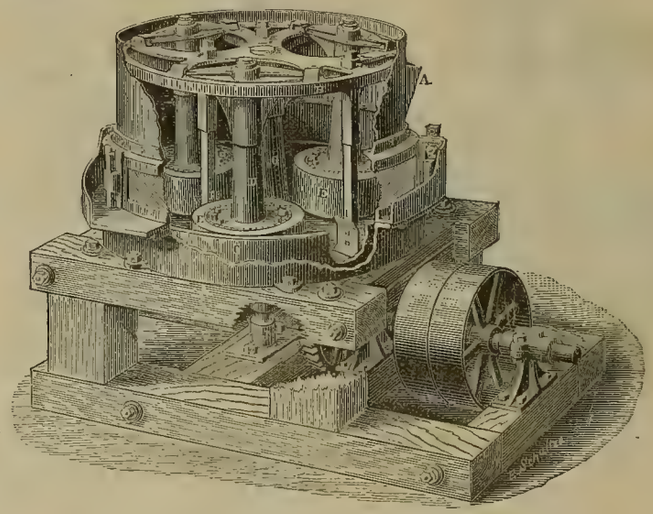
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

The Jenisch and Loehnert Ball-Mill.

A Pulverizer for Wet or Dry Ores.

The Jenisch and Loehnert ball-mill is, in Europe, a favorable machine for grinding and pulverizing quartz, ores, gravel, cements, basic slag, etc., and as it is about to be introduced in California, a description will be of interest. The working is continuous. The material can be put into the mill in pieces up to five inches in diameter, rendering superfluous breakers, crackers or stamps. In the dry process the powder is turned out without dusting, and in the wet process a continual jet of water is conducted into the mill and the pulp washed through the screen.

The ball-mill consists of a rotary drum of 63-inch diameter, containing a certain quantity of hard iron or steel balls of different sizes, say about 4–5 inches diameter. The material to be ground is put into this drum by a side-hopper and the grinding is effected by the falling, grating and pounding of the balls during the rotation.

As the drawings show, the drum is formed by a certain number of perforated and curved steel plates (inclined surfaces) of one-inch thickness. These plates are arranged in such a way that they rise from the periphery inward to the axis of the drum, and thus the end of one plate overtops by some inches the beginning of the next one, and both leave an open slit between themselves. This raising of the inclined surfaces is intended to divert the balls from the circular motion, to let them fall down one step on every octave rotation and thereby increase their grinding effect.

Behind each of the inclined surfaces and in the same direction is fastened a preservative sieve for the defense of the fine sieve, surrounding the whole periphery of the drum. This exterior sieve is made, according to the desired fineness of the produce, of brass or steel wire, perforated or slitted copper, or steel sheets, and consists of a number of frames drawn over with the corresponding wire or sheets.

The material has therefore first to pass the holes of the interior plates, then the preservative sieves, and finally the meshes, holes or slits of the fine exterior sieves. All the material which is not yet fine enough to pass the preservative sieves or the exterior fine sieves, will fall, during the revolution of the drum, through the slits formed by two inclined surfaces, back into the drum and again be subjected to the action of the balls. The drum is inclosed by a casing which, in its lower part funnel-shaped, prevents the produce from dusting away and collects it in bags, barrels or carts placed beneath.

The driving of a ball-mill of 63-inch diameter requires from six to eight-horse power. The wear and tear embraces principally the balls. The inclined surfaces show less wearing. The side walls of the drum are covered with defensive plates. The inclined surfaces as well as the defensive plates of the side walls can easily and with very small expense be replaced. For this purpose one of the inclined surfaces is provided with a man-hole.

The 63-inch ball-mill complete weighs about four tons. The drum is intended not to make more than 26 to 28 revolutions per minute. The mill does not occupy much space and costs $950.

On the continent the ball-mill has been principally employed up to this time for crushing basic slag and Portland cement, and the experience shows that the whole wear and tear of the

Ione Valley.

[Written for the PRESS by S. L. H.]

As the shadows come slowly creeping
Up the valley and from the west,
And cool winds are lightly sweeping
O'er grain-fields with golden crest,
I in fancy recall the dawning,
So many long years ago,
Of a glorious summer morning
O'er yon glittering peaks of snow.

What a beautiful sight must have greeted the eyes of the tired traveler who first from an eminence of the foothills caught sight of the beautiful valley situated in Amador county and long known by the name "Ione Valley." The wild oats, it is said, stood a waving, level sea higher than a man's head. Two clear streams of water, as yet unstained by mining debris, meandered unobstructed through its length, joining their forces at its lowest point. Immense live-oaks spread their drooping branches to the earth, affording a protecting shelter in summer or winter for the wild deer or wilder natives of the country. Wild vines trailed low, or climbed to the topmost branches of the trees on the banks of the streams, their perfect clusters of purple fruit nestling temptingly beneath the fast-changing and falling leaves.

Rising in picturesque forms on every side of the lovely vale were undulating hills covered with evergreen trees, whispering pines, oaks, chaparral with white, fragrant blossoms, patches of pale-blue myrtle, manzanita bushes with brilliant stalks surmounted with glossy leaves, waxlike blossoms and dainty berries. Here and there was to be seen a brilliant patch of glowing red berries like heaps of fire. Through all the narrow space between the shrubbery, and beneath the dark green trees, shone like yellow gold the luxuriant ripened grass. Silent all, save the riotous song of birds, the chirp and hum of insect life, the rippling of stream and the soothing rustling of the leaves as the light breeze passed through them. The bright blue sky arching grandly above seemed to rest down just beyond the surrounding hills, encircling all in a loving embrace.

How this lovely valley came to be called Ione is a disputed question, although there are some living here still who were here at a very early period of its settlement by the whites. Some claim that it was so named from the frequent utterance of the words "I own," by one of its early settlers by the name of Hicks. When asked by parties: "Whose land is that, or that?" "Whose cattle are those?" "Whose band of horses?" "Whose sheep?" the reply invariably was, "I own it or them," as the case might be. Thus it came to be a saying, "Hicks owns the valley," and it finally became "Ione valley."

Others claim that from its beauty it was called Ione, or named for some beautiful woman of that name. Howbeit, the valley is beautiful, the name is beautiful, and neither, I think, will ever change.

At its upper or eastern end, creeping slowly but surely up the "big hill," nestles the village of the same name. Its numerous cozy homes are almost buried amid trees and clinging vines; fruit of all kinds is abundant, each in its season. Glowing blossoms decorate the yards and fill the air with fragrance. A large, substantially built brick schoolhouse and an efficient corps of teachers speak well for the educational advantages for the children of the place. Four well-constructed churches, each one well attended, speaks volumes for the religious sentiment of the citizens. Two drug stores and as many resident physicians speak assuringly of the means for the speedy restoration to health, should one fall ill. Four well-stocked general merchandise stores and a bountiful meat market stand ready to supply almost any want of the people. Two hotels are well fitted to furnish good food and comfortable shelter for the traveling public.

One weekly paper, the *Ione Valley Echo*, affords a means of advertising and chronicles the doings of the place and vicinity.

In the days of forty-nine and the early fifties, there were rich placer mines near, and many a golden nugget was unearthed and quantities of yellow dust found its way to the Mint from the gulches around and from the neighboring "cities" of "Irish Hill," "Muletown," etc.

Great energy was displayed by the people in this section during the copper excitement in the "sixties," and two valuable lodes were opened—the Newton, three miles east of Ione in the hills, discovered by Dr. Newton, which was profitably worked for years but is now idle; and the Arroyo Seco copper mines, discovered and located by John J. McNeely, three miles to the northwest of Ione. From it some very rich ore was taken and shipped to Swansea, after which the ore passed through was not so rich in copper, but the vein is there and in time undoubtedly will be again worked with profit. There are other lodes of the metal also near.

Where once the wild oats waved in emerald green is now crossed and zigzagged by many lines of fence, cutting up the lovely valley into farms great and small. Orchards in many places have taken the place of the live-oak groves. Vineyards, orchards and wheat-fields occupy much of the space. Black walnut trees have been planted along the line of some of the roads and lanes, and yield an abundance of nuts.

In the northern edge of the valley is the gravel mine known as the Lambing mine. Much money has been expended in perfecting machinery with which to remove the dirt and quicksand so as to obtain the gold deeply hidden below. An immense derrick is used for that purpose.

When this garden spot was in its first early bloom, after being settled by an enterprising class of people from the East, and every one who was fortunate enough to own a portion of its prolific soil felt that he was rich indeed, and every one was prosperous and at peace with his neighbor, and Ione was considered by its residents as the "Eden of California," that greatest of all blights, a floating Spanish grant, embracing I forget how many leagues, was floated over the bare plains west of here—over the dry hills and less promising country on either side, and settling down, took solid root where the land was already in a high state of cultivation, the homes made, the vineyards planted, the orchards in bearing. It floated not in square leagues as perhaps was intended, but narrowed here where the soil was not so good, widened again and strained and reached out so as to take in this home and that grain-field, and still another orchard and vineyard, rested its eastern line just above the village, and all that was lovely and desirable belonged to one man of yellow visage—"Senor Andreas Pico."

As the price of a title to what each had considered his own, and had, in many instances, paid a high price for previously, a sum was required equal to the full value of the land, and the improvement put on the same at the settler's own expense, an effectual check was put upon all industries, and from which Ione is now slowly but surely recovering.

The "Grant" has several times changed hands. The grand early settlers, most of them became impoverished and sought homes elsewhere. Thousands of acres of fairly cultivable land are inclosed by barbed wire fencing into one immense field for stock-grazing—many acres of the richest loam in the valley are devoted to the raising of alfalfa and pasturing of hogs. Still the people hope that one day this place will become one of importance.

The fair grounds and pavilion for Agricultural Fair, No. 26, are located here. The "Preston School of Industry" is to be built here in the near future.

There are extensive beds of fairly good coal that have been worked for years, and are still being worked.

Quantities of good potters' clay are shipped to many places. There is a new quarry, said to be very valuable, of beautiful red sandstone for building purposes, lately opened and from which tons of rock are being hauled daily and shipped. A soil from which can be produced a good quality of anything you may wish to plant, and a climate equal to any other section of the State.

These are simply a few facts in regard to Ione valley, of which much more might be written.

Good Pumping Work.

EDITORS PRESS:—The Eureka Como mine has been drained at a cost of about $2000. They are now pushing their work of exploration on the 300-foot level, as fast as possible, with good indications ahead. We are pumping fifteen miners' inches of water, and a No. 9 Cameron plunger pump does all the work, forcing the water from the 300 level to the surface, and working perfectly. Some may be interested in knowing that a pump of this capacity can do this work. It was an experiment with us, but it has proved satisfactory. We make a saving in wood of two cords per day in favor of the one pump. We formerly used two pumps to do the same work, one of them stationed at the 200 level. S.

IMPORTANT MINING DISCOVERY.—We learn from reliable authority that Mr. A. P. Shively of this place, who has been prospecting more or less for several years in the vicinity of Pilot peak, and southeast of Toano, has discovered during that time many valuable lodes. This spring he again resumed his work of exploring for the hidden treasures, and some ten days ago discovered what is known among old miners as the "Lost Mines." This find is situated southeast of Toano, in this county. One of the ledges is some 30 feet in width, the croppings being bold and prominent, and running north and south. There are also several other valuable ledges, samples of ore from which carry galena heavily charged with silver, and is very rich. The formation is lime and quartz. Our informant states that there is an abundance of wood and water in the immediate vicinity for working purposes. We congratulate our fellow-townsman upon his good luck.—*Elko Free Press.*

IMPROVED TREATMENT OF CHROME ORE.—A Norwegian engineer, Herr O. Olsen, Christiania, has obtained a ten years' patent for a new process for the manufacture of chrome iron. In his process a well-mixed proportion of finely pulverized chrome ore, powdered charcoal, and tar are heated to red heat in a closed vessel, then allowed to cool, and finally remelted in a crucible, together with a certain proportion of pulverized iron ore, powdered charcoal, borax, ground glass, and cyanide of potassium. The proportions of the mixture are naturally kept a secret.

The Lakes of the San Joaquin Valley.

University Experiment Station Bulletin.

The rapid contraction by evaporation of the three lakes of the upper San Joaquin valley, the consequent concentration of their waters into alkaline lyes too strong for animal life, and the nature of the soils laid bare on their margins, have formed the subjects of investigation and discussion in former reports of this department, especially in connection with the reclamation and cultivation of alkali soils. (See reports for 1879, pp. 30 to 39; 1880, pp. 12 to 33; 1882, pp. 56 to 60; 1884, pp. 61 to 69; 1886, revised reprint from report of 1880: "Alkali lands, Irrigation and Drainage in their mutual relations," 45 pp.) It is a matter of regret that it has not been possible to pursue the subject by personal visits as systematically as its practical importance and theoretical interest might have warranted; for we are here in presence of a group of phenomena that have been repeated many times in past geological epochs, and for the study of which, in their physical, chemical and biological aspects, opportunity is not often afforded. Hence, while the information and data here given are of necessity incomplete and fragmentary, they are of interest as affording an insight into processes regarding which but little is thus far on record; and their communication may perhaps serve to incite others having the opportunity to do so, to a closer study of the progressive changes.

For a better understanding of the situation in the Kern and Tulare basins, the following statements from former reports are reprinted:

"A personal examination of Kern lake, and of the region lying between it and Buena Vista lake, as well as of the Mussel Slough country, made under the auspices of the United States census, in March, 1880, satisfied me that in none of these rich agricultural sections could the slightest increase of alkali be safely risked; and analyses subsequently made of the waters of both Kern and Tulare lakes prove that a very few years' use of the water then filling either of these reservoirs would be promptly fatal to the productiveness of the lands irrigated. As regards Kern lake, this was obvious enough from a casual examination and tasting of the water. Having been shut off from the natural influx of Kern river for a number of years, it has been rapidly evaporating and receding from its former shores, so that at the time of my visit a difference in level of over four feet had been produced in 15 months, leaving high and dry a boat wharf built at that distance of time. About 18 months before, all the fish and turtles in the lake had suddenly died, creating a pestilential atmosphere by their decay; and even the mussels were now mostly dead, a few maintaining a feeble existence. A strong alkaline taste and soapy feeling of the water fully justified their choice of evils. The tule marsh, laid dry by the recession of the lake, was thickly crusted with alkali, and the tules were dead, except where still moistened by the water of the lake, showing that the latter was not yet too strong for such hardy vegetable growth, albeit fatal to animal life.

"Buena Vista lake was stated to be in a similar condition, but not yet quite so far advanced in evaporation, and still maintaining some animal life in its waters, having lost its connection with the river more recently. Tulare lake is well known to be full of fish, and as it annually receives the overflow of Kern and the regular inflow of King's river, its evaporation and recession has been much slower; yet its water's edge is now distant several miles from the former shore-line, and as the water of the rivers is more and more absorbed by irrigation it will doubtless continue to recede until a point is reached at which the regular seepage from the irrigated lands will balance the evaporation. This epoch would seem, however, to be quite in the future as yet, for the rate of recession has, apparently, not sensibly changed in the last few years. It is not likely in any case that the water of the lake will be more abundant or less impregnated with mineral matter than is now the case, at the time when the state of equilibrium shall have been reached.

"With the lights now before us, it can hardly be regretted that the old Westside ditch, which was to irrigate the lower country with the corrosive waters of Tulare lake, was not successful. The lake level is now several feet below the bottom of that outlet, and the lake keeps receding annually, and its alkali becomes stronger as the mass of the water decreases. It is difficult to say where it will stop; but if, as is probable, a state of equilibrium is reached whenever the waters of Kern and King's rivers shall have fully filled the parched depths of the plains by a more general system of irrigation, it is not at all probable that the lake water will thereby become fresher; on the contrary, such seepage water will be likely to bring into it the alkali now dried up in the lower strata, and the annual evaporation will concentrate the solution more and more. It would certainly be most desirable to utilize the lake as a great reservoir for irrigation supply; but to render this practicable, it would be necessary first to empty out or displace the mass of alkaline water at present occupying the basin. The discussion of the feasibility of such an undertaking, however, belongs to the province of the engineer corps.

"The analyses referred to above gave the following results (in grains per gallon):

	Kern Lake.	Tulare Lake.
	—1880.	
Date of taking sample	March.	January.
Total solid contents	211.50	81 80
Soluble after evaporation	182.75	71.16
Potassium sulphate		3 24
Sodium chloride (common salt)	115.41	22.77
Sodium sulphate (Glauber's salt)		17 23
Sodium carbonate (sal-soda)	64 37	27 93
Insoluble after evaporation	9.29	8.36
Calcium carbonate	....	2 97
Magnesium carbonate	....	4.95
Silica	....	.44
Organic matter and water	22.43	2 23

"To convey to those unaccustomed to the consideration of such matters an idea of the meaning of the above figures, it may be stated that the solid contents of river waters vary usually from 5 to 12 grains per gallon. The water of Tulare lake, where it is undiluted by the inflow of King's river, is therefore about 10 times, and that of Kern lake about 26 times, stronger than an average river water. Even this, however, conveys but an inadequate idea of the relation sustained by these waters to organic life. The average sea water (containing mainly common salt) is about ten times stronger than the water of Kern lake as regards its solid contents; yet in sea water, fresh-water fish live freely during part of the season, while in Kern lake the fish died at a time when, according to a minimum estimate, the water must have had about twice the strength of Tulare lake, or about one-thirteenth of the strength of sea water. This shows strikingly the deadliness of the Kern lake alkali as compared with sea salt, or, in other words, of Kern lake water as compared with tide water."

Condition of the Lake Water in June, 1888.

Early in June, 1888, at my request, Mr. B. F. Moore, Patron of the Experimental Station near Tulare City, sent a messenger to obtain a sample of the lake water in order to ascertain the progress of evaporation. The sample was taken 2½ miles out in the lake, 8 miles east of the mouth of King's river, not far from the Cross creek fisheries.

The water had a general greenish turbidity and considerable greenish sediment at the bottom of the bottles. This sediment showed under the microscope an abundance of green cellular plants, mingled with adherent fine silty matter, partly silicious, partly calcareous.

A partial analysis of this water (by Assistant Geo. E. Colby) resulted as follows:

	Grains per gallon.
Total solid contents	204.7
Soluble after evaporation	186.9
Sodium carbonate (sal-soda)	74.3
Insoluble part	3.7
Organic matter and water	14.1

The *soluble* part consists chiefly of carbonate of soda and common salt with Glauber's salts.

The *insoluble* part consists of gypsum and carbonates of calcium and magnesium with some silica and alumina (probably clayey matter).

It will be seen from a comparison of this analysis with those made in 1880, that the solid contents of the lake water had increased very nearly 2½ times in the eight years, and that its concentration approximated closely to that of Kern lake in 1880. Yet it appears that an abundance of fish survived, at least of certain kinds, although, as will be seen below, the mussels had already succumbed.

The Condition of Tulare Lake in Winter of 1888-9.

Having been informed in November, 1888, that "the fish in Tulare lake were dying by shoals," I concluded that the water of that basin had by evaporation at length reached the limit of endurance of its inhabitants, who had probably found themselves unfit to survive the altered surroundings. Desiring to verify the facts, I in January, 1889, made arrangements to visit the lake in company with Mr. J. G. Woodbury of the State Fish Commission; but being delayed by imperative duties, I requested Mr. Woodbury to proceed alone, and while making his observations on the economic side of the question, to collect a sample of water and such other data as might present themselves. He accordingly visited the northeastern part of the lake, near the mouth of Cross creek, during the first week in February, and on his return communicated to me the following interesting account, which is here reproduced by consent.

"On the train I met several gentlemen who live along the railroad, opposite the lake, and was told by them that Tulare City was the best place to start from for a visit to the fishing-grounds. I engaged team and driver to take me to the fishery near Cross creek, a distance of about 25 miles, according to the driver's statement, and not less than 20 by my own estimate. At this point the lake receded last year about half a mile, and in consequence the fishermen were compelled to move their position about a mile farther into the lake. Their pound for the fish is half a mile from the shore and their seine is pulled 2½ miles farther out into the lake. It is afterward pulled in by a horse and windlass located about 200 yards from the shore, on a platform where the horse is also stabled.

"They catch about 125 pounds at a haul at this fishery; the fish come in on the seining grounds in warm weather rather than when it is cold; and as the same ground is continually seined over, it seems that the fish must travel considerably to keep it constantly stocked.

"I inquired about the reported dying of the fish. The fishermen said that it occurred last summer and autumn, and that it was mostly catfish, 'greasers' and some of the so-called trout, also some carp, but very few perch. Now it is the perch that is so much valued by the fishermen; in fact, the perch is what they fish for, as the catfish do not sell so well and the greasers are of no account. The 'trout,' of which I did not see any, they say are very soft and do not keep well, also are very insipid.

"The perch is certainly a very fine fish, large, bright and clean-looking; they are also very good eating, as I had occasion to verify. These perch have enormous mouths, and in that of every one in the pound can be seen a 'shiner,' (or 'slick,' as they call the fish) with the tail sticking out of the great mouth, being drawn farther in as the process of digestion proceeds. One perch which I took along to have cooked, I took by the gills, and looking down his big mouth, I saw the tail of a fish, which I readily got hold of with my fingers and pulled out. It was six inches long and only its head partly digested. The fishermen say that all these perch when caught have fish in their mouths, in proof of which he pulled out one at random

with a dip net, and showed the perch with a shiner's tail still out of the mouth.

"The fishermen state that no catfish are now caught, while two and three years ago they would get a wagon load at each haul; also, that trout are now seldom caught, although they used to be very abundant. The men expressed no opinion as to the cause of the death of the fish, but stated that the catfish especially were drifted upon the shore, dead, by thousands.

"Catfish, however, are found by millions at present in the creeks and sloughs that run into the lake. A gentleman who lives on his farm fully ten miles from the lake, and who fishes in a small way for his own table, is of opinion that the destruction of the catfish and carp is caused by their being driven on the shallows by the wind, and left in shallow pools which, when the water recedes, soon become so hot that the fish die. I questioned him very particularly about this; and as he is very intelligent and his father was a fisherman whom he frequently assisted in his work, his views are entitled to weight. He has a boat and sailed around the lake last summer, and states that the deepest part of the lake, in the channel which runs from south to north in the direction of the old outlet into the San Joaquin river, does not exceed 20 feet; that outside of that channel it is generally not over four feet, gradually shallowing toward the shore. Notwithstanding this shallowness, the action of the wind should mingle the different portions pretty thoroughly and render the alkali about even throughout.

"Before starting on this trip he was told that he would have a good wind throughout his journey, as the wind blew from the center of the lake toward the shore. He states that he found it to be true; that he had the wind 'abeam' all the way.

"The two bottles of water I sent you were taken at various distances from the shore out to the fish-pound. Although the fishery is located off the mouth of Cross creek, as there is no water in that creek for several miles out from the lake, the water of that portion could not have been perceptibly freshened by its influx at this season, although some seepage doubtless occurs. The water of the lake is very muddy and has a nasty taste and smell; very much like that of a well about a mile from shore and 100 feet deep, which was, however, drank by the people at the farmhouse as well as by their stock, and left them all healthy. One of the horses of my team, however, was relaxed in its bowels all the way to Tulare, and the same happened to the driver and to myself.

"All the shore of the lake for miles, as far as I could see, was strewn with mussel or clam-shells; the surface of the ground was white with them, and the wheels of the carriage crushed through them as though more than half the substance of the ground was actually made up of shells, as I have no doubt is really the case. They told me that these shells extend here, as thickly as on top, down to the depth of a hundred feet, as shown in the well referred to above. Not a live clam can be found in the lake now.

"I have subsequently been informed that ten years ago there were large numbers of live mussels in Tulare lake and that the hogs used to live on them then; that they would wade out into the lake and plunge their heads under water, get hold of a mussel and hold their noses up in the air and chew them up.

"All the (seven or eight) fisheries are located within four miles of Cross creek mouth; no fishing is now or appears to have been done near the mouth of King's river, 10 miles to northward, for the reason (according to the fishermen) that the water is too shallow.

"For the whole distance of 20 miles from Tulare City the country is of remarkable fertility, almost level, and where put into wheat the growth was strong, even to within two miles of the shore of the lake, where the land had been plowed through solid tule roots. The growth was very compact, strong, and of a beautiful green color, and had stooled out abundantly; which, to my mind, showed that the rawness of the soil or the quantity of alkali had but little effect upon the growth. For long distances among the tules alfileria covered the ground. I had no idea of the value and extent of the arable land of Tulare county until I rode over the immense extent of that plain to the lake. I think the time will come when Tulare will be one of the very best of the agricultural counties of the State.

"Speaking of the future of the lake—it must have been a good deal lower than it is now, for near the mouth of Cross creek there are many stumps which were under water only last year, and among which the fishermen used to get their nets entangled; these stumps are now just at the water's edge. Of course they could not have grown under water. Again, in a little surface well near the landing-place at the fishery, there is at the depth of about 18 inches, all around, a ring of blackish organic matter or mold, quite distinct from the yellowish clayey earth both above and below it. It looked as if it might be decomposed tules, and if so, the water must have been off the ground long enough to allow these tules to be decomposed and made into soil. There are now under this water about 200,000 acres of land of what might be made the best quality, and this land under alfalfa would be worth many times what it is now under water, for fishes. Why would it not be a good idea to drain this lake down four feet lower, to the banks of that channel, into the San Joaquin river, through a canal that would at the same time serve as a water-way up to that old channel in the lake through which boats could go with freight? I think that by this scheme in a short time all the surplus alkali would be drained into the ocean from the lake and the surrounding country, for as the fresh water from the mountains is spread over the land it must sink down and gradually push the more alkaline waters down the canal. So the land would in time be freed from alkali and the canal would be kept full by underdrainage, which the lake now receives and evaporates."

Present Composition of Tulare Lake Water.

The sample of water sent by Mr. Woodbury was quite turbid, partly from fine mud, partly from the presence of greenish micro-organisms. Its taste was flattish saline, and quite nauseous to the stomach. Exposed to the light, it soon became filled with rapidly increasing green gelatinous films and cocci, the exact nature of which was not investigated.

Upon filtration, which progressed very slowly, and did not clear the water completely (as is usual with waters impregnated with alkaline carbonates), considerable organic matter still remained in solution, and had to be removed by ignition before proceeding with the analysis. In presence of an excess of carbonate of soda, this ignition could not interfere with the accuracy of the determinations of acidic ingredients.

The result was as follows:

Analysis of Lake Tulare Water.*

Specific gravity, 1.0050 at 62.5°.

	Grains per gallon.	Parts in 10,000.
Total solids	303.07	51.88
Soluble after evaporation	297.97	47.93
Sodium chloride (common salt)	95.79	16.40
Sodium sulphate (Glauber's salt)	73.76	12.63
Sodium carbonate (sal-soda)	94.74	16.22
Potassium sulphate	15.68	2.68
Insoluble after evaporation	6.57	1.19
Calcium sulphate (gypsum)	1.47	.25
Calcium carbonate	1.07	.18
Magnesium carbonate	2.55	.44
Silica	1.87	.32
Organic matter and water	16.12	2.76

The following table summarizes the composition of the Tulare lake water at the three different periods:

	1880.	1888.	1889.
Date of taking sample	Jan'y.	June.	Feb'y.
Total solid contents	81 80	204.7	303 07
Soluble after evaporation	71 16	199.9	297 97
Sodium chloride (common salt)	22 77		95 79
Sodium sulphate (Glauber's salt)	17 23		73 76
Sodium carbonate (sal-soda)	27 92	74 3	94 74
Potassium sulphate	3 24		15.68
Insoluble after evaporation	8 .5	4.8	6 .5
Calcium sulphate (gypsum)			1.47
Calcium carbonate	2 97		1 07
Magnesium carbonate	4.95		2.55
Silica	.44		1.87
Organic matter and water	2.28	14.1	16.12

The figures in the above table hardly require comment unless it is to draw attention to the extremely rapid increase of the solid contents of the water between June, 1888, and February, 1889, as compared with the effect produced during the previous 7½ years. The latter was about 2½ times or 150 per cent on the whole, or an average of 13 per cent a year; while in the eight months preceding the last examination, the increase was nearly 45 per cent. It should be noted that these eight months were remarkable for very great evaporation elsewhere on the coast, also; and that they formed the end of three years of rather deficient rainfall in the State. The more abundant moisture of the season just passed, may have stopped or perhaps even reversed the process; a point which will receive attention within a short time. It will then be possible to predict with some degree of approximation how nearly the condition of natural equilibrium between the evaporation from the lake surface and the seepage from the streams and irrigated plains referred to above, is being approached, and to forecast the future of the lake and of its inhabitants if left to themselves.

Whether or not it will be expedient to interfere with the natural course of events, either for the establishment of a great irrigation reservoir, or (as suggested by Mr. Woodbury) for the reduction of the lake to a mere water-way in order to reclaim the lands now covered by it, is a question too complex to be discussed here. The answer will in a measure be determined by the decision of another question, viz.: whether the increased saline strength of the lake water is due wholly to evaporation, or in part to concentrated solutions of alkali extracted from underlying beds by the inward seepage. If a consideration of the area and depth lost by the lake within the last year shall show that there has been a distinct accession of alkali salts from the outside, the use of the drained lake-bed as an irrigation reservoir will be of very doubtful practicability, as it would imply an annual addition of such salts to those already contained in the natural soils irrigated therewith.

It is hoped that all persons who may, from their own observation, be able to throw light upon the history of the recession of these lakes, will communicate the facts so as to place them on record. It is with the hope of obtaining such additional data that this bulletin is issued in advance of the general report of which its subject-matter will form a part.

E. W. HILGARD.

Berkeley, Cal., June 15, 1889.

*Analysis by Mr. E. M. Hilgard, Special Student in the Agricultural Laboratory.

THE YAUPON—Ilex Cassine.

Gold-Extraction To-Day.

Gold mining is in many minds still associated with a flannel-shirted, long-booted, gambling class of doubtful manners, who, with pick, shovel and pan, found fortunes in the hill streams of the far West or of the land of the kangaroo. But this race of miners is rapidly becoming as extinct as the redskin of California or the black boy of Australia. As the superficial deposits which attracted the pioneers were exhausted, the aid of machinery and science became essential, and a new order of things began, introducing the capitalist, the chemist and the engineer. Moreover, in their haste to get rich, and with their rough-and-ready appliances, the early diggers only worked the richest ground and passed over tons—acres—of stuff that, with modern methods, would pay handsomely. To convey an idea of the perfection which has been attained in some of the processes of to-day, one illustration will suffice. During a quarter's (three months) working last year of the alluvial deposits of Daylesford, Victoria, some 33,560 tons of gravel were treated, and gave an average yield of 18½ grains troy of gold from each ton of gravel. That is to say, of all this enormous mass of material dug up, passed through the apparatus and redeposited, only one eighteen hundred and fourteenth part was of value, the other 1813 parts being useless. In other words, suppose an acre of land 15 feet deep to be turned over, broken up to the most minute proportions, and bodily removed in order that it might be made to yield up a hidden treasure in the form of fine dust, the whole of which could be easily held in a small coal-scuttle. And this was accomplished presumably at a cost which left a reasonable margin of profit. These results are altogether unparalleled in any other kind of metal mining. As a rule, the metal or its ore forms the bulk of the mass treated. Thus iron often constitutes 75 per cent of the mineral, lead 85 to 87 per cent, copper 78 to 98 per cent, and silver 85 to 99 per cent, while the gold in the case quoted only amounted to .000118, or a little over one ten-thousandth part of one per cent.

A Native Medicinal Tree.

A famous tree with an interesting history is the Yaupon or Cassena, of which a flowering and fruiting branch is shown on this page. It is included in the series of native medicinal growths described by Dr. Vasey, U. S. Botanist, and our engraving is from his drawing. Its botanical name is *Ilex cassine*, and it is a small tree, 15 to 25 feet in hight, or only a shrub, growing in the Southern Atlantic and Gulf States, near the coast, and in the southern part of Arkansas. It is said to reach its greatest development in the river bottoms of Eastern Texas. It is a handsome evergreen. The leaves are three-quarters of an inch to an inch and a half in length, thick, smooth, shining green above, pale beneath, mostly of an oblong or ovate form, sometimes entire on the margins, sometimes with small obtuse teeth. They are alternate and very short stalked. The flowers are in small clusters in the axils or points between the leaf and the twig. They are white and minute, the parts requiring a glass for their plain discrimination. The calyx has from four to six obtuse teeth. There are from four to six sepals and as many stamens. The ovary develops into a small red berry, becoming black, of the size of a small pea. These berries consist mostly of the two to four bony seeds which they contain. The leaves have a peculiar intoxicating property, and were used by the Indians under the name of black drink, both as a medicine and as a drink of etiquette at their councils. Prof. Venable of the University of North Carolina has recently made an analysis of the leaves, and states that they contain a small percentage of caffeine, or the peculiar principle found in coffee, and in the mate, or Paraguay tea (*Ilex paraguayensis*) of South America.

REGARDING the discovery of silver ore in the new district situated 100 miles south of Reveille, prospectors who have recently returned from there say that the ledge discovered by a Mexican is not so large as at first reported. The prospectors have made several locations, however, and it is their intention to revisit that district during the summer and develop their properties.

AN INCH OF RAIN or ten of snow means a gallon of water spread over a surface of two square feet, or a fall of about 100 tons on an acre of ground.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador *Ledger*, June 22: The timbers for the additional ten stamps to the Wildman mill are coming in rapidly, and the mechanics are already at work on the job of building. We expect in about six weeks to report the additional stamps in successful operation. Sinking at the North Star is progressing favorably. The contractors threw up the job some time ago, as they were not making their two feet a day, which was required to make wages. The men who have succeeded them, however, are said to be making their two feet without any trouble, and expect to keep it up unless they encounter harder ground. The Lincoln is running light, on account of a slackness in the water-power from the creek. Capitalists are coming in quite freely, looking for mining investments.

MISCELLANEOUS.—A nugget of gold weighing four ounces was taken from the Arroyo Seco gravel claim last Thursday. The Reed & Askey mill is running only five stamps, on account of the breakage of one battery. At a meeting of the Directors of the Alpi Mining Co. held Saturday, B. F. Taylor was authorized to go to West Point in behalf of the company and inspect a five-stamp mill for sale in that neighborhood, with pump and engine, and report as to the advisability of its purchase. At the mine the work of crosscutting the ledge has been completed, proving the vein to be seven feet thick. Another contract has been let to extend the tunnel 60 feet farther, below a point in the surface where some ore was worked many years ago with flattering results.

COSMOPOLITAN.—*Dispatch*, June 22: Sinking is being pushed with all possible speed; the shaft is now down 580 feet; are opening up 300 and 400 levels so as to have everything ready for taking out ore as soon as the mill is completed.

DRYTOWN CON.—They have the shaft all in good working order and started to sink on Monday morning. There is some very good looking rock coming out of the bottom; the walls are 12 feet wide at the bottom of the shaft; the ledge is about seven feet wide but mixed with granite and five feet of porphyry. They will be able to sink 10 or 12 feet per week from now on. There seems to be a change in the ground at the bottom, and they expect to get a better quality of ore inside of 50 feet.

PAUGH.—The tunnel is now in 125 feet on this property. A portion of it was in very hard rock, but now the face is in soft slate; 250 feet more will be necessary to tap the shaft, which is 340 feet deep. After reaching Paugh shaft, will follow Paugh ledge until they strike the Union ledge, which crosses the Paugh; will then follow the Union ledge and tap the Union shaft, which is 360 feet deep. Both properties are owned by the same company.

DOYLE.—Two or three men are working on this mine; 750 feet of tunnels, drifts and shaft have been run. The walls are well defined and are 120 feet apart. On the hanging, a tunnel 225 feet in length has been run, while on the footwall a length of 250 feet has been excavated. It is proposed to get farther in the hill before crosscutting. A crushing of ore from this property, which was made at the Amador Queen mill some time ago, yielded $5 per ton in free gold.

VALPARAISO.—This property, which is situated near the Mokelumne river, is owned by Messrs. Ginochio, Poggi and others, and has been worked on a small scale for a good while. A tunnel 1500 feet in length has been run, and occasional rich spots were found. They commenced making an upraise a short time ago, and last Saturday they were rewarded by finding a nice ledge of good ore averaging from three to four feet in width.

MISCELLANEOUS.—Henry D. Emerson is engaged in the construction of a cannon-ball mill near the Granger mine in Pine Grove. The millsite, which is small, is excavated and ready for the machinery. At present he is putting up a steam engine which is to run the mill, as well as a pump which is to force water from the reservoir below to serve the battery. The Granger prospect is 80 feet deep; 75 tons of ore on dump.

MORLEY.—Our predictions regarding the Morley property, in Hunt's gulch, are about to be verified. From what we can learn nothing has yet been found to show that a mine exists there, and the company are about disgusted with it. At present a winze is being sunk, and if nothing is found the probability is that it will close.

GOVER.—The Gover mill has been closed down for a week; they have been hoisting water from the lower levels in the mine, and could not hoist rock enough to keep the mill running while doing that work.

GINOCCHIO MINE.—W. Parsons & Co. have their Huntington mill ready for work; cannot get water at present. They have considerable good ore on the dump.

HENRY CLAY.—The Crocker tunnel is in 150 feet; the contractors are doing good work; they expect to finish their 300 feet by August first.

Calaveras.

UTICA.—Angels *Monitor*, June 20: The north shaft at the Utica mine is now over 600 feet deep and sinking is still going on. By the sinking of this shaft the fact that the mines of Angels are permanent ones, and that the ledges extend downward to an unknown depth, and increase in richness as depth is attained, is being demonstrated to a certainty.

LANE & TULLOCH.—Work is progressing finely at the Lane & Tulloch mine in the southern part of this town. A large, well-defined ledge has just been discovered. The ore prospects well and the owners are strong in the belief that they have one of the best mines in the country. The mill is kept in continual operation and the battery plates present a healthy appearance.

LINDSAY.—The Lindsay mine, situated about three-quarters of a mile west of this town, and which is supposed to be a continuation of the famous Amador lode, is being worked continually, but on a small scale, owing to the lack of funds to more extensively develop it. This mine is non-productive simply for the want of capital to open it up.

GWIN MINE.—Calaveras *Chronicle*, June 22: We are credibly informed that the parties who have been prospecting the King Solomon mine are to move their milling machinery upon the Gwin mine to work the rock of the old dump on that mine and to prospect a "stringer" of the main lead. Without positive information to that effect, there is reason to believe that this is merely a forerunner of more extensive operations on the famous location. From what we can learn the King Solomon mine has not turned out a success on account of the difficulty to save the gold. The material seems to prospect well, but it does not respond to the practical milling test. The material evidently demands an additional process for successful working.

Fresno.

A RICH MINE.—*Expositor*, June 19: A gentleman from the Mt. Raymond mining district, well known in mining circles, gave us the following information concerning the Star mine at that place. The company now operating that mine are from Montana, and use the same style of reduction works that are so successful in that Territory. The mill only concentrates, the smelting and refining being done at Selby's smelting works in San Francisco. The peculiar feature of the works here is the conveyance of the ore from the mine to the mill. The mine is a mile and a half from the mill, and the ore is brought down by an endless cable; the loaded buckets coming down carry the empties back. The cost of transportation of the ore is 20 cents per ton, and the mill has a concentrating capacity of 150 tons every 24 hours. Ten tons of ore are reduced to one ton of concentrates, making 15 tons per day of the latter. The ore, as it comes from the mine, averages $40 per ton, and consequently the concentrates are worth $400 per ton, making the output of the mine $6000 per day. As to the amount of ore at the mine, it is unlimited. There is a mountain of it hundreds of feet high. There is enough in sight to keep the mill running for 50 years to come, and if the property is handled properly, it will be the biggest paying mine in the United States. The company is now making preparations for the construction of its own smelting works, when it will also double the capacity of its concentration. Mt. Raymond is rapidly growing in population, and no man entering the mining district goes away seeking work.

Inyo.

CERRO GORDO.—*Independence*, June 22: For some time past vague rumors have been current of important mining transactions at the lower end of the valley. It is now publicly known that Archie Farrington and others have got control of the Union group of mines at Cerro Gordo. That group is credited with having yielded about thirteen millions of dollars in the flush times. For several years past good ore has been taken out steadily by parties working under lease. But in the meantime tunnels, winzes and levels were allowed to cave in; and the mines are reported to be in such condition as will require a good deal of expense to put them in thorough working order again. It is said that Mr. Farrington and his partners have secured the mines to work for one year, with the privilege of purchase at a certain price at the end of that time, or sooner, if they decide to buy. These parties have abundant capital and will put the mines in thorough working order and open up new ground. No one who knows the ground has any doubt but that there are ore bodies there as rich as were found in the flush times. The opening up of the Cerro Gordo mines will employ a large number of men and will give immense impetus to mining all along the Inyo Range. The ore body recently found by Dumphy & O'Keefe is said to be five feet of solid silver-lead. This gives all indications of being an immense ore body. It is in the continuation of the old Union ledge. Unfortunately a lawsuit is likely to grow out of this find. Joe Diaz, an old miner, claims an interest in the mine which Dumphy & O'Keefe refuse to recognize. Diaz has gone to San Francisco to consult with Mr. Hawley, another interested party, and to get legal advice. Hon. P. Reddy is owner of one-third of the claim with Dumphy & O'Keefe; so if law is resorted to the other claimant of an interest in the mine won't get it by whistling for it, but will have to clearly prove his right, and so he should. Mr. Farrington will take possession of the Cerro Gordo mines on the first of July and work will be begun at once.

MINING REVIVAL.—Inyo *Index*, June 19: Unless all signs fail, and we don't believe they will, Inyo will soon assume the first place among the mining counties of the Pacific Coast. It is currently reported that a syndicate of mining capitalists, headed by Archie Farrington of Reno, will soon assume control of the famous Union mines at Cerro Gordo; that they will be worked on an extensive scale, and can be relied on to equal, or even exceed, their old-time reputation as ore-producers. There are many splendid mines in Inyo which only await the aid of capital to become valuable properties.

SUCCESSFUL TESTS.—Last week some working-tests were made with the Victor concentrator at the Maxim Mill, the result of which was highly satisfactory. From tailings which had been worked over the second time, and which by assay showed seven per cent of metal, over five per cent was saved. Rich ore was run through and reduced one-half without losing any of its value. Further tests were made on low-grade galena ores and all the metal was saved. The ores worked were from Lookout, and Mr. J. J. Gunn, who was present, says every test was a complete success.

PROSPECTING.—A party of four experienced gold prospectors started from Independence Wednesday morning to make a thorough search for mines in the heart of Sierras northwest from here. They were well equipped and are men who understand the business.

Mono.

THE BODIE CON.—Bodie *Miner*, June 24: During the past week west crosscut No. 2 from north drift, 1200 level, was advanced 11 feet. East crosscut from north drift, same level, was advanced 15 feet. There were employed ten miners and one foreman.

MONO.—During the past week west crosscut from south drift, 1200 level, was advanced 31 feet, and joint upraise with Bodie from south drift was driven 24 feet. Winze from south drift, 1000 level, was driven 7 feet.

Plumas.

BUNKER HILL.—*National*, June 22: The Bunker Hill mine at the head of Poorman's creek is reported paying $5 to the carload. A large amount of ground is being opened up by the main tunnel, and the Bunker Hill is undoubtedly the best drift mine in Plumas county.

Sierra.

EMPIRE MINE.—*Mountain Messenger*, June 22: The Empire mine is at Gold Valley. For this mine a United States patent was issued to Nathaniel Gray, who, two or three years ago, bonded it to E. E. Hellings, upon condition that he would run in the tunnel at least 200 feet. Mr. Hellings took possession and has expended upon the mine a large sum of money in the erection of buildings, mills, etc. In September, 1888, his money gave out and he had not completed his contract in regard to the tunnel. He was obliged to abandon the work, and the mine has reverted to its original owners. On the 19th inst. the Sheriff sold to Giles H. Gray all the personal property in Gold Valley which had been brought there by the Hellings party. Mr. Nathaniel Gray died in April last, and his two sons, Giles H. Gray and George D. Gray, have succeeded to his interests. Mr. Giles H. Gray has been in town during the past week and says that there is a fair prospect that the mine will soon be worked by an English Co. who have bargained to purchase it; if not, he will probably proceed to run the tunnel with a view to working the mine and employing a large force of men In the meantime Archie McDonald is in possession for Mr. Gray. It is said that if Hellings' Co. had expended less money upon the outside in making tracks, building unnecessary chlorination works and useless buildings, and expended it in the tunnel, they would not have lost their right to purchase the mine. The mine was lately examined by English experts and reported upon very favorably.

BUFFALO.—It is possible that another party will lease the Buffalo mine and put in a steam engine on the ground this summer. The ledge prospects wonderfully well—not in base metal as some report—but in pure gold by every acid test, and will no doubt yet be made a paying property.

PRIMROSE.—The owners of the Primrose quartz mine, Hog Canyon, are expected up in a few days, and intend to thoroughly develop their mine this season. Everybody in this vicinity will wish them good speed and success.

Sonoma.

COAL PROSPECT.—Sonoma *Democrat*, June 22: R. A. King and John A. Hillis have been for the last two weeks clearing up and opening one of their coal tunnels on Mark West creek, preparatory to taking out coal for sale. They have put in a new car and track and are now facing a vein of merchantable coal over six feet in thickness.

Trinity.

EAST FORK ROAD AND MINES.—*Journal*, June 22: The machinery for the mill which is being erected by Mr. Peterson has been transported over the East Fork road, which is evidence that the road is in good condition. Other machinery will soon be taken to the mines and the camp will liven up in grand style. Mr. Paxton informs us that as soon as he can complete the desired amount of development work on the Yellowstone to determine what mill capacity will be needed, a stamp-mill will be put up. It will probably take about a month to do sufficient work to enable them to use proper judgment in the matter. On or about the 4th of July the buildings for the accommodation of the workmen will be completed, and at that time Mr. Paxton will increase his forces and push work on the mine as rapidly as possible.

NEVADA.

Washoe District.

HALE & NORCROSS.—Virginia *Enterprise*, June 22: On the 300 level the north drift from the new station is advanced 30 feet. On the 400 level the stopes in the north drift from No. 1 west crosscut continue in ore of good quality. On the 500 level the several stopes are looking well and yielding the usual quantity of ore. From the 600 and 700 levels are extracting usual quantity and quality of ore. Resumed work in the face of the north drift on the 500 level, and also in the face of the north drift on the 600 level, and they have been advanced respectively 20 and 25 feet. During the week have hoisted 1041 cars of ore, and shipped to the Nevada mill 990 tons and milled 930 tons. Average battery assays, $25.50. Have bullion on hand and previously shipped this month amounting to about $38,000.

BELCHER.—The 1100 raise is up 100 feet and the top is in soft porphyry with small seams of quartz through it. The 1100 south drift is out 255 feet, and have connected with the crosscut and started a winze in the vein. The 1000 level south lateral drift is out 106 feet in vein material, showing small streaks of quartz. The 1200 level south lateral drift is out 112 feet in porphyry and quartz, and there is a little water coming in it. The 200 level west crosscut is out 30 feet in hard ground.

SAVAGE.—On the 400 level the joint west crosscut was advanced 19 feet. The face is in favorable looking vein material. From Nos. 1 and 2 west crosscuts are stoping fair-grade ore; also extracting ore from the old stopes in the north and south drifts. During the week have hoisted 505 cars of ore, and shipped to the Rock Point mill 499 tons and milled 490 tons. Average battery assay, $21.70. Shipped $7014 in bullion.

CROWN POINT.—No change to report in the 500 workings. Have raised to the 14th floor south stope, 400, and found the clays have nearly come together there. Are still following the pay south on the 13th floor and find it about seven feet wide and of fair quality. Most of the ore is now coming from the 400 north stope, which looks about the same as last report. Shipped to mill during the week 840¼ tons of ore.

SILVER HILL.—The north drift on the 260 level has been advanced 20 feet through quartz and porphyry; total distance from shaft, 330 feet, Southeast drift, 160 level, at a point 670 feet from the shaft, there is an old raise which has been repaired a distance of 60 feet. The formation is quartz and gypsum, which prospects well in the pan.

JUSTICE.—The north winze is down 40 feet and the bottom shows four feet in width of good ore. No change to report in the north and south stopes. The shaft is down 76 feet, and the bottom is in very hard rock. Shipped to the mill during the week 223 tons of ore, the average battery sample of which was $26.96 a ton.

CHOLLAR.—East crosscut, 150 feet south of north line on the 550 level, is out 55 feet; face in low-grade quartz. The north lateral drift on the 750 level is out 310 feet; face in porphyry with streaks of quartz giving fair assays. The only work done in the north lateral on the 850 level the past week has been confined to repairs.

EXCHEQUER.—East crosscut, 150 feet south of the north line on the 825 level, is out 29 feet; face in clay and porphyry. West crosscut, 150 level, south of north line, is out 40 feet; face in clay and quartz. North lateral drift on 500 level is out north of the Alpha shaft 565 feet; face in hard porphyry.

CONFIDENCE.—The joint Challenge-Confidence and Imperial north drift on the 500 level is in 683 feet from the Yellow Jacket shaft. The face shows porphyry. The joint Challenge-Confidence raise from the east drift on the 1250 level is up 31 feet. The face shows quartz and porphyry.

POTOSI.—The south lateral drift of the 750 level is out 480 feet. Face in porphyry. The south lateral drift on the 850 level is out 416 feet; face in hard porphyry. South lateral drift on the 930 level is out 750 feet south of the Chollar shaft; face in clay and porphyry.

OVERMAN.—Have run the mine six days, extracted 248 tons and 1600 pounds of ore; shipped to the Vivian mill 307 tons of ore. At top of upraise from east drift have drifted south 22 feet, a total length of 44 feet; material, porphyry and quartz.

SEG. BELCHER.—The 1100 raise is up 112 feet, having been advanced 39 feet during the week. The top of the raise shows streaks of quartz two feet wide, which give fair assays.

ALPHA.—500 level east crosscut, 50 feet north of Alpha shaft, is out 29 feet; face in quartz and clay of no value. The west crosscut on the south line is out 80 feet; face in clay.

NEW YORK.—North lateral drift from the northwest crosscut on the 800 level is out 50 feet. Face in clay and quartz. This drift is being run on the east side of the ledge.

ALTA.—The usual work is reported from this mine, and extracting the same quantity and quality of ore. The mill is running steadily.

CHALLENGE CON.—The work, which continues to be jointly with Confidence, is described in the report from the last-named mine.

BALTIMORE.—Are extracting ore of good grade from the crosscuts on the 225 and 338 levels. Both places are quite wet.

CON. IMPERIAL.—North drift on 300 level now in 114 feet from the south line. The face shows porphyry.

YELLOW JACKET.—Are shipping about 100 tons of white gold rock daily to the Brunswick mill.

Bernice District.

BULLION.—*Silver State*, June 22: W. W. Williams brought in from Bernice this week four bars of bullion valued at $3500, making $1400 for the month from his five-stamp mill.

Eureka District.

FURNACES.—*Sentinel*, June 22: The Eureka Con. Co. started up one of their furnaces on Thursday, and will start another the first of the coming month.

Jackrabbit District.

ONONDAGA MINE.—Pioche *Record*, June 22: Active work on this property, by the company, ceased several weeks ago, and the north end of the mine was leased to Dave Meyers and Henry Tracy. This part of the property is entirely undeveloped, excepting the work done of late. A drift was started and almost immediately opened up ore which has increased in quantity and quality until the north end rivals the south end in value. Several carloads have already been shipped from the strike. The south end of the mine as left by the company looks fine, but much of the ore is low grade, and it was thought best to await the starting of the reduction works here, or the advent of a railroad, which, as now surveyed, will pass within two miles of the property, and thus save a material sum in freight.

Jefferson District.

GOOD ORE.—Work is pushed as usual in the mines at Jefferson, and some good ore is being encountered. What is wanted in Jefferson district as well as in all other mining districts in this county is sufficient capital to work the mines in a proper and systematic manner. The deepest hole in the ground is only 600 feet, and yet Nye county has produced and shipped over $25,000,000 in silver and gold bullion.

Jumbo District.

A REGION FERTILE IN GOLD.—Virginia *Chronicle*, June 24: The discovery of another vein of gold-bearing quartz assaying high in the yellow metal is reported, two miles northwest of Jumbo district. The vein has a breadth of 30 inches between walls, six inches of which, next to the hanging-wall, is very high grade, gold being plainly discernible in the ore without the aid of a magnifying glass. The character of the ore is entirely different from that heretofore found on the western slope of Mt. Davidson. It is dark gray in color and pulverizes with a blow of a shovel. It is the only vein so far discovered in that vicinity with well-defined walls of the same material as those inclosing the Comstock lode. The western slope of Mt. Davidson bids fair to become as famous for its production of gold bullion as the eastern slope is for silver.

Mt. Cory District.

THE BIG INDIAN.—Walker Lake *Bulletin*, June 20: Work was resumed last Saturday on the Big Indian mine in real earnest, after a long shut-down. This mine is located near the Cory, and has until recently been the property of McDonald & Crossman. Considerable good ore has been taken out in years past, and a small mill was built by former owners, but owing, it is said, to bad management, the mine did not pay and work was discontinued. Last month Senators John Forbes and E. D. Boyle purchased the mine and will proceed at once to active work. Both gentlemen are experienced miners, and if there is anything in the mine they will get it out. About 10 tons of ore are now on the dump, and if present operations warrant it, Messrs. Forbes and Boyle will erect a new mill, which will be utilized

to crush ore from the Big Indian, North Star and other properties in the vicinity owned by Mr. Forbes and his associates. There are several promising claims in this district, and if the present venture is successful it will give a fresh impetus to prospecting on Mt. Cory. George Dunn is foreman of the Big Indian.

Pioche District.

PROSPECT.—Pioche *Record*, June 22: C. F. Norton and Dr. Nesbitt are said to have a fine prospect in a location recently made near the old Portland mine on the hill east of town. Their prospect shaft, now down about 12 feet, has been in pay ore from the start. Rich pieces of float similar to those now frequently found in the vicinity of the burying-grounds, led to an examination of the hillside, and it is believed the ledge from which the float came has been found. The showing is unusually good.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, June 21: North drift on the 500-foot level extended 15 feet. West crosscut from the 300-foot station has been extended 24 feet.

COMMONWEALTH.—100-foot level: East intermediate drift has been extended 16 feet; total, 200 feet. Intermediate drift from top of No. 14 upraise has been advanced 15 feet. Upraise from west intermediate has been extended up 12 feet, exposing some very fine ore. The stopes north of the shaft are being opened as fast as practicable; they all look well. South of the shaft the stopes continue about as last reported; 150-foot level: No. 13 upraise has been extended upward 11 feet; will make connection with ore body opened above by Saturday. All the stopes on the level are yielding fully as well as at any time heretofore; 228¾ tons of ore have been sent to the mill. Battery pulp, $121 per ton; shipments made, $11,542.16, $13,537.64, and about $12,000 on hand.

NEVADA QUEEN.—No. 1 winze from the 450-foot level has been sunk seven feet. The bottom is all in the vein, two feet being good ore; the balance is low-grade. There is considerable water, but it is being hoisted all right. Average assay of the ore, $164 per ton. South drift from east crosscut 150-foot level has been advanced 11 feet. Some small seams of ore have been encountered, but not enough to pay. The concentrator has been stopped during the last week, water having failed, so we could not run full capacity.

NORTH COMMONWEALTH.—Upraise No. 1 from the end of east crosscut, 100-foot level, has reached a hight of 25 feet, passing through eight feet of ore; three feet of it is high-grade, the top part of the vein carrying considerable chloride.

NAVAJO.—West crosscut from south drift on east vein, 350-level, extended 15 feet. An upraise has been started on the east vein near the south end, same level, showing some high-grade ore.

GRAND PRIZE.—400-foot level: Stopes are furnishing the usual amount of ore. Good progress is being made with the work on the concentration plant.

DEL MONTE.—North drift, 100-foot level, extended 10 feet; the face shows seams of spar carrying some ore.

Tybo District.

RICH ORE.—Eureka *Sentinel*, June 22: Dimick is pushing the work of development in his mine at Tybo with energy. There are large quantities of rich ore in sight.

ARIZONA.

MINERAL PARK AND CHLORIDE.—Mohave *Miner*, June 22: J. C. Cross has a force working on the Elkhart taking out lead ore, of which that mine has plenty. "Rattlesnake" Jim has a shipment ready for the sampler which he will send in at the first opportunity. The Rogers' are taking out a large quantity of good gold ore from the Tintic mine, which improves as it is developed. Charles E. Sherman has shipped a carload of high-grade ore from the Queen Bee, near Mineral Park, and has lots of ore in sight. Martines & Garcia are driving the main shaft of their mine, the Goldback, fifty feet deeper, which will give them a couple of fair stopes. E. J. Edmiston will soon have a carload of ore ready for shipment from the Bridal Chamber mine, some of which carries a high per cent of copper. O'Brien & Chadwick are working the Schuylkill lead mine and have a good showing of ore. A. M. McDuffee having purchased the interests of G. H. Harvey and Barney McCall in the Rustler property, about half a mile northeast of the Tuckyho mine, is now busily prospecting the claim. Dan McKinnon has joined forces with Barney McCall on the Sunset mine, having purchased a one-half interest. It is rumored hereabouts that Frank L. Smith intends to run the leaching plant on the Juno mine. This property has furnished thousands of tons of leaching ore. Down in Blowpipe Flat things are in a lively state. Ewing & Prisk have got their one-stamp mill in operation, and easily crush one and a half tons of ore per day of ten hours, through a No. 6 mesh. The mill is one or two "Injun" power, consequently not very expensive. They have on the dump about 75 tons awaiting to be crushed, while more is coming out of the mine. The Keystone mill at Mineral Park is pounding away night and day on a fair grade of ore, and from what an outsider can see and ascertain, the run promises to be a long and successful one; while the mine is looking well and can keep the mill going without resorting to a "night shift."

BRITISH COLUMBIA.

MCMURDO.—Donald *Truth*, June 15: Little of interest is reported for the week. The McCabe party is out in McMurdo district engaged in waiting; five men are on Toby Creek; John McRae and party are at Windermere mountain; three men are running a tunnel on the Ebenezer near Golden; Cochrane & Brady have sold all their interests on Findlay creek to an English company, it is reported; the Perry Creek Gold Mining Company want five miles more of that creek; a half-dozen men are at work on claims round about Illecillewaet; and twenty-five men are working like slaves out on Porcupine creek. The last-named camp is really the only one near the line of the C. P. R. in which men are drawing pay. It is placer, and the yield for 1889 expected to be up in seven figures.

EIGHT DOLLARS A DAY TO THE MAN.—On Porcupine creek the Elsie Company's last cleanup panned out an even $208, which was the work of one man for 26 days. The Discovery Company have made two cleanups, both satisfactory. The Donald Company, in ground-sluicing for a shaft, cleaned up enough to prove that the surface ground in the deep diggings will pay if properly worked by low-priced labor. The creek is over 12 miles long.

CAUGHT ON.—Neil L. Morrison has succeeded in getting a company to take hold of his claims in the McMurdo district, and is highly pleased with the showing. Neil will superintend the development work.

COLORADO.

NOTES.—Georgetown *Courier*, June 20: George Lane's Headlight lode is said to be in good pay. Dump-pickers on Lamartine sold $1050 of ore for the month of May. The shaft on the Neath mine is being put down as rapidly as possible, with three shifts a day. The Mary Foster mine was sold at trustee's sale last Saturday to Capt. Swaine of Denver for $7600. Ore was milled from the Evening Star last week that returned 488 ounces silver and 17 ounces gold per ton. Dr. G. Kruss and F. W. Schmidt have called the new metal discovered by them in commercial nickel and cobalt, gnomium. Five sets of lessees are employed on the Corvin lode, and all are taking out mineral. Amos & Co. are said to be in excellent pay. E. T. Evans has a new discovery up in Argentine from which he has taken ore assaying 368 ounces silver and 7 ounces gold per ton. The new hoisting machinery on the Financier, Ute creek, started up last Saturday. This mine is reported to be in good ore now. Empire City is being driven to its intersection with the Belle of Empire lode. Walsenburgh people are the interested parties. Four men are employed. Live Yankee at Lawson has been started up by the Two Sisters Co. Work of removing the water is finished and systematic development will soon commence. Ore has been struck at the depth of 75 feet in the Ben Harrison shaft. This property adjoins the Lamartine and is owned by Armstrong & Williams of Freeland. The Burrell has ordered a complete plant of air-compressing machinery for hoisting and drilling in sinking the new shaft. A plat is being graded out for its erection. Pauline Ditch and Mine Co. of St. Louis are working a full force of men on their placers at North Empire. They have about completed a new arastra to be used in treating the large quantities of quartz uncovered by their placer workings. The Lamartine mine gives regular employment to 50 men. The main shaft is over 300 feet deep and the ore body improving. This is but one of the many bonanza mines of Cascade and Trail Creek districts. The average monthly production is 130 tons of first-class ore. Colorado Springs capital has been interested in the Hidden Treasure group on Lincoln Mt., belonging to Markey & Co. Work commenced on Monday; $20,000 is reported from reliable source to have been raised as working capital. This is the property from which the rich gold ore was taken in December of 1887.

DAKOTA.

BULLION.—Deadwood *Pioneer*, June 19: The usual semi-monthly shipment of $170,000 gold bullion was made yesterday by the Caledonia, Homestake and associated mines.

ANOTHER STRIKE.—It was reported on pretty good authority that a strike of excellent ore, better than any before discovered in the mine, had been made in the Uncle Sam, Sunday morning. Four hammers were at once put on to prospect the find more thoroughly.

WHERE IS THE MOTHER LODE?—Where the mother gold lode of the Black Hills is situated has not been satisfactorily determined. While we have the Homestake group, the DeSmet, Caledonia, Deadwood-Terra, and scores of other well-defined ledges, most of which are yielding pay ore and are being profitably worked, not one of them is considered the "parent" to the gold deposit of the Hills. Whether or not there is a general "parent lode" the future may or may not bring forth. In the meanwhile, however, there are not a few who are convinced that the largest and richest body of gold ore the Hills contain is yet to be found. The opinion of Professor Zahn that the mother tin lode is at Nigger Hill, or Bear Gulch, induces some to believe that the mother gold lode is in the same neighborhood. It is a well-established fact that the coarsest gold and largest nuggets in the Hills have been found in placer mining in Bear gulch, Potato gulch and other small gulches in the same section. This strengthens the recently formed idea that the mother lode (always provided there is one) is to be found at Nigger Hill. Two or three Deadwood men have discussed the advisability of prospecting for it, and it is probable an outfit well provided with whatever may be necessary, including sufficient funds to keep them in the field for a reasonably long time, and to enable such developments as may prove advisable, will shortly be forwarded to the scene.

IDAHO.

CŒUR D'ALENE MINES.—Helena *Mining Review*, June 20: A gentleman in from the Cœur d'Alene mining region informs us that times in that section are good, bad and indifferent. Some of the camps are booming, while others are struggling to keep up a show, but on the whole the general outlook promises well for the mining industry. One of the great drawbacks to this section is the low price of lead and the exorbitant freight charges of the N. P. railroad, but the extension of the O. R. & N. road into the mines encourages the miners to new life and hope. All along Canyon creek developments are being pushed ahead as fast as possible. In the Belle, the Gum, the Black Bear group, and the San Francisco mines a good showing is being made. Work on the concentrators is going on as rapidly as possible. The mines around Mullan are all turning out well. The Grouse, Morning, Evening, Central, Little Giant, and Hunter Mining Co. are all splendid mines, and are doing their share toward increasing the mineral product of the country. One of the richest mines in the Cœur d'Alene is the Diamond Hitch, near Burke, the ore assaying from 130 to 700 and 800 ounces per ton in silver. The Tiger and Poorman mines still hold an advanced position among the best mines of the region. The Nine Mile, the Custer, Granite and Panhandle are all rich in ore and have plenty of it. The Mountain Goat, Parrott, Sitting Bull, Excelsior, Grand Central, Pocahontas and Hidden Treasure are great mines, and only require railroad facilities and cheap freight rates to bring to their owners untold riches.

ORE CHUTES.—Wardner *News*, June 22: The ore chutes extending throughout the various districts of Cœur d'Alene are astonishing the most ardent upholders of the country, and property-holders are pushing development work with commendable energy. The prospect of adding, during this season, to the number of valuable mines is extremely flattering, and while the producing mines are doing as well as can be desired, a determined effort to develop the mineral wealth of the country at large is apparent, and the miners and prospectors are working with an energy, at least deserving of success. Where work has progressed steadily through the winter, the summer, most cases, brings the cheering knowedge to the laborer that the locations on which toil and money have been expended are fully up to the standard of Cœur d'Alene discoveries, and an increased interest is consequently manifested in every mining venture.

THE JULIA.—Wood River *Times*, June 19: John Filshie came in yesterday from the Dry Fork of Antelope to have samples assayed. They were extracted from the Julia claim, which he and Dan Dougherty located last New Year's day. The vein is 15 inches wide, all ore, and the assay will determine whether or not it will pay to ship. The Julia is an extension of the Henrietta, which yielded a seven-ton lot of ore that sold in Salt Lake City and netted over $900 after paying all expenses.

THE CHAMPLAIN.—Supt. Knight of the Champlain is employing but a small force at present, owing to the existence of some legal complications which he hopes to see ended ere long, when he will largely increase the working force of the mine and start up the mill.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, June 20: The arrival of the ten-stamp mill of the Torres Mining Co. has enlivened this camp considerably. Each stamp weighs 750 pounds, and the plant is being put in place on the site. The mill will do custom work, and much rich ore is on many dumps waiting for the tooting of the whistle. The dies of the Butler mill have again been broken, but Butler's spirit is not, and the mill will soon be running. The finest of water, and plenty of it, has been found on the town site, and a large tank and windmill will be put up at once. Water will be piped all over the town at a low rental, and the pipes are now on the way. Timber, lumber and shingles for the town and mines are expected to be furnished within 60 days. The south end of the Laguna pine region will be tapped by a new road and portable saw and shingle mills will be put in. The price of adobes has lowered from $18 per thousand to $8 to $10. Several contracts have been let for the construction of adobe houses in the new town. They are the best kind of houses for this climate—warm in winter and cool in summer. Not much has been said of the placers lately, but they continue to yield an average (estimated) of $1200 a day. Since the 15th of March, when digging began in earnest in Mexican Gulch, it would be a low estimate to put the average output for the three months at $1000 a day, or a total of $90,000 in gold. Very little of this has reached Ensenada or San Diego, but it is sent direct to the San Francisco mint. There has been little change in the quartz mines since last week. Work is being pushed steadily forward, and the veins hold their width and richness far beyond expectation. Every day adds thousands of tons to the ore in sight. Several promising veins have been uncovered, notably the Baltimore, on the hill northwest and below the Elsinore. Santa Clara is holding her own. The shaft on the Maud S. is down nearly 40 feet, and shows great bodies of ore.

MONTANA.

THE SILVER CHEST.—Phillipsburg *Mail*, June 20: Charles Clark, president of the Bi-Metallic Mining Co., also a member of the Granite directory, arrived in town this week from St. Louis. The object of Mr. Clark's visit this time is principally business connected with the Silver Chest Mining Company, with which he has recently become identified. This property is located in close proximity to Philipsburg, and although its development was not commenced until last fall, already offers most favorable indications, and the time has come when it is necessary to put in machinery for extensive development in a proper manner. Mr. Clark comes forward with the cash, which will assure the extensive explorations soon to be commenced. The machinery has already been purchased, including an air pump, hoist, drills, boiler, engine, etc. The tunnel on the Bluebird, which is one of the principal claims in the group, is already in over 400 feet. This will be continued some 2000 feet farther, and the sinking of a shaft several hundred feet will also be begun at once. Messrs. Tibbetts, McWilliams & Co. obtained a bond from Al. Hudlemeyer and others last fall on these properties, which embrace the Silver Chest, Combination, Trade Dollar, Retta, Bluebird, Viola and the Sunday claims. They are located south of the San Francisco.

GRANITE MOUNTAIN.—The output for the week ending June 20th was 52 bars of bullion, containing 81,645 ounces silver and 124.99 ounces gold. Shipped to smelter 31,720 pounds of ore, carrying 931.4 ounces of silver and 0.56 gold.

THE ANACONDA SMELTER.—*Inter-Mountain*, June 20: There are 300 men on the pay-roll of the Anaconda company at the lower smelting works at Anaconda. Some needful repairs and alterations have been made in the silver mill, and it is ready for business again. The Brueckner furnaces that were injured by the fire have been repaired and are as good as new again. The first shipment of iron for the new smelter building was reported at Garrison yesterday. Material will now be arriving constantly. The building must be completed, according to the contract with Connecticut parties, within 60 days.

NEW MEXICO.

DIVIDENDS.—Silver City *Enterprise*, June 21: The Illinois mine at Kingston paid in dividends in the past five months, $45,000. Again the rumor reaches willing ears that the Graphic smelter at Socorro is about to be started up. The Silver Mining Company of Lake Valley, this territory, has declared dividend No. 2, of $25,000, payable June 20th.

HACHITA.—R. L. Powell returned last week from Hachita, where he had been to survey the American mine for patent. The mine is in splendid shape, shipping two cars of ore per day. The ore is a lead carbonate carrying silver.

STOPING GROUND.—The connecting of the two shafts on the Pacific No 2, at Pinos Altos, will soon be made, at a depth of 226 feet. The shafts are 300 feet apart. This will open up a large amount of stoping ground, in addition to that above the first level, which has not been exhausted. Col. Jack Crawford of Kingston has returned from London and has actively resumed work upon his properties. He brought with him $185,000, which he will expend in development work, the circulation of which will greatly benefit Kingston.

FELL THROUGH.—The sale of the Golden Giant for $50,000 fell through, owing, it is said, to a telegram sent by H. J. Longmaid of Carlisle, stating that the mine was worth but $20,000. The property was examined by an expert who reported favorably on it, and the money was raised, and the sale would no doubt have been made but for Mr. Longmaid's telegram.

TELEGRAPH.—John T. Mitchell and H. J. Walton came in from Telegraph last Wednesday. Mr. Mitchell reports favorably on the future prospect of the camp. A small vein of ore assaying $1250 has been encountered in the Tecumseh tunnel, 150 feet from the breast, which has every indication of permanency.

THE MOUNTAIN VIEW strike with depth is improving and is now the leading property of the district. The London mine, the north extension of the eastern end of the El Dorado group, has been exploited to a depth of 110 feet, with favorable results.

OREGON.

MINERAL CITY.—Bedrock *Democrat*, June 16: From a gentleman who just returned from a visit to Mineral City we learn that times in that camp are getting quite lively. A large number of prospectors are pouring in and new discoveries are reported daily. Two large quartz-mills are being erected on the Egan and Daniel Boone mines. These properties are owned by Portland capitalists and it is the opinion of our informant that their investment will prove very profitable. A wealthy English syndicate, who recently purchased the Black Maria, has ordered a twenty-stamp mill and a large concentrating plant which will be put up this summer. The company intend spending $250,000 in machinery and development work this season. Other properti s are changing hands and the mines of that district promise to prove among the best ore-producers in the country. Work on the Huntington Mineral wagon-road will be pushed ahead as fast as possible and with its completion a new impetus in mining matters will undoubtedly follow.

CORNUCOPIA.—Bedrock *Democrat*, June 24: Good reports come in from Cornucopia concerning the operations of the Oregon Gold Mining Co. Its mill is running and has been for some time on not less than $50 ore and the monthly output will be enormous. Since the recent rich strike in the Red Jacket new confidence has been inspired at that camp and a bright future assured.

UTAH.

PARK NOTES.—*Record*, June 22: Developments in the Anchor are going ahead at a satisfactory rate. After the drain tunnel reached a point under the shaft, north and south crosscuts were run, and lately work in the north drift was stopped. Now the south crosscut is being driven with all possible speed, and it is expected that the ledge will be encountered very soon. The work of boring the six-inch hole from the present bottom of the shaft to the tunnel level, for drainage purposes, is progressing favorably.

CAMP CROSSCUTS.—The Silver Key workings are being cleaned out preparatory to being worked by leasers. No bullion or silver sulphides were produced at the Marsac mill this week, but a shipment is being made up. The Apex is beginning to make a record as an ore-producer which is creditable to the property. During the week over 110,000 pounds of Apex ore, including the leasers' jiggings from the dump, were shipped.

THE DISAPPOINTMENT.—This property, situated up Thaynes canyon, opposite the Crescent, is proving to be a veritable misnomer. The ore body is increasing in size and richness almost daily and several tons of ore are on the dump. As soon as it can be sorted over a little more thoroughly, shipments will be inaugurated. The ore will average $40 to $50 a ton.

ABOUT THE COMSTOCK.—Everything goes well at the new Comstock, adjoining the Disappointment, and three shifts are kept at work. The lower tunnel is being driven with all speed possible, and it is expected that the ledge will be cut by the tunnel in about 60 days. Mr. Dusseldorf expects a carload of supplies, cars, tools, etc., to arrive in a few days.

WASHINGTON TERRITORY.

IRON MINES.—Ellensburg *Capital*, June 22: The greatest iron mines yet found this side of Lake Superior are within a few miles of Ellensburg. These mines are so extensive, so great in magnitude and so rich in iron—the ore averaging 66 per cent—that English capitalists and experienced iron men have been seeking to control them. These English gentlemen have been patiently awaiting statehood that these iron mines might be free from Government requirements, and thence more easily influenced and controlled by foreign capital. If this Territory had been admitted two years ago these mines would now be turning out pig iron. They are declared the equal of Alabama's iron mines. Then, again, there is an abundance of superior coal, that which will coke, and this is next adjacent to the iron mines. All the needed fluxes are in close proximity. This is not all; the Cascade range is rich in mineral. All known minerals, gold included, are here found in a crude state. The Salmon river mines have been developed and proven rich.

MECHANICAL PROGRESS.

SOME VALUABLE INFORMATION ABOUT HOW IRON RUSTS.—The necessary conditions for the production of rust are—first, metallic iron; second, liquid water; third, oxygen; and fourth, carbonic acid—both the latter being dissolved in the liquid water. Water in the vaporous condition, even in the presence of carbonic acid and oxygen, does not affect the metal, except at high temperatures, as in the formation of magnetic oxide of iron. Liquid water with oxygen dissolved in it does not act at ordinary temperatures on iron. This is shown by the fact that ordinary water exposed to the air does not rust iron if the water contains a substance such as lime or caustic alkali. As soon, however, as the lime or alkali is carbonized, the water and carbonic acid begin to act upon the iron, the first result being the formation of ferrous carbonate, which subsequently is changed to bicarbonate and dissolves, and then to reddish-brown ferric hydrate. As in this process the carbonic acid gas is first absorbed and then given off again, the continuation of the process of rusting is not dependent on new carbonic acid absorbed from the air, but the original carbonic acid can carry on the process indefinitely, as long as liquid water is present and oxygen is supplied from the air. Once the process is started, it goes on rapidly, because the porous rust not only does not protect the iron, but favors, by its hygroscopic character, the condensation of water vapor from the air as liquid water. A piece of iron, therefore, which has begun to rust will continue rusting in an atmosphere not saturated with water vapor, an atmosphere in which a piece of clean iron will not rust, because liquid water will condense from such an atmosphere on the hygroscopic rust, but not on the bright iron.—*Kansas City Architect.*

THE FUTURE OF METALLURGY IN THIS COUNTRY.—HON. A. S. Hewitt of New York is, or recently was, on a mission to England, where, in an interview with an English newspaper reporter, as given in the English correspondence of the *American Manufacturer*, he explains the object of his mission as one for investigation of matters connected with the manufacture of steel, more particularly the basic process of making open-hearth steel. Mr. Hewitt first saw the process of making open-hearth steel at the Paris Exposition in 1867. It was then a new discovery, but he predicted that it would in time supplant the Bessemer steel. Within three months after the utterance of this prophecy Mr. Hewitt's company built the first open-hearth furnace in America. "Now," said Mr. Hewitt, in the interview referred to, "while it is true that more Bessemer steel than open-hearth steel is being made, it is also true that the latter has been rapidly gaining upon it." He has been investigating in this country steel works and Admiralty tests in order to determine whether American manufacturers of open-hearth steel cannot produce it more cheaply upon the basic system than by the present acid process. His conclusion is that they can. Basic steel, in Mr. Hewitt's view, is destined to take the place of wrought iron in all the uses to which it is now put. "My visit will probably result in time in the general adoption in America of the basic process. It is well adapted to the Southern States." Mr. Hewitt is convinced that America will make the iron and steel for mankind in the long future. He very correctly puts it: "We have the iron, the coal, the capital, the skill and the energy necessary to do it."

A REMARKABLE METAL-ROLLING MACHINE.—The famous Lick telescope revolves on hardened steel balls one inch in diameter, which were rolled by an improved metal-rolling machine, the capacity of which is said to be limited only by the ingenuity displayed in making the dies. The principle of this remarkable machine is that of two inclined planes, the dies on these planes forcing the metal to the required shape, the adaptability of its operation ranging all the way from the smallest steel boot-calks up to carriage axles, and even larger, all done at a single operation. Such is its diversity of capacity that it will take a billet of iron and at one working produce a carriage axle, journal, shoulder, and threaded on the end, as well as the square body usually made, all in less than thirty seconds; also, two track bolts are rolled together, oval under the head, threaded, all complete, in less than ten seconds, screws for monkey-wrenches ready to put into the wrench being likewise made in the same time. Steel bolts of any diameter, from three-sixteenths to two inches or larger, are thus produced more accurately than by any other method.

INCREASING THE DENSITY OF STEEL.—In working steel by hammering, or drawing it down by the process of rolling, it is a well-known fact that the steel forming the corners becomes more dense by the operation, or has the appearance of being refined, for where drills for cutting stone are used they are found to work much better by having the bit or cutting edge come in line with these compressed edges. In rolling eight-square steel, the line of dense metal comes in the form of a Maltese cross, and as the bit of a rock drill, where power drilling, is made use of, is something of the same form, care is taken to have them coincide. The etching process must show this action of steel to perfection, if a section could be worked off true and even, and polished. After hardening, the etching fluid will take hold of the softer metal with greater freedom, and bring out all the features that can be contributed to the action of the hammering or the refining from the rolling operation.

EXCHANGING EXPERIENCE.—We have already made mention of the fact that the Pennsylvania Railroad Company has imported one of the most improved English compound locomotives for trial with American-built locomotives on its road. We have since seen it stated that an American locomotive is soon to have a chance to show its points on an English road. Possibly the American engine may prove more satisfactory than the English machine has on the Pennsylvania road, although it will have to encounter prejudice which is not likely to yield on short trial. The English compound locomotive is still on its trial and is making a good record. It has been found to make a saving of eight pounds of coal per mile, but the great objection now found is that it is slow in starting. The engine in her trials has hauled some very heavy loads at a fair speed, and when being hard pushed on grades and the like, makes very little smoke, showing the combustion to be much more perfect than upon the other engines of the road. Although the difficulty in starting is a serious objection, the economy in fuel is an important consideration.

TO HANDLE BLOOMS AND BILLETS.—At the Bellaire mill, Pennsylvania, there is now in operation an improved apparatus, devised by O. P. Mason, for facilitating the handling of steel blooms, billets and slabs, in a rolling-mill. The tables by means of which the ingot is led to the rolls have driven rollers on which the ingot lies, and by which it is moved backward and forward as it is passed to and fro through the rolls. A horizontal shaft is arranged on bearings under the rollers, and provided with projecting arms of crescent shape, at right angles to its axis, the arms extending upward between the rollers, and the shaft being operated by a pinion working into a rack actuated by a hydraulic cylinder, the length of the rack being such as to allow the shaft to make one complete revolution. With this construction the ingot, as it lies on the rollers, can be readily moved from one side to the other, the crescent-shaped arms catching the piece on its lower corner and tumbling it over, as the horizontal shaft is put in motion.

IMPROVEMENT IN THE ELECTRIC-WELDING PROCESS.—The ordinary methods of electric-welding by passing the current through the points to be fused together, are not convenient for all purposes, and Professor Samuel Sheldon, of Harvard University, suggests what he believes would be better for many cases. The pole of a powerful magnet strongly attracts or repels the electric arc, which may by this means be driven out sidewise into a point very similar to the point of flame projected from an ordinary blowpipe. At the end of this point the heat is intense, being sufficient to melt large copper wire instantly and to fuse any of the metals. It would serve admirably for welding, and a slight alteration would fit any arc lamp to perform the double function of lighting and welding.

CONVERTING IRON INTO STEEL.—M. Robert of Stenway, France, has patented a rapid mode of converting iron into steel by providing means for maintaining constant relations throughout the whole period of conversion, which is effected by varying the position and volume of the blast. He applies a blast of air to a body of molten metal at a maximum pressure at the beginning of the operation, and after thus overcoming the inertia of the metal and imparting to it the proper speed of gyratory motion, he lowers the level of the blast, without carrying it into the body of the metal, and varies its pressure and volume in accordance with the requirements caused by the reduction in the combustible elements of the iron and the increased fluidity of the metal.

COPPER-STEEL ALLOY.—Schneider & Co. of France have recently taken out a patent for manufacturing steel containing a variable portion of copper, which is to be used in making artillery of large caliber, armor plates, rifle barrels and projectiles. Ordinary copper is used for the purpose, care being taken to prevent it from oxidizing before it is mixed with the steel in the crucible, and the composition contains two to four per cent of copper, the alloy being capable of far more resisting power and more elastic and malleable than simple steel would be. This new material will also probably be valuable for making girders for building purposes and ship plates.

A SOUND FLANGE JOINT.—To make a flange joint that won't leak nor burn out on steam pipes, mix two parts white lead to one part red lead to a stiff putty; spread on the flange evenly, and cut a liner of gauze wire—like mosquito-net wire—and lay on the putty, of course, cutting out the proper holes; then bring the flanges "fair," put in the bolts and turn the nuts on evenly. For a permanent joint this is A 1.

ONE VOLUME of liquid benzine will render 16,000 volumes of air inflammable and 5000 volumes of air highly explosive, but nothing but contact with flame or a white-hot body will touch off the most explosive mixture of petroleum vapor and air.

SCIENTIFIC PROGRESS.

The World Wearing Out

Everybody knows that the world is wearing out, says the Chicago *News*—that the time is coming when we will have no coal to burn in our grates, and no iron to make our grates out of, even had we the coal. A close record of the output of the oil-field discovers the fact that petroleum reservoirs are running dry, and investors have not the faith in the inexhaustible flow of natural gas that the sellers of wells would wish. We know that precious metals are dug out in less quantities than formerly; that the diamond market, in spite of Kimberley, is cornering itself; that mahogany and pine will some day be things of the past, like the buffalo robe and dodo. We are confronted with the fact that the guano deposits will not last forever, that there is a human limit to the production of electricity, and that our children several times removed will have neither quinine, chloroform nor aniline dyes.

Of course this general exhaustion of old earth's treasure-house is some time ahead of us. It will not happen in our day nor in the next century. We can go on burning the candle at both ends for a few hundred years before humanity has to adjust itself to the newer or more economical conditions. But, despite the fact that the time of stress is so far ahead of us that we can look on to it jokingly, it is pleasant to learn that science is getting ready for the rainy day. We are on the eve of a new age and on the threshold of a new civilization. Aluminum, according to nature, is making ready to take the place of steel, and it will be cheaper, lighter, stronger and one-thousand-fold more plentiful and cheap.

Its price now puts the new elements in the debatable land between pure chemistry and practical commerce, and it is a question of time merely when we shall build our houses, our telephones, and our air-ships out of the silvery core of our common clay, instead of heavy and refractory iron.

Heat and food, according to science, we are to gather from the sea in proper fish culture and wise electrical work. The economist brightly believes that we will solve the labor problem before the middle of the twentieth century, and solve it to the satisfaction of both parties.

THE CREATION OR DIFFUSION OF FOGS BY CONCUSSION.—A novel proposal for the dispersion of fogs has been made by a Swiss artillery officer, who has placed upon record his opinion that a phenomenon of this kind recently occurring under his observation was due to a discharge of some pieces of ordnance. This statement has been circulated in France, and has elicited communications upon the atmospheric effects of artillery fire, leading to quite a different conclusion. It has been stated, for instance, that during the siege of Belfort, in the Franco-Prussian war, where an average of 1000 discharges of cannon per hour was registered for many days in succession, firing was frequently suspended on both sides, owing to the dense fogs which settled down upon the field of action. This observation would give ground for the supposition that concussions of the air near the surface of the soil, by interfering with the circulation of air, bring about that congested condition of the atmosphere which is a necessary condition for the production of fogs. This conclusion leads further to the idea that not only the aggregation of houses in towns, preventing the passage of light breezes, determines the production of fogs in such localities, but also that the concussion of air due to the shocks of town traffic may operate in the same way. Further observations are desirable in regard to this matter; but now that the nature and causes of town fogs are so carefully studied with a view to their prevention and cure, it is desirable that every contribution to the elucidation of the subject, however apparently insignificant, should receive its due meed of attention, because if not conclusive in itself it may possibly contain the hint of something that it would be misleading to overlook.

THE HEAT PRODUCING CAPACITY OF THE COMMON AIR.—Speculating upon the heat-producing capacity of the common air, Lorin Blodget, in the journal, *Light, Heat, and Power*, says: "It cannot be unknown to metallurgists, whose works require the highest degrees of heat, that the most perfect melting heat is that of the air-blast upon the incandescent carbon, and as free from actual carbonaceous combustion as possible, the presence of the incandescent surface and the action of a powerful blast being the principal conditions. It cannot be a wholly new principle to assume that the heat is chiefly derived from the burning air-blast. The common air, with its admitted proportions of oxygen and passive or neutral nitrogen, is in reality a compound of oxygen and nitrogen, the gaseous form of heat itself, and which is evolved as heat and converted into sensible heat of the greatest intensity by the blast of air delivered upon a surface of incandescent carbon."

DO LOCOMOTIVES INCREASE THE RAINFALL?—A correspondent of the *Northwestern Railroader* advances a curious theory for the increasing prevalence of floods and rainstorms. He says that there are over 30,000 locomotives in use in North America, and estimates that from them alone over 53 billion cubic yards of vapor are sent into the atmosphere every week, to be returned in the form of rain, or over seven billion cubic yards a day—"quite enough," he says, "to produce a good rainfall" every 24 hours. Estimating the number of other non-condensing engines in use as eight times the number of locomotives, the total vapor thus projected into the air every week in this country amounts to over 470 billion cubic yards. "Is this not," he asks, "sufficient for the floods of terror? Is there any reason to wonder why our storms are so damaging?"

PHENOMENA ATTENDING THE RECENT SEVERE STORM—DAKOTA.—A Minneapolis journal has secured the experiences of residents of Dakota during the recent storms. A gentleman living near Huron is responsible for the following: "The stoves in the houses were so charged with electricity that one could hardly endure the shock that came from contact with them. If you touched your finger to a chandelier, a spark came from it with a crackling noise. Electrical phenomena of a remarkable character were reported on all sides. The air was full of it. A gentleman who lives near Huron told me that a barbed-wire fence on his farm became so charged with electricity that one day when the wire broke, and one end struck the dry grass on the ground, the grass at once took fire. I do not vouch for this, and it hardly seems possible, but it was told to me for fact. A representative of the *Scientific American*, studying the nature of the winds at Huron, and the electrical phenomena which accompanied them, advanced the idea that the atmosphere was so charged with electricity that it only lacked two or three degrees of producing spontaneous combustion. All over the Territory, however near the truth may be, I know that there was enough electricity in the air to help along the fires that were burning there some weeks ago."

SEA BIRDS STILL THE TROUBLED SEAS.—"Oil on troubled waters," says the New York *Tribune*, has proved to be so efficacious in smoothing rough seas that mariners have begun to provide their ships with cans of fish oil and oakum bags, to be used in times of great storms against the buffeting of the waves. Science might have learned lessons from Dame Nature centuries ago and utilized oil for the safety of all men who "go down to the sea in ships." Lieutenant Gibbons of the navy, referring to the use of oil at sea, said a few days ago: "To close observers of sea birds on their own element during bad weather, it must have been shown that, however rough the ocean may be, where there are birds resting on the sea there is scarcely a ripple to disturb them. All fish-eating birds, cape pigeons, petrels, etc., eject oil from the mouth when captured, and doubtless they adopt a similar expedient to aid them in stilling the waves when searching for food in the sea. In the South Atlantic and South Pacific oceans I have frequently witnessed sea birds floating in spaces of seemingly quiet waters when the sea around was rough. The unusual smoothness of the water where the birds floated was evidently induced by the quantities of oil deposited by them upon the water, either voluntarily or involuntarily."

A NAME FOR THE NERVOUS APPREHENSION OF HIGH PLACES.—Among the many curious physical experiments that are now attracting the attention of scientific minds, the one to which the term "acrophobia" has been applied has several points of interest. Dr. Verga has recently described the phenomena in his own case: Though by nature not at all timid, all his courage leaves him when above ground. He complains of palpitations in mounting a step-ladder, for instance; finds it extremely unpleasant to ride on the top of a coach or even look out of a first-story window. This idiosyncrasy forbids him the use of an elevator, and the mere thought of those who have cast themselves down from high places causes tingling all over his person. His acrophobia even goes so far that the thought of the earth spinning through space is enough to cause discomfort.—*Science.*

CURIOUS BELIEF.—Considering the fact that many astronomers are inclined to regard Alcyone, the chief star of the Pleiades, as the center about which the universe revolves, it seems quite curious that many savage and semi-civilized tribes have given this group of stars an extraordinary importance. The peculiar beliefs which they hold concerning it appear to be of great antiquity. It is more than probable that the ancients made much further progress in astronomy and possibly some other sciences than we now give them credit for.

BELLS AS INDICATORS OF MOISTURE.—To inhabitants of Lebbeke, Belgium, the hearing of several small bells four or five miles away is a certain indication of rain. One bell, about six miles distant, is heard twice a year—in March or April and in September or October—and always during the same atmospheric conditions. M. de Ridder finds that not only does moisture favor the transmission of sound, but that contrary winds are not always an obstacle.

IRRIGATION IN EGYPT.—A project is being considered for adding 250,000 acres to the irrigated area in Egypt, the water being taken from a point so high upon the Nile that the canals shall never run dry.

GOOD HEALTH.

The Brain in Sleep.

Sleep is a process of restoration and readjustment, and physicians well know that the healing powers of nature assert themselves most effectually during the entire suppression of volitional control characterizing a deep slumber. In dreams, too, the absence of direct sense impressions and volitional interference seem to favor an automatic function of the brain which, in that respect, might be defined as a method of mental digestion. And just as the process of physical digestion and assimilation eliminates the superfluous elements of food, retaining only those needed for the special purposes of the organism, the brain, during sleep, appears to deal specially with topics of direct concern for the personal interests of the sleeper and to assort and adjust the store of empiric impression (the mental *ingesta*, as it were) after eliminating all unessential and inconsequential elements. Withal, the suspense of conscious cerebration by no means implies an eclipse of the intellectual faculties.

Dreams are not limited to plays of fancy; the brain in slumber may deal with philosophical and abstrusely scientific speculations, or resolve moral doubts which perhaps have puzzled the mind for days, and it is a common experience that the distressing problems of practical life adjust themselves, as it were, in sleep, by a more or less conscious process of the cerebral laboratory In short, there is no doubt that the instinct guarding the welfare of the individual presides over dreams as it presides over the automatic functions of the physical organism. The very suspension of the will-power, with its passions and prejudices, seems, indeed, to enable an inner monitor to decide vexing doubts in accordance with the best permanent interests of the sleeper.

The saving crisis of dangerous diseases which often supervenes in deep slumber may be explained by the circumstance that the complete repose of the volitional faculties enables the organism to concentrate all its energies upon a needed work of repair, and for similar reasons the non-interference of waking prejudices may give the instinct of self-preservation a long-desired chance for removing a baneful delusion as to our best intereat in a proposed mode of action, or as to the true character of designing fellow-men. Something or other in the looks or actions of a marked rascal may have suggested a suspicion of his secret motives, though at the time collateral circumstances observed that misgiving, leaving only a vague, unexplained uneasiness as the direct result of such experiences. But in sleep that impression reasserts itself with a force free from the interference of prejudice, and for a moment removes the mask of false appearances; "the sleeper receives a warning." Similar warnings often correct the impression of false hope. Impending perils may cast a shadow persistently ignored in a waking state, while the mind is calmed by the influence of a self-deluding optimism—the wish that is father to the belief in the insignificance of the threatening danger. But in sleep the voice of the monitor cannot be silenced by such illusions, and warning forebodings often take the form of distinct visions, repeated with a vividness and frequency which at last cannot fail to influence the actions of the individual, in spite of all waking sophisms.—*Dr. Felix L. Oswald.*

THE CURE OF ANGINA PECTORIS, OR BREAST PANG.—Angina pectoris (agony of the chest) carries off many people, the last of whom, according to the newspapers, was the novelist Rev. E. P. Roe, who expired in one day because of its crushing anguish, writes Montrose A. Palmer, M. D., in *Belford's Magazine* for November, 1888. Major-Gen. George B. McClellan (according to the published reports of that time) likewise succumbed after 24 hours of uncontrollable pain. Just how these patients were treated I am unable to say; but Dr. Richardson of London, long before Gen. McClellan's death, had received a prize of 25,000 francs from the Academy of Medicine in Paris, for having discovered an almost infallible remedy for angina pectoris by the administration, in the very small doses, of 1-100 to 1-25 of a grain of nitro-glycerine! This discovery entitles Dr. Richardson to the never-ending gratitude of every suffering man, woman or child, afflicted with angina pectoris. I know a number of persons who always carry tablets of nitro-glycerine with them, and I am equally certain that all these people, by the use of nitro-glycerine, are living in comparative comfort, who would otherwise have fallen under the insupportable torture of that form of heart neuralgia, the most dreadful of all pains.

HEADS UP.—An erect bodily attitude is of vastly more importance to health than most people generally imagine. Crooked bodily positions, maintained for any length of time, are always injurious, whether in the sitting, standing, or lying posture, whether sleeping or waking. To sit with the body leaning forward on the stomach, or to one side, with the heels elevated on a level with the hands, is not only in bad taste, but exceedingly detrimental to health; it cramps the stomach, presses the vital organs, interrupts the free motion of the chest, and enfeebles the functions of the abdominal and thoracic organs, and, in fact, unbalances the whole muscular system. Many children become slightly hump-backed or severely round-shouldered by sleeping with their heads raised on a high pillow. When any person finds it easier to sit, or stand, or walk, or sleep in a crooked position than a straight one, such may be sure his muscular system is deranged, and the more careful he is to preserve an upright position and get straight again the better.

SEVERAL COMMON MISTAKES.—Here is a list made by an exchange, of mistakes which it characterizes as "serious," and into one or more of which the reader will probably find he is in the habit of falling more or less frequently. These mistakes are: To labor when you are not in a fit condition to do so. To think that the more a person eats the healthier and stronger he will become. To go to bed at midnight and rise at daybreak and imagine that every hour taken from sleep is an hour gained. To imagine that if a little work or exercise is good, violent or prolonged exercise is better. To conclude that the smallest room in the house is large enough to sleep in. To eat as if you only had a minute to finish your meal in, or to eat without an appetite, or continue after it has been satisfied, merely to satisfy the taste. To believe that children can do as much work as grown people and that the more hours they study the more they learn. To imagine that whatever remedy causes one to feel immediately better (as alcoholic stimulants) is good for the system, without regard to the after-effects. To take off your proper clothing out of season because you have become heated.

WHY MEATS POISON.—When people are poisoned by eating tinned meats it is not because there was poison in the meat before the can was opened, but because the meat had been allowed to develop the poison of putrefaction after the can was opened. For instance, it was not the tinned salmon that poisoned a family who had eaten it with impunity the first day after it was opened, but it was salmon that was spoiled by 48 hours' exposure to the hot and humid atmosphere. It is very rare that any one is made sick by metallic salts in canned foods. The only metal that may cause poisoning in the case of these foods is lead, and this is not likely to be found in tinned foods. It is, however, possible that poisoning may occur from the solder, but it is highly improbable, from the excellent manner in which the tins are made.

PECULIARITIES OF THE APPETITE.—Wallace says that some of the Pacific islanders will never eat hens' eggs, considering them unfit for food; but they sell them to sailors. The Esquimaux will not eat vegetables, considering it a perverted taste that will indulge in such stuff. The New Guinea natives refuse to eat bread and biscuits, and abhor sugar. On the contrary, such tribes enjoy ants, grasshoppers, monkeys and snakes. Those Malayans that collect edible birds' nests never can be induced to eat of them. African tribes that keep most cattle never taste milk. Salt is where all the world finds kinship, for no nation or tribe but craves it, and needs it. On the whole, we shall have to go back to the old Latin saw for an explanation of such diversities: "There is no accounting for tastes."—*Globe-Democrat.*

USEFUL INFORMATION.

How Carpets are Made and Judged.

"What do you mean by the 'standard?'" asked a reporter of a dealer in carpets.

"Look at this piece of ingrain. You see the threads are interwoven across and lengthwise. Now a thread running across we call a 'pick.' Count the number of 'picks' in an inch. There should be 14. That is the way we make our 'standard.' If there are one, two or three less than 14, you see the carpet is far more loosely woven and less durable, though you wouldn't notice the difference on the surface. An ingrain, you know, consists of several thicknesses or layers of thread woven together—'ply,' as we say—that is, a two-ply carpet is two thicknesses of threads, and a three-ply, three. The three-ply is the carpet of our grandmothers. After having fallen into disuse for many years it is coming again. No, I don't think the rage for the antique has anything to do with it; people are beginning to believe again in its serviceability, that is all.

"So much for the cheaper carpets; the more expensive kinds, the Brussels and the Wiltons, are woven on a rack upon wire running crosswise; the standard is ten to an inch. The wires being drawn, semi-cylindrical tubes of wool are left. This is the surface of the Brussels carpet. The Wiltons differ in this way, that the tubes of wool are woven thicker and higher. The wires here have a knife attachment on the end, and upon being withdrawn by machinery split directly through the top of the tiny tube. A rich and plush-like surface is thus formed. Here you can get effects and delicacy of tints and shades that you can't have in a Brussels carpet. Compare these two pieces," and he threw on the floor, side by side, a Wilton and a Brussels. "Now these are exactly the same pattern. That is evident, made of exactly the same shade and kind of wool. That is not so evident, for it doesn't seem so in the least; their effect is totally different. The plush and velvety surface of the Wilton has a softness, a richness, a delicacy which makes the Brussels look flat beside it. Still you wouldn't notice the difference unless you compare them directly, as we have been doing. This carpet, the Wilton, is thicker and finer and heavier, and handsomer, than the other, but it costs about twice as much. An Axminster? Oh, that is the finest of all."

Concerning Moths.

Regarding moths, says the *Upholstery Trade Review*, many are not aware that the damage done is when the millers commence to fly, as their very presence indicates the absence of the worm. It is to prevent the miller incubating that precautions should be taken. A large proportion of the millers never hatch eggs, but die without causing any harm. The male miller, which does not fly, but runs very rapidly, is quite easily detected by his triangular shaped figure, but, keeping himself out of sight, he is not so easily found. His hiding explains the devious flights of the female in her search. The killing of one male is equal to the extinction of many ordinary millers. The male miller is commonly known by the name of "silver fish."

Carpets are seldom troubled with moth worms except where hatched in a dark, unprotected space, and where it is moderately warm. It is for this reason, no doubt, that carpet-houses are seldom, if ever, troubled by them, the stocks in the larger houses being disposed of between seasons. Nearly all the trouble from moths emanates from the furniture, the burlap inside the outer covering being their best field for work, where they can be free from annoyance and find plenty to eat. Many furniture dealers realize their danger, and cleanse the burlap used with naphtha.

It is when the worms are either tired of their food or it lacks the nourishment that they desire, that they seek an outlet and drop upon the carpet.

Cleansing carpets by the naphtha process is regarded as the surest and most satisfactory, where there is the slightest suspicion of moth eggs or worms. It is especially adapted to pile carpets. Caution should be exercised as to the purity and clearness of the naphtha used and the thorough extraction of the grease, else the dirt adheres more easily than before. Where carpets are to remain in storage some time, the odor can be left in the carpet. A more thorough cleansing can be assured by having the carpet beaten first. A surface application of naphtha will drive the impurities through the article to be absorbed by that which is under it.

HOW TO KILL GOPHERS AND RATS.—A Los Angeles county farmer, says the Chino *Champion*, has discovered that the little beasts of gophers love celery, and that putting poison on this vegetable and placing it in their way is a sure method of killing them. Asa Kimble of Chino says the poison should be put on what they are eating at the time; that is, if they are eating potatoes, put it on them; if trees, put it on the place eaten, and so on with any root, tree or vine they are destroying. An irresistible bait for rats is alluded to by the Washington correspondent of the Cincinnati *Commercial Gazette* as follows: An interesting, not to say valuable, discovery has been made by Capt. Weedin, in charge of the animals at the Zoo. The building is infested by rats, and how to get rid of them has long been a perplexing question. Traps were used, but nothing would tempt the rodents to enter. In a storeroom drawer was placed a quantity of sunflower seeds, used as a food for some of the birds. Into this drawer the rats gnawed their way, a fact which led the captain to experiment with them for bait in the traps. The result was that the rats can't be kept out. A trap which appears crowded with 6 or 8 rats is found some mornings to hold 15.

AGAINST FACTORY WHISTLES.—A movement is on foot in New Haven, Conn., to have the Common Council pass an ordinance prohibiting the blowing of factory whistles within the city limits. The *Register*, speaking of the custom of factory whistle blowing, says: "There is no doubt that they are a source of great annoyance to people who are nervous, who may be ill or troubled with insomnia. In fact, steam whistles and the crowing of roosters is a matter of almost daily complaint which physicians have to listen to. The custom of blowing the whistles probably came from the fact that, years ago, when only the wealthy people were able to own watches, the poorer classes needed something to remind them that the hour for commencing or quitting work had arrived. In these days, however, it is not thought that the average day laborer needs to be prompted about such things, for if he does not wear a gold hunting-case watch, he at least has a Waterbury, which answers all purposes."

A RIVAL TO PETROLEUM.—It seems that there is a future in store for cocoa-nut oil as a lubricant, and it has been found equally serviceable for lighting purposes. A Frenchman in the island of Cuba has just established a factory for the manufacture of this oil. He has imported the most perfect machinery, in order that the oil produced shall be as pure as possible. It is said to be very fluid, to oxidize slowly, and to keep long without turning rancid.

RECIPE FOR AXLE GREASE.—An excellent home-made axle grease is said to be made of two parts tallow, two parts castor oil, and one part of pulverized black lead.

ELECTRICITY.

Electric Motors in Factories.

A late novelty in the application of electric motors to the movement of machinery, says the *Railway Review*, is found in the new factory of an electric motor company in New York City. Each machine is run by a separate motor, thus doing away with a line of shafting and all the belts running to it. The vibration is very much reduced, and the machine shop is far less noisy than the average. A dynamo in the basement furnishes electricity.

Mechanics have for some time used electric motors to run machinery so placed as to make it difficult to get power from a line of shafting or to run machines which travel within given limits, such as transfer tables, traveling cranes, etc. In such cases the use of electricity is especially valuable.

In the equipment of a new shop, electricity thus applied also possesses advantages. The amount of power required to drive a main line of shafting, belts and loose pulleys on the counter-shafts is considerable, and when but a few machines are in operation the power expended at the machines forms but a small portion of the whole. By this arrangement of motors, however, the power furnished is used with but little loss in transmission, and when a machine is not in use, no power is expended in keeping in motion shafting and belting used in transmitting power to it. The motors should run at a given speed with but a small percentage of variation. The possibility of adjusting the speed of the motor to suit special cases and still have a uniform motion, is an advantage which in some classes of work will prove valuable. The results of this application will be watched with interest, and, if successful, may be the means of a much wider application of electricity in machine shops.

CONSTRICTION REMOVED BY ELECTRICITY.—Dr. Dujardin-Beaumetz brought before the French Academy of Medicine on the 13th of March a patient cured of constriction of the œsophagus by the use of electricity. The patient, who came from Nievre, arrived in Paris on Feb. 16th. The œsophagus did not measure more than five millimetres in diameter, and only allowed with difficulty the passage of a few drops of soup. The patient now eats all kinds of food, he has gained 10 pounds in weight, and the œsophagus now measures 14 centimetres in diameter. This is the first instance of the application of electrolysis to the cure of constriction of the œsophagus. We have already, in these columns, recorded the fact of the removal of a needle from the flesh of a patient, which had eluded the search of the surgeon's knife. Another similar case has since been announced by the Hartford *Courant*, as follows: The last patient at the electrical surgery, otherwise known as the Hartford Electric Light Station, was a little girl, from whose foot a broken needle was extracted last evening. She got it in her foot seven weeks ago, and at the time an incision a quarter of an inch deep was made without finding it. Under the influence of the big magnet it came out easily. The piece was about three-quarters of an inch long.

A NOVEL SYSTEM OF ELECTRIC-POWER.—*Practical Electricity* says that a novel system of electric-power is to be installed by the Sprague Electric Railway and Motor Company of New York, in a New Hampshire cotton-mill. A bank of three wheels is geared to a jack shaft, and next to the third wheel, on a large pulley fastened to the jack shaft, and between the pulley and the second wheel is placed a coupling. From the pulley belt on to a short counter is carried a friction clutch pulley belted to a dynamo. When it is desired to operate a motor or to start lights in the mill anywhere, it is only necessary to throw the clutch into action. If lights and motor-power are wanted when the mill is not in operation, the single wheel on the jack shaft is employed by starting the one wheel. This one wheel also drives fire pumps, runs elevators in a storage-house several hundred feet from the main building, and operates a tramway. From the one dynamo these, or any other motors located in the vicinity, can be operated.

WHERE WILL IT END?—One of the most suggestive facts connected with the development of electric-power transmission, says *Electric Power*, is the continual growth of the field to which it seems adapted. Steam has been with us so long that all know its wonderful power, even though they may not comprehend the various devices by which it is applied to useful work. The peculiar properties of electricity, however, its generation at the dynamo, its instantaneous transmission to distant points over a solid conductor, without any visible manifestation of motion, all tend to raise a doubt as to its perfect control. The duty which it has been called upon to perform, for intercommunication, and the supply of artificial light, is but a hint at its unfathomable future. We write of it to-day as the most economical and satisfactory agent for the transmission of energy. Those who ridicule its claims may live to see it take its place but a single step from the very fountain-head of energy itself.

COAL loses from 10 to 40 per cent of its evaporative power if exposed to the effects of sunshine and rain.

Passing Events.

It is stated that Secretary Windom will give early attention to the complaints of the miners against the free importation of lead ores carrying silver. The ruling has operated to the great advantage of a few large smelting works, but greatly to the injury of miners. The importation of lead ores in this way should have been stopped long since, but it was only this year that the miners made a concerted effort.

Some attention is being paid to reservoir dams in California, and some very foolish things are being said of the dangers connected with them. The dams here are thoroughly examined at stated intervals, and some of them have been standing for 30 years and upward.

While little is being done in the Lower California placers, the quartz mines seem to be doing very well with promise of good pay in the future, when properly developed.

This number of the PRESS marks the close of a volume, and it is proper to say that this is a good time to renew subscriptions.

Close of the Volume.

Volume LVIII of the MINING AND SCIENTIFIC PRESS closes with this number. On the last page is a very complete index not only of general articles, but of all Pacific Coast patents and local incorporations. A casual glance at this will show how wide a range of subjects has been covered in the last six months, and how fully the branches of industry the paper represents have been treated.

The PRESS is the oldest mining paper in the United States, and for almost the entire period of its existence has been conducted by its present publishers. They may, therefore, claim some considerable experience in publishing a paper devoted to the mining industry. Of late the number and size of the illustrations have been increased, and the paper has had additional pages. This has been necessary owing to increased advertising patronage and a desire to give more space for reading-matter.

The mining field of this coast is now much more fully developed than formerly and covers a much wider area. Regions which formerly had but few scattered camps have now become settled up with towns and a larger population and the mining industry has advanced proportionately. In all these mining towns and camps the PRESS is a visitor. We endeavor to collect what information will be of interest to miner, mechanic and industrial classes; such things as will assist them in their business in the way of methods, processes, systems or machinery, it is our purpose to illustrate and describe. The current mining news is presented in a condensed form, gathered from all quarters. The other special departments are carefully compiled so as to give the greatest information in the least space.

We shall be pleased to have those who have long been readers of the PRESS call the attention of new-comers to the merits of the paper in order that they in turn may become subscribers. The larger our list the better the position in which we shall be placed in the way of improvements.

Reservoir Dams.

One of the daily papers of this city has published an article on the reservoir dams of California, in which some very foolish statements are made. The article is calculated to arouse apprehension among those not conversant with the facts, and also do an injustice to the owners of the dams themselves. There are some very large reservoir dams in the mountain counties, but they are watched day and night and telephonic and telegraphic communication is provided for emergencies. Only one of these large dams in California has ever broken, and that was weakened by dynamite, applied by enemies of the owner.

The article referred to draws an imaginary picture of the damage to be done by the breakage of these dams, in which it is shown that Marysville, Sacramento, the great valley and many small towns would be wiped out or damaged. A little trouble would have shown that this is purely imaginary. The second largest one in the State did break, and no one in Marysville or Sacramento was damaged five cents' worth. The people hardly knew of the occurrence.

In the MINING AND SCIENTIFIC PRESS of last week we gave detailed facts of the breakage of this dam. The experience was valuable in this: that it exactly disproved what the article in the daily paper referred to tries to prove. At no other place in the world has opportunity offered to measure the hight of the wave and the speed of the body of water suddenly released. But here this opportunity was given, and we have published the facts. The result showed much less damage than might have been expected. In the narrow canyons in the immediate vicinity of a dam, damage would be done. But the valleys and cities by the river-side would experience no ill effects. This experience proves.

These "standing menaces to the State," as these dams are called, are not at all standing menaces. A few months since these same papers were urging the Government to build reservoirs to store water for arid lands, while now they hold up as dangerous dams which have stood for years.

Those interested should read the facts presented in the PRESS of last week, where the progress of the wave from the burst reservoir is described and details of its decreasing hight and speed are given during its travels from Sierra county to the Golden Gate.

Silver Facts and Figures.

NUMBER I.

The position of the agricultural societies in the United Kingdom and of State Granges in the United States in favor of remonetizing silver is forcing that question to the front, which promises in the near future to overshadow other political issues, unless the European nations and this country grapple with it and bring about bimetallism. At the last session of the Oregon State Grange, representative farmers belonging to that Order took advanced views on the silver problem, and with no uncertain sound pronounced in favor of free coinage of silver by the mints in this country. This the farmers are forced to, outside of a more liberal supply of metallic currency, so as to raise the price of silver bullion by which the unjust competition of India and Russia farmers in the world's demand markets for wheat, etc., can be brought to a stand. The lower the price of silver the cheaper can Indian and Russian wheat be landed in England, Germany and France; and, on the other hand, the higher the price of silver the more it costs to deliver the above wheat in the European demand markets. It is asserted by monometallists in this country that to have free coinage for silver will make this country the dumping-ground for European silver. This is the special and plausible plea of the "gold-bugs," who, by making silver and all securities based on its price speculative, can turn many pennies in the course of a year into their already overflowing coffers. That this reasoning is fallacious does not admit of a doubt. The United States has grown in population and wealth, taking the two as a whole, ranking any civilized nation in the world, and therefore any advanced step taken by this country on the silver question will not only command attention, but bring about a new order of things. It is safe to assert, and without the fear of successful contradiction, that the United States mints alone can be thrown open to silver without drawing upon the silver from other nations. By free coinage the coinage value of silver would be instantly and permanently re-established for silver bullion. Basing our assertion on the history of the past, it is reasonable to claim that within 48 hours after promulgating the fact of free coinage of silver being re-established by the United States, not an ounce of silver bullion could be bought in any trade center of the world below the coinage rate, less the expenses for transportation and attending charges. That announcement would be a notification to the world that silver bullion of our standard of fineness is a cash sale at 60⅞ to 61d instead of about 42d, the present market price in London. Of course no holder of silver would sell it for less as long as the Mint and Government of the United States was solvent. Besides this, the Latin nations of Europe would soon fall into line and re-establish free coinage of silver. France would only be too pleased to successfully adopt such a course so as to get even with Germany, which demonetized silver to get a financial stab at that country.

In the 13 years preceding 1872, when there was no silver discount in any quarter of the globe, India imported 1,309,867,000 rupees worth of silver bullion, or $314,358,080 worth, and in the 13 years following 1872 India imported 931,997,000 rupees worth, or $223,672,280 worth of silver bullion. In the 13 years of exchange parity between the two hemispheres, and in a period of about half as long of silver yield, India imported 41 per cent more silver in the 13 years of an exchange disparity averaging about 30 to 37 per cent and in a period of nearly double the yield of silver by the mines. Yet there is no man who will deny that silver bullion is salable and exchangeable in India at the full value of 1872 and before, and at a rate of about one-fifteenth higher than our coinage parity.

These are incontrovertible facts which go to prove that the stock of silver of all forms in the Western Hemisphere is reduced to a quantity more than $2,000,000,000 less than in 1851, and about $1,200,000,000 less than in 1873, when the bullion value of a silver dollar at our present coinage par was $1.03 gold. The production of the silver mines of the world from 1850 to 1886 amounted to $2,303,125,000. The silver coined by the nations of Europe and the United States alone from 1850 to 1886 amounted to $1,801,487,760. The silver coinage of India in that period amounted to $1,110,000,000. The coinage of Mexico during the like time amounted to $750,000,000. Other nations, which in 1886 and 1885 each coined silver to the amount of $21,000,000 a year, are not included in the above general footings. The aggregate coinage of 14 nations from 1851 to 1886 amounted to $3,661,487,000. The imports of silver by India from 1850 to 1886 amounted to $1,399,000,000. The coinage of the United States and Europe alone from 1851 to 1886 consumed all the world's product of silver in that period save $504,513,000, but in that same length of time East India absorbed $1,399,000,000, leaving a net abstraction from the supply of bullion of $886,000,000. Including the Mexican coinage in this, that mintage being largely for the Chinese trade, the net abstraction in these two channels alone from the bullion supply of the Western Hemisphere in 36 years is $1,636,000,000 worth.

Mining in Japan.

The Pelton Water-Wheel Co. report an order from the Japanese Government for one of their water-wheeel hoists, similar to two recently constructed by this company for Messrs. Hayward & Hobart for their mines in Amador county.

These hoists are operated by double reversible-wheels with three streams applied to each. The nozzles have separate gates controlled by levers brought to a central station, giving perfect control of all movements, and admitting of such variations of speed and power as may be desired. In this way only the water required to move the load is used, affording great economy of water, at the same time giving ample power for any emergency. They are to operate a double-compartment shaft, with capacity to work to a depth of 2000 feet, and to be equipped with every known appliance for safety.

The Japanese are a progressive people, quick to adopt the most improved mining appliances that experiment has proved of value in this country, the above order being the result of investigation made by Government engineers sent here a few months ago to examine into modern methods of mining on this coast.

SUTRO TUNNEL ROYALTY.—The Sutro Tunnel Co. will collect above $300,000 in royalty on Comstock ore the current year. This will exceed by above $50,000 the revenue of the company from that source during any single year since the completion of the tunnel. The expenses of the company will probably not exceed $50,000 annually. The cost of extending the tunnel one mile west of its present terminus, which will bring it under the peak of Mount Davidson, will not exceed $200,000.

THE bullion yield of the Con. California and Virginia mine the current month will exceed that of May over $30,000, provided the assay value of ore extracted does not fall below the average of that so far produced on June account. The assays so far this month average nearly $3 per ton higher than last month. It requires a gross bullion yield of nearly $330,000 to cover operating expenses and a 50-cent dividend.

THE Copper Queen Co. at Bisbee, Arizona, has another smelter ready for firing up by the first of next month. It will have a capacity of 100 tons per day. The company has now in operation four smelters, one of 100 tons and three of 30 tons each, and the addition of the new one will make the total capacity 290 tons per 24 hours, or in round figures 212,000,000 pounds per year.

G. F. SCHILD of Vallejo, who patented the floating caisson for closing the mouth of the big stone dock at Mare island, has obtained judgment against the Government for infringement. An assessment of damages will be made.

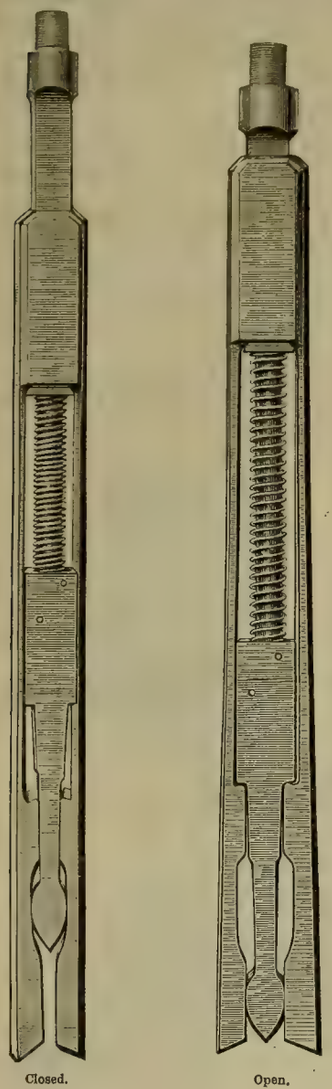
VANADIUM.—A sample of copper ore containing vanadium, from Wolverine district, Nev., analyzed in San Francisco, shows less than two per cent of that valuable metal.

SECRETARY TRACY has decided to grant an extension in the time for the completion of the Charleston by the Union Iron Works.

Day's Well-Boring Apparatus.

Engravings on this page show Day's patent reamer, which is employed for drilling in rock or hard material. The drills or cutting tools have their cutting edges beveled outward, as shown. The shanks of these tools are made of considerable thickness for a short distance above the cutting points, and at one point is formed an offset or shoulder from which the remainder of the shank extends upwardly in the form of a comparatively thin plate, which is sufficiently elastic to allow the lower parts or cutters to open and close as much as may be necessary for the work.

The upper ends are thickened or enlarged. The rods from the surface down come inside the casing. They pass between the two sides of the drill-shanks, and, extending downwardly between the elastic portions, the lower end of the rod is fitted into the upper end of the block



Closed. Open.

DAY'S WELL-BORING APPARATUS.

and is held in place by boring holes through the block, which go one-half into each side of the rod, and placing bolts or rivets therein.

Below the shoulders a spear-point is formed, and the thickened extensions between the drill-points and shoulders are grooved or chambered out, as shown, sufficient to receive the spear-head and inclose it between the sides of the concavities.

The operation is as follows: The spear-head is drawn up until it lies between the concavities of the drill-shanks, the springs being compressed by this action, and the shanks of the drills are drawn in or contracted sufficiently to pass easily down the well-tube or casing. As soon as the lower ends of the drills have passed out of the casing and pass into the hole already drilled, the spring raises the drill-shanks and spreads them to the required diameter.

The drills are thus spread apart, so as to be of greater diameter than the exterior of the casing. The drill-rods are then lifted up and allowed to fall, the weight acting upon the drill-points and cutting away the bottom in the usual way, giving a diameter large enough to allow the casing to pass down freely. The shoulders on the block come in contact with the shoulders on the cutting tool, which are very near to the points of the drills, so that only the very thick metal intervenes between the points of the drills and the shoulders.

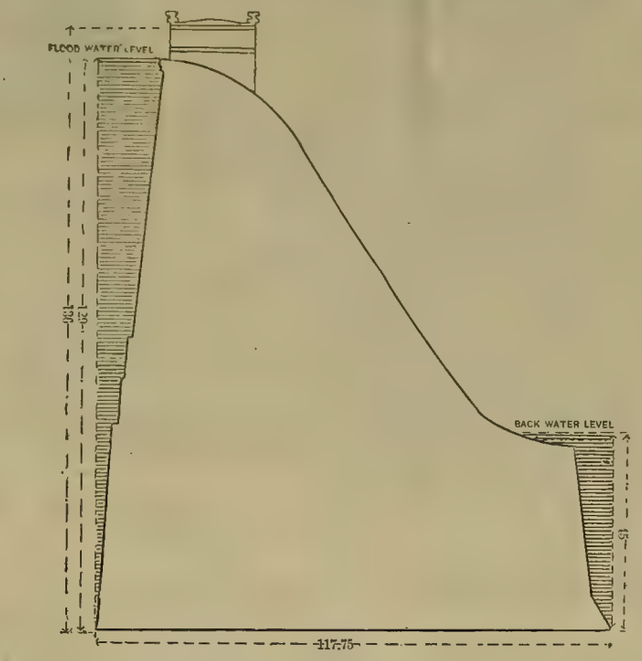
It will be seen that the blows applied through the shoulders at this point act more directly upon the points of the drills than if they were applied at the upper ends, and by this construction the jar and strain is taken off from the thin elastic portions of the drill-shanks.

When it is necessary to withdraw the drills from the well, by drawing up the rods, the friction of the drill-shanks on the casing is sufficient to compress the spring until the spear-head is again brought into the concavities, when the shanks will close up sufficiently to allow the drills to be drawn up through the well-tube or casing again. The patent for this device was recently obtained through the MINING AND SCIENTIFIC PRESS Patent Agency by J. E. Day and a half-interest has been assigned to Joseph Pracy of this city. Any further information concerning it may be obtained by addressing the inventor, No. 109 Mission street.

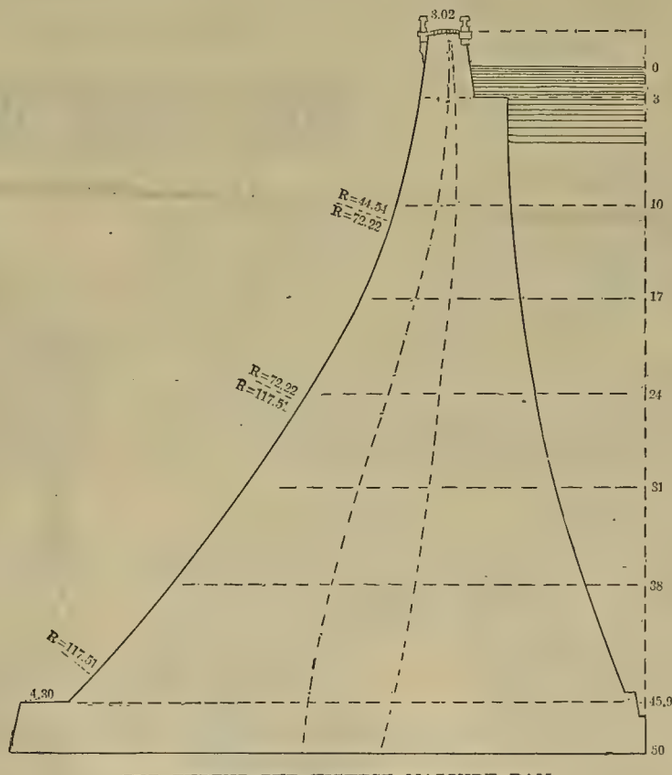
Two Notable Dams.

Now that the subject of reservoir dams is attracting attention, it will be of interest to learn some facts connected with the Furens and Vyrnwy dams; one, the highest masonry dam, and the other, a more modern form designed to allow the water to pass over it in case of sudden floods.

The Furens dam, a section of which is shown herewith, was completed in 1868 in the valley of the Furens river, France, in order to protect the town of Saint Etienne from inundations. The greatest depth of water in the reservoir is 164 feet, the total storage capacity being 422,625,000 gallons. The inlet from the reservoir consists of two cast-iron pipes passing through a lateral tunnel. In constructing a dam exceeding in hight any then existing, the engineers took every precaution for strength. As the gorge to be closed was very narrow, the dam was made curvilinear, the radius being 328 38 feet. This is the first French dam that was made curvilinear in form. The profile was based on the type of M. Delocre. The greatest hight of the dam above foundation is 187.72 feet on the down-stream side, but up-stream it is only 170.6 feet. Great pains were taken in all details of construction. Before excavating foundation a new permanent channel was made for the river, and two lateral tunnels were excavated for outlet pipes. By these means and a coffer-dam the foundation was kept perfectly dry.



THE VYRNWY DAM AND WASTE WEIR.



THE FURENS—THE HIGHEST MASONRY DAM.

All loose or seamy portions of the foundation rock were removed, and where the surface of the rock was smooth, it was roughened. The whole wall, including the facing, was built of rubble masonry, the last stones being selected for the faces. The stones varied in size from two to seven cubic feet. The masonry was carried up about five feet high at a time over the whole wall, in order to prevent unequal settling. Cut stones were placed in the front face in quincunx order.

The thickness of the dam at highest level where water is stored (146 feet) is 20.9 feet. Above this there is a guard-wall, and on top are two parapets.

The Furens dam is the highest reservoir-wall of the present time, and "the first masonry dam which has been built in accordance with correct scientific principles." Its construction was in every respect a perfect success.

The Vyrnwy dam was commenced in 1882, and forms the large storage reservoir on the Vyrnwy river for the water-supply of Liverpool. It is 1350 feet long on top, the plan being straight. Its maximum hight above foundation is 136 feet. The profile adopted (as the cut shows) differs from all others in not being designed simply to resist the water pressure, but also to form a waste weir. The front face of the wall is made, therefore, to conform to the curve described by the water in overflowing and to deflect it into the basin in front of the dam. This dam is built of Cyclopean rubble, and the blocks are shaped roughly in the quarry. So many large dams have been destroyed by an overflow, that this newest one was designed to obviate danger from that source. The cuts and description we take from the recently published valuable work on "Masonry Dams" by E. Wegmann, published by John Wiley & Son.

MECHANICS' FAIR.—Two new boilers will replace the old ones at the Mechanics' Institute Fair building. Director Dow of the Committee on Power and Machinery reported in favor of accepting the bid of the Union Iron Works. The successful bidders will erect two separate boilers, of the latest improved make, for $6250, the two to have a combined capacity of 350-horse power. The new boilers will be in place and ready for work on the opening of the next fair, on August 27th. William Cameron, the agent for the exposition, states that the preparations for the fair are progressing in a most satisfactory manner. The display of machinery will be much larger than ever before. Already over 140 applications have been made for space on the floor of the pavilion, which will cover more than 60,000 square feet of room.

IRON AND STEEL MILLS.—A dispatch from Baltimore says: A syndicate of leading English iron and steel men have made heavy purchases of mineral lands near Cumberland Gap, on the line between Kentucky and Tennessee. A new town will be built under the name of Middlesborough, Ky., where immense steel and iron mills will be erected. It is to be known as the American Association (Limited). Over $4,000,000 in cash has already been paid out, and upward of 60,000 acres of mineral land purchased. Over $7,000,000 more is pledged for the new enterprise.

THE OIL STEAMER W. L. Hardinson was burned at the wharf at Ventura on Tuesday; loss, $8000. This steamer was constructed with tanks for transporting oil in bulk to San Francisco from Southern California ports. The vessel belonged to the Mission Transfer Co.

THE United States Mint at Carson City, Nev., will resume coinage operations on the 1st of July, after a suspension of four years. Up to April 1, 1885, the mint had coined a total of $35,735.813, including $16,596,845 in gold and the remainder in silver.

THE AMERICAN PHARMACEUTICAL ASSOCIATION is in session in this city. Several hundred delegates have come from the East. The papers read at the meetings will be published in the journal of the association.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California.

Location of works, Placer County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 15th day of May, 1889, an assessment, No. 13, of Five Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 327 Pine St., Room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 16th day of July, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale, By order of the Board of Directors.

O. H. BOGART, Secretary.

OFFICE—327 Pine St., Room 9, San Francisco, California.

POSTPONEMENT.

The delinquent day of above assessment has been postponed until Tuesday, the 2d day of July, and the day of sale until Tuesday, the 23d day of July, 1889. By order of the Board of Directors.

O. H. BOGART, Secretary.

DIVIDEND NOTICE.

THE GERMAN SAVINGS & LOAN SOCIETY

526 California Street.

For the half year ending June 30, 1889, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on Term Deposits, and four and one-quarter (4¼) per cent per annum on Ordinary Deposits. Payable on and after Monday, July 1, 1889.

GEO. TOURNY, Secretary.

SAN FRANCISCO SAVINGS UNION,

532 California St., Cor. Webb.

Branch, 1700 Market St., Cor. Polk.

For the half year ending with the 30 h of June, 1889, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on term deposits, and four and one-quarter (4¼) per cent per annum on ordinary deposits, free of taxes, payable on and after Monday, July 1, 1889. LOVELL WHITE, Cashier.

WANTED.

FIVE OR SIX THOUSAND DOLLARS

Are required by the Owners of a

Well Developed and Very Valuable Gold Mine

To complete its mill and means of output of ore, etc. For this advance of capital a valuable interest will be given at a very low price. The mine is remarkably well located, with abundance of wood and water and every facility for mining, and can soon become one of the notable gold properties of the State. The owners are responsible men and practical miners.

G. M., Box 2517, San Francisco, Cal.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No 1, 32 ft.; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leller, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

A New Book on Assaying.

The Newest and Best in the English Language.

IT LEADS ALL OTHERS!

Just Ready.

THE ASSAYERS' MANUAL.

An Abridged Treatise on the Docimastic Examination of Ores, and Furnace and other Artificial Products. By Bruno Kerl, Professor in the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by Wm. T. Brannt, Editor of "The Techno-Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by F. Lynwood Garrison, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 Engravings. Three hundred and fifty-four pages, 8vo., cloth, price $3.00. *By mail, free of postage, to any address in the world.*

Abstract of Contents: GENERAL DIVISION.—I, Mechanical Manipulations; II, Chemical Operations; III, Assay Furnaces; IV, Assay Vessels; V, Balances and Weights; VI, Tools and Implements; VII, Assay Reagents. SPECIAL DIVISION.—I, Lead; II, Copper; III, Silver; IV, Gold; V, Platinum; VI, Nickel; VII, Cobalt; VIII, Zinc; IX, Cadmium; X, Tin; XI, Bismuth, XII, Mercury; XIII, Antimony; XIV, Arsenic; XV, Uranium; XVI, Tungsten; XVII, Chromium; XVIII, Manganese; XIX, Sulphur; XX, Fuels; Appendix; Index.

☞ *A circular of 8 pages, quarto, giving the full Table of Contents of this Important Book, as well as a new List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will send his address.*

☞ *The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 84 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.*

HENRY CAREY BAIRD & CO.,

INDUSTRIAL PUBLISHERS, BOOKSELLERS AND IMPORTERS,

810 Walnut St., Philadelphia, Pa., U. S. A.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron bangers for top saw. Friction feed-works, patent steel screw double-throw headblocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,

San Francisco, Cal.

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.

One 3-inch Sergeant Drill.

One 5-ft. Double Screw Drifting Column with Arms.

One 4-ft. Single Screw Stoping Bar.

One 8x13 ft. Air Receiver.

One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the

PAYMASTER MINING CO.,

Yuma, Arizona Territory.

Sargeant Rock Drills For Sale.

The undersigned, having seven new 3-inch Sargeant Drills, complete with clamps and columns and three extra tripods, more than they can make use of, will sell all or any one, delivered in San Francisco at much below cost, the price depending on the number ordered.

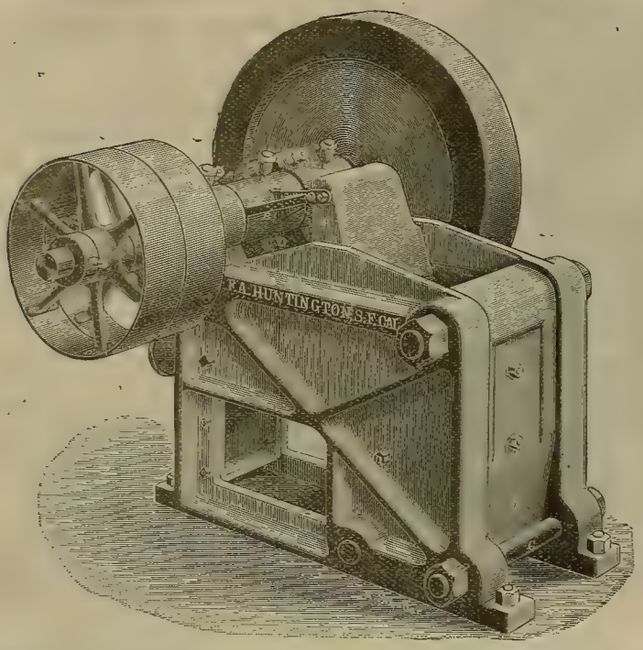
F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

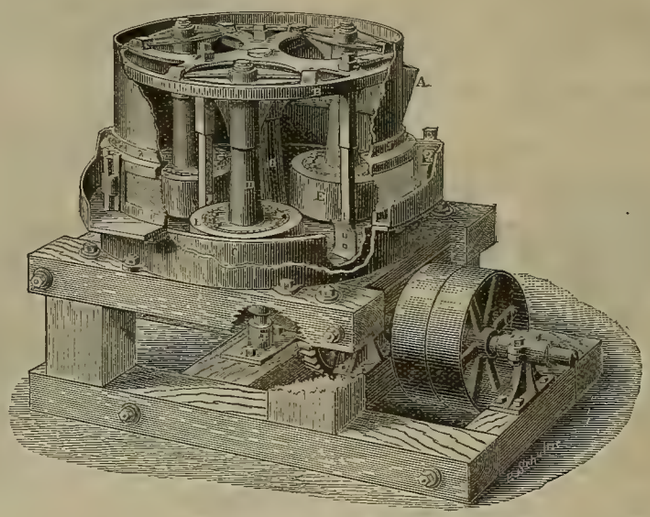
PRINCIPAL OFFICE, 45 FREMONT STREET, SAN FRANCISCO.



Huntington's Improved Rock-Breaker.

The main features of this machine are strength, ease of adjustment and simplicity of construction.

The movable jaw *A* is worked by the eccentric *B* and is pivoted at the bottom. The stationary jaw *D* is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt *C*. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt *C* and the jaw *D*. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.



F. A. HUNTINGTON'S
Centrifugal Roller Quartz Mill.

The following will explain the above cut:

The ore and water being fed into the mill at the hopper *A*, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

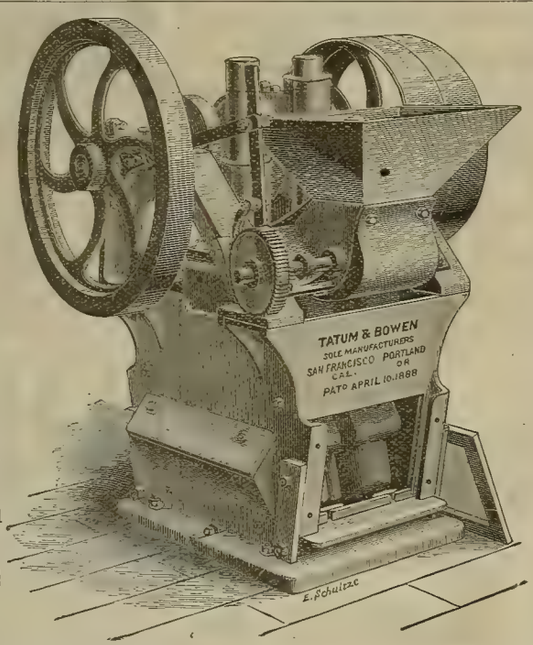
The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing and gold saving it has no equal.

I claim especial merit in that feature of this system *which prevents* ALL FLOURING of gold and quicksilver, and the consequent loss of gold that attends stamp milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

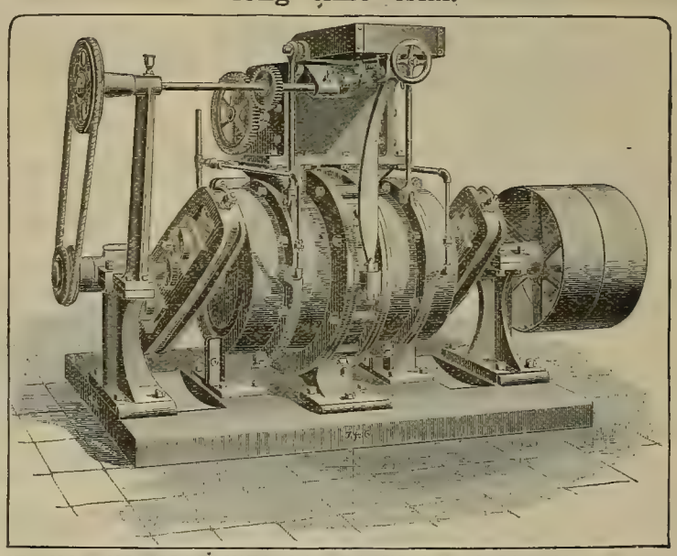
TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,
AND PORTLAND, OREGON.

MANUFACTURERS OF MINING AND SAW MILL MACHINERY.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JUNE 18, 1889.

405,337. — AMALGAMATOR — Jos. Behm, West Point, Cal.

405,393. — MACHINE FOR AFFIXING POSTAGE STAMPS — L. J. Bone, S. F.

405,532. — ADVERTISING — J. A. Christy, Los Angeles, Cal.

405,537. — STAPLE-DRIVER — E. M. Dean, Alta, Cal.

405,253. — VEGETABLE COOKER — F. W. & E. Gaines, Colfax, W. T.

405,358. — SUPPORT FOR BEAMS OR GIRDERS — P. H. Jackson, S. F.

405,512. — SASH HOLDER — R. P. Waddell, Alameda, Cal.

405,513. — SAFETY RAILWAY SWITCH — J. H. Wait, Junction City, Ogn.

405,642. — SURGICAL INSTRUMENT — I. N. Woodle, Albany, Ogn.

The following brief list by telegraph, for June 25th, will appear more complete on receipt of mail advices:

California—Percy L. Davis, San Francisco, store service apparatus; Henry E. Freyshlag, San Jose, fishing net; Gotlardo Guobbini, Point Reyes, gate; Peter H. Jackson, San Francisco, frame for illuminating tiles; Viola Moore, San Francisco, music stand and portfolio; Winfield S. Odle, Los Angeles, portable extension ladder; Ernest L. Ransome, San Francisco, finishing concrete and artificial stone surface; Henry Root, San Francisco, machine for making wire rope; Hamlet Sutcliffe, Oakland, fire gate.

Oregon—Jesse M. Keith, Albany, machine for building wire and picket fence.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AMALGAMATOR.—Joseph Behm, West Point, Calaveras county. No. 405,337. Dated June 18, 1889. This invention relates to an apparatus for more perfectly amalgamating and saving gold and silver together with mercury or other precious or valuable metal which is capable of amalgamation. It consists of a tub or tank having the interior lined with silver or copper plates, a means for introducing the pulp and conveying it into said tank, and a series of vertically-reciprocating inverted funnel-shaped plungers of silvered or coppered plates. The invention is intended to thoroughly agitate pulp which has already been reduced to a proper degree of fineness to prevent it from settling to the bottom of the tank, and to bring all parts of it intimately and repeatedly into contact with the amalgamated surfaces by which means the greatest amount of the precious metals may be saved.

SUPPORT FOR BEAMS OR GIRDERS.—P. H. Jackson, S. F. No. 405,358. Dated June 18, 1889. This is an improvement on a previous patent by the same inventor. It consists in such a construction that he is enabled to dispense with holes (which it was formerly necessary to make) through the beams and diaphragms, and by this construction is avoided the time and expense of handling and transporting these heavy beams from the rolling-mill or place of manufacture to the place where they are to be punched to prepare them for being put together.

COMPRESSING NATURAL GAS.—The contract for the two large duplex gas compressors and boilers for the Kentucky Rock Gas Company was placed with the Clayton Air-Compressor Works, No. 43 Dey street, New York. These compressors have a capacity of 2,000,000 cubic feet per day and are to compress the natural gas at the wells to a pressure of 200 pounds per square inch and force it a distance of 32 miles to Louisville for light and power purposes. The Clayton air compressors are practically the only ones adapted for compressing natural gas, and that they are eminently suitable for this purpose has been demonstrated by their performance at the natural-gas fields of Bradford and Wellsville.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE volume of water in the Carson river has shrunk rapidly during the past few days, but the flow is still more than sufficient to operate to their full capacity the stamp-mills along its course.

A First-Class Type-writing Machine for $50.

One of the best machines in the market, with the late improvements and in perfect order. Regular price, $85. Call at or address the office of this paper.

The Jenisch and Loehnert Ball-Mill.

(*Continued from page 473.*)

machine amounts to not quite ten cents per ton pulverized material. With gold quartz the wear is much less.

The machine is said to be capable of crushing 30 to 50 cwt. of gold quartz per hour by wet process, and by dry process 10 to 14 cwt. per hour. Over 250 of these mills have been put in use on the continent of Europe since June, 1887. B. & E. Albert, who pulverize all of the basic slag from Krupp's factory, use 17 of the mills. Over 65 of them are working in the Portland cement works, in Germany, Russia, Switzerland, Norway, Sweden and England. They are working also successfully in gold quartz in the mines of Hungary, Chili and Bolivia. They have been found also useful in pulverizing, arsenic, asphaltum, sulphur phosphates, gypsum, fire-clay, lime, etc.

At the present exhibition of mining appliances in Berlin, these mills attracted great attention, and 13 were sold in the first part of May. Mr. Robert Mack of Oakland, Alameda Co., Cal., has obtained the sole control of the sale of this mill for North America, and is about to arrange for its introduction on the Pacific Coast.

Gold in River Channels.

A New Theory of Its Deposition.

EDITORS PRESS:—During a recent visit to the drift-mining districts near Laporte and Gibsonville, in Plumas and Sierra counties, I made certain discoveries which suggested a new theory as to the deposits of heavy gold and worn quartz bowlders lying invariably beneath lava ridges, which to my mind must displace the ancient-river theory so long held in California. This theory was foreshadowed in my second annual report as State Mineralogist, 1882, folio 98.

I have in preparation a paper which it is my intention to publish in the MINING PRESS with illustrations, giving my reasons for so thinking. I send you this preliminary notice to secure priority.

The substance of my theory is briefly as follows:

The channels are lake-beds scooped out by glaciers that in course of time retired to mountains of greater altitude and continued their work during a long period on a larger scale, and finally became extinct.

The bedrock at this locality being soft clay slates, mica schists and argillaceous shales filled with small quartz veins containing gold, were reduced to mud and washed away, leaving the harder quartz in rounded bowlders with the coarse gold in the lake-bed, which was still filled with water. Rivers like the Rhone in Switzerland, brought down from the still active but distant glaciers crushed quartz, and for many centuries deposited it in the lake, covering the bottom with what our miners call "pipe clay." The lake and the low mountain-tops were subsequently covered by an overflow of volcanic mud, the so-called lava. Modern rivers which still flow in their channels cut down through the lava, the gravel deposits, and deep in the soft bedrock. That portion between the rivers protected by the lava became rounded ridges, and a portion still flat as a floor remaining on the summits of the mountains are "table mountains." The channels so called are the intact lake-beds and the present drift mines. The new river channels are the placer mines of the forty-niners and the hydraulic mines of past history.

It is my opinion that the contents of the channels came from a small area, and were not brought from a distance, as generally supposed. The blue quartz which imparts a general character to these deposits I found in place near Gibsonville, as I did also all the bowlder rocks common to the deposits.

That there were numerous lakes of this character I am prepared to believe, but on reducing the Lake of Geneva to the same scale as my map, I find it to extend from Pilot peak to Nevada City, and to cover most of the important drift and placer mines between those two points.

Assuming that such a lake existed, I have named it Lake Trask, from the first State Geologist of California, who made this subject a special study and nearly discovered the facts to which I alluded. HENRY G. HANKS.

718 Montgomery St.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

Huntington Hopkins Co.

REMOVAL TO THEIR NEW BUILDING.

For several days the MINING AND SCIENTIFIC PRESS windows have overlooked an interesting and busy scene in the removal of the immense hardware stock of the Huntington Hopkins Co., from their former place of business at the junction of Market, Bush and Front streets, to their handsome and commodious new building on Fremont street, between Market and Mission, Nos. 18 to 24 inclusive. The new building has a frontage of 93 feet on Fremont street, and in hight is five stories and basement, extending back 137½ feet, where it joins the rear of an older four-story brick structure, also owned by the company, and having a frontage of 137½ feet on First street by a depth of 137½ feet. The two buildings are connected by a paved court, roofed with glass and iron, and make a total depth of 275 feet. This arrangement permits of a double driveway through the entire premises, thereby enabling heavy trucks entering from either street to load and unload and pass through without turning.

The new Fremont-street building presents an imposing front and reflects much credit upon the taste of the architect. It is very substantially constructed of granite, brick, iron and steel.

The interior of the building has been fitted with a special view to the requirements of an immense business, nothing having been omitted that would contribute to this end. Five hydraulic ram elevators and two hand elevators are in constant service, raising and lowering goods between the basement and the floors above.

Well-lighted and commodious offices are situated at the rear of the main salesroom, which is on the ground floor of the Fremont-street front. In this great salesroom, while containing many shelf goods may be seen conveniently arranged samples of nearly every line of hardware, etc., that the house carries. These consist of a great variety of agricultural implements, miners', blacksmiths' and carpenters' tools, and extensive line of builders' hardware, the best grades of cutlery and sporting goods of all kinds. In heavier goods there is constantly on hand a large stock of bar, bundle, sheet and plate iron and steel, wrought and cast-iron pipe, plumbers', blacksmiths', milling, mining and railroad supplies. The company gives employment to 90 men—salesmen, accountants, correspondents, porters, etc., in the San Francisco house alone. A history of this great business enterprise, from its establishment by C. P. Huntington in Sacramento forty years ago to the present time, would fairly illustrate the commercial progress of the Pacific Coast, as embodied in its own energy and successful achievements.

For many years the original house at Sacramento, as well as the business in San Francisco, has been conducted under the firm name of Huntington, Hopkins & Co., but on February 23, 1888, it was incorporated under the name of the Huntington, Hopkins Company, the officers of the corporation being Albert Gallatin, president, Charles Miller, vice-president, W. R. S. Foye, secretary, and Collis P. Huntington, treasurer.

Notwithstanding the immense business transactions of the company, which extend over the entire Pacific Slope from the Isthmus of Panama to Alaska, a visitor to the establishment will not fail to be impressed by the perfect order with which the details are conducted and the absolute discipline and system which prevail. An unsurpassed record of 40 years for integrity and straightforward business methods has earned for this house an enviable reputation, which does credit to the city and State alike.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

STEEL BOILERS IN TWO PLATES.

Steam Users, Attention!

The engraving represents our standard Boilers. These boilers are made of STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are bought which have a small hand-hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 1 Steam Drum, 1 Breeching, 1 Smokestack, 300 Feet Galvanized Strand for Guys, 1 C. I. Front Complete, 1 Foundation Plate for Front, 1 Set Grate Bars for Coal or Wood, 1 Back Bar Bearer, 1 Ash Cleaning Door and Frame, 1 Back Arch Plate, 1 Set Binder Braces and Bolts for Brickwork, 1 Stand for Back End of Boiler, 1 Steam Gauge for Syphon, 1 Glass Water Gauge Complete with Column and 3 Gauge Cocks, 1 Safty Valve, 1 Feed Valve, 1 Blow-off Valve, 1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds.

Boilers of the following Sizes in Two Sheets kept Constantly on Hand ready for Shipment: 60 Inches Diameter x 16 Feet Long; 54 Inches Diameter x 16 Feet Long; 48 Inches Diameter x 16 Feet Long; 42 Inches Diameter x 16 Feet Long.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

"RED FLAX TRADE MARK RED CORD CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. ☞ Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 27, 1889.

Trade the past week was dull, but not more so than usually obtains during the mid-summer days. It is very generally claimed that when we are well into next month a gradually increasing trade will set in. Farmers are in the midst of harvest work, and until that is well off their hands trading by them is confined as much as possible. From the mining sections no large trade is looked for for two or three months.

The local money market continues easy. Remittances from the interior are light, but this is always the rule at this season of the year. Merchants and manufacturers' requirements are said to be light; consequently the call for funds from them is small. It is claimed that the call for funds this year to move the wool clip was smaller than usual, due to the free marketing by growers. The fruit crop has required considerable money, but as a rule the bulk was met by interior banks and capitalists. It is generally claimed that the wheat and barley crops will be marketed slow, unless prices advance. If stored, large sums of money will be tied up. The wheat surplus is placed at from 1,100,000 to 1,300,000 tons. This represents a cash valuation at to-day's prices of from $28,000,000 to $35,650,000. To move this, not taking into consideration the 400,000 tons for food and seed, will require large sums of money, and an almost constant drain on our banks will set in, and continue well into August or September, when funds remitted to the interior will begin to set back again.

In next month there will be large disbursements in this city to pay accrued interests and dividends. It is difficult to say how much will be disbursed, but it is generally claimed that it will go to over $2,000,000. This is independent of the sums that will be sent, or have already been sent away to pay interest on railroad and other bonds held at the East and also abroad.

There is still an almost entire absence of any speculative movements. The only thing that approaches such is wheat futures. Local securities are so high that cautious, conservative operators are afraid to invest. Mining stock securities have been so poorly handled by mining-stock pools for outside operators, that outside of chronic dealers no one is taking much interest in them. While this is the case there is no doubt but the work in those mines listed on the two exchanges is closely watched. There are many believers that the unexpected running into a large body of ore may happen at almost any time. As long as this belief exists, mining stocks will be dealt in.

For the week ending June 22, there was loaned on realty in this city $200,775, at from 6 to 7 per cent per annum by the banks and as high as 12 per cent by private individuals.

The steamer hence June 20 for China took out $161,885 in Mexican dollars, $72,000 in silver bullion, $8096 in gold coin and $50 in gold-dust. The same steamer took out for Japan $274,600 in silver bullion.

Exchanges closed to-day lower and weak under a small inquiry.

The imports of treasure by sea the past week are reported to aggregate in coin $21,431, of which $10,766 was Mexican.

SILVER—The European and Eastern markets held steady up to-day, when New York came through at 91⅞c. In our market there has been a continued free inquiry at 92⅛@92⅜c bid, and 92⅝@92¾c paid, with the latest reported sales made at the latter figure. To-day one buyer named 92¾c for silver, another 92½c, while a leading seller says that prices are no lower in this market.

QUICKSILVER—Receipts the past week aggregate 252 flasks and the exports 355 flasks to Mexico. The market is without essential change.

LEAD—The market with us continues very strong, but not quotable higher. At the East there is a good speculative and consumptive demand. English advices report that dealers there expect that if the ruling by the United States Treasury be against Mexican ore, all of the latter will be diverted to England.

BORAX—Concentrated is quoted lower. Eastern advices report a strong market. There were no receipts at this port the past week. The exports aggregate 339,795 lbs. to New York via Panama.

LIME—Receipts the past week aggregate 3355 barrels. The demand continues steady.

TIN—Imports the past week aggregate 8000 bxs. of plate from the East by overland railroad. The market for both pig and tinplate favors buyers. Consumers are said to confine their wants as much as possible. There was exported by sea the past week 2200 lbs. of plate to Mexico and 27,000 lbs. to Victoria, B. C.

COPPER—There was shipped to New York the past week 170,850 lbs. of ore. The market is without change. Lake, at the East, is established at 12c, although it is said that the price can be shaded. The latest statistical position of copper is in favor of holders, as the consumption is growing, the output less and the stocks being reduced.

IRON—The last steamer for Panama took out en route for New York 476,960 lbs. of ore. For pig the market is without particular change to note. Buyers and sellers are still apart. Consumers hold off as much as possible, unless offered inducements to take a round parcel. Several claim that with good prospects for freights on this coast, considerable will be brought here in ballast, and consequently prices cannot advance. On the other hand, sellers claim that the market abroad will more than offset any decline in charters or freights. Eastern advices report a quiet and easier market.

COAL—Imports the past week aggregated as follows: From Tacoma, 4000 tons; Nanaimo, 1914; Coos bay, 1200; Australia, 1570. Total, 8684 tons. There are signs of an increasing call for all kinds, which causes a firmer tone, but no advance. The temporary light receipts, no doubt, have something to do with spot and near-by, but for shipment or distant cargoes, we fail to see any indications of buyers operating, except when offered inducements. The ships on the way from and loading at New Castle, N. S. W., have a registered tonnage as follows: For this port, 45,575 tons; for San Diego, 16,720. Total, 62,295 tons. From Sydney the tonnage is as follows: For this port, 22,377 tons; for San Pedro, 7308; and San Diego, 2438. Total, 32,123 tons.

Eastern Metal Markets.

By Telegraph.

NEW YORK, June 26, 1889.—The following are the closing prices the past week:

	Silver in London	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 1-16	92	$12 00	$4 00	$20 00
Friday	42	91⅞	12 50	4 00	19 95
Saturday	42	91⅞	12 00	4 00	19 90
Monday	42	91⅞	12 00	4 00	19 95
Tuesday	42	92	12 00	4 02½	19 90
Wednesday	42	92	12 00	4 05	19 90

NEW YORK, June 26.—Refined and powdered California borax is scarce, higher and firm at 9½c. Concentrated is unchanged; 7¾@8¼c. Quicksilver is firm at 65@66c. Recent Rothschild quotation £9 5d. The iron and steel interests are well supported. Rails are strong at $28. Lake copper is nominally $12, but that price, shaded in late German and French bids, is said to have been rejected by mining companies. The London market is stronger. Casting brands sold here at $10¾@11¼. Pig lead has considerably recovered, with a good speculative and consumptive demand. Closing prices were $4@4.05 for the rest of June and July and $4.05@4.07½ for August and September delivery.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, June 23, $72,000; Alice, 17, $20,960; Justice, 20, $3942; Crescent, 19, $5600; Hanauer, 20, $7250; Crescent, 20, $2356; Germania, 20, $25 688; Hanauer, 21, $4850; Germania, 22, $3138; Hanauer, 22, $2400.

THERE are on the Comstock to-day about 400 miners out of employment. There is but slight chance, if any at all, for them to get work within the next three or four months. These are facts which wise men should not fail to heed.—*Virginia Enterprise.*

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Mining Share Market.

The market exhibited more activity the past week with freer transactions under steadily advancing prices up to Monday, when a jump of 10 to 25 cents per share took place in the Comstocks. On Tuesday the market began to set off, which continued up to yesterday (Wednesday), when a slight drop under a bear raise took place. In "Pauper alley" there are fewer men of all shades, character and standing waiting for opportunities to make money without work than have been seen for many months past. While this is so on that noted thoroughfare, the "tickers" in the more high-toned places in various parts of the city are less patronized by the slaves to that important instrument. There are various reasons assigned for the falling off in outside interest in stocks, the leading ones being: 1st, the almost constant drag, relieved only by small upward moves, which few benefit by, that has obtained since about the middle of last April; 2d, many devotees to the business being out of the city under assurance that there would not be anything yet awhile; 3d, free losses have driven many to other and more stable business. Those who are left are quite hopeful that with next month there will be a change in the tide for the better. This opinion is based chiefly on the fact that the principal mining magnates are now here; heavy disbursements of money the fore part of July; the Sutro tunnel legally changing hands on July 14th; the natural desire of leading operators to unload, if possible, large lines of stocks owing to the expected demand for money to move the crops; and last, but not least, of favorable reports expected from the mines to favorably influence the market, notwithstanding a growing scarcity of water on the Comstock, the bullion output falling off each week (last week's was only about $140,000), and several more assessments looked for at an early day. In the outside stocks there was more done in some of the Tuscaroras, with Nevada Queen advancing about 100 per cent, but the others only moved up a few cents. These stocks, outside of Commonwealth, one year ago sold many times higher than they are selling for to-day. The shrinkage in their market value is accounted for by too big reports of ore, bullion, expected dividends, etc, but in lieu thereof assessments and similar kind of fare for outside holders. The Quijotoas have shown more life, but then owing to their low prices outsiders handle them rather gingerly. The Bodies held strong with only moderate business. Bodie even advanced slightly, while the Comstocks went down. Their strength, it is claimed by many usually well informed on the streets, is due to a desire of two of the large holders of the stocks to sell out and not net a loss, while there are a few who report a continued favorable change in the mines. The latter report the writer is unable to have verified up to this writing by thoroughly reliable information from the mines.

From the mines the news is of an unimportant character. Comstock advices continue to report the Mexican west crosscut being driven ahead as fast as possible. The same news comes from Yellow Jacket. It now looks as if leading miners' hopes are centered in these two crosscuts cutting within the next few weeks the gold ledges west of the silver-bearing lode that is now being worked. If when the gold-bearing lode is found it proves as rich in mineral as is expected, a general revival in mining interests will follow. About Best and Belcher and Gould and Curry mysterious hints are put out, but not tangible enough to admit of entertainment by the more conservative miners. In the other mines the usual routine work comes to hand, with the more important, if there be any, information held back. The water supply on the river is growing scarcer. From the Tuscarora district our advices are still of the usual order, "ore, bullion," etc., which has grown stale and unprofitable to outside holders of the stock. From the Quijotoa district there is nothing new to report, outside of official information. From the Bodies there is nothing new, so far as obtainable, to report. The usual "driving" business is reported in the official advices. From the Columbus and Eureka districts there is nothing new obtainable outside of official advices.

The stock market opened this morning firm, and held fairly steady under light business up to the noon adjournment. In the afternoon board, the Comstocks were lower, but the outside stocks were steady.

THE Virginia *Enterprise* says that the Combination shaft, on the Comstock, which is 3300 feet deep, has cost $7,000,000, and not a dollar ever came out of it.

GEN. W. H. DIMOND has been appointed superintendent of the U. S. branch mint in this city.

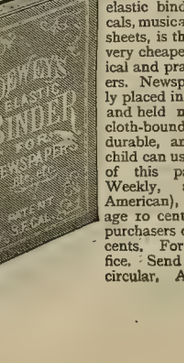
THE San Francisco supervisors have passed an order requiring all cable-car companies to provide suitable devices for guards on all dummies after August 1st.



A NEW PAPER BINDER—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrate d circular. Agents wanted.

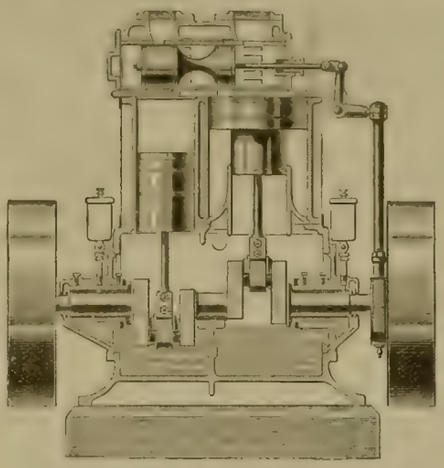
PARKE & LACY COMPANY

IMPORTERS AND MANUFACTURERS OF

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,
AIR COMPRESSORS, ROCK DRILLS,
WALL'S CRUSHING ROLLS,
CONCENTRATORS, PULVERIZERS,
TURBINE WATER WHEELS,
ROCK BREAKERS, DRY JIGS

Golden Gate Concentrators,
GREATEST CAPACITY
OF ANY CONCENTRATOR MADE,
One Machine Taking Pulp from 10 Stamps.



SAW MILLS, MACHINE TOOLS,
PLANING MILLS, INJECTORS and EJECTORS,
BELTING, PACKING, OILS, LUBRICATORS,
FIRE EXTINGUISHERS,
CENTRIFUGAL PUMPS,
ROTARY PUMPS, GANG EDGERS,
CAMPBELL'S STEAM FEEDS,
MILL and MINE SUPPLIES.

GENERAL AGENTS FOR

WESTINGHOUSE AUTOMATIC ENGINES.

SALES DURING LAST FOUR MONTHS:

COMPOUND, 44 ENGINES, 5215 HORSE POWER. STANDARD, 99 ENGINES, 4500 HORSE POWER. JUNIOR, 166 ENGINES, 4260 HORSE POWER.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W.

MINERS ATTENTION!

SPRAGUE ELECTRIC RAILWAY AND MOTOR CO., OF NEW YORK.

LOW-GRADE ORES CAN BE PROFITABLY WORKED BY ELECTRIC TRANSMISSION OF POWER FROM DISTANT WATERFALLS.

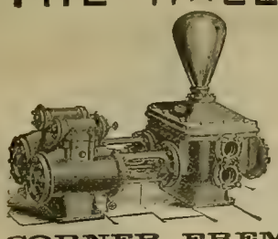
Plants will, in many cases, pay for themselves in from 1 to 5 years by the saving produced by Electric Transmission compared with other systems.

Suspension and Surface Tramways, Hoists, Pumps, Drills, Stamp-mills, etc., operated by Electric Motors.

☞ FOR FURTHER INFORMATION, CIRCULARS, ESTIMATES, ETC., APPLY TO

JAYNE & DUNCAN, Agents, Room 16, No. 132 Market St., San Francisco, Cal.

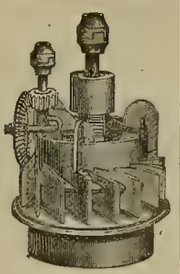
THE HALL DUPLEX STEAM PUMP,



The Most Simple, Efficient and Durable Duplex Steam Pump in Use
FOR ALL DUTIES.

THE T. H. RISDON TURBINE WATER WHEEL,

SUITABLE FOR ALL FALLS. ADAPTED TO ALL CONDITIONS.
Built Specially for Durability.
HAS THE HIGHEST RECORD FOR PERCENTAGE OF POWER.
Catalogues Sent on Application.



W. T. GARRATT & CO.,

CORNER FREMONT AND NATOMA STS., SAN FRANCISCO.

CHAS. F. BLACKBURN,
Practical Mining Geologist,
SALMON CITY, IDAHO.

(Formerly of the United States Geological Survey; 15 years practical experience on the Rocky Mountains and adjacent ranges.)

WILL REPORT ON THE CONDITION and value of any Mining property in Idaho or Montana. Topographic and Geological maps furnished. All work strictly scientific.

RICH GOLD AND SILVER LODES for sale. Bargains guaranteed. Correspondence solicited, especially with capitalists seeking good paying mines.

This region is the most extensive solid mountain country in the United States, and its metallic wealth is practically inexhaustible.

1889. CATALOGUE OF 200 PAGES. 1889.

A TREATISE AND HANDBOOK ON

ROCK DRILLING —AND— AIR COMPRESSING

Mailed Free.

The matter is readily available.—*Tradesman.*

A Complete Work.—*Colliery Engineer.*

Handy for reference.—*Min. and Sci. Press.*

Should be in the hands of every Engineer and Contractor.—*Eng. and Min. Journal.*

DEWEY & CO. {220 MARKET ST. S. F. Elevator, 12 Front.} PATENT AGENTS.

Iron and Machine Works.

UNION IRON WORKS,
SACRAMENTO, CAL.

ROOT, NEILSON & CO.,
MANUFACTURERS OF
Steam Engines, Boilers,
AND ALL KINDS OF
MACHINERY FOR MINING PURPOSES.
Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.
Front St., bet. N & O Sts., Sacramento, Cal.

ADAM SCHILLING & SONS,
117-119 Main St., San Francisco.
Practical Machinists and Engineers.
Repairing of every description of Machinery promptly attended to.

CALIFORNIA MACHINE WORKS,
WM. H. BIRCH & CO.,
ENGINEERS AND MACHINISTS,
No. 119 Beale St., - - San Francisco.
—BUILDERS OF—
Steam Engines, Saw Mills, Mining Machinery, Dredging Machines, Rock Crushers, Cable Railway Machinery, Ellithorp Air Brake Co.'s Patent Steam and Hydraulic Elevators, Air Cushions and Air Brakes. POSITIVE SAFETIES. Improved Ram Elevators, Sidewalk and Hand Hoists. B. E. Henrickson's Patent Automatic Safety Catches.
Machines of all kinds Made and Repaired. Orders Solicited.

Golden State & Miners Iron Works.
Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.
STEVENSON'S PATENT
Mold-Board AMALGAMATORS,
Golden State Pressure Blowers.
First St., between Howard & Folsom, S. F.

THOMAS THOMPSON THORNTON THOMPSON
THOMPSON BROTHERS,
EUREKA FOUNDRY,
129 and 131 Beale St., between Mission and Howard, S.F.
MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

C. K. ORTON. J. H. WILLIAMS.
Williams & Orton,
MANUF'RS OF GENERAL MACHINERY.
Works, No. 315 Mission St., San Francisco.
Special attention given to Woodworking Machinery Steam and Gas Engines. Correspondence solicited.

MINING ENGINEERS.

W. A. GOODYEAR,
Civil and Mining Engineer,
MINING EXPERT AND GEOLOGIST.
Address "Business Box A," office of this paper, San Francisco.

ROSS E. BROWNE,
Mining and Hydraulic Engineer,
No. 307 SANSOME ST., SAN FRANCISCO.

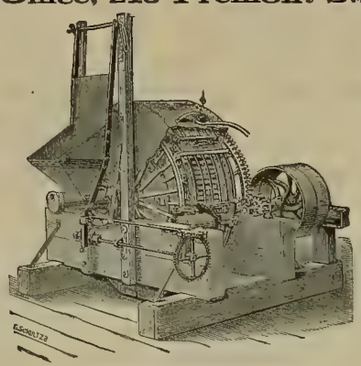
ISRAEL W. KNOX,
Mining and Mechanical Engineer
AND PURCHASING AGENT FOR
Mines, Mining Machinery & Supplies.
Mines Examined, Reports and Estimates Furnished, Contracts made, etc.
Office, 237 First St., San Francisco, Cal.

U. S. PROTECTIVE BUREAU.
Reliable Attorneys and Correspondents in all parts of this continent and Europe.
Superior facilities for obtaining information. The collection of hard and doubtful accounts a specialty.
Office, Rooms 3 and 4,
235 Kearny St., - San Francisco, Cal.

WINANS'
ANTI-INCRUSTATION POWDER
Or Boiler Compound
For Removing or Preventing Scale, Corrosion and Pitting in Steam Boilers. Send for references.
Also FEERLESS RUBBER M'F'G CO. Plumbago Sheet, and Piston and Valve Rod Packing, to be had only of
J. C. WINANS, 220 Fremont St., S. F., Cal.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
— ALSO —
HOMOGENEOUS STEEL, SOFT and DUCTILE,
SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.
ALSO Steel Rods, from ¼ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 213 Fremont St., San Francisco.
—MANUFACTURERS OF—

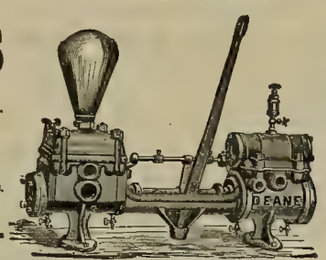


TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.



SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers. DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

DR. RICORD'S RESTORATIVE PILLS, a specific for exhausted vitality, physical debility, wasted forces, nervous derangements, constitutional weakness, etc., approved by the Academy of Medicine, Paris, and the medical celebrities of the world. Agents, **J. G. STEELE & CO., 635 Market Street. Palace Hotel, San Francisco, Cal.**
☞Sent by mail or express anywhere. Box of 50, $1.25; of 100, $2.00; of 200, $3.50; of 400, $6.00; preparatory pills, $2.00.
☞SEND FOR CIRCULARS.

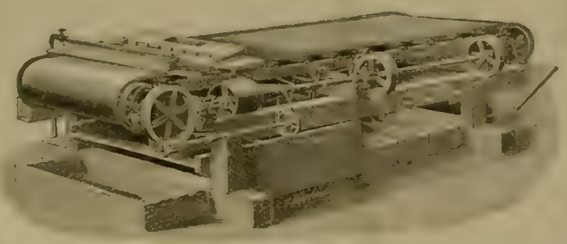
INVENTORS on the Pacific Coast should secure their Patents through Dewey & Co.'s MINING AND SCIENTIFIC PRESS Patent Agency, No. 220 Market St., S. F.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information, apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS: - Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

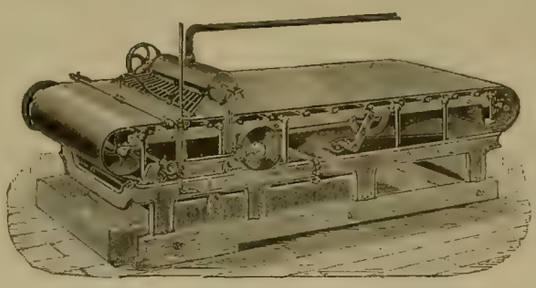
The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

—o—

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanner or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty eight (28) are now in constant successful operation.

FOR WATER WORKS
AND GAS PLANTS,
CONVERSE PATENT LOCK-JOINT PIPE.
Strength, Durability, Economy.
